
3.9 DUCTWORK SYSTEM INSULATION SCHEDULE

- A. Omit insulation on the following:
 1. Fibrous glass ductwork (ductboard).
 2. Lined ductwork.
 3. Ductwork with sound absorbing linings.

- B. Prohibited insulation:
 - 1. Polyisocyanurate installed within a return air plenum.

- C. Outdoor Air:
 - 1. Service:
 - a. Interior untreated outdoor air intake ducts.
 - 2. Acceptable Insulation:
 - a. Flexible mineral fiber.
 - b. Rigid mineral fiber.
 - c. Cellular glass.
 - d. Polyisocyanurate.
 - e. Flexible elastomeric.

- D. Supply Air:
 - 1. Service:
 - a. Supply ducts from air handling equipment.
 - b. Insulate neck and bells of supply diffusers.
 - 2. Acceptable Insulation:
 - a. Flexible mineral fiber.
 - b. Rigid mineral fiber.
 - c. Cellular glass.
 - d. Polyisocyanurate.
 - e. Flexible elastomeric.

- E. Return Air:
 - 1. Service:
 - a. Interior ductwork within 10 feet of exterior roof or wall penetrations.
 - 2. Acceptable Insulation:
 - a. Flexible mineral fiber.
 - b. Rigid mineral fiber.
 - c. Cellular glass.
 - d. Polyisocyanurate.
 - e. Flexible elastomeric.

- F. Exhaust Air.
 - 1. Service:
 - a. Interior ductwork within 10 feet of exterior roof or wall penetrations.
 - 2. Acceptable Insulation:
 - a. Flexible mineral fiber.
 - b. Rigid mineral fiber.
 - c. Cellular glass.
 - d. Polyisocyanurate.
 - e. Flexible elastomeric.

3.10 DUCT SYSTEM INSULATION THICKNESS SCHEDULE

- A. Flexible Mineral Fiber:
 - 1. Interior Ductwork:
 - a. 0.75 pounds per cubic foot density:
 - 1) 1-1/2 inch thick, minimum R-4.2.
 - b. 1.5 pounds per cubic foot density:
 - 1) 1-1/2 inch thick, minimum R-4.2.
 - 2. Meet R-value installed at maximum 25% compression, application limited to concealed locations.

B. Rigid Mineral Fiber:

1. Interior Ductwork:
 - a. 1.5 pounds per cubic foot density:
 - 1) 1 inch thick, minimum R-4.2.
 - b. 3 pounds per cubic foot density:
 - 1) 1 inch thick, minimum R-4.2.
 - c. 6 pounds per cubic foot density:
 - 1) 1 inch thick, minimum R-4.2.
2. Ductwork installed in machine, fan, and mechanical equipment rooms:
 - a. 2 inch thick, minimum R-8.0.
3. Exterior Ductwork or Ductwork Exposed to Weather, or Ductwork:
 - a. 2 inch thick, minimum R-8.0.
4. Ductwork in an Unconditioned Space:
 - a. 2 inch thick, minimum R-8.0.

C. Cellular Glass:

1. Interior Ductwork:
 - a. 1-1/2 inch thick, minimum R-5.0.
2. Exterior Ductwork or Ductwork Exposed to Weather, or Ductwork:
 - a. 2-1/2 inch thick, minimum R-8.0.
3. Ductwork in an Unconditioned Space:
 - a. 2 inch thick, minimum R-8.0.

D. Polyisocyanurate:

1. Interior Ductwork:
 - a. 1 inch thick, minimum R-6.0.
2. Exterior Ductwork or Ductwork Exposed to Weather:
 - a. 1-1/2 inch thick, minimum R-8.0.
3. Ductwork in an Unconditioned Space:
 - a. 2 inch thick, minimum R-8.0.

E. Flexible Elastomeric:

1. Interior Ductwork:
 - a. 1 inch thick, minimum R-4.2.
2. Exterior Ductwork or Ductwork Exposed to Weather:
 - a. 2 inch thick, minimum R-8.0.
3. Ductwork in an Unconditioned Space:
 - a. 2 inch thick, minimum R-8.0.

3.11 DUCTWORK JACKET SCHEDULE

A. Omit jacket on internally lined ductwork.

B. Exposed ductwork within mechanical rooms (below 10 feet):

1. Foil Scrim Kraft (FSK).
2. Polypropylene Scrim Kraft (PSK).
3. All-Service Jacket (ASJ).
4. Polypropylene Scrim Polyester (PSP).
5. Flexible Metal Cladding (flexible elastomeric only).
6. Aluminum with smooth finish.

C. Exposed ductwork within mechanical rooms (above 10 feet):

1. Foil Scrim Kraft (FSK).

2. Polypropylene Scrim Kraft (PSK).
3. All-Service Jacket (ASJ).
4. Polypropylene Scrim Polyester (PSP).
5. Flexible Metal Cladding (flexible elastomeric only).

D. Exposed ductwork:

1. Foil Scrim Kraft (FSK).
2. Polypropylene Scrim Kraft (PSK).
3. All-Service Jacket (ASJ).
4. Polypropylene Scrim Polyester (PSP).
5. Flexible Metal Cladding (flexible elastomeric only).
6. Aluminum with smooth finish.

E. Ductwork within return air plenums:

1. Foil Scrim Kraft (FSK).
2. Polypropylene Scrim Kraft (PSK).
3. All-Service Jacket (ASJ).
4. Polypropylene Scrim Polyester (PSP).
5. Flexible Metal Cladding (flexible elastomeric only).

F. Ductwork in an unconditioned space:

1. Foil Scrim Kraft (FSK).
2. Polypropylene Scrim Kraft (PSK).
3. All-Service Jacket (ASJ).
4. Polypropylene Scrim Polyester (PSP).
5. Flexible Metal Cladding (flexible elastomeric only).

G. Exterior ductwork and ductwork exposed to weather:

1. Flexible Metal Cladding (flexible elastomeric only).
2. Aluminum with stucco finish.
3. Multilayer Laminate Vapor Barrier Cladding.
4. Rubberized Asphalt Vapor Barrier Cladding.

END OF SECTION

SECTION 15991 (230800) - COMMISSIONING OF HVAC SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Commissioning process requirements for HVAC systems, assemblies, and equipment.

1.2 SUMMARY

- B. Retain the services of a third-party registered design professional or approved agency that is regularly engaged in conducting commissioning to develop a commissioning plan, supporting documentation, and reports.
- A. This section covers the Contractor's responsibilities for commissioning; each subcontractor or installer responsible for the installation of a particular system or equipment item to be commissioned shall be responsible for the commissioning activities relating to that system or equipment item.
- B. The Commissioning Authority (CxA) shall direct and coordinate all commissioning activities and provide Prefunctional Checklists and Functional Test Procedures for Contractor's use.
- C. The entire HVAC system and its appurtenances shall be commissioned, including controls, ductwork, piping, noise and vibration control devices, specialty systems (e.g., smoke control systems), and other systems identified elsewhere in the Contract Documents.
- D. The Prefunctional Checklist and Functional Test requirements specified in this section are in addition to, not a substitute for, inspection or testing specified in other sections.

1.3 RELATED REQUIREMENTS

- A. Division 01 Commissioning requirements that apply to all types of work.

1.4 REFERENCE STANDARDS

- A. ASHRAE Guideline 0 – The Commissioning Process, most current edition.
- B. - The HVAC Commissioning Process; most current edition.

1.5 DEFINITIONS

- C. Refer to Division 01 “General Commissioning Requirements” for additional abbreviations and definitions.
- A. BAS: Building Automation System.
- B. Basis of Design (BOD): A document that records concepts, calculations, decisions, and product selections used to meet the OPR and to satisfy applicable regulatory requirements, standards and guidelines. The document includes both narrative descriptions and lists of individual items that support the design process.

- C. Commissioning Authority (CxA): An entity identified by the Owner who coordinates the commissioning team to implement the Commissioning Process.
- D. Commissioning Plan: A document that outlines the organization, schedule, allocation of resources, and documentation requirements of the Commissioning Process.
- E. Commissioning Process: A quality-focused process for enhancing the delivery of a project. The process focuses on verifying and documenting that the facility and all of its systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the OPR. Commissioning is intended to achieve the following objectives:
 - 1. Verify that applicable systems and equipment are designed and installed according to the manufacturer's recommendations and to industry accepted minimum standards.
 - 2. Verify that applicable systems and equipment receive adequate operational checkout by installing contractors.
 - 3. Verify and document proper performance of equipment and systems.
 - 4. Verify that O&M documentation provided to the Owner is complete.
 - 5. Verify that the Owner's operating personnel are adequately trained.
- F. Commissioning Report: A report that includes the following:
 - 1. Results of final functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
 - 2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
 - 3. Itemization of resolved deficiencies found during preliminary commissioning.
 - 4. List of deferred tests that cannot be performed at the time of final commissioning report preparation because of climatic conditions.
- G. Functional Performance Test (FPT): A test that verifies the equipment or item being tested performs in the manner intended.
- H. Owner's Project Requirements (OPR). A document that details the functional requirements of a project and the expectations of how it will be used and operated, including the following:
 - 1. Project goals.
 - 2. Energy efficiency goals.
 - 3. Ventilation requirements.
 - 4. Project documentation requirements
 - 5. Facility functions.
 - 6. Hours of operation and any need for after-hours operation.
 - 7. Equipment and system expectations.
 - 8. Building envelope performance expectations.
 - 9. Measurable performance criteria.
 - 10. Cost considerations.
 - 11. Benchmarks.
 - 12. Success criteria
 - 13. Supporting information.
- I. Operations and Maintenance Manual (O&M): A system-focused composite document that includes the operation manual, maintenance manual, and additional information of use to the Owner during the occupancy and operation of the building.
- J. Pre-Functional Checklist (PFC): A checklist that verifies all components and accessories related to a system that will be subjected to an FPT are present and functional.

- K. Systems, Subsystems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, equipment, and components.
- L. TAB: Testing, Adjusting, and Balancing.

1.6 SUBMITTALS

- A. Updated Submittals: Keep the Commissioning Authority informed of all changes to the HVAC system documentation made during installation, and startup; revise and resubmit when substantial changes are made.
- D. Submit a commissioning plan that includes the following:
 - 1. General project information and commissioning goals.
 - 2. Commissioning team information.
 - 3. Narrative description of commissioning process activities, schedules, responsibilities, and personnel required during commissioning.
 - 4. List of equipment and systems to be tested with description of tests to be performed. Include an explanation of the original design intent.
 - 5. List of functions to be tested, including calibration and economizer controls.
 - 6. List of conditions under which the tests shall be performed.
 - 7. List of measurable criteria for performance.
- B. Draft Prefunctional Checklists and Functional Test Procedures for Control System: Detailed written plan indicating the procedures to be followed to test, checkout and adjust the control system prior to full system Functional Testing; include at least the following for each type of equipment controlled:
 - 1. System name.
 - 2. List of devices.
 - 3. Step-by-step procedures for testing each controller after installation, including:
 - a. Process of verifying proper hardware and wiring installation.
 - b. Process of downloading programs to local controllers and verifying that they are addressed correctly.
 - c. Process of performing operational checks of each controlled component.
 - d. Plan and process for calibrating valve and damper actuators and all sensors.
 - e. Description of the expected field adjustments for transmitters, controllers and control actuators should control responses fall outside of expected values.
 - 4. Copy of proposed log and field checkout sheets to be used to document the process; include space for initial and final read values during calibration of each point and space to specifically indicate when a sensor or controller has "passed" and is operating within the contract parameters.
 - 5. Description of the instrumentation being used for testing.
 - 6. Indicate the tests required on each system that should be completed prior to TAB using the control system for TAB work. Coordinate with the Commissioning Authority and TAB contractor for this determination.
- C. Submit startup reports pre-functional tests, and trend logs for review by the Commissioning Authority.
- E. Submit a copy of the preliminary commissioning report. Preliminary commissioning report shall include the following:
 - 1. Results of preliminary functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
 - 2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
 - 3. Completed Commissioning Compliance Checklist.

4. Itemization of deficiencies found during testing that have not been corrected at the time of preliminary commissioning report preparation.
 5. List of deferred tests that cannot be performed at the time of preliminary commissioning report preparation because of climatic conditions.
 6. List of climatic conditions required for the performance of the deferred tests.
- F. Submit a final commissioning report that includes the following:
1. Results of final functional performance tests. Organize equipment and components specified by other Divisions in separate sections for independent review.
 2. List of functional performance testing procedures used during commissioning, including measurable criteria for test acceptance.
 3. Itemization of resolved deficiencies found during preliminary commissioning.
 4. Submit report to the Engineer and Owner within 90 days of the date of receipt of the certificate of occupancy.
- D. Project Record Documents:
1. Submit as-built drawings indicating changes that occurred during the construction phase.
 2. Submit updated version of control system documentation, for inclusion with operation and maintenance data.
 3. Show actual locations of all sensors on project record drawings.
- G. O&M Manual: The O&M manual shall expand upon the more traditional operating and maintenance documentation to include information gathered during the commissioning process. Include the following for each system:
1. Manufacturer information.
 2. Equipment specifications and recommendations.
 3. Programming procedures and data points.
 4. Narratives.
 5. Other means of illustrating to the Owner how the building, equipment, and systems are intended to be installed, maintained, and operated.
 6. Label that includes required regular maintenance actions for equipment and systems.
 - a. Include in the label the title or publication number for the O&M manual for the model and type of product.
 7. Site information, including facility description, history, and current requirements.
 8. Site contact information.
 9. Description of major systems.
 10. As-built control schematics for each commissioned system.
 11. As-built control sequences for each commissioned system, including final setpoints and list of all control points.
 12. Final parameters of all peripheral equipment (e.g., final parameters resident in a VFD.)
 13. Recommended operating procedures for each piece of primary equipment
 14. Instructions for integrated building systems.
 15. Instructions for basic troubleshooting.
 16. Recommended schedule of maintenance requirements and frequency, troubleshooting guidelines, and emergency procedures.
 17. Site equipment inventory and maintenance notes.
 18. Site events log.
 19. Copy of all special inspection verifications required by the enforcing agency or standards.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

- A. Provide all standard testing equipment required to perform startup and initial checkout and required functional performance testing. Unless otherwise noted such testing equipment will NOT become the property of Owner.
- B. If not otherwise specified, provide test equipment certified and calibrated within the past year of use. Meet the following minimum accuracy requirements:
 - 1. Temperature sensors and thermometers: Accuracy of plus/minus 0.5 degrees F and resolution of plus/minus 0.1 degrees F.
 - 2. Pressure sensors: Accuracy of plus/minus 2.0 percent of value within the range of values being measured (not full range of sensor).
- C. Equipment-Specific Tools: Where special testing equipment, tools, and instruments are specific to a piece of equipment, are only available from the vendor, and are required in order to accomplish startup or Functional Testing, provide such equipment, tools, and instruments as part of the work. Such equipment, tools, and instruments shall become the property of Owner.

PART 3 - EXECUTION

3.1 COMMISSIONING PROCESS OVERVIEW

- A. The following narrative provides a brief overview of the typical commissioning tasks performed during the design, construction, acceptance, and post-occupancy phases and the general order in which they occur. Coordinate with the CxA to comply with the commissioning requirements of the project.
 - 1. Owner furnishes documentation to support the OPR and BOD to the design team and CxA.
 - 2. The CxA holds a design review kickoff meeting.
 - 3. The design team prepares construction documents to meet the OPR and BOD.
 - 4. The CxA develops the commissioning plan.
 - 5. The CxA conducts a construction document checklist review.
 - 6. Plans are permitted and construction-related submittals for all commissioned equipment are provided to the CxA during the normal submittal process.
 - 7. The CxA develops specific equipment PFCs and furnishes them to the contractor.
 - 8. The CxA conducts a kick-off meeting early during construction and presents the commissioning process for the project.
 - 9. The Contractor coordinates project construction and prepares the project for inspecting, acceptance testing, and PFCs.
 - 10. The Contractor coordinates with the CxA to execute and document the PFCs. The CxA reports on the PFC process including an issues report.
 - 11. PFCs are completed before start-up, testing and balancing, and functional testing.
 - 12. The Contractor and responsible subcontractors shall document equipment start-up and initial checkout with assistance from manufacturer's technicians. The CxA may request copies of the manufacturer's or contractor's field start-up reports.
 - 13. The CxA develops specific FPT plans for review by the Engineer, Contract Administrator and responsible subcontractors.
 - 14. The Contractor coordinates TAB for the project.
 - 15. Testing, adjusting and balancing of completed HVAC systems is completed and verified by the CxA.

16. The Contractor and responsible subcontractors complete the installation and checkout of all building control systems.
17. The CxA coordinates and executes the FPTs with the assistance of responsible subcontractors. The CxA reports on the testing process including all observed deficiencies.
18. The CxA develops a preliminary commissioning report.
19. Testing of other commissioned systems not requiring formal functional testing is completed.
20. The CxA reviews close-out documentation and schedules deferred testing.
21. The Contractor and CxA coordinate to compile the O&M manual.
22. The CxA verifies training as required by the Contract Documents is completed.
23. The CxA develops a final commissioning report.

1.2 DESIGN REVIEW KICKOFF MEETING

- A. Hold the meeting during the schematic design phase of the project.
- B. The CxA shall coordinate the following parties to be included in the meeting:
 1. Owner or owner's representative.
 2. Project manager.
 3. Design team.
 4. Design reviewer.
- C. Review the following during the meeting:
 1. OPR.
 2. BOD.
 3. Drawing set.
 4. Specifications.
 5. Project scope.
 6. Design elements and assumptions.
 7. HVAC system selection.
 8. Recommended energy efficiency measures.

3.2 PREPARATION

- A. Cooperate with the Commissioning Authority in development of the Prefunctional Checklists and Functional Test Procedures.
- B. Furnish additional information requested by the Commissioning Authority.
- C. Prepare a preliminary schedule for use by the Commissioning Authority. Develop the following schedules and update the schedule as appropriate during the course of construction:
 1. Leakage testing of duct systems.
 2. Pressure testing of piping systems.
 3. Flushing and cleaning piping systems.
 4. Equipment startup.
 5. Testing, adjusting, and balancing systems.
- D. Notify the Commissioning Authority when scheduled tests shall occur. When commissioning activities not yet performed or not yet scheduled will delay construction, notify ahead of time and be proactive in seeing that the Commissioning Authority has the scheduling information needed to efficiently execute the commissioning process.
- E. Put all HVAC equipment and systems into operation and continue operation during each working day of testing, adjusting, and balancing and commissioning, as required.

1. Include cost of sheaves and belts that may be required for testing, adjusting, and balancing.
 - F. Provide test holes in ducts and plenums where directed to allow air measurements and air balancing; close with an approved plug.
 - G. Provide temperature and pressure taps in accordance with the contract documents.
 1. Provide a pressure/temperature plug at each water sensor that is an input point to the control system.
- 3.3 INSPECTING AND TESTING - GENERAL
- A. Refer to the latest adopted edition of the applicable energy code for more information.
 - B. Coordinate appropriate acceptance testing technicians to perform required acceptance tests and complete documentation for acceptance testing.
- 3.4 PREFUNCTIONAL CHECKOUT
- A. Submit startup plans, startup reports, and PFCs for each item of equipment or other assembly to be commissioned.
 - B. PFCs shall demonstrate the commissioned equipment is properly installed and ready for startup and initial operation.
 - C. Perform the PFCs directed by the CxA for each item of equipment or other assembly to be commissioned.
 - D. Document items from the PFCs and startup that were not completed successfully.
 - E. Complete and submit all PFC forms and provide notice that the equipment is ready for testing, adjusting, and balancing.
 - F. Deficiencies: Correct deficiencies and re-inspect or re-test, as applicable, at no extra cost to Owner.
- 3.5 TESTING AND BALANCING COORDINATION
- A. Coordinate commissioning schedule with TAB schedule.
 - B. Notify the CxA at least 7 days in advance of testing and balancing work. Provide access for the CxA to witness test TAB work.
 - C. Review the TAB plan to determine the capabilities of the control system toward completing TAB.
 - D. All required Prefunctional Checklists, calibrations, startup, and component Functional Tests of the system shall be completed and approved by the CxA prior to starting TAB.
 - E. Coordinate with the BAS and TAB Contractor to make available technicians, instrumentation, and tools to assist the CxA in verification of data points associated with TAB of HVAC systems.

3.6 FUNCTIONAL PERFORMANCE TESTING

- A. The CxA shall furnish FPT procedures to the subcontractors and equipment manufacturers for review for feasibility, safety, equipment, and warranty protection.
- B. Perform the FPTs directed by the CxA for each item of equipment or other assembly to be commissioned, including equipment, controls, and economizers. FPTs shall demonstrate the following:
 - 1. The operation, function, and maintenance serviceability for each commissioned equipment, component, and system is confirmed according to the approved plans and specifications.
 - 2. The sequence of operations, including modes, backup modes (if applicable), alarms, and mode of operation upon a loss of power and restoration of power for each control device, equipment, component, and system. Reference section Control System Functional Testing below for more information.
 - 3. Control devices, components, equipment, and systems are calibrated, adjusted, and operate in accordance with the approved plans and specifications.
 - 4. Air economizers operated in accordance with manufacturer's specifications and specified sequence of operation.
 - 5. Terminal units: For multiples of like equipment (VAV terminal units, unit heaters, etc.), commission a minimum of 50 percent of total number of units.
- C. Coordinate with the responsible sub-contractors to provide trained technicians to perform commissioning tests and/or coordinate with equipment manufacturers to make available authorized technicians for the same purpose.
- D. Test equipment under design conditions when possible. Impose simulated design conditions using an artificial load when it is not practical to test under design conditions. Provide additional equipment to impose simulated loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
 - 1. The CxA may direct that set points be altered when simulating conditions is not practical.
 - 2. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- E. If tests cannot be completed because of a deficiency outside the scope of the HVAC system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.
- F. If the Commissioning Plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.
- G. Deficiencies: Correct deficiencies and re-inspect or re-test, as applicable, at no extra cost to Owner.

3.7 DEFERRED AND SEASONAL TESTING

- A. If any PFC or FPT cannot be completed due to an unforeseen condition not within control of the Contract Administrator, defer execution of the PFC or FPT based on the recommendation of the CxA and approval of the Owner. Complete the affected testing as soon as practical.
- B. During the warranty period, complete tests purposely delayed until weather conditions are closer to the system's design conditions. The CxA shall coordinate this activity. Any final adjustments to the O&M manuals and/or as-built drawings due to the testing shall be made by the CA.

3.8 OPERATION AND MAINTENANCE MANUALS

- A. See Division 01 and Section “General Mechanical Requirements for HVAC” for additional requirements.
- B. Add design intent documentation furnished by Architect to manuals prior to submission to Owner.
- C. Submit manuals related to items that were commissioned to Commissioning Authority for review; make changes recommended by Commissioning Authority.
- D. Commissioning Authority will add commissioning records to manuals after submission to Owner.

3.9 DEMONSTRATION AND TRAINING

- A. See Division 01 for additional requirements.
- B. Complete all related commissioning requirements prior to final inspections.
- C. Demonstrate operation and maintenance of HVAC system to Owner' personnel; if during any demonstration, the system fails to perform in accordance with the information included in the O&M manual, stop demonstration, repair or adjust, and repeat demonstration. Demonstrations may be combined with training sessions if appropriate.
- D. These demonstrations are in addition to, and not a substitute for, Prefunctional Checklists and demonstrations to the Commissioning Authority during Functional Testing.
- E. Provide classroom and hands-on training of Owner's designated personnel on operation and maintenance of the HVAC system, control system, and all equipment items indicated to be commissioned.
- F. Provide the services of manufacturer representatives to assist instructors where necessary.
- G. Provide the services of the HVAC controls instructor at other training sessions, when requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
- H. Document systems operations training in the commissioning report.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15900 (23 09 00) - BUILDING AUTOMATION SYSTEM

09-03-2021	Original Issue
10-11-2021	Revised to reduce manufacturer list to Walmart approved providers only, running on Walmart network, without option for stand-alone, non-network attached systems. Updated sequence of operations based upon common control sequences utilized in Walmart buildings.
10-27-2021	Revised to expand approved providers and reduced specification language to limit information approved providers need to execute the work.
12-01-2021	Added contact for intelli-building systems and made adjustments to the requirements to align with Walmart Global Tech requirements.
1-14-2022	Add note regarding placement of primary and secondary controllers (within secured rooms located in office areas, coordinated during shop drawing review).

PART 1 - GENERAL

1.01 RELATED SECTIONS:

- A. Drawings, general provisions of the Contract, including General and Supplementary Conditions, and Division-1 Specification Sections and Division 15 (20) Specification Sections, apply to work of this Section.

1.02 ACCEPTABLE PROVIDERS:

- A. Systems furnished and installed by the following approved national manufacturers and/or their authorized representatives are acceptable subject to full compliance with the contract documents.

Edit list below to suit project.

ES2 is approved for all conditioned facilities.

1. Engineered Systems & Energy Solutions, Inc. (ES2), Jesse Gentling – jgentling@es2ok.com 405-595-9728.

Intelli-Building Controls and Solutions is approved for all conditioned facilities.

2. intelli-building Controls & Solutions, LLC, Tom Franzo – tom@intelli-building.com 312-802-7134, 773-299-1903.

Industrial Controls & Electrical is **required** for controlling ventilation in ambient facilities and is **approved** for controlling office areas and full building conditioning.

3. Industrial Controls & Electrical (ICE), Clint Benedetto. Clint@ice-electric.com 731-285-8863.

1.03 WORK INCLUDED:

- A. The contractor shall provide the following:

1. Contractor must coordinate with the owner's technology team regarding approved design for the selected providers system including owners security processes.
2. Provide a fully integrated Building Automation System (BAS), UL listed, incorporating direct digital control (DDC) for energy management, equipment monitoring and temperature control.
3. Provide all wiring, conduit, panels, dampers, sensors, devices, etc. as required for a complete system as required to accomplish the operating sequences identified herein.
4. Provide all final electrical connections to each DDC controller. Perform all wiring in accordance with all local and national codes.
5. Surge transient protection shall be incorporated in design of system to protect electrical components in all DDC controllers.

1.04 GENERAL SYSTEM DESCRIPTION:

- A. A primary building supervisory controller using HTML5 processing shall be used for the building controller and management of equipment level devices using Building Automation Controls Network (BACnet) and Modbus protocols. The system shall integrate multiple building functions including equipment supervision and control, alarm management, energy management and historical data collection.
 1. Main controllers shall be located in main office area as directed and coordinated by owner during shop drawing review. Secondary controllers, if required, will be located in secured rooms within remote offices as directed and coordinated by owner during shop drawing review.
- B. The system equipment shall include a combination of application specific controllers and terminal equipment controllers. The installed system shall be modular in nature and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, DDC controllers and operator devices. Provide capacity for all equipment provided under this project, plus an additional 25% for future use.
- C. System architectural design shall eliminate dependence upon any single device for control execution and alarm reporting. Each DDC controller shall operate independently by performing its own specified control, alarm management, operator I/O and data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices. DDC controllers shall be able to access any data from or send control commands and alarms directly to any other DDC controller or combination of controllers on the network without dependence upon a central processing device.
- D. Communication between the control panels shall be over the high-speed Ethernet local area network (LAN) within the building. All nodes on this network shall be peers. The operator shall not have to know the panel identifier or location to view or control an object. Application specific controllers shall be constantly scanned by the network controllers to update point information and alarm information. Communication between control panels shall utilize BACNet protocol (a combination of MSTP, ethernet and IP).
- E. Packaged unitary rooftop units shall be provided with native BACnet unitary controllers as part of system HVAC equipment provided by others under owner national accounts. The BAS system shall fully integrate with this equipment by others to accomplish the system operating sequences as defined herein. Contractor is responsible to familiarize themselves with the capabilities and/or limitations of the control points and configurable sequences available from the equipment manufacturer and is responsible for final setup and setpoints.

- F. HVLS fans will be provided with manufacturer's standard control system and a BACnet communication interface card. HVLS controls shall be integrated into the BAS systems for central monitoring and control. HVLS fans shall also be interlocked with fire alarm system to shut down on trouble signal as required to meet NFPA13.
- G. Access shall be provided via methods pre-approved by owners technology team and in accordance with owners security processes using a unique URL that will allow access directly to the BAS system using tenant determined methods.
1. The graphic interface shall be similar to a conventional workstation interface with full color graphics incorporating dynamic points including temperatures, damper positions, etc. and ability to change setpoints, access alarms and change the time-of-day schedules.
 2. Graphic interface shall be available for users to view the general building plans with current operating parameters and conditions in each space and with links to pages for various equipment items and systems serving those spaces.
 3. Graphic interface shall be available for users to view each mechanical system and sub-system including each packaged rooftop unit, terminal unit, exhaust fan, etc. with links to detailed screens for related equipment and links to text screens of control sequences for the equipment shown. The graphics for each system shall represent in a general way the arrangement of major pieces of equipment within each space.
 4. Dynamic temperature values, humidity values, flow values and status indication shall be shown in their actual respective locations and shall automatically update to represent current conditions without operator intervention. Colors shall be utilized throughout the graphics to allow the operator to quickly identify a value that is out of range for normal operation. Animation shall be used to visually indicate run status of each component (i.e. spinning fans, dampers open/closed, etc.), and include real-time conditions at each component.
 5. Summary pages shall be developed that allows the operator to quickly determine the operating status of equipment. Information shall include equipment name, operational status, space temperature, fan status and discharge air temperature as applicable.
 6. Include a target button on the Home Page graphic that will automatically display the Sequences of Operation for this project for historical reference. The method of display may be either in text graphic or other form acceptable to owner. The text shall be modified at the Acceptance of the project to reflect any changes that occurred in the Sequence from the time of submittal to the finalization of the software.
 - a. Target buttons at each sublevel screen shall be included which will automatically display the Sequence of Operations for just the portion of the system displayed.
 7. A target button shall be included on the Home graphic that will automatically display the O & M data for the project. The method of display may be either in text graphic or other form acceptable to owner. O & M data sheets shall include identifying marks which correspond to labels on other graphic screens, allowing an operator to determine the correct data sheet for a particular device in the system.
 8. Final approval of graphic interface shall be subsequent to review between

Engineer and Owner. Modifications shall be made upon request.

1.05 SYSTEM COMMISSIONING:

- A. Contractor shall execute functional performance testing of all systems and control sequences and fully commission the control system independently, prior to final commissioning and punch list by Owner and engineer or independent commissioning agent (Cx) if applicable to project. System commissioning by contractor shall include verification and documentation of all sequences of operation.
 - 1. Submit verification forms and documentation for approval by the engineer prior to beginning the commissioning process.
- B. At the completion of system installation, demonstrate to the Owner and Engineer that all sequences are functioning correctly, and explain to the Owner's personnel the step-by-step operation of starting, running, and stopping of all equipment and the maintenance of the controls.

1.06 STANDARD REQUIREMENTS:

- A. Provide system warranty for period and coverages in accordance with national account agreements.
- B. Extended service and preventative maintenance agreements shall be in accordance with national account agreements.
- C. Owner training including content and extent shall be in accordance with national account agreements.
- D. Provide multilevel password access protection in accordance with national account agreements to allow the owner to limit workstation control, display and data base manipulation capabilities as appropriate for each user, based upon an assigned password.
- E. Establish data trending as requested by Owner's facility representative at the time of completion and in accordance with national account agreements.
- F. Set up building occupancy schedules as defined by Owner's representative and in accordance with national account agreements including weekday, weekend, and holiday schedules. Multiple occupancy schedule spreadsheets may be required for different units of the building including separation of warehouse and office areas. Consult the owner for specific building schedules. Refer to Article 3.01 for standard space setpoints.
- G. Following commissioning and the date of final acceptance by the Owner, provide final record documentation for future reference by the owner in accordance with national account agreements. Provide software and firmware licensing agreement documentation as part of record documents.

PART 2 - PRODUCTS

2.01 FIELD DEVICES:

- A. TEMPERATURE SENSORS:
 - 1. Shall be the manufacturer's standard sensors suitable for the controller and the

application and meeting the accuracy and performance requirements of the sequence of operation.

2. Space temperature sensor covers shall be durable, impact resistant material finished in acceptable color. Provide clear, locking cover for all thermostats.
3. Outside air sensors shall be designed to withstand the environmental conditions to which they will be exposed and equipped with solar shields.
4. Duct mount sensors shall be mounted through a hole in the duct and be positioned so as to be easily accessible for repair or replacement. A seal shall be used on the sensor assembly to prevent air leaks.

B. HUMIDITY SENSORS:

1. Humidity sensors shall utilize an all polymer, capacitive humidity sensing element to measure the relative humidity (RH) over the entire range 0% to 100% RH, and send a proportional 0-10 Vdc or 0-5 Vdc signal to the system's controller.
2. Humidity sensor shall be resistant to corrosion in harsh environments and shall have no minimum air flow requirements.
3. Humidity sensor shall have an accuracy of $\pm 3\%$ RH for 5-95% RH and $\pm 5\%$ RH for 0-5% and 95-100% RH.

C. CARBON DIOXIDE SENSORS:

1. Provide manufacturer's standard sensors suitable for the demand control of ventilation.
 - a. Molded plastic enclosure suitable for wall mounting, to reliably and accurately measuring and transmitting CO2 levels.
 - b. Rating: 0 to 5,000 ppm; operating 0 deg F to 120 deg F
 - c. Range: 0 - 2,000 ppm / 0 - 5,000 ppm (user selectable)
 - d. Accuracy: +/- 50 ppm.
 - e. Output: 0 - 10 Vdc, 0 - 20 mA or 4 - 20 mA

D. DEVICE LABELING:

1. On face of each thermostat or temperature sensor, provide adhesive film label indicating designation of specific unit it controls. Labels shall be machine printed in black, by thermal transfer or equivalent process, and with 1/4" letter height.
2. Install engraved plastic laminate sign or plastic equipment marker on or near each major item of equipment and each operational device or panel.

E. CONTROL WIRE AND CABLE:

1. General: Provide wire and cable not included as work of another contract.
2. Control wiring:
 - a. All control wiring for Digital or Analog Functions: shielded 2 or 3 wire to match function hardware. 18 AWG minimum,
 - b. Control wiring for 24VAC and 120VAC control shall be minimum 14 gauge.
 - c. Control wire or cable: shall be installed in accordance with Division 26 Specification.
 - d. Do not install Class 2 wiring in conduit with Class 1 wiring.
3. All branch and trunk wire and cable installed in return air spaces above ceilings shall be installed in conduit or shall be plenum rated for the duty.
4. Label all wiring, including within factory-fabricated panels, within 2" of termination. All labels shall be self-laminating polyester. Do not use handwritten labels.

5. All network cabling shall be provided in a color different than that used by Owner.

F. SMOKE DETECTORS

1. Furnished and installed by packaged rooftop unit manufacturer at all unit locations.

PART 3 - SEQUENCE OF OPERATION

- 3.01 The sequences described herein shall be strictly adhered to as to the scope of the operation. All required devices and programming to accomplish these sequences shall be furnished whether directly specified or not.

A. General:

1. All setpoints indicated below are to be adjustable.
2. All systems to incorporate provisions for unoccupied cycle set-back and set-up temperature setpoints.
3. All air systems to incorporate morning warm-up and morning cool-down cycles when switching from unoccupied cycle to occupied cycle. Units shall start and run on a fully recirculating basis until such time as a preset space temperature is attained, at which time, the outside air damper shall open to minimum position and the discharge air temperature/s shall be placed under automatic control as indicated below.

B. Scheduling:

Confirm scheduling with design project manager. Schedules below are a baseline and the schedules are easily configurable in the field after commissioning.

1. Office and Support Areas:
 - a. Building "Occupied" periods:
 - (1) Monday thru Saturday: 6:00 am to 6:00 pm
 - (2) Space temperature set point for all areas shall be 75°F (cooling), 72°F (heating).
 - b. Building "Unoccupied" period: All other times not listed as "Occupied."
 - (1) Space temperature set point for all areas shall be 80°F (cooling), 65°F (heating), unless otherwise specified.
 - c. Occupant 2-hour forced override shall be provided via space temperature sensor buttons.
2. Warehouse Areas:
 - a. Building "Occupied" periods:
 - (1) Monday thru Sunday: two 12-hour shifts - 24/7 operation
 - (2) Sunday: 6:00 am to 6:00 pm
 - (3) Warehouse temperature setpoint shall be 80°F (cooling), 65°F (heating)
 - b. Building "Unoccupied" period: All other times not listed as "Occupied."
 - (1) Warehouse temperature set point shall be 85°F (cooling), 50°F (heating).

3.02 PACKAGED ROOFTOP HEATING AND COOLING UNITS:

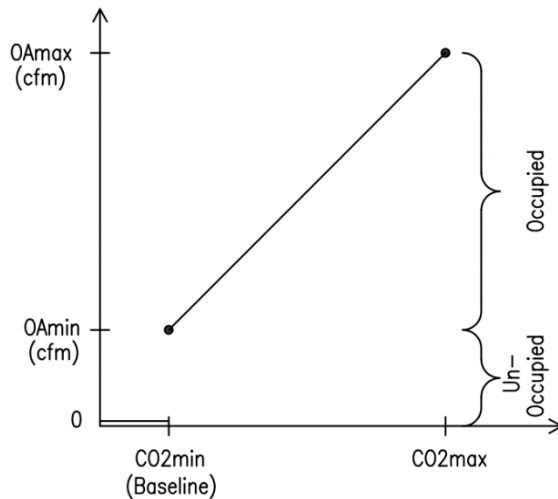

- A. Equipment description:
1. Each unit is provided with a mixed air section (having return and outdoor air dampers), filters, DX cooling coil, hot gas reheat coil for dehumidification (office units only), natural gas heating or multiple-stage electric heating coil (positioned in the reheat position), supply air fan, compressors and condenser coils and fans. Multi-zone VAV system with terminal reheat has parallel fan-powered, electric terminal unit reheat.
- B. RTUs shall be provided with configurable DDC controller by the equipment manufacturer. The manufacturer shall configure controllers from the factory to meet the operating sequences specified herein, i.e. constant volume, single-zone variable air volume (VAV) or multi-zone VAV. BAS contractor shall verify configuration of controller and coordinate with the equipment manufacturer using technical support factory resources via telephone. (On-site support from manufacturer's technicians shall be borne by BAS contractor).
- C. RTU's shall have the ability to operate independently of each other and independently of the Building Automation System (BAS). Control shall revert to the individual unit controller in the event communications with the BAS is lost.
- D. Occupied Mode:
1. Operate unit as needed to maintain occupied set points.
 2. Outdoor and return air dampers modulate as needed, refer to ventilation sequence.
 3. Provide remote occupant unoccupied over-ride capability from any space temperature sensor.
- E. Unoccupied Mode:
1. Operate unit as needed to maintain unoccupied (night setback) set points.
 2. Outdoor air damper will be closed except if unit is in unoccupied economizer free cooling mode.
 3. If there is no call for heating, cooling or dehumidification the unit shall be off.
- F. RTU COMMON SEQUENCES OF OPERATION
1. Space Temperature Sensor Operation
 - a. Each zone shall be provided with a thermostat with slide point or dial adjustment and over-ride button (2-hour, adjustable). Thermostats (by the equipment manufacturer) shall be approved by the Owner.
 - b. Thermostat shall have capability of a 5°F dead band between heating and cooling to meet ASHRAE 90.1.
 2. Dehumidification Sequence (on equipped systems):
 - a. Space humidity shall be monitored continuously via humidistat. Refer to plans for humidistat locations. This contractor shall provide sensors, wiring and installation.
 - b. Sequence shall be available whenever space temperature set point is satisfied.
 - c. Controller shall stage scroll compressors until the humidistat is satisfied. If the room temperature drops below set point during dehumidification sequence, RTU hot gas reheat (SZ VAV) or terminal electric reheat (VAV)

with terminal reheat) shall be enabled for reheating purposes. Once the humidistat is satisfied, the RTU will return to normal operation.

3. Morning Warm-Up Sequence:
 - a. Schedule ½ hour (adjustable) prior to unoccupied-to-occupied changeover.
 - b. Where applicable, VAV boxes are driven to heating CFM position.
 - c. Supply air fan indexed to on.
 - d. Outdoor air dampers held closed.
4. Off Sequence:
 - a. Occurs in the Unoccupied Mode when no heating, cooling or dehumidification demands exist.
 - b. Supply fan is off and the outside air damper is closed.
5. Minimum Outdoor Air Measurement and Control
 - a. During unoccupied mode, outdoor air dampers shall be closed, unless used for free cooling.
 - b. During occupied mode, outdoor air damper shall partially open and return air damper shall be partially closed to maintain minimum ventilation rate indicated on the mechanical schedule.
 - c. Demand Controlled Ventilation: "Densely occupied" spaces are furnished with dedicated rooftop unit and space CO2 sensor (refer to drawings) CO2 sensors shall be continuously polled, and the RTU outdoor air quantity shall be provided in conjunction with CO2 sensor output.
 - (1) For units designated to employ CO2 based demand-controlled ventilation, damper settings shall be set to produce the "area based" ventilation and will modulate open in response to CO2 in the space. If not otherwise defined, "area" ventilation shall be 20% of specified minimum ventilation airflow.
 - (2) CO2 sensor output below setpoint, 800 ppm: Zone airflow requirements shall equal "area" quantity per ASHRAE 62.1.
 - (3) CO2 sensor output above setpoint: Zone ventilation air requirement shall be computed using a linear relationship between CO2 level and ventilation air requirements, where ventilation air requirement is equal to the "area" quantity at 800 ppm and equal to the "area plus people" quantity (the scheduled minimum outside airflow) at 1100 ppm.
 - (4) For spaces with CO2 sensors, the BAS shall monitor the CO2 level and compare it to the threshold setpoint. If the CO2 level exceeds the lower setpoint, the ventilation rate setpoint shall be increased, and the new zone ventilation setpoint shall be used in critical ventilation ratio calculations for the respective rooftop unit. Ventilation rate setpoint shall be decreased back toward scheduled minimum after CO2 levels have dropped below threshold.
 - (5) A PID algorithm shall be applied to optimize the required zone ventilation setpoint in response to deviation from CO2 threshold.
6. Condenser Fan Control
 - a. Condenser fans shall be controlled by RTU manufacturer, (via variable speed drives for units with dehumidification sequence.)
 - b. RTU manufacturer's internal controls shall control the function of the condenser fans in all modes of operation.

7. Coil Suction Temperature Setpoint Reset: By RTU manufacturer's internal controls.
 8. Supply Air Temperature Setpoint Reset:
 - a. During occupied periods with all terminal unit heaters staging or modulating, supply temperature shall be indexed upwards. Add one degree per every 15 minutes that all heaters are staged or modulating, maximum 60 degrees F. As terminal unit heaters stage off, reverse the sequence.
 9. Temperature Protection, Lockouts: By RTU manufacturer's internal controls.
 10. Outputs: All available RTU status and alarm signals shall be provided to the front-end interface.
 11. Smoke detectors: (Furnished and installed by Div.16 (26) on office units). Upon detection of smoke, the outdoor air dampers shall be closed, all operations of the RTU shall be shut down, gas valve in RTU closed, and an alarm shall be sent to the end and to the fire alarm system.
- G. SINGLE ZONE CONSTANT VOLUME SEQUENCE (RTU-x):
1. Occupied Mode – Supply fan will run continuously.
 2. Unoccupied Mode – Supply fan will cycle on a call for heating or cooling.
 3. Cooling mode:
 - a. Compressor capacity shall be modulated as needed to maintain space temperature set point.
 4. Heating Mode:
 - a. Natural gas heating or stages of electric heat shall be indexed via manufacturer's sequence to maintain the space temperature set point.
- H. SINGLE ZONE VARIABLE AIR VOLUME SEQUENCE (RTU-x)
1. Occupied Mode – Supply fan will run continuously.
 2. Unoccupied Mode – Supply fan will cycle on a call for heating or cooling.
 3. Cooling mode:
 - a. Supply fan speed shall be varied to meet space temperature set point.
 - b. Compressor capacity shall be staged as needed to maintain supply air discharge temperature leaving unit at to meet space set point.
 - c. Refer to Section 4.01.B for setpoints.
 4. Heating Mode:
 - a. Supply fan speed shall be varied to meet space temperature set point.
 - b. Natural gas heating or stages of electric heat shall be indexed via manufacturer's sequence to maintain the heating supply air temperature set point.
- I. SINGLE ZONE VARIABLE AIR VOLUME WITH CO2 CONTROL (RTU-x):
1. Occupied Mode – Supply fan will run continuously.
 2. Unoccupied Mode – Supply fan will cycle on a call for heating, cooling or dehumidification.
 3. Cooling mode:

- a. Supply fan speed shall be varied to meet space temperature set point.
 - b. Compressor capacity shall be modulated as needed to maintain supply air discharge temperature leaving unit at set point.
 - c. Refer to Section 4.01.B for setpoints.
4. Heating Mode:
- a. Supply fan speed shall be varied to meet space temperature set point.
 - b. Natural gas heating or stages of electric heat shall be indexed via manufacturer's sequence to maintain the heating supply air temperature set point.
5. Single Zone Demand Controlled Ventilation
- a. Scheduled unoccupied periods: O/A dampers shall be closed.
 - b. Scheduled occupied periods: O/A damper position shall vary linearly with space CO2 sensor output, between "minimum" and "maximum O/A damper positions. Refer to sketch below for reference.

- (1) RTU:
 - (i) CO2min ("Baseline") = measured per item c.
 - (ii) O/Amin = (Determined by Engineer) CFM
 - (iii) CO2max = baseline + 700 ppm
 - (iv) O/Amax = (Determined by Engineer) CFM
 - (2) Coordinate outdoor damper and CO2 sensor output with test and balance contractor. Calibrate the "baseline" CO2 level using CO2 sensor output when space is unoccupied and RTU has been in operation for more than 1 hour.
 - (3) CO2 sensors shall be provided at the following spaces:
 - (i) Training Rooms
 - (ii) Large Conference Rooms
 - (iii) Break Rooms
- J. VARIABLE AIR VOLUME WITH TERMINAL ELECTRIC REHEAT and CO2 CONTROL IN HIGH DENSITY SPACES (RTU-x):
1. Building Occupied Mode:
 - a. The BAS shall index the unit to "building occupied" mode based on the

optimum start/stop program or the time scheduling program. This will enable all components as needed.

2. Supply Air Temperature Setpoint: Cooling and heating shall be controlled to maintain a discharge air temperature of 57 deg. F (adjustable) leaving the unit.
3. Supply Air Temperature Reset: Supply air discharge temperature shall be reset based on outdoor air temperature. Discharge temperature shall reset between 57° F at 55 ° F outdoor temperatures and 62° F at 20° F outdoor temperature.
4. Supply fan operation:
 - a. Fan shall be driven by RTU manufacturer's VFD.
 - b. Occupied Mode: Supply fan will run continuously. The status of the fan shall be monitored via unitary controller output and should operation not be confirmed within two (2) minutes of start-up, an alarm shall be initiated.
 - c. When the system is indexed to occupied mode, the fan shall be ramped up in speed until the duct static pressure set point is met.
5. Unoccupied Mode: Supply fan will cycle on a call for heating, cooling or dehumidification.
6. Static Pressure Sensors: Locate in ductwork near end of supply main. The BAS shall trend this sensor and at the end of six months, this contractor shall issue a report of the trends to the Owner confirming that static pressure reset is operating per ASHRAE 90.1 requirements.
7. Fan speed zone reset control:
 - a. Baseline: Setpoint nominal 0.8 in.w.c.
 - b. Reset: The BAS shall monitor the damper positions of all VAV terminal units served by the RTU. The supply fan static pressure setpoint shall be adjusted down by 0.1 in.w.c. every 10 minutes as long as no damper position is greater than 80% or until the system reaches the minimum static pressure setpoint 0.5 in.w.c. When any damper position is greater than 95% open, the static pressure setpoint shall be increased by 0.1" wc every 10 minutes until no damper position is greater than 95% or until the system reaches the maximum static pressure setpoint of 1.5 in.w.c.
8. Discharge static pressure limit safety: Set manufacturers static pressure high limit safety device to stop the supply fan whenever fan discharge pressure rises above 2.5 in.w.c.
9. Cooling mode:
 - a. Supply fan speed shall be varied to meet duct static pressure setpoint.
 - b. Compressor capacity shall be modulated as needed to maintain supply air discharge temperature leaving unit at set point.
 - c. Supply air temperature reset sequence: If all terminal units are a minimum position, supply air temperature shall be reset higher to avoid terminal reheat operation per ASHRAE Standard 90.1.
10. Heating Mode:
 - a. Stages of electric heat shall be indexed as needed to maintain supply air discharge temperature at set point.

3.03 VARIABLE VOLUME TERMINAL UNITS (FPB-x):

- A. Terminal Unit Controller: The VAV terminal units shall each be controlled by a dedicated VAV controller. The VAV controller with differential pressure sensor and damper motor shall be furnished to the terminal unit manufacturer for factory mounting. Individual zone temperature set point and control logic shall reside at the zone level, and not be

dependent upon the BAS for control.

- B. Occupancy Determination: "Building occupied" mode shall be determined from the BAS schedule. "Zone occupied" mode shall be determined by local occupancy sensor(s). Zones not having an occupancy sensor shall be indexed to occupied based on the building occupancy schedule.
 - 1. Where more than one occupancy sensor is located within the area served by a single VAV terminal unit, indication of occupancy at any one of the respective sensors shall initiate ventilation control.
- C. Zone Temperature Sensors: Individual zone temperature setpoint and control logic shall reside at the zone level, and not be dependent upon the BAS for control. Zone temperature sensor shall include a setpoint slider knob. Room setpoint range shall be limited in software. Initial setting shall be +/- 3°F.
- D. Calibration: The DDC VAV controller shall automatically recalibrate its air flow sensing and air valve position feedback systems on a scheduled weekly basis.
- E. Setpoints: Separate heating & cooling setpoints will exist for building occupied, zone occupied and unoccupied mode.
- F. As the space temperature rises above the cooling setpoint, the terminal unit damper shall modulate to its maximum CFM. As the space temperature falls below the cooling setpoint, the terminal unit damper shall modulate to its minimum cooling CFM. Before heating is initiated, the VAV controller enters a 2 deg F (adj) no-load dead band. As the space temperature continues to fall, the terminal unit electric heater shall be staged or modulated (as scheduled) to maintain space temperature at setpoint. If the discharge air temperature is met and the space temperature continues to fall, the terminal unit damper shall modulate towards its maximum heating position (scheduled.) Upon a rise in space temperature, this sequence shall be reversed.
- G. During building "unoccupied" periods, the variable volume terminal unit damper shall remain at its minimum position. If the space temperature in any area reaches either of the unoccupied space temperature set points, the BAS shall start the respective air handling unit and the variable volume terminal unit damper shall modulate to maintain unoccupied space temperature set point, but only until the space temperature increases 3° F above the unoccupied space temperature set point.

3.04 ELECTRIC UNIT HEATERS (EWH-x, EUH-x):

- A. Electric unit heaters shall be provided with integral or remote, wall-mounted line voltage temperature control by unit manufacturer. No BAS interface required.

3.05 TOILET ROOM and LOCKER ROOM EXHAUST FANS (EF-x):

- A. Fans shall be on during occupied hours and off during unoccupied hours, controlled by the BAS. Provide start/stop and status on graphics.

3.06 GUARDHOUSE

- A. Split system heating and cooling and supplemental cabinet heaters shall be controlled by local or integral thermostat control. No BAS interface required.

3.07 PUMPHOUSE EXHAUST FANS (EF-x):

- A. Fans shall be enabled and motorized damper at intake opened based upon space temperature. For diesel fire pump side of pumphouse, motorized damper shall also be interlocked with operation of fire pump to provide combustion air. No BAS interface required.

3.08 MISCELLANEOUS FANS:

- A. Battery charging exhaust fan (EF-x):
 - 1. Fan shall operate continuously.
- B. Welding exhaust fan (EF-x):
 - 1. Fan shall be manually switched via motor starter on wall within Welding Area.

3.09 GENERATOR

- A. No BAS interface required.

3.10 FIRE ALARM SYSTEM

- A. Upon fire alarm signal in office area, fire alarm system shall shutdown RTU's.

3.11 LIGHTING CONTROL SYSTEM INTERFACE

- A. No BAS interface required.

3.12 MONITORING VISUALIZATION SYSTEM (MVS)

- A. No BAS interface required at this time. System design allows output of data for management operational analysis. Owner may integrate at a later date.

This specification section will only be applied for Midwest or northern regional projects requiring snow melt systems in pedestrian walkways.

3.13 SNOW MELT SYSTEM BOILERS and PUMPS:

- A. BAS shall enable snow melt system pumps below exterior temperature of 35°F (adjustable) and once enabled, pump operation shall be disabled once exterior temperature rises above 40°F.
- B. BAS shall enable boiler operation below exterior temperature of 35°F (adjustable). Boiler shall be controlled via manufacturer's integral controller. Once enabled, boiler operation shall be disabled above exterior temperature of 40°F.

END OF SECTION

SECTION 15992 (230913) - INSTRUMENTATION AND CONTROL DEVICES FOR HVAC

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Control panels.
- B. Control dampers.
- C. Operators.
- D. Flow measuring apparatus.
- E. Humidistats.
- F. Input/Output sensors and transmitters.
- G. Output control devices.
- H. Power Supplies.
- I. Thermostats.
- J. Weather stations.

1.2 DEFINITIONS

- A. BAS: Building Automation System.
- B. Control Wiring: Includes conduit, wire and wiring devices to install complete control systems including motor control circuits, interlocks, thermostats, EP and IP switches and like devices. Includes all wiring from Intelligent Devices and Controllers to all sensors and points defined in the input/output summary shown on the drawings or specified herein and required to execute the sequence of operations
- C. DDC: Direct Digital Control.
- D. EPDM: Ethylene Propylene Diene Monomer.
- E. High voltage: 50 volts or higher.
- F. Low voltage: Below 50 volts.
- G. PTFE: Polytetrafluoroethylene.
- H. TEFZEL: A modified ETFE (ethylene tetrafluoroethylene) fluoroplastic.

1.3 CONTRACTOR RESPONSIBILITIES

- A. Reference Division 23 Section "Electrical Coordination for Mechanical Equipment" for contractor responsibilities.

- B. BAS Contractor:
 1. Installation of the BAS shall be by the BAS Contractor or his subcontractors.
 2. Low voltage control wiring.
 3. Coordinate high voltage control wiring to instrumentation and control devices with Division 26. Where high voltage power is required for instrumentation and control devices that is in addition to what is shown on the drawings, the BAS contractor shall cover the cost of providing this wiring.
 4. All interlock wiring regardless of voltage (e.g., exhaust fan interlocked to supply fan).
 5. Coordinate with Division 26 that motor starters are provided with auxiliary contacts as required for interlocks.
 6. Coordinate power wiring to BAS controllers and instrumentation and control devices with Division 26.
 7. Coordinate installation of back-box rough-in for wall-mounted control devices sensors, etc. with Division 26. Coordinate with mechanical contractor all locations, quantities, and sizes required for installation by Division 26.
 8. Perform startup and demonstration services as specified in Section "Direct Digital Control for HVAC".
- C. Sheet Metal Contractor:
 1. Installation of automatic control dampers, smoke control dampers, and necessary blank off plates.
 2. Access doors where and as required.
- D. Mechanical Contractor:
 1. Coordinate conduit and wall box rough-in, power wiring and magnetic starter requirements for controls and mechanical equipment with Division 26.

1.4 SUBMITTALS

- A. Refer to Division 01 for submittal procedures.
- B. Product Data: Provide description and engineering data for each control system component. Include dimensions, capacities, size, performance characteristics, electrical characteristics, and finishes of materials.
- C. Shop Drawings: Indicate complete operating data, system drawings, wiring diagrams, and written detailed operational description of sequences. Submit schedule of valves indicating size, flow, and pressure drop for each valve. For automatic dampers indicate arrangement, velocities, and static pressure drops for each system.
- D. Manufacturer's Instructions: Provide for all manufactured components.
- E. Operation and Maintenance Data: Include inspection period, cleaning methods, recommended cleaning materials, and calibration tolerances.
- F. Project Record Documents: Record actual locations of control components, including panels, thermostats, and sensors. Accurately record actual location of control components, including panels, thermostats, and sensors.
- G. Warranty: Submit manufacturer warranty and ensure forms have been filled out in Owner s name and registered with manufacturer.

1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.

- B. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc., as suitable for the purpose specified and indicated.
- C. Measurement devices and sensors shall be calibrated using NIST traceable standards.

1.6 WARRANTY

- A. Correct defective Work within a one year period after Substantial Completion.
- B. Provide extended warranty for control devices and equipment as specified herein.

PART 2 - PRODUCTS

2.1 CONTROL PANELS

- A. Construction:
 - 1. Panel shall be UL 508A listed.
 - 2. NEMA 250, general purpose utility enclosures with enameled finished face panel.
 - 3. NEMA 4X utility enclosure for outdoor or wash-down applications.
 - 4. Provide common keying for all panels.

2.2 CONTROL DAMPERS

- A. Dampers shall be factory fabricated and sized as shown on drawings and as specified.
- B. Individual damper sections shall not be larger than 48 inches x 60 inches. Provide a minimum of one damper actuator per section.
- C. Performance: Test in accordance with AMCA 500-D.
 - 1. Pressure Drop: Unless otherwise scheduled or indicated on the Drawings, size control dampers as follows:
 - a. Modulating Dampers: Provide dampers with linear flow characteristics. Size modulating dampers based on the smaller of the following.
 - 1) Maximum velocity of 1,500 feet per minute.
 - 2) Maximum Full-open air pressure drop of 0.1 inches W.C.
 - b. Two Position Dampers: Dampers shall be full duct size and selected to minimize pressure drop.
 - 2. Leakage:
 - a. Motorized dampers for outdoor, exhaust and relief air and for shaft and stairway vents shall be Class I leakage and shall not exceed 4.0 CFM/square foot in full closed position at 1 inch W.G. pressure differential across damper.
 - b. Motorized dampers for other applications shall be Class II leakage.
- D. Frames: Galvanized steel, extruded aluminum, or stainless steel, welded or riveted with corner reinforcement.
 - 1. Use minimum 16 gauge for rectangular dampers.
 - 2. Use minimum 20 gauge for round dampers.
 - 3. For aluminum frames, use 1/8 inch thick material.
 - 4. All damper frames shall have a flange for duct mounting.
 - 5. Reference Part 3 Execution for application of the material type.
- E. Blades: Galvanized steel, extruded aluminum, or stainless steel, maximum blade size 6 inches wide, 48 inches long, attached to minimum 1/2 inch shafts with set screws.
 - 1. Use minimum 16 gauge for rectangular dampers.

2. Use minimum 16 gauge for round dampers.
 3. For aluminum blades, use 1/8 inch thick material.
 4. The blades shall be suitable for the air velocities to be encountered in the system.
 5. Dampers longer than the maximum blade length shall be fabricated in sections.
 6. Reference Part 3 Execution for application of the material type.
- F. Blade Seals: Synthetic elastomeric inflatable or Neoprene, mechanically attached, field replaceable.
1. Installed along the top and bottom of the frame and on all mating surfaces.
- G. Jamb Seals: Spring stainless steel.
1. Installed inside the frame sides.
- H. Shaft Bearings: One of the following as recommended by manufacturer for the application:
1. Oil impregnated sintered bronze.
 2. Graphite impregnated nylon sleeve with thrust washers at bearings.
 3. Lubricant free, stainless steel, single row, ground, flanged, radial, antifriction type with extended inner race.
 4. Molded synthetic bearings.
- I. Linkage Bearings: One of the following as recommended by manufacturer for the application:
1. Oil impregnated sintered bronze
 2. Graphite impregnated nylon.
- J. Maximum Pressure Differential: 6 inches wg.
- K. Temperature Limits: -40 to 200 degrees F.
- L. Manufacturers:
1. Greenheck.
 2. CESCO.
 3. Pottorff.
 4. Nailor.
 5. Ruskin.
- M. Reference the Damper Schedule in Part 3 for basis of design damper model and material for the application.
- N. Extended Warranty: Control dampers utilized in an economizer assembly shall be covered with minimum 5 year manufacturer warranty, certified to operate through 60,000 damper opening and closing cycles, and certified to meet leakage requirements specified above.

2.3 OPERATORS

- A. General:
1. Voltage: Voltage selection shall be as required to achieve the required torque for the application.
 - a. Reference Part 3 for Damper Operator Voltage Schedule.
 2. Type: Motor operated, with or without gears. Motor type shall be continuous duty.
 3. Construction:
 - a. For Actuators Less Than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
 - b. For Actuators from 100 to 400 W: Gears ground steel, oil immersed, shaft hardened steel running in bronze, copper alloy or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel or cast-aluminum housing.
 - c. For Actuators Larger Than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.

4. Field Adjustment:
 - a. Spring Return Actuators: Easily switchable from fail open to fail closed in the field without replacement.
 - b. Gear Type Actuators: External manual adjustment mechanism to allow manual positioning when the actuator is not powered.
5. Two-Position Actuators: Single direction, spring return or reversing type. End-switches shall be integral to the actuator to determine actuator status.
6. Modulating Actuators:
 - a. Operation: Capable of stopping at all points across full range, and starting in either direction from any point in range.
 - b. Control Input Signal:
 - 1) Three Point, Tristate, or Floating Point: Clockwise and counter-clockwise inputs. One input drives actuator to open position and other input drives actuator to close position. No signal of either input remains in last position.
 - 2) Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for zero- to 10-Vdc or 2- to 10-Vdc and 4- to 20-mA signals.
 - 3) Pulse Width Modulation (PWM): Actuator drives to a specified position according to pulse duration (length) of signal from a dry contact closure, triac sink, or source controller.
 - c. Programmable Multi-Function:
 - 1) Control Input, Position Feedback, and Running Time: Factory or field programmable.
 - 2) Diagnostic: Feedback of hunting or oscillation, mechanical overload, mechanical travel, and mechanical load limit.
 - 3) Service Data: Include, at a minimum, number of hours powered and number of hours in motion.
7. Position Feedback:
 - a. Where indicated on the controls drawings, equip two-position actuators with limits switches or other positive means of a position indication signal for remote monitoring of open and close position.
 - b. Where indicated on the controls drawings, equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
 - c. Actuator shall contain position indicator and graduated scale indicating open and closed travel limits.
8. Integral Overload Protection:
 - a. Provide against overload throughout the entire operating range in both directions.
 - b. Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.
9. Attachment:
 - a. Unless otherwise required for valve interface, provide an actuator designed to be directly coupled to device without the need for connecting linkages.
 - b. Attach actuator to device drive shaft in a way that ensures maximum transfer of power and torque without slippage.
10. Temperature and Humidity:
 - a. Temperature: Suitable for operating temperature range encountered by application.
 - b. Humidity: Suitable for humidity range encountered by application, non-condensing.
11. Enclosure:
 - a. Suitable for ambient conditions encountered by application.
 - b. NEMA 4 for indoor wash-down or wet locations.
 - c. NEMA 4X, Belimo ZS-300, or equivalent; for outdoor applications.
 - d. Provide actuator enclosure with heater and control where required by application.
12. Stroke Time:
 - a. Coordinate with stroke time indicated on the control drawings.
 - b. Unless otherwise noted, select operating speed to be compatible with equipment and system operation.

B. Damper Operators:

1. Controls contractor shall size damper operator.
2. Sizing: Provide smooth proportional control with sufficient power for air velocities 20 percent greater than maximum design velocity and to provide tight seal against maximum system pressures. Provide spring return for two position control and for fail safe operation.
 - a. Provide sufficient number of operators to achieve unrestricted movement throughout damper range.
 - b. Provide one operator for maximum 20 sq ft damper section or maximum 7 in-lb/sq ft damper area.
3. Fail Positions:
 - a. Spring return to normal position as indicated on freeze, fire, temperature, or loss of power protection. Normal positions are indicated on the control drawings.
 - 1) Return air damper, normally open.
 - 2) Outside air damper, normally closed.
 - 3) Exhaust/Relief air damper, normally closed.
 - b. Operator shall fail in place for all other applications not listed under spring return.

C. Manufacturers:

1. Damper Operators:
 - a. Belimo.
 - b. Honeywell.
 - c. Johnson Controls.
 - d. Schneider Electric (Invensys).
 - e. Siemens.

2.4 FLOW MEASURING APPARATUS

A. Airflow Measuring Stations

1. Sensor quantity and spacing shall comply with the Equal-Area or Log-Tchebycheff method as defined in the ASHRAE Handbook of Fundamentals.
2. Element Construction: Non-corrosive material such as stainless steel, aluminum, or cadmium-plated.
3. Stations and insertion elements utilizing thermal dispersion technology shall utilize hermetically sealed thermistors for each sensor and shall be factory calibrated to NIST traceable standards.
4. Stations and insertion elements using velocity pressure shall be tested and certified in accordance with AMCA 611.
5. Air Inlet Measuring Stations:
 - a. Intended for location within an air inlet to equipment, such as a hood or louver.
 - b. Elements:
 - 1) Element constructed of 316 stainless steel, factory mounted in a circular puck constructed of 14 gauge galvanized steel. Housing shall meet NEMA 1.
 - 2) Element shall not induce a measurable pressure drop, adversely affect fan performance or amplify the sound level within the fan system by its presence in the airstream.
 - 3) Element shall not be affected by the presence of moisture, dirt, or debris in the airstream and shall be unaffected by gusting wind.
 - 4) Density corrected for ambient temperature variances and atmospheric pressure due to altitude.
 - c. Range: Minimum 100 to 2,400 fpm.
 - d. Accuracy: Plus/minus 5.0 percent of reading within the calibrated airflow range.
 - e. Manufacturers:
 - 1) Air Monitor Corporation.
 - 2) Approved equal.
6. Fan Inlet Air Flow Measuring Stations:
 - a. Located in the fan cone inlet with a minimum of two sensing elements.

- b. Traverse Type Elements:
 - 1) The elements shall not induce a measurable pressure drop, adversely affect fan performance or amplify the sound level within the fan system by its presence in the airstream.
 - c. Surface Mount Probes:
 - 1) Thermal Dispersion Type: Two surface mounted thermal dispersion probes mounted on opposite ends of the fan cone shall monitor the airflow.
 - 2) Velocity Pressure Type: The piezometer ring probes shall monitor the pressure difference between the largest and smallest diameters of the inlet cone venturi. High and low pressure sensors shall be connected to flow tubes extending to a termination plate mounted on the fan housing.
 - d. Range: Minimum 100 to 10,000 fpm.
 - e. Accuracy: Plus/minus 3.0 percent of the measured airflow range.
 - f. Manufacturers:
 - 1) Air Monitor Corporation.
 - 2) Ebtron.
 - 3) Greenheck
 - 4) Johnson Controls.
 - 5) Paragon Controls.
 - 6) Ruskin.
 - 7) Sensocon.
7. Duct Air Flow Measuring Stations
- a. Located in a configuration and size equal to that of the duct it is installed.
 - b. The airflow traverse probe shall not induce a measurable pressure drop, nor amplify the sound level within the duct by its presence in the airstream.
 - c. Flow Straightener: Provide flow straightener as required by manufacturer of construction as needed to meet the application.
 - d. Range: Minimum 400 to 4,000 fpm.
 - e. Accuracy: Plus/minus 2.0 percent of the measured airflow.
 - f. Manufacturers:
 - 1) Air Monitor Corporation.
 - 2) Ebtron.
 - 3) Johnson Controls.
 - 4) Paragon Controls.
 - 5) Ruskin.
 - 6) Sensocon.
8. Signal Processor:
- a. Microprocessor-based, field programmable, capable of local display of the measured airflow rate.
 - b. Factory calibrated to NIST traceable standards.
 - c. Accuracy: 0.1 percent of full scale, including linearity, hysteresis, dead band, and repeatability.
 - d. Output: 0 to 10 Vdc or 4-20 mA scaled output signal for remote monitoring.

B. Gas Flow Meter: Furnish gas flow meter as specified in Division 23 Section, "Meters and Gauges for HVAC Piping."

2.5 HUMIDISTATS

A. Room Humidistats:

- 1. Performance Characteristics:
 - a. Throttling range: Adjustable 2 percent relative humidity.
 - b. Accuracy: Plus/minus 3 percent over the operating range.
 - 1) Accuracy shall include temperature effects.
 - c. Operating range: 20 to 80 percent.

- d. Drift: Less than 1 percent per year.
- 2. Construction:
 - a. Wall-mounted enclosure: Plastic, NEMA 250, Type 1.
 - b. Cover: Set point indication.
- 3. Output: Linear, proportional type over shielded cable pair, 4 - 20 mA or 0 – 10 Vdc signal..

B. Limit Duct Humidistat:

- 1. Insertion, two position switch type.
- 2. Performance Characteristics:
 - a. Throttling range: Adjustable 2 percent relative humidity.
 - b. Accuracy: Plus/minus 5 percent over the operating range.
 - 1) Accuracy shall include temperature effects.
 - c. Operating range:
 - 1) High Limit Type: Minimum 50 to 95 percent.
 - d. Drift: Less than 1 percent per year.
- 3. Construction:
 - a. Enclosure: Metal, NEMA 250, Type 1.

2.6 INPUT/OUTPUT SENSORS AND TRANSMITTERS

A. General:

- 1. Performance Requirements:
 - a. Device must be compatible with project DDC controllers.
 - b. Elements used shall be general-purpose type.
 - c. Provide transmitters or transducers with sensors as required, with range suitable for the system encountered.
 - 1) Transmitters and transducers shall have offset and span adjustments.
 - 2) Shock and vibration shall not harm the transmitter or transducer.
 - 3) Transmitters and transducers shall have a zeroing capability of readjusting the transmitter zero.
 - d. Accuracy requirements shall include the combined effects of linearity, hysteresis, repeatability, and the transmitter.
- 2. Output: Linear, proportional type over shielded cable pair, 4 - 20 mA or 0 – 10 Vdc signal.
- 3. Input Power: Low voltage, nominal 24 Vdc.

B. Temperature Sensors:

- 1. Use thermistor or RTD type temperature sensing elements with characteristics resistant to moisture, vibration, and other conditions consistent with the application without affecting accuracy and life expectancy. Sensor shall be UL 873 listed for temperature equipment.
- 2. Performance Requirements:
 - a. Thermistor:
 - 1) Accuracy (All): Plus/minus 0.36 degrees F minimum.
 - 2) Temperature Differential Accuracy: Plus/minus 0.15 degrees F minimum.
 - 3) Resolution: Plus/minus 0.2 degrees F minimum.
 - 4) Heat Dissipation Constant: 2.7 mW per degree C.
 - 5) Drift: 0.04 degree F after 10 years within temperature range.
 - b. RTD:
 - 1) Construct RTD of nickel or platinum with base resistance of 1000 ohms at 70 degrees F. 100 ohm platinum RTD is acceptable if used with project DDC controllers.
 - 2) Accuracy (All): Plus/minus 1 degree F minimum, unless otherwise noted below.
 - a) Room Sensor Accuracy: Plus/minus 0.5 degrees F minimum.
 - b) Chilled Water Accuracy: Plus/minus 0.5 degrees F minimum.
 - c) Temperature Differential Accuracy: Plus/minus 0.15 degrees F minimum.
 - 3) Resolution: Plus/minus 0.2 degree F.
 - 4) Drift: 0.04 degrees F after 10 years within temperature range.

- c. Sensing Range:
 - 1) Provide limited range sensors if required to sense the range expected for a respective point.
 - 2) Use RTD type sensors for extended ranges beyond minus 30 degrees F to 230 degrees F.
- d. Wire Resistance:
 - 1) Use appropriate wire size to limit temperature offset due to wire resistance to 1.0 degree F or use temperature transmitter when offset is greater than 1.0 degree F due to wire resistance.
 - 2) Compensate for wire resistance in software input definition when feature is available in the DDC controller.
- 3. Outside Air Sensors: Watertight inlet fitting shielded from direct rays of the sun.
- 4. Room Temperature Sensors:
 - a. Construct for surface or wall box, or enclosure with insulated backing suitable for exterior wall mounting.
 - b. Button Sensor for High Finish Spaces: Where noted on the drawings or scheduled, provide cable type, button probe sensor designed for flush mounting in wall or ceiling with the following features:
 - 1) 6 inch leads.
 - 2) 1/2 inch plastic spacer with locking nut.
 - 3) Finish as specified on the drawings. If not specified, provide [Plastic, field paintable][Aluminum][Brass][Stainless Steel] finish.
 - c. Provide the following features:
 - 1) Non-adjustable, blank front panel.
 - 2) Setpoint reset slide switch, dial wheel, or push-button interface with an adjustable temperature range.
 - 3) Individual heating/cooling setpoint slide switches, dial wheel, or push-button interface.
 - 4) Momentary override request push button for activation of after-hours operation.
 - 5) Locking cover where noted on the drawings.
 - 6) Integral digital display with the following:
 - a) Indication of space temperature.
 - b) Setpoint adjustment to accommodate room setpoint.
 - c) Display and control fan operation status.
 - d) Manual occupancy override and indication of occupancy status.
 - e) Controller mode status.
- 5. Temperature Averaging Elements:
 - a. Use on duct sensors for ductwork 10 sq ft or larger.
 - b. Use averaging elements where prone to stratification with sensor length range between 16-22 ft.
 - c. Provide for all mixed air and heating coil discharge sensors regardless of duct size.
- 6. Insertion Elements:
 - a. Use in ducts not affected by temperature stratification or smaller than 10 sq ft.
 - b. Provide dry type, insertion elements for liquids, installed in immersion wells, with minimum insertion length of 2.5 inches for pipe sizes greater than 4 inches.
 - c. Immersion Well Housing: 1/2 inch NPT brass or stainless steel. Stainless steel required for piping 6 inch and larger.

C. Humidity Sensors:

- 1. Elements: Accurate within 3 percent full range with linear output.
 - a. Accuracy shall include temperature effects.
- 2. Resolution: Plus/minus 1 percent.
- 3. Drift: Less than 1 percent full scale per year.
- 4. Sensing Range: 0 to 100 percent relative humidity.
- 5. Room Sensors: Provide housing with integral sensor. Housing shall be plastic, NEMA 250, Type 1. Provide with insulated backing suitable for exterior wall mounting.

- a. Cover: Provide display indicating sensed humidity value.
- 6. Duct Sensors: Insertion type probe with mounting plate. Housing shall be metal, NEMA 250, Type 1.
- 7. Outside Air Sensors: With element guard and mounting plate.

D. Pressure Transmitters:

- 1. Duct Static Pressure:
 - a. Type: Unidirectional, fixed range.
 - a. Performance Characteristics:
 - 1) Accuracy: Plus/minus one percent of full scale.
 - 2) Thermal Effects: Temperature compensated over a minimum 40 to 120 F range. Zero and span shift of plus/minus 0.06 percent or less of full scale per degree F.
 - 3) Sensing Range: Select sensor so that the high end of the nominal sensor range is not less than 150 percent and not more than 300 percent of maximum expected input.
 - 4) Long Term Thermal Stability: Plus/minus one percent full scale per year.
 - b. Construction:
 - 1) Insertion or traverse type sensor suitable for use in flat oval, rectangular, and round duct configurations.
 - 2) Insertion length selected as appropriate for duct size.
 - 3) Traverse sensors shall have at least one pickup point every 6 inches.
 - 4) Element: Variable capacitance sensing technology.
 - 5) Housing: Fire retardant glass-filled polyester, brass, stainless steel, or aluminum.
- 2. Space Static Pressure:
 - a. Type: Bi-directional, fixed range.
 - b. Performance Characteristics:
 - 1) Accuracy: Plus/minus 0.5 percent of full scale.
 - 2) Thermal Effects: Temperature compensated over a minimum 40 to 120 F range. Zero and span shift of plus/minus 0.06 percent or less of full scale per degree F.
 - 3) Sensing Range: Select sensor so that the high end of the nominal sensor range is not less than 150 percent and not more than 300 percent of maximum expected input.
 - 4) Long Term Thermal Stability: Plus/minus 0.5 percent full scale per year.
 - c. Construction:
 - 1) Sensing Port Wall Mounting: Wall plate with integral sensor, sized to fit standard single gang electrical box. Back of sensor plate fitted with union fitting for tubing connection.
 - 2) Sensing Port Ceiling Mounting: Round plate with union fitting for tubing connection.
 - 3) Sensor Element: Variable capacitance sensor technology.
 - 4) Sensor Housing: Fire retardant glass-filled polyester, brass, stainless steel, or aluminum.
- 3. Hydronic Pressure:
 - a. Type: Unidirectional, fixed range.
 - a. General Sensor Performance Characteristics:
 - 1) Accuracy: Plus/minus 1.0 percent of full scale.
 - 2) Thermal Effects: Temperature compensated minimum 30 to 150 F range. Zero and span shift of plus/minus 0.02 percent or less of full scale per degree F
 - 3) Long Term Thermal Stability: Plus/minus 0.5 percent full scale per year.
 - 4) Range: Select sensor so that the scheduled differential pressure setpoint is near the midrange of the sensor pressure range.
 - b. Performance Characteristics for Chiller/Boiler Equipment Differential Pressure:
 - 1) Application: Variable-Primary Flow Systems.
 - 2) Accuracy: Plus/minus 0.05 percent of full scale.
 - 3) Thermal Effects: Temperature compensated minimum 30 to 150 F range. Zero and span shift of plus/minus 0.02 percent or less of full scale per degree F.
 - 4) Long Term Thermal Stability: Plus/minus 0.125 percent full scale per year for minimum 5 years.

- 5) Range: Select sensor so that the scheduled differential pressure setpoint is near the midrange of the sensor pressure range.
 - 6) Manufacturers:
 - a) Rosemount, 3051S
 - b) Approved equal.
 - c. Construction:
 - 1) Suitable for the media temperature and pressure.
 - 2) Chiller/Boiler differential sensor shall have push button zero and span adjustments. No internal mechanical linkages shall be used in the transmitter.
 - 3) Element: Diaphragm type, stainless steel.
 - 4) Housing: Fire retardant glass-filled polyester, stainless steel, or aluminum.
4. Gas Pressure:
- a. Type: Uni-directional, fixed range.
 - b. Performance Characteristics:
 - 1) Accuracy: 0.35% full scale.
 - 2) Operating Temperature Range: -40 to 260 F.
 - 3) Long Term Drift: Plus/minus 0.2% full scale per year.
 - 4) Sensor Output: 4-20 mA.
 - 5) Range: Select sensor so that the scheduled pressure setpoint is near the midrange of the sensor pressure range.
 - c. Construction:
 - 1) Suitable for the media temperature and pressure.
 - 2) Sensor Element: 17-4 PH or 316L stainless steel.
 - 3) Housing: Stainless steel with FKM, EPDM or all welded seals.

E. Equipment Operation Sensors:

- 1. Status Inputs for Airside Equipment:
 - a. Type: Fixed range differential pressure switch with adjustable setpoint.
 - b. Performance Characteristics:
 - 1) Range: Not greater than two times the design fan static pressure.
 - c. Construction:
 - 1) Enclosure: Comply with NEMA enclosure ratings, suitable for the ambient conditions encountered.
 - 2) Provide Insertion tube for use in duct configurations. Insertion length selected as appropriate for duct size.
 - 3) Contact Type: Single-pole, single-throw (SPST). Provide multiple poles or throw contacts to meet additional alarms required.
- 2. Status Inputs for Electric Motors:
 - a. Analog Current Transducer:
 - 1) Type: Split core design, cable of being installed or removed without dismantling the primary bus cables.
 - 2) Performance Characteristics:
 - a) Accuracy: Plus/minus 2 percent of selected range.
 - b) Range: Multi-range device, suitable for the amperage encountered with internal zero and span adjustment.
 - 3) Construction:
 - a) 24 V or Self-powered.
 - b) Provide with integral command relay.
 - c) Device shall accept overcurrent up to twice its trip into range.
 - d) Enclosure: UL 94 approved thermoplastic, rated for V-0. No metal parts shall be exposed other than the terminals.
 - b. Binary Current Sensing Relay:
 - 1) Type: Split core with current transformers, adjustable and set to 175 percent of rated motor current.
 - 2) Self-powered with solid-state circuitry and a dry contact output.
 - 3) Adjustable trip point.

- 4) Contact Type: Single-pole, double-throw (SPDT).
- 5) LED indicating the on or off status.
- 6) A conductor of the load shall be passed through the window of the device.
- 7) Device shall accept overcurrent up to twice its trip into range.

F. Leak Detection Sensors

1. Leak detection sensors shall be stand alone as described in Division 23 Section, Common Work Results for HVAC”. Monitor leak detection sensors as noted on the drawings.

G. Carbon Dioxide Sensors:

1. General: Provide non-dispersive infrared (NDIR) CO2 sensors with integral transducers and linear output.
 - a. Linear, CO2 Concentration Range Display: 0 to 2000 ppm.
 - b. Full Scale Accuracy: Plus/minus 75 ppm at concentrations of both 600 and 1,000 ppm when measured at sea level at 77 degrees F.
 - c. Maximum Response Time: 1 minute.
 - d. Analog Output: 0-10 Vdc or 4-20 mA.
 - e. Rated Ambient Conditions:
 - 1) Air Temperature: Range of 32 to 122 degrees F.
 - 2) Relative Humidity: Range of 0 to 95 percent (non-condensing).
2. Calibration Characteristics:
 - a. Factory calibrated and certified by the manufacturer to require calibration not more frequently than once every 5 years.
 - b. Automatically compensating algorithm for sensor drift due to sensor degradation.
 - c. Sensor shall be temperature compensated throughout entire operating range.
 - d. Maximum Drift: 2 percent per year.
3. Construction:
 - a. Sensor Chamber: Non-corrosive material for neutral effect on carbon dioxide sample.
 - b. Duct Mounting: Provide duct mounted sensors with duct probe designed to protect sensing element from dust accumulation and mechanical damage.
 - c. Wall/Surface Mounting: Construct for surface or wall box or enclosure suitable for wall mounting.

2.7 OUTPUT CONTROL DEVICES

A. Control Relays:

1. Provide relay with contact rating, configuration, and coil voltage that is suitable for the application.
2. Provide NEMA 1 enclosure when relay is not installed in a local control panel.
3. Control relays shall be UL listed plug-in type with dust cover and LED “energized” indicator.
4. Time delay relays shall be UL listed solid-state plug-in type with adjustable time delay. Delay shall be adjustable plus/minus 200 percent minimum from setpoint.

B. Fan Speed Controllers:

1. Solid-state model providing field-adjustable proportional control of motor speed. Equip with filtered circuit to eliminate radio interference.

2.8 POWER SUPPLIES

A. Reference Division 23 Section “Direct Digital Controls for HVAC” for DC power supply requirements.

B. Control power transformers shall meet NEMA/ANSI standards.

C. Control power transformers shall be UL listed for Class 2 current-limited service or provided with over-current protection on both primary and secondary circuits for Class 2 current-limited service.

- D. Connected load on the transformer shall not exceed 80 percent of the transformer's rated capacity.
- E. The core and windings shall be completely encased in a UL approved thermoplastic. No metal parts shall be exposed other than the terminals.
- F. Performance Characteristics:
 - 1. Accuracy: Plus/minus 1 percent at 5.0 A full scale output.
- G. Provide a disconnect switch for each transformer.

2.9 THERMOSTATS

- A. General:
 - 1. Programmable, with the following features:
 - a. LCD or LED display screen.
 - b. Button or touch-screen Interface.
 - c. 7-day programmable scheduling.
 - d. Temperature information display.
 - e. Setpoint display and adjust.
 - f. Operation mode display and adjust.
 - g. Fan switch setting (Off/Auto/Low/Med/High), configured with the fan system it serves.
 - h. Override.
 - i. Remote temperature sensor interface terminal.
 - j. Lockout.
 - 2. Performance Requirements:
 - a. Accuracy: Plus/minus 1.0 degree F minimum.
 - b. Resolution: Plus/minus 0.2 degrees F.
 - c. Range:
 - 1) Operating Temperature: 32 degrees F to 122 degrees F minimum.
 - 2) Operating Humidity: 0 percent to 95 percent relative humidity, non-condensing.
 - 3) Setpoint Control:
 - a) Cooling: 54 degrees to 100 degrees F.
 - b) Heating: 40 degrees to 90 degrees F.
 - d. Multi-stage as required to match unit cooling and heating stages scheduled on the drawings.
- B. Electric Room Thermostats:
 - 1. Type: 24 volts, two position switch, programmable with setback/setup temperature control.
 - 2. Covers: Locking with set point adjustment and indication.
 - 3. Setpoint functional range: 45 degrees F to 90 degrees F.
- C. Room Thermostat Accessories:
 - 1. Thermostat Covers: Brushed aluminum.
 - 2. Insulating Bases: For thermostats located on exterior walls.
 - 3. Thermostat Guards: Locking transparent plastic mounted on separate base.
 - 4. Adjusting Key: As required for device.
 - 5. Aspirating Boxes: Where indicated for thermostats requiring flush installation.
 - 6. Integrated sensors: At the contractor's option, the following sensors may be provided with the thermostat in a single device. Refer to the drawings where additional sensors are required. Refer to "Input/Output Sensors" section of this specification for language governing performance of the integrated sensors.
 - a. Occupancy sensor.
 - b. Humidity sensor.
 - c. Carbon dioxide sensor.

- D. Immersion Thermostat:
 1. Remote bulb or bimetallic rod and tube type, proportional action with adjustable setpoint and adjustable throttling range.

- E. Airstream Thermostat:
 1. Remote bulb or bimetallic rod and tube type, proportional action with adjustable setpoint in middle of range and adjustable throttling range.
 2. Averaging service remote bulb element: minimum 7.5 feet or length as required to fit duct.

- F. Electric Low Limit Thermostat:
 1. Snap acting, single pole, single throw, manual or automatic reset switch as indicated on the drawings that trips if temperature sensed across any 12 inches of bulb length is equal to or below setpoint,
 - a. Provide double-throw contacts (one for direct equipment control, one for BAS system notification) where additional alarms are scheduled.
 2. Bulb length: Minimum 1 foot for every 1 square foot of coil cross sectional area.
 3. Provide one thermostat for every 20 sq ft of coil surface.
 4. Setpoint shall be adjustable.

- G. Electric High Limit Thermostat:
 1. Snap acting, single pole, single throw, manual reset switch that trips if temperature sensed across any 12 inches of bulb length is equal to or above setpoint,
 2. Bulb length: Minimum 1 foot for every 1 square foot of coil cross sectional area.
 3. Provide one thermostat for every 20 sq ft of coil surface.
 4. Setpoint shall be adjustable.

- H. Fire Thermostats:
 1. UL labeled, factory set in accordance with NFPA 90A.
 2. Normally closed contacts, manual reset.
 3. Fixed or adjustable settings to operate at not less than 75 degrees F above normal maximum operating temperature.

2.10 WEATHER STATIONS

- A. Manufacturers:
 1. Davis Instruments.
 2. Intellisense System
 3. Meter Environment
 4. WeatherHawk

- B. Description:
 1. Weather station shall measure and record wind speed and direction, air temperature and relative humidity, barometric pressure, solar radiation, and rain.
 2. Design weather station for applications with minimal visual impact, high reliability, and a long interval between routine servicing.
 3. Weather station shall use solid-state sensors with no moving parts.
 4. Weather station shall not be impaired by heavy snowfall or freezing conditions that produce rime ice. Provide a thermostatically controlled heater element in the sensor head that keeps the wind sensor elements and the precipitation sensor surface free of snow and ice to minus 62 deg F.
 5. Weather station shall directly connect to host device, or wirelessly connect to a host device through a fully integrated, industrial-grade, 916-MHz spread spectrum radio-frequency communications technology.
 6. RS-232 serial data I/O shall be located on the bottom of the weather station and used as a second serial communications port, for programming and testing the system, or for direct data downloads using a personal computer or personal digital assistant.

7. Weather station shall be provided with a mounting system supplied by weather station manufacturer that is suitable for the installation.

C. Sensor Technology:

1. Wind speed and direction shall use acoustic techniques. Sensor shall consist of three equally spaced ultrasonic transducers in a horizontal plane. Values of any two array paths shall enable computation of both wind speed and direction, and a signal processing technique shall enable the measurement to be calculated using the two array paths of the best quality.
2. Rain shall be measured using a stainless-steel piezometric impact surface that counts the raindrops and measures their acoustic signature, integrating that information to provide a near-real-time value for rainfall amount and rate.
3. Barometric pressure, relative humidity, air temperature, and solar radiation measurements shall be made by scientific grade sensors.
4. Air-temperature and relative-humidity sensors shall be combined in an integrated, user-replaceable unit that requires no calibration.
 - a. Relative humidity sensor shall be a thin-polymer, capacitive sensor.
 - b. Air-temperature sensor shall be a capacitive ceramic sensor.
5. Barometric pressure shall be measured with a capacitive silicon, temperature-corrected, strain gage.
6. Solar radiation shall be measured by a silicon pyranometer with a cut filter limiting the spectral exposure to the 300- to 1100-nm wavelength.

D. Performance: Sensors shall have similar performance criteria as specified herein.

1. Air Temperature:
 - a. Range: Minus 40 to 140 deg F.
 - b. Accuracy: Within 0.9 deg F.
 - c. Resolution: 0.1 deg F.
2. Relative Humidity:
 - a. Range: Zero to 100 percent.
 - b. Accuracy: Within 3 percent over the range of zero to 90 percent and within 5 percent between 90 to 100 percent.
 - c. Resolution: 0.1 percent.
3. Barometric Pressure:
 - a. Range: 17.72- to 32.48-in. Hg.
 - b. Accuracy: 0.015-in. Hg between 32 to 86 deg F.
 - c. Resolution: 0.03-in. Hg between minus 40 to 140 deg F.
4. Solar Radiation:
 - a. Spectral Range: 300 to 1100 nm.
 - b. Reproducibility: Within 2 percent.
 - c. Output: 0.2 mV per watts per square meters.
 - d. Range: Zero to 1000 W per square meters.
 - e. Temperature Range: Minus 40 to 130 deg F.
5. Rain:
 - a. Collecting Area: 9.3 sq. in.
 - b. Range: Zero to 7.87 inches per hour.
 - c. Accuracy: Within 5 percent.
 - d. Resolution: 0.001 inch.
6. Wind Direction:
 - a. Azimuth: Zero to 360 degrees.
 - b. Response Time: 250 ms.
 - c. Accuracy: Within 2 degrees.
 - d. Resolution: 1 degree.
7. Wind Speed:
 - a. Range: Zero to 134 mph.
 - b. Response Time: 0.25 second.
 - c. Accuracy: Greater of 0.67 mph or 2 percent.

- d. Resolution: 0.22 mph.
- 8. Data Storage: 60 days of hourly data.
- E. Output Signals:
 - 1. RS-232 or RS-485 serial interface directly from weather station to host.
 - 2. In applications that cannot accept a serial signal, provide a serial-to-analog converter.
 - 3. Serial-to-Analog Converter:
 - a. Serial converter designed to add analog outputs for measuring instruments that have only serial output.
 - b. Configure to give analog outputs from all measuring sensors and calculated parameters.
 - c. Each converter shall have four analog outputs with a 4- to 20-mA signal.
 - d. Provide multiple converters for applications requiring more points.
 - e. Converter requires a 24-V dc power supply.
- F. Communication Interface:
 - 1. Weatherproof serial cables shall be used to connect the RS-232 I/O on the weather station. Cables shall use nickel-plated brass DB-9 connectors for corrosion resistance and include a Sanoprene jacket suitable for both high-ultraviolet and direct-burial environments.
 - 2. An RF4xx spread spectrum radio-frequency transceiver shall be provided with every wireless weather station.
- G. Unit shall be provided with a 120-V ac, 60-Hz power supply, a serial cable, and an antenna.
- H. Software:
 - 1. Data Transfer Protocols, Software, and Data Interface Hardware: Weather stations that communicate using a proprietary protocol shall be provided with a software development kit to enable a qualified software developer in development of software drivers for third-party devices or software.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify existing conditions before starting work.
- B. Verify that systems are ready to receive work.
- C. Beginning of installation means installer accepts existing conditions.
- D. Sequence work to ensure installation of components is complementary to installation of similar components in other systems.
- E. Coordinate installation of system components with installation of mechanical systems equipment such as air handling units and air terminal units.

3.2 INSTALLATION

- A. Cooperate with other contractors performing work on this project as necessary to achieve a complete and coordinated installation. Each Contractor shall consult the Drawings and Specifications for all trades to determine the nature and extent of others work.
- B. General Workmanship:
 - 1. Install equipment, piping, and wiring/raceway parallel to building lines wherever possible.
 - 2. Provide sufficient slack and flexible connections to allow for vibration of piping and equipment.

3. Install all equipment in readily accessible locations.
4. All installations shall comply with industry specifications and standards for performance, reliability, and compatibility and be executed in strict adherence to local codes and standard practices.
5. Install all products in accordance with manufacturer's instructions.

C. Sensors:

1. Mount sensors rigidly and adequately for the environment within which the sensor operates.
2. Room temperature sensors shall be installed on concealed junction boxes properly supported by the wall framing. Coordinate installation of room/space sensors with architect and other trades to ensure a neat and orderly installation.
3. All wires attached to sensors shall be air sealed in their raceways or in the wall to stop air transmitted from other areas affecting sensor readings.
4. Sensors used in mixing plenums and hot and cold decks shall be of averaging type. Averaging sensors shall be installed in a serpentine manner vertically across the duct. Each bend shall be supported with a capillary clip.
5. Low-limit sensors used in mixing plenums shall be installed in a serpentine manner horizontally across duct. Each bend shall be supported with a capillary clip. Provide 1 foot of sensing element for each square foot of coil area.
6. Do not install temperature sensors within the vapor plume of a humidifier. If installing a sensor downstream of a humidifier, install it at least 10 feet downstream.
7. Install temperature, humidity, and smoke detectors for both supply air and return air applications a minimum of 10'-0" downstream or upstream of the air handling unit and prior to any branch duct takeoffs.
8. All pipe-mounted temperature sensors shall be installed in wells. Install all liquid temperature sensors with heat-conducting fluid in thermal wells.
9. Install outdoor air temperature sensors on north wall, complete with sun shield where shown on the plans. If not shown, locate sensors in an accessible location, a minimum of 15 feet away from exhaust or relief air locations.
10. Differential air static pressure.
 - a. Supply Duct Static Pressure: Pipe the high-pressure tap to the duct using a pitot tube. Pipe the low-pressure port to a tee in the high-pressure tap tubing of the corresponding building static pressure sensor (if applicable) or to the location of the duct high-pressure tap and leave open to the plenum.
 - b. Building Static Pressure: Pipe the low-pressure port of the pressure sensor to the static pressure port located on the outside of the building. Pipe the high-pressure port to a location suitable to sense common building pressure or as indicated on the drawings.
 - 1) Panel mount the transducer adjacent to its associated building automation system controller. Provide an independent manometer gauge next to transducer for calibration.
 - c. The piping to the pressure ports on all pressure transducers shall contain a capped test port located adjacent to the transducer.
 - d. All pressure transducers, other than those controlling VAV boxes, shall be located in field device panels, not on the equipment monitored or on ductwork. Mount transducers in a location accessible for service without use of ladders or special equipment.
 - e. All air and water differential pressure sensors shall have gauge tees mounted adjacent to the taps. Water gauges shall also have shutoff valves installed before the tee.
11. Adjust flow switch to meet sensitivity required to ensure minimum flow through the equipment.
12. Check and verify location of thermostats, humidistats, and exposed control sensors with plans and room details before installation. Locate 48 inches above floor. Align with adjacent lighting switches and humidistats.
 - a. Install devices to meet ADA requirements unless otherwise noted on the plans.
13. Mount freeze protection thermostats using flanges and element holders.
 - a. Install thermostat completely across the surface the thermostat serves.
14. Mount outdoor reset thermostats and outdoor sensors indoors, with sensing elements outdoors with sun shield.
15. Provide separable sockets for liquids and flanges for air bulb elements.

16. Provide guards on thermostats in areas indicated on the drawings.
17. Calibrate each instrument installed that is not factory calibrated and provided with calibration documentation.
18. Install shutoff valves in the high and low pressure reference lines connecting to hydronic pressure sensors and switches. Install a shunt valve across the high and low reference pressure ports for servicing. Valves may be ordered as an integral option with the sensor.

D. Control Dampers:

1. Install dampers with extruded aluminum or stainless steel frames and blades in corrosive environments and areas with high humidity.
2. Install smooth transitions, not exceeding 30 degrees, to dampers smaller than adjacent duct. Install transitions as close to damper as possible but at distance to avoid interference and impact to performance. Consult manufacturer for recommended clearance.
3. Clearance:
 - a. Locate dampers for easy access and provide separate support of dampers that cannot be handled by service personnel without hoisting mechanism.
 - b. Install dampers with at least 24 inches of clear space on sides of dampers requiring service access.
4. Service Access:
 - a. Dampers and actuators shall be accessible for visual inspection and service.
 - b. Install access door(s) in duct or equipment located upstream of damper to allow service personnel to hand clean any portion of damper, linkage, and actuator. Comply with requirements in Division 23 Section, "Air Duct Accessories."
5. Duct openings shall be free of any obstruction or irregularities that might interfere with blade or linkage rotation or actuator mounting.
6. Install dampers straight and true, level in all planes, and square in all dimensions. Install supplementary structural steel reinforcement for large multiple-section dampers if factory support alone cannot handle loading.
7. Provide mixing dampers of parallel blade construction arranged to mix streams. Where shown on the drawings, provide separate minimum outside air damper section adjacent to return air dampers with separate damper motor.
8. Provide isolation (two position) dampers of parallel blade construction.
9. Provide opposed blade damper configuration for all other applications.
10. Install damper motors on outside of duct in warm areas. Do not install motors in locations at outdoor temperatures.
11. After installation of low-leakage dampers and seals, caulk between frame and duct or opening to prevent leakage around perimeter of damper.

E. Operators:

1. Mount and link control damper actuators according to manufacturer's instructions.
 - a. To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5 degrees open position, manually close the damper, and then tighten the linkage.
 - b. Check operation of damper/actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
 - c. Provide all mounting hardware and linkages for actuator installation.
2. Dampers: Actuators shall be direct-mounted on damper shaft or jackshaft unless shown as a linkage installation. For low-leakage dampers with seals, the actuator shall be mounted with a minimum 5 degree available for tightening the damper seals.
3. Valves: Actuators shall be connected to valves with adapters approved by the actuator manufacturer.

F. Control Panels:

1. Install control panels where shown on the drawings and where required to house controllers for the controlled systems and equipment.

2. Mount control panels adjacent to associated equipment on vibration free walls or free standing angle iron supports. One cabinet may accommodate more than one system in same equipment room. Provide engraved plastic nameplates for instruments and controls inside cabinet and engraved plastic nameplates on cabinet face.
 3. Coordinate 120V power requirements with Division 26 to panels used for the building automation system and transformers for low voltage power to controllers.
- G. Install "hand/off/auto" selector switches to override automatic interlock controls when switch is in "hand" position.
- H. Provide an insulation standoff on control devices, cables, and other items that do not require flush mounting to ductwork, piping, or equipment.

3.3 MAINTENANCE

- A. Refer to Division 01 closeout requirements for additional requirements relating to maintenance service.
- B. Provide service and maintenance of control system for one year from Date of Substantial Completion.
- C. Provide complete service of controls systems, including call backs, and submit written report of each service call.

3.4 STARTUP AND DEMONSTRATION

- A. Control Dampers:
1. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.
 2. For c dampers equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.
 3. Verify that all two-position dampers operate properly and that the normal positions are correct.
 4. Verify that all modulating dampers are functional, that the start and span are correct, that direction and normal positions are correct, and that they achieve proper closure.

3.5 DAMPER SCHEDULE

<u>SERVICE</u>	<u>RUSKIN MODEL</u>	<u>MATERIAL</u>
Outside, Exhaust and Relief		
Air Control, Stairway and Shaft Vents	CD-50	Aluminum
Control	SD-60	Galvanized Steel
All Other	CD-356	Galvanized Steel

3.6 DAMPER OPERATOR VOLTAGE SCHEDULE

<u>SERVICE</u>	<u>VOLTAGE</u>
Interlocked with HVAC fans	120V
Multi-section dampers	120V
Large dampers (> 60 inches in any dimension)	120V
All other operators control wiring	24V

1. Note: Coordinate with Division 26 if 120V power is required for operator to achieve appropriate torque requirements for damper actuation.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15996 (230923) - DIRECT-DIGITAL CONTROL FOR HVAC

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. System Description.
- B. Operator Interface.
- C. Controllers.
- D. Electrical Control Power Wiring and Low Voltage Wiring.
- E. Local Area Network.
- F. System Software.
- G. Controller Software.

1.2 REFERENCE STANDARDS

- A. ANSI/CEA 709.1.D - Control Network Protocol Specification; 2014.
- B. ASHRAE Std 135 - BACnet - A Data Communication Protocol for Building Automation and Control Networks; most current edition.
- C. IEEE C37.90.1 – IEEE Standard for Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus, most current edition.
- D. IEEE C62.41.2 – IEEE Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and less) AC Power Circuits, most current edition.
- E. ISO 7498 – Information Processing Systems – Open System Interconnection – Basis Reference Model, International Standards Organization, most current edition.
- F. NEMA – National Electrical Manufacturers Association.
- G. NFPA 70 - National Electrical Code; National Fire Protection Association; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers.

1.4 DEFINITIONS

- A. ASC: Application Specific Controller. Examples include controllers for specific applications (e.g., FCU, VAV box, etc.) that can be configured through any network services software.
- A. ATU: Air Terminal Unit (e.g., VAV boxes, fan-powered boxes, fan coil units).

- B. BAS: Building Automation System.
- C. BTL: BACnet Testing Laboratories. Third party independent testing and listing program for devices which have been tested according to ASHRAE Standard 135.
- D. Control Wiring: Includes conduit, wire and wiring devices to install complete control systems including motor control circuits, interlocks, thermostats, EP and IP switches and like devices. Includes all wiring from Intelligent Devices and Controllers to all sensors and points defined in the input/output summary shown on the drawings or specified herein and required to execute the sequence of operations
- E. DDC: Direct Digital Control.
- F. EMT: Electrical Metallic Tubing
- G. High voltage: 50 volts or higher.
- H. IP: Internet Protocol.
- I. LAN: Local Area Network.
- J. VLAN: Virtual Local Area Network.
- K. Low voltage: Below 50 volts.
- A. NiCS: Niagara Compatibility Statement license.
- L. OSI: Open System Interconnection
- M. PC: Personal Computer.
- N. PICS: Protocol Implementation Conformance Statement.
- O. Point: Point is a generic term used to describe a single item of information in a BAS. Points may be further described as input, output, digital, binary, discrete, analog, modulating, internal, external, virtual or global. Each unique point used by digital controllers, or in a BAS, is typically identified by an address.

1.5 CONTRACTOR RESPONSIBILITIES

- A. Reference the following sections for additional contractor responsibilities and coordination:
 1. Division 23 Section "Electrical Coordination for Mechanical Equipment."
 2. Division 23 Section "Commissioning for HVAC."
 3. Division 23 Section "Instrumentation and Control Devices for HVAC."
- B. Reference Part 3 for additional electrical contractor responsibilities for BAS controls.

1.6 SUBMITTALS

- A. Refer to Division 01 and Division 23 Section "General Mechanical Requirements" for submittal procedures.
- B. General:
 1. The drawings and specifications are not intended to show all details. The BAS contractor shall secure satisfactory information before submitting the proposal and include in the proposal a sum

sufficient to cover all items of labor and material required for the complete installation for the devices and system described.

1. Inform Engineer in writing of any deviation in the exhibits submitted from the requirements of the drawings, specifications, and sequences of operations.

C. Product Data:

1. Submit manufacturer technical data for each system component and software module required for a complete installation.
2. Indicate dimensions, weights, and enclosure construction for all BAS distributed controllers.
2. Submit technical data on all new software supplied including description of functions performed by software and location within the system where software shall reside. Include all software licensing agreements.
3. Submit the PICS for each BACnet device used in the BAS.
4. Submit the NiCS for each type of Niagara station in the BAS.

D. Power and Communication Wiring Transient Protection:

1. Submit catalog data sheets providing evidence that all BAS products offered by the manufacturer are tested and comply with IEEE C62.41.2.
2. Testing shall include power and communication trunk wiring.
3. Compliance with IEEE C62.41.2 shall imply conformance with IEEE C37.90.1 based on the stated position of ANSI and IEEE.

E. Shop Drawings:

1. Submit a trunk cable schematic showing locations of all programmable control units, controllers, and workstations, with associated network wiring.
 - a. Indicate equipment served by each controller on the diagram.
 - b. Indicate switches, power requirements to each controller, and daisy chained controllers.
3. Submit detailed schematic control drawings for each controlled device and equipment.
 - c. Reference all control components to manufacturer make and model number.
 - d. Include all control and power wiring with termination point (controller and terminal number).
 - e. Include clearly indicated and written sequences of operation referenced to specific control components (e.g., "shall modulate valve V-3").
 - f. Include default position (e.g., N.O., N.C., etc.) for all components where applicable.
 - g. Clearly differentiate between existing components and new components.
 - a. Include detailed wiring diagrams showing methods of connections to VFDs, motor starters, energy meters, and all other devices, and all other field wiring necessary for system installation.
 - b. The use of "typicals" will be allowed where appropriate.
2. Submit detailed drawings for each individual BAS distributed controller.
 - a. Include controller identification.
 - b. Include components included in the controller.
 - c. Include numbering of terminals and communications ports.
 - d. List connected data points, including connected control unit and input device.
 - e. Include type of cable connected to each terminal port.
 - f. Identify specific field devices wired to each terminal including identification of each field device and application.
 - g. Clearly differentiate between existing controllers and new controllers.
 - h. Indicate source (electrical panel ID) of 120V power to each panel to which 120V power is connected.
 - i. Indicate method of connecting controller to equipment supplied by others and to existing communications networks.
3. Submit floor plans that indicate the following:
 - a. Location of all new BAS distributed controllers and control panels.
 - b. Routing of all new building level network communications wiring not located in mechanical and electrical rooms.

- c. Routing of wiring to controllers, sensors, and control points not located in mechanical and electrical rooms.
 - d. Location of building system connection to Owner's campus wide data network.
 - 4. Submit methods and materials used to integrate into existing networks.
 - 5. All control drawings and schematics shall be generated using AutoCAD software or equivalent. All project drawings shall be supplied to the Owner in a format as desired by the Owner upon project completion.
 - 4. Submit system identification nomenclature.
 - a. Nomenclature shall be consistent throughout the network and consistent with any existing networks that are integrated. If not defined, nomenclature shall be similar to the point names shown on the drawings.
 - b. Object name and ID number shall be unique within a control device.
 - c. Control device name and ID number shall be unique within the network.
 - d. Network number shall be unique within the BAS.
 - 6. Indicate system graphics indicating monitored systems, data (connected and calculated) and operator notations.
 - a. Submit example graphic visualizations and screenshots for the BAS. At a minimum, submit examples for major HVAC equipment components, including chillers, boilers, air handling units, fan coil units, heat pumps, fans, etc.
 - b. Font size and type shall be manufacturer standard.
 - c. Provide graphics demonstration package in a format as desired by the Owner.
 - 7. Indicate description and sequence of operation of operating, user, and application software.
- F. Manufacturer's Instructions: Indicate manufacturer's installation instructions for all manufactured components.
- G. Manufacturer's qualification statement.
- H. Installer's qualification statement.
- I. Project Record Documents: Record actual locations of control components, including control units, thermostats, and sensors.
 - 1. Revise shop drawings to reflect actual installation and operating sequences.
 - 2. Include submittals data in final "Record Documents" form.
 - 3. All additions or changes to the BAS during the course of construction shall be reflected upon the drawings and submitted to the Engineer before project close-out.
- J. Testing and Commissioning Reports and Checklists: Submit completed versions of all reports and checklists, along with all trend logs, used to meet the requirements of Part 3, Startup and Demonstration.
- K. Operation and Maintenance Data:
 - 1. Include maintenance data and recommended spare parts list for digital control equipment and control components.
 - 2. Include trouble-shooting maintenance guides.
 - 3. Include interconnection wiring diagrams showing complete field installed systems with identified and numbered system components and devices.
 - 4. Include keyboard illustrations and step-by-step procedures indexed for each operator function.
 - 5. Include inspection period, cleaning methods, cleaning materials recommended, and calibration tolerances.
 - 6. Include a maintenance manual which contains the information listed above, product data, shop drawings, final software code for sequences of operation and maintenance data in accordance with requirements of Division 01.
 - 7. Include logbook for documentation of software updates and patches applied BAS for the time period included in the software licensing agreement.

8. Provide names, addresses, and telephone numbers of installing contractors and service representatives for equipment and control systems.

L. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner's name and registered with manufacturer.

M. Maintenance Materials:

1. Refer to Division 01 for additional provisions.
2. Extra Stock Materials: Two printer cartridges and cartons of printer paper.

1.7 QUALITY ASSURANCE

A. Perform work in accordance with NFPA 70.

B. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc., as suitable for the purpose specified and indicated.

C. BACnet devices used in the BAS shall be BTL listed according to its device profile.

D. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.

E. Installer Qualifications: Company specializing in performing the work of the type specified and with minimum documented experience as follows:

1. All personnel of the BAS Contractor shall have a minimum of three years of experience within their appropriate trades.
2. All subcontractors utilized by the BAS Contractor shall have a minimum of five years experience within their appropriate trades.

1.8 WARRANTY

A. Refer to Division 01 for additional project warranty requirements.

B. Labor and materials for the BAS specified shall be warranted free from defects in workmanship and material for a period of 1 year after Substantial Completion and system acceptance.

C. BAS failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner.

D. All work shall have a single warranty date, even when the Owner has received beneficial use due to an early system start-up. If the work specified is split into multiple contracts or a multi-phase contract, then each contract or phase shall have a separate warranty start date and period.

E. Provide updates to operator workstation software, project-specific software, graphic software, database software, and firmware that resolve Contractor-identified software deficiencies at no charge during warranty period. If available, Owner can purchase in-warranty service agreement to receive upgrades for functional enhancements associated with above-mentioned items. Do not install updates or upgrades without Owner's written authorization.

F. Provide five year manufacturer's warranty for field programmable micro-processor based units.

G. Special warranty on instrumentation:

1. All instrumentation shall be covered by manufacturer's transferable one-year "No Fault" warranty. If manufacturer warranty is not available, the BAS installer shall provide the same.

1.9 PROTECTION OF SOFTWARE RIGHTS

- A. Prior to delivery of software, the Owner and the party providing the software will enter into a software license agreement with provisions for the following:
 - 1. Limiting use of software to equipment provided under these specifications.
 - 2. Limiting copying.
 - 3. Preserving confidentiality.
 - 4. Prohibiting transfer to a third party.
- B. Software provider shall provide software updates and patches to the BAS as part of the software licensing agreement as the updates and patches are released. If any security vulnerabilities are discovered by the provider, the provider shall notify the client within five business days.
- C. Ownership of Proprietary Material: Project-specific software and documentation shall become Owner's property upon project completion. This includes, but is not limited to the following:
 - 1. Graphics.
 - 2. Record drawings.
 - 3. Database.
 - 4. Application programming code.
 - 5. Documentation.

PART 2 - PRODUCTS

1.1 PRE-APPROVED MANUFACTURERS

- A. Engineered Systems & Energy Solutions, Inc. (ES2), Jesse Gentling – jgentling@es2ok.com 405-595-9728.
 - B. Intelli-building Controls & Solutions, LLC, Tom Franzo – tom@intelli-building.com 312-802-7134, 773-299-1903.
 - C. Johnson Controls, Metasys.
 - D. Industrial Controls & Electrical (ICE), Clint Benedetto. Clint@ice-electric.com 731-285-8863.
- A. The above list of manufacturers applies to operator workstation software, controller software, the custom application programming language, building controllers, custom application controllers, and application specific controllers. All other products specified under Division 23 Section "Instrumentation and Control Devices for HVAC" need not be manufactured by the above manufacturers.

2.2 SYSTEM DESCRIPTION

- A. General:
 - 1. The BAS shall consist of all necessary hardware and software to perform the control sequences of operation as called for in the Specifications and Drawings. Contractor shall install and commission all necessary devices to ensure a reliable and stable network.
 - 2. System design is based on a distributed system of fully intelligent, stand-alone controllers, operating in a multi-tasking, multi-user environment on token passing network, with central and remote hardware, software, and interconnecting wire and conduit.
 - 3. Include computer software and hardware, operator input/output devices, control units, local area networks (LAN), sensors, control devices, actuators.

4. The BAS shall be capable of integrating multiple devices, sensors, and functions from multiple control vendors into a common front end, including equipment supervision and control, alarm management, energy management, and trend data collection.
5. The BAS shall be modular in nature, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, ASC's, and operator devices.
6. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.

B. Local Area Network:

1. The BAS shall be set up using a VLAN connection into the Owner's internet or enterprise intranet. Verify with owner, The VLAN shall be digitally separate from all other networks and shall share a common physical cabling backbone. Coordinate with the Owner to configure Ethernet and IP router switches to accommodate the VLAN.

C. Network Architecture: The BAS network architecture shall be based upon the OSI basic reference model in accordance with ISO 7498.

1. Application/Network Layer:
 - a. BACnet protocol complying with ASHRAE Standard 135.
2. Physical/Data Link Layer:
 - a. Hard-wired type:
 - 1) Ethernet according to ISO 8802-2 protocol.
 - 2) EIA-485 Twisted Cable Pair according to Master Slave/Token-Passing (MS/TP) protocol.
3. Communication between operator workstation(s) and building controller(s):
 - a. Ethernet.
 - b. MS/TP.
 - c. Zigbee.
 - d. Wi-Fi.
4. Communication between building controller(s) and application specific and custom application controllers:
 - a. MS/TP.
 - b. PTP.
 - c. Zigbee.
 - d. Wi-Fi.

D. Web Services Enabled Network:

1. The network shall be capable of being accessed remotely over the internet via a virtual link according to Internet Protocol.
2. System software shall be based on a client/server architecture, designed around the open standards of web technology. The BAS server shall be accessed using a web browser over the BAS network, Owner's LAN, and remotely over the Internet (through the Owner's LAN).
3. No special software other than a web browser shall be required to access graphics, point displays, and trends, configure trends, configure points and controllers, or to edit programming. Connection shall be browser agnostic.
4. Software applications shall be designed and optimized for hand-held device interface (e.g., tablets, smart phones, etc.). Interface shall grant visibility and control access, at a minimum, to the following data: Summary, Alarm, Setpoints, Status, Schedule, and Trending.

E. Network Integration:

1. The BAS network shall be integrated with other automation networks controlled by the Owner. Coordinate with the Owner's information technology (IT) department for networks that shall be integrated.
2. Provide gateways or other integration devices across networks with different communication protocol to provide a single network visibility and interoperability at the operator workstation. Coordinate communication protocol with each automation system specified.

3. Interoperable networks shall be capable of sharing all point and point information across networks to a single BAS front end.
4. Interoperable networks shall be capable of automatically downloading application program changes.
5. For integrated networks that cannot automatically download application program changes, provide a link to the Controller Manual Download Schedule, as defined in the submittals section of Part 1 on the BAS front end summary page

F. Network Interoperability:

1. Provide communication between control units over local area network (LAN).
2. Communication services over the LAN shall result in operator interface and value passing that is transparent to the network architecture as follows:
 - a. Connection of an operator interface device to any one controller on the network shall allow the operator to interface with all other controllers as if that interface were directly connected to the other controllers. Data, status information, reports, system software, custom programs, etc., for all controllers shall be available for viewing and editing from any one controller on the network.
 - b. All database values (e.g., objects, software variables, custom program variables) of any one controller shall be readable by any other controller on the network. This value passing shall be automatically performed by a controller when a reference to an object name not located in that controller is entered into the controller's database. An operator/installer shall not be required to set up any communication services to perform network value passing.

2.3 OPERATOR INTERFACE

A. General:

1. The Operator Interface shall provide overall BAS supervision and system software interface. Communications from the workstation shall be executed directly to and between the integration level building controllers and field level controllers.
2. The operator interface shall be capable of command entry, information and alarm management, database management, access of all system data, and be independent of hardware technology.

B. Hardware:

1. Desktop:
 - a. Computer(s) and display(s) to be provided by BAS controls manufacturer.
 - b. PC shall be general purpose and commercially available, with sufficient memory and processing capability to meet the requirements of the BAS.
 - 1) Quantity: 1.
 - 1) Minimum RAM: 4.0 gigabytes.
 - 2) Minimum Processing Speed: Intel i3 Dual Core Microprocessor or better running at no less than 3.0 gigahertz.
 - 3) Minimum Hard Drive Memory: 500 gigabytes.
 - 2) Drives: 32X CD Rom/8X DVD drive.
 - 4) Ports:
 - a) Minimum of 2 USB 2.0 or faster ports on front of tower.
 - b) Minimum of 2 free USB 2.0 or faster ports on rear of tower.
 - b. Monitor: Minimum 17 inch VGA or higher resolution, color graphic LCD or LED monitor with a compatible VGA or higher resolution card.
 - c. Location(s): As directed by the Owner.
 - d. Network Connection:
 - 1) Suitable for network technology provided.
 - 2) Ethernet interface card with minimum Speed: 10/100/1000.
 - 3) Wireless interface card, dual band.
 - e. Standard 101 key keyboard.
 - f. Standard mouse with track wheel.
2. Laptop:

- a. Laptop(s) to be provided by BAS controls manufacturer.
 - b. Laptop shall be general purpose and commercially available, with sufficient memory and processing capability to meet the requirements of the BAS.
 - c. Quantity: 1.
 - c. Minimum RAM: 4.0 Gigabytes.
 - d. Minimum Processing Speed: Intel i3 Dual Core Microprocessor or better running at no less than 3.0 gigahertz.
 - e. Minimum Hard Drive Memory: 500 Gigabyte.
 - f. Drives: External 32X CD/8X DVD drive with USB connection.
 - g. Ports: Minimum of 2 USB 2.0 or faster.
 - h. Display: Minimum 15 inch.
 - i. Network Connection:
 - 1) Suitable for network technology provided.
 - 2) Ethernet interface card with minimum speed: 10/100/1000.
 - 3) Wireless interface card, dual band.
3. System Printer:
- a. Printer(s) to be provided by BAS controls manufacturer.
 - b. Quantity: 1.
 - c. Type: Business/office quality inkjet or laser jet equivalent printer.
 - d. Resolution: Up to 600 x 1200 dots per inch (dpi) black and up to 4800 x 1200 dpi color.
 - e. Minimum Print Speed: Minimum 18 ppm black and 10 ppm color.
 - f. Locations(s): As directed by the Owner.
4. Database Save/Restore/Back-Up:
- a. Back-up copies of all Building Controller and ASC data as well as mass storage for trend logs shall be stored in the mass storage device designated by the Owner.

1.2 CONTROLLERS

C. Building Controllers

- 1. General:
 - a. Input Power Requirements: 24Vac.
 - b. Manage global strategies by one or more, independent, standalone, microprocessor based controllers.
 - c. Provide sufficient memory to support controller's operating system, database, and programming requirements.
 - d. Share data between networked controllers.
 - e. Controller operating system manages input and output communication signals allowing distributed controllers to share real and virtual object information and allow for central monitoring and alarms.
 - f. Utilize real-time clock for scheduling.
 - g. Continuously check processor status and memory circuits for abnormal operation.
 - h. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
 - i. Communication with other network devices to be based on assigned protocol.
 - j. Monitor the status of all overrides, and include this information in logs and summaries to inform the operator that automatic control has been inhibited.
- 2. Communication:
 - a. Perform routing when connected to a network of custom application and application specific controllers.
 - b. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
 - 1) Port shall be USB type.
- 3. Anticipated Environmental Ambient Conditions:
 - a. Outdoors and/or in Wet Ambient Conditions:
 - 1) Mount within NEMA 4X waterproof enclosures.
 - 2) Rated for operation at 40 to 150 degrees F and 95 percent RH, non-condensing.

- b. Conditioned Space:
 - 1) Mount within NEMA 1 dustproof enclosures.
 - 2) Rated for operation at 32 to 120 degrees F.
- 4. Provisions for Serviceability:
 - a. Diagnostic LEDs for power, communication, and processor.
 - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
- 5. Memory: In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
- 6. Power and Noise Immunity:
 - a. Maintain operation at 90 to 110 percent of nominal voltage rating.
 - b. Perform orderly shutdown below 80 percent of nominal voltage.
 - c. Upon restoration of normal power, the controller shall automatically resume full operation without manual intervention.
 - d. Operation shall be protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.
- 7. Surge and Transient Protection:
 - a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
 - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.

D. Custom Application Controllers

- 1. General:
 - a. Input Power Requirements: 24Vac.
 - b. Provide sufficient memory to support controller's operating system, database, and programming requirements.
 - c. Share data between networked, microprocessor based controllers.
 - d. Controller operating system manages input and output communication signals allowing distributed controllers to share real and virtual object information and allowing for central monitoring and alarms.
 - e. Utilize real-time clock for scheduling.
 - f. Continuously check processor status and memory circuits for abnormal operation.
 - g. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
 - h. Communication with other network devices to be based on assigned protocol.
 - i. Monitor the status of all overrides, and include this information in logs and summaries to inform the operator that automatic control has been inhibited.
- 2. Communication:
 - a. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
- 3. Anticipated Environmental Ambient Conditions:
 - a. Outdoors and/or in Wet Ambient Conditions:
 - 1) Mount within NEMA 4X waterproof enclosures.
 - 2) Rated for operation at 40 to 150 degrees F and 95 percent RH, non-condensing.
 - b. Conditioned Space:
 - 1) Mount within NEMA 1 dustproof enclosures.
 - 2) Rated for operation at 32 to 120 degrees F.
- 4. Provisions for Serviceability:
 - a. Diagnostic LEDs for power, communication, and processor.
 - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
- 5. Memory: In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
- 6. Power and Noise Immunity:
 - a. Maintain operation at 90 to 110 percent of nominal voltage rating.

- b. Perform orderly shutdown below 80 percent of nominal voltage.
 - c. Upon restoration of normal power, the Digital Panel shall automatically resume full operation without manual intervention.
 - d. Operation protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.
7. Surge and Transient Protection:
- a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
 - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.
- E. Application Specific Controllers
- 1. General:
 - a. Input Power Requirements: 24Vac.
 - b. Not fully user programmable, microprocessor based controllers dedicated to control specific equipment.
 - c. Customized for operation within the confines of equipment served.
 - d. Provide sufficient memory to support controller's operating system, database, and programming requirements.
 - e. Communication with other network devices to be based on assigned protocol.
 - 1) Each ASC shall be capable of stand-alone operation and shall continue to provide control functions without being connected to the network.
 - f. Monitor and assume predetermined failure mode and generate alarm notification upon detection of abnormal operation.
 - 2. Communication:
 - a. Provide service communication port for connection to a portable operator's terminal or hand held device with compatible protocol.
 - 3. Anticipated Environmental Ambient Conditions:
 - a. Outdoors and/or in Wet Ambient Conditions:
 - 1) Mount within NEMA 4X waterproof enclosures.
 - 2) Rated for operation at 40 to 150 degrees F.
 - b. Conditioned Space:
 - 1) Mount within NEMA 1 dustproof enclosures.
 - 2) Rated for operation at 32 to 120 degrees F and 95 percent RH, non-condensing.
 - 4. Provisions for Serviceability:
 - a. Diagnostic LEDs for power, communication, and processor.
 - b. Make all wiring connections to field removable, modular terminal strips, or to a termination card connected by a ribbon cable.
 - 5. Memory. In the event of a power loss, maintain all BIOS and programming information for a minimum of 72 hours.
 - 6. Power and Noise Immunity:
 - a. Maintain operation at 90 to 110 percent of nominal voltage rating.
 - b. Perform orderly shutdown below 80 percent of nominal voltage.
 - c. Upon restoration of normal power, the controller shall automatically resume full operation without manual intervention.
 - d. Operation shall be protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W. at 3 feet.
 - 7. Surge and Transient Protection:
 - a. Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard C62.41.2.
 - b. Isolation levels shall be sufficiently high as to allow all signal wiring to be run in the same conduit as high voltage wiring where acceptable by electrical code.
- F. Input/Output Interface

1. Hardwired inputs and outputs shall tie into the BAS through building, custom application, or application specific controllers.
2. All Input/Output Points:
 - a. Protect controller from damage resulting from any point short-circuiting or grounding and from voltage up to 24 volts of any duration.
 - b. Provide universal type for building and custom application controllers where input or output is software designated as either binary or analog type with appropriate properties.
 - c. Universal-type inputs or outputs configurable between binary and analog are acceptable.
3. Binary Inputs:
 - a. Allow monitoring of On/Off signals from remote devices.
 - b. Provide wetting current of 12 mA minimum, compatible with commonly available control devices and protected against the effects of contact bounce and noise.
 - c. Sense dry contact closure with power provided only by the controller.
4. Pulse Accumulation Input Objects: Conform to all requirements of binary input objects and accept up to 10 pulses per second.
5. Analog Inputs:
 - a. Allow for monitoring of low voltage 0 to 10 Vdc, 4 to 20 mA current, or resistance signals (thermistor, RTD).
 - b. Compatible with and field configurable to commonly available sensing devices.
6. Binary Outputs:
 - a. Used for On/Off operation or a pulsed low-voltage signal for pulse width modulation control.
 - b. Outputs provided with three position (On/Off/Auto) override switches.
 - c. Status lights for building and custom application controllers to be selectable for normally open or normally closed operation.
7. Analog Outputs:
 - a. Monitoring signal provides a 0 to 10 Vdc or a 4 to 20 mA output signal for end device control.
 - b. Provide status lights and two position (AUTO/MANUAL) switch for building and custom application controllers with manually adjustable potentiometer for manual override on building and custom application controllers.
 - c. Drift to not exceed 0.4 percent of range per year.
8. Tri State Outputs:
 - a. Coordinate two binary outputs to control three point, floating type, electronic actuators without feedback.
 - b. Limit the use of three point, floating devices to the following zone and terminal unit control applications:
 - 1) VAV terminal units.
 - 2) Duct mounted heating coils.
 - 3) Zone dampers.
 - 4) Radiant devices.
 - c. Control algorithms shall run the zone actuator to one end of its stroke once every 24 hours for verification of operator tracking.

2.4 ELECTRICAL CONTROL POWER AND LOW VOLTAGE WIRING

- A. Power Wiring: Copper wiring, plenum cable, and raceways shall be as specified in the applicable section of Division 26.
- B. Power and Communication Wiring Transient Protection:
 1. Comply with IEEE C62.41.2.
 2. Communications trunk wiring shall be protected with a transient surge protection device providing the minimal protection required.
 3. Communication circuitry, input/output circuitry, and communication unit shall provide protection against a 1000 volt, 3 amp transient signal, directly applied to the communication or input/output terminations.

- a. For systems not complying with this requirement, provide equivalent protection external to the automatic temperature control system controller. Protection shall be provided for the individual communications and input/output terminations for each automatic temperature control system controller.
 - b. Submittal documentation shall clearly define how this requirement will be met and how the external protection will not affect the performance of the controllers.
- C. Power Supplies:
- 1. Provide UL listed control transformers with Class 2 current limiting type or over-current protection in both primary and secondary circuits for Class 2 service as required by the NEC.
 - 2. Limit connected loads to 80 percent of rated capacity.
 - 3. Match DC power supply to current output and voltage requirements.
 - 4. Supplies shall be full wave rectifier type with output ripple of 5.0 mV maximum peak to peak.
 - 5. Regulation to be 1 percent combined line and load with 100 microsecond response time for 50 percent load changes.
 - 6. Provide over-voltage and over-current protection to withstand a 150 percent current overload for 3 seconds minimum without trip-out or failure.
 - 7. Operational Ambient Conditions: 32 to 120 degrees F.
 - 8. EM/RF meets FCC Class B and VDE 0871 for Class B and MIL-STD 810 for shock and vibration.
 - 9. Line voltage units UL recognized and CSA approved.
- D. Power Line Filtering:
- 1. Provide external or internal transient voltage and surge suppression component for all workstations and controllers.
 - 2. Minimum surge protection attributes:
 - a. Dielectric strength of 1000 volts minimum.
 - b. Response time of 10 nanoseconds or less.
 - c. Transverse mode noise attenuation of 65 dB or greater.
 - d. Common mode noise attenuation of 150 dB or greater at 40 to 100 Hz.
- E. Input/Output Control Wiring
- 1. Control wiring shall be sized to accommodate the voltage drop associated with the distance between the control device and the controller. Minimum size shall be as specified herein.
 - 2. In all communication conduits, provide one spare twisted pair to be installed, tagged and labeled at each end.
 - 3. Control wiring not installed in conduit shall be UL rated for plenum installation.
 - 4. Ethernet control wiring shall be fiber optic or single pair of solid 24 gauge twisted, shielded copper cable.
 - 5. RTD wiring shall be three-wire or four-wire twisted, shielded, minimum number 22 gauge.
 - 6. Other analog inputs shall be a minimum of number 22 gauge, twisted, shielded.
 - 7. Binary control function wiring shall be a minimum of number 18 gauge.
 - 8. Analog output control functions shall be a minimum of number 22 gauge, twisted, shielded.
 - 9. Binary input wiring shall be a minimum of number 22 gauge, twisted, shielded.
 - 10. Thermistors shall be equipped with the manufacturer's calibrated lead wiring.
 - 11. 120V control wiring shall be #14 THHN in 3/4 inch conduit. Provide 20% fill extra wire in each conduit.
- F. Splices: Splices in shielded cables shall consist of terminations and the use of shielded cable couplers that maintain the integrity of the shielding.
- G. Conduit and Fittings
- 1. Conduit for Control Wiring, Control Cable and Transmission Cable: EMT with compression fittings, cold rolled steel, zinc coated or zinc-coated rigid steel with threaded connections.
 - 2. Outlet Boxes (Dry Location): Sheradized or galvanized drawn steel suited to each application, in general, four inches square or octagon with suitable raised cover.

3. Outlet Boxes (Exposed to Weather): Threaded hub cast aluminum or iron boxes with gasket device plate.
4. Pull and Junction Boxes: Size according to number, size, and position of entering raceway as required by National Electrical Codes. Enclosure type shall be suited to location.

H. Relays

1. Relays other than those associated with digital output cards shall be general purpose, enclosed plug-in type with 8-pin octal plug and protected by a heat and shock resistant duct cover. Number of contacts and operational function shall be as required.
2. Solid State Relays (SSR):
 - a. Input/output isolation: Greater than 10×10^9 ohms with a breakdown voltage of 1500V root mean square or greater at 60 Hz.
 - b. Contact Life: 10×10^6 operations or greater.
 - c. Ambient Temperature Range: Minus 20 to +140 degrees F.
 - d. Input impedance: Not be less than 500 ohms.
 - e. Relays shall be rated for the application. Operating and release time shall be for 100 milliseconds or less. Transient suppression shall be provided as an integral part of the relay.
3. Contactors:
 - a. Type: Single coil, electrically operated, mechanically held, double-break, silver-to-silver type protected by arcing contacts.
 - b. Positive locking shall be obtained without the use of hooks, latches, or semi permanent magnets.
 - c. The number of contacts and rating shall be selected for the application. Operating and release times shall be 100 milliseconds or less. Contactors shall be equipped with coil transient suppression devices.

2.5 SYSTEM SOFTWARE

A. General:

1. Provide all necessary system software to form a complete operating system for all operator interface devices.
2. System software shall integrate with all controller software and allow management of software applications at the operator workstation.
3. System software display language: English.

B. Device Profile: BACnet devices shall Conform to the following device profiles as specified in ASHRAE/ANSI 135 BACnet Annex L:

1. Operator workstation: BACnet Operator Workstation (B-OWS) or][BACnet Advanced Workstation (B-AWS).
2. Building Controller: BACnet Building Controller (B-C).
3. Advanced Application Controller: BACnet Advanced Application Controller (B-AAC).
4. Application Specific Controller: BACnet Application Specific Controller (B-ASC).

C. Software Programming:

1. Provide programming for the system and adhere to the sequences of operation provided. Provide actions for all possible situations. All other system programming necessary for the operation of the system shall be provided by the Contractor. Imbed into the control program sufficient comment statements to clearly describe each section of the program. The comment statements shall reflect the language used in the sequences of operation. Provide text-based, graphic-based, and parameter-based programming where appropriate.

D. Operating System:

1. Concurrent, multi-tasking capability.
2. Common Software Applications Supported:

- a. Microsoft Windows and Microsoft Office Suite.
 - b. Open platform compatible database: Microsoft Access, Oracle Database, IBM Analytics, or other SQL database software. Proprietary databases shall not be acceptable.
3. Acceptable Operating Systems: Most recent version of operating system.

E. System Graphics:

- 1. Color type, saved in an industry-standard format such as BMP, JPEG, PNG, or GIF.
- 2. Allow simultaneous display for comparison and monitoring of system status.
- 3. Web based graphics shall require no plug-in (such as HTML and JavaScript) or shall only require widely available no-cost plug-ins (such as Active-X, Java Virtual Machine, and Adobe Flash).
- 4. Animate displayed objects by shifting image files of objects based on object status.
- 5. Functionality: Provide method for operator with password to perform the following:
 - a. Move between, change size, and change location of graphic displays.
 - b. Modify on-line.
 - c. View a summary of the most important data for each controlled zone or piece of equipment.
 - d. View a summary of the most important global data for the project, including but not limited to date, day of week, time, outdoor dry bulb temperature, and humidity.
 - e. Use point-and-click navigation between graphic screens.
 - f. Edit setpoints and other specified parameters.
 - g. Indicate areas or equipment in an alarm condition using color or other visual indicator.
 - h. Add, delete, or change dynamic objects consisting of:
 - 1) Analog and binary values.
 - 2) Dynamic text.
 - 3) Static text.
 - 4) Animation files.
 - i. Display graphic file, text, and dynamic object data together on a single graphic. Display all measured and commanded data, setpoints, calculated values, and input and output control points with appropriate engineering units associated with each system schematic.
 - j. Dynamic Data Displays: Dynamic temperature values, humidity values, flow values, and status indication shall be shown in their actual respective locations, and shall automatically update to represent current conditions without operator intervention.
 - k. Dynamic Data Displays shall be capable of including point data from multiple ASC's.
- 6. Include at least one graphic for each of the following:
 - a. Each piece of equipment.
 - b. Occupied zone.
 - c. Floor plan displays of the building. Indicate summary conditions for each floor.
 - d. Indicate thermal comfort on floor plan using dynamic colors to represent zone temperature relative to zone setpoint.
- 1. Graphic Tree Structure:
 - e. Structure graphic system tree to allow access to individual graphic screens from a macro to a micro level.
 - f. Allow each level of graphic direct access to the graphic screen above and below the graphic screen in the system tree.
 - g. Allow direct access to the main summary graphic screen/map from any individual graphic screen.
- 7. Sequence of Operation Graphics:
 - a. Display the complete Sequence of Operation or include a link to a separate text file that contains the sequence of operation, as submitted by the Contractor and approved by the Engineer with each system schematic view. The Sequence of Operation text shall be in a separate frame above, below, or to the side of the graphic as appropriate for the graphic size and content.
- 8. Custom Graphics Generation Package:
 - a. Allow operator to create, delete, modify, and save custom graphic files and displays. File format of graphics shall be compatible with BAS software.
 - b. Web-based Graphics: HTML graphics to support web browser compatible formats.

- c. The BAS Contractor shall provide libraries of pre-engineered screens and symbols depicting standard components with which custom graphics may be built. Standard components include but are not limited to
 - 1) Air handling unit components (e.g., fans, cooling coils, filters, dampers, etc.).
 - 2) Complete mechanical systems (e.g., constant volume-terminal reheat, VAV, etc.).
 - 3) Electrical symbols.
 - d. The graphic development package shall use a mouse or similar pointing device in conjunction with a drawing program to allow the user to perform the following
 - 1) Define symbols.
 - 2) Position and size symbols.
 - 3) Define background screens.
 - 4) Define connecting lines and curves.
 - 5) Locate, orient and size descriptive text.
 - 6) Define and display colors for all elements.
 - 7) Establish correlation between symbols or text and associated system points or other displays.
 - 8) Capture or convert graphics from AutoCAD.
 - e. Graphical displays shall be capable of representing a group of objects. Groups shall be capable of representing any logical grouping of system points or calculated data based upon building function, mechanical system, building layout, or any other logical grouping of points which aids the operator in the analysis of the building.
2. Standard HVAC Graphics Library: Furnish a complete library of standard HVAC equipment graphics and standard symbols for ancillary equipment in a file format compatible with the graphics generation package program. Graphics shall include, but not be limited to, the following:
- a. HVAC Equipment:
 - 1) Air Handlers.
 - 2) Terminal HVAC Units.
 - 3) Fan Coil Units.
 - b. Ancillary Equipment:
 - 1) Fans.
 - 2) Dampers.
 - 3) Ductwork.

F. Workstation System Applications:

- 1. General Application Functions:
 - a. All applications shall be capable of being executed automatically without the need for operator intervention, and shall be flexible enough to allow user customization.
 - b. Allow BAS configuration and future changes or additions by operators with password protection.
 - c. Execute configured processes defined by the user to automatically perform calculations and control routines.
 - d. Process Inputs and Variables: It shall be possible to use any of the following in a configured process:
 - 1) Any system-measured point data or status
 - 2) Any calculated data
 - 3) Any results from other processes
 - 4) Boolean logic operators (and, or)
 - e. Process Triggers: Configured processes may be triggered based on any combination of the following:
 - 1) Time of day
 - 2) Calendar Date
 - 3) Other processes
 - 4) Events (e.g., point alarms)

- f. Data Access: A single process shall be able to incorporate measured or calculated data from any and all other ASC's. In addition, a single process shall be able to issue commands to points in any and all other ASC's on the local network.
2. Network Configuration:
 - a. Allow for configuration of the BAS network.
 - b. Provide alarm when a break in communication between devices is detected.
 - c. Enable the operator to add, delete, or modify the following:
 - 1) Building controllers and ASC's.
 - 2) Points of any type, point parameters, and tuning constants.
 - d. Provide automatic reconfiguration if any station is added or lost.
 3. Save and Restore:
 - a. Automatic System Database Save and Restore Functions:
 - 1) Store current database copy of each Building Controller on hard disk or server.
 - 2) Backup database on a user adjustable frequency basis. Default frequency shall be monthly.
 - 3) Automatically update upon change in any system panel.
 - 4) In the event of database loss in any system panel, the first workstation to detect the loss automatically restores the database for that panel unless disabled by the operator.
 - b. Manual System Database Save and Restore Functions by Operator with Password Clearance:
 - 1) Save database from any system panel.
 - 2) Clear a panel database.
 - 3) Initiate a download of a specified database to any system panel.
 4. On-line Help:
 - a. Include context-sensitive system to assist operator in operation and editing.
 - b. Include topics available for all applications.
 - c. Include relevant screen data provided for particular screen display.
 - d. Include additional help via hypertext.
 5. Security:
 - a. Require user name and password for Operator log-on to view, edit, add, or delete data.
 - b. Include selectable system security for each operator. Support a minimum of five levels of access:
 - 1) Level 1 = Read-only data access and display.
 - 2) Level 2 = Level 1 + scheduling.
 - 3) Level 3 = Level 2 + operator overrides and commands.
 - 4) Level 4 = Level 3 + database generation and modification.
 - 5) Level 5 = Level 4 + Audit trail management.
 - 6) Operators shall be able to perform only those commands available for their respective passwords. Menu selections displayed at any operator device shall be limited to only the items defined as accessible for the user.
 - 7) Support a minimum of 4 passwords at each Building Controller.
 - c. Allow system supervisor to set passwords and security levels for all other operators.
 - d. Allow operator passwords to restrict functions accessible to viewing and/or changing system applications, editor, and object.
 - e. Include automatic, operator log-off results from keyboard or mouse inactivity during user-adjustable, time period.
 - f. Store all system security data in encrypted format.
 - g. Log all user actions and store data for audit with permission access by system administrator only.
 - 1) Include the modified system.
 - 2) Include the value modified.
 - 3) Include the time of modification.
 6. System Diagnostics:
 - a. Operations Automatically Monitored:
 - 1) Workstations.
 - 2) Printers.
 - 3) Network connections.

- 4) Building management panels.
 - 5) Controllers.
 - b. Device failure is annunciated to the operator.
7. Alarm Management:
- a. Allow alarm prioritizing to minimize nuisance reporting and to speed operator response to critical alarms.
 - 1) Provide a minimum of three, user definable priority levels.
 - 2) Enable users to manually inhibit alarm reporting for each point.
 - 3) Enable users to manually inhibit nuisance alarm reporting for maintenance or repair work that is scheduled to be performed.
 - 4) Enable user to define conditions under which point changes need to be acknowledged by an operator, and/or logged for analysis at a later date.
 - 5) Allow alarm prioritization to lock out or circumvent other alarms that may be generated as a result of primary alarm.
 - b. Prohibit interference with the ability of the system software to report alarms by either operator activity at the local I/O device, or communications with other system controllers on the network.
 - c. Allow all system objects that are configurable to "alarm in" and "alarm out" of normal state.
 - d. Configurable Objects:
 - 1) Alarm limits.
 - 2) Alarm limit differentials.
 - 3) States.
 - 4) Reactions for each object.
 - 5) Alarm delay.
 - e. Alarm Messages:
 - 1) Descriptor: English language. Acronyms or mnemonics for objects in alarm are not acceptable.
 - 2) Recognizable Features:
 - a) Source.
 - b) Location.
 - c) Nature.
 - d) Time and Date.
 - e) Alarm message box to more fully describe the alarm condition or direct operator response.
 - f) Each Alarm messages shall be assignable to any point in the BAS. Alarm messages shall be assignable to multiple points.
 - a) Notification of an alarm override.
 - f. Configurable Alarm Reactions by Workstation and Time of Day:
 - 1) Logging.
 - 2) Printing.
 - 3) Starting programs.
 - 4) Displaying messages.
 - 5) Phone text message.
 - 6) Email.
 - 7) Providing audible annunciation.
 - 8) Displaying specific system graphics.
8. Custom Trend Logs:
- a. Maintain trend information for minimum 365 days.
 - b. Definable for any data object in the system including interval, start time, and stop time.
 - 1) Resolution: Interval periods shall be adjustable down to one minute.
 - 2) Multiple Interval Period: Each trended point shall have the ability to be trended at a different trend interval.
 - c. Trend Data:
 - 1) Sampled and stored on the building controller panel.

- 2) Auto-Delete Period: Software shall be capable of automatically deleting stored trend data after a user-adjustable period of time. Each trended point shall have the ability to have a different auto-delete interval period.
 - 3) Archivable on hard disk or server.
 - 4) Retrievable for use in reports, spreadsheets and standard database programs.
 - 5) Protected and encrypted format to prevent manipulation or editing of historical data and event logs.
- d. Trend Graph Display:
- 1) Group Trend Time Series Plots:
 - a) Provide user-selectable Y-axis points.
 - b) Provide user editable titles, point names, and Y-axis titles.
 - c) Individual trended points shall be able to be grouped into groups of up to four points per plot with up to four plots per page.
 - 2) X-Y Trend Plots:
 - a) User selectable X and Y trend inputs.
 - b) User editable titles, point names, and X and Y-axis titles.
 - c) User selectable time period options:
 - i) 1-day 24-hour period.
 - ii) 1-week 7-day period.
 - iii) 1-month period with appropriate days for the month selected.
 - iv) 1-year period.
 - v) User shall be able to select the beginning and ending period for each X-Y chart, within the time domain of the database being used.
 - vi) User selectable display up to 6 plots per screen in 2 columns.
 - 3) Automatic Scaling: System shall automatically scale the axis on which trends are displayed when multiple points with different trend interval periods are selected for graphical display.
 - 4) Dynamic Update: Trends shall be able to dynamically update at operator-defined intervals.
 - 5) Zoom: Software shall allow zoom-in function for detailed examination of trends.
- e. Numeric Value Display: Software shall display value of any sample on a trend when picked.
9. Alarm and Event Log:
- a. View all system alarms and change of states from any system location.
 - b. List events chronologically.
 - c. List alarm priority.
 - c. Allow operator with proper security to acknowledge and clear alarms. Log operator and time when alarm is acknowledged.
 - d. Archive alarms not cleared by operator to the workstation.
10. Object, Property Status, and Control:
- a. Provide a method to view, edit if applicable, the status of any object and property in the system.
 - b. Status Available by the Following Methods:
 - 1) Menu.
 - 2) Graphics.
 - 3) Custom Programs.
11. Clock Synchronization:
- a. The real-time clocks in all building control panels and workstations shall be able to automatically synchronize daily from any operator-designated device in the system.
 - b. The system shall automatically adjust for daylight savings and standard time, if applicable.
12. Reports and Logs:
- a. Reporting Package:
 - 1) Allow operator to select, modify, or create reports.
 - 2) Definable as to data content, format, interval, and date.
 - 3) Under no conditions shall the operator need to specify the address of hardware controller to obtain system information.

- 4) Provide ability to obtain real-time logs of all objects available by type or status such as alarm, lockout, normal, etc.
 - 5) Stored on hard disk and readily accessible by standard software applications, including spreadsheets and word processing.
 - 6) Allow printing on operator command or specific time(s).
 - b. Standard Report Format Options:
 - 1) Objects with current values.
 - 2) Global modification values.
 - 3) Current alarms not locked out.
 - 4) Disabled and overridden objects, points and variables.
 - 5) Objects in manual or automatic alarm lockout.
 - 6) Objects in alarm lockout currently in alarm.
 - 7) Objects currently in override status.
 - 8) Objects in Schedules
 - a) Daily.
 - b) Weekly.
 - c) Holiday.
 - 9) Logs:
 - a) Alarm History.
 - b) System messages.
 - c) System events.
 - d) Trends.
 - c. Custom Report Format Options:
 - 1) Daily.
 - 2) Weekly.
 - 3) Monthly.
 - 4) Annual.
 - 5) Time and date stamped.
 - 6) Title.
 - 7) Facility name.
 - 8) Point Groups.
 - a) User-selectable.
 - b) Group may be comprised of specific points, group of equipment objects, group of groups, or for the entire facility without restriction due to the hardware configuration of the BAS.
13. Global Modify:
- a. Allow global modification of all editable data. Similar data shall be grouped into logical objects based on building function, mechanical system, building layout, or any other logical grouping of points.
 - b. Allow each common type of equipment to be excluded or included within the global editing process.
 - c. Display status information on all similar points in one global report.
 - d. Allow modification of the following:
 - 1) Individual data point edited.
 - 2) List of all points within the category.
 - 3) Global change field.
 - 4) Copy feature to assist in downloading the new changes.
 - 5) Verification that all changes were completed.
 - e. Include a change-all feature to change all selections.
 - f. Prevent acceptance of changes until an accept icon is acknowledged.

G. Workstation Applications Editors:

1. Provide editing software for each system application at the PC workstation.
2. Edited applications shall be automatically downloaded and executed at the controller panel.
3. Programming Description: Definition of operator device characteristics, ASC's, individual points, applications and control sequences shall be performed through fill-in-the-blank templates.

4. System Definition/Control Sequence Documentation: All portions of system definition shall be self-documenting to provide hard copy printouts of all configuration and application data.
5. System definition and modification procedures shall not interfere with normal system operation and control.
6. Provide consistent text-based displays of all system point and system applications.
7. Point identification, engineering units, status indication, and application naming conventions shall be the same at all operator devices.
8. Full screen editor for each application shall allow operator to view and change:
 - a. Configuration.
 - b. Name.
 - c. Control parameters.
 - d. Set-points.
 - e. Schedules.
9. Scheduling:
 - d. Allow scheduling down to the zone or room level.
 - a. Monthly calendar indicates schedules, holidays, and exceptions.
 - b. Allows several related objects to be grouped, scheduled, and copied to other objects or dates.
 - c. Start and stop times adjustable from master schedule.
 - e. Schedule expiration.
 - d. Temporary overrides of systems with user adjustable time-out.
 - f. Provide minimum three tiers of priorities for scheduling.
 - 1) Priority 1: Event, temporary, or override.
 - 2) Priority 2: Calendar.
 - 3) Priority 3: Default.
 - g. Higher priority schedules shall overlay with lower priority schedules without interrupting or deleting them. Upon expiration of a higher priority schedule, schedule shall revert to next lower priority.
 - h. Expired priority 1 and priority 2 schedules shall be automatically deleted after execution.
10. Custom Application Programming:
 - a. Create, modify, debug, edit, compile, and download custom application programming during operation and without disruption of all other system applications.
 - b. Programming Features:
 - 1) English oriented programming language, allowing for free form programming.
 - 2) Alternative language graphically based using appropriate function blocks suitable for all required functions and amenable to customizing or compounding.
 - 3) Insert, add, modify, and delete custom programming code that incorporates word processing features such as cut/paste and find/replace.
 - 4) Allows the development of independently, executing, program modules designed to enable and disable other modules.
 - 5) Debugging/simulation capability that displays intermediate values and/or results including syntax/execution error messages.
 - 6) Support for conditional statements (IF/THEN/ELSE/ELSE-F) using compound Boolean (AND, OR, and NOT) and/or relations (EQUAL, LESS THAN, GREATER THAN, NOT EQUAL) comparisons.
 - 7) Support for floating-point arithmetic utilizing plus, minus, divide, times, square root operators; including absolute value; minimum/maximum value from a list of values for mathematical functions.
 - 8) Language consisting of resettable, predefined, variables representing time of day, day of the week, month of the year, date; and elapsed time in seconds, minutes, hours, and days where the variable values can be used in IF/THEN comparisons, calculations, programming statement logic, etc.
 - 9) Language having predefined variables representing status and results of the system software enables, disables, and changes the set points of the controller software.

2.6 CONTROLLER SOFTWARE

- A. All applications reside and operate in the system controllers and editing of all applications occurs at the operator workstation.
- B. System Security:
 - 1. User access secured via user passwords and user names.
 - 2. Passwords restrict user to the objects, applications, and system functions as assigned by the system manager.
 - 3. User Log On/Log Off attempts are recorded.
 - 4. Automatic Log Off occurs following the last keystroke after a user defined delay time.
- C. Object or Object Group Scheduling:
 - 1. Weekly Schedules Based on Separate, Daily Schedules:
 - a. Include start, stop, optimal stop, and night economizer.
 - b. 10 events maximum per schedule.
 - c. Start/stop times adjustable for each group object.
 - 2. Exception Schedules:
 - a. Based on any day of the year.
 - b. Defined up to one year in advance.
 - c. Automatically discarded and replaced with standard schedule for that day of the week upon execution.
 - 3. Holiday or Special Schedules:
 - a. Capability to define up to 99 schedules.
 - b. Repeated annually.
 - c. Length of each period is operator defined.
- D. System Coordination: Provide a standard application for equipment coordination. The application shall provide the operator with a method of grouping together equipment based on function and location. Groups shall be capable of being used for scheduling and other applications.
- E. Alarms:
 - 1. Binary object is set to alarm based on the operator specified state.
 - 2. Analog object to have high/low alarm limits.
 - 3. All alarming is capable of being automatically or manually disabled.
 - 4. Alarm Reporting:
 - a. Operator determines action to be taken for alarm event.
 - b. Alarms to be routed to appropriate workstation.
 - 5. Reporting Action Options:
 - a. Start Programs.
 - b. Print.
 - c. Logged.
 - d. Custom messaging.
 - e. Graphical displays.
 - f. Dial out to workstation receivers via system protocol.
- F. Maintenance Management: System monitors equipment status and generates maintenance messages based upon user-designated run-time limits.
- G. Sequencing: Application software based upon specified sequences of operation on the control drawings.
- H. PID Control Characteristics:
 - 1. Provide proportional-integral algorithms.
 - 2. Direct or reverse action.

3. Anti-windup.
 4. Calculated, time-varying, analog value, positions an output or stages a series of outputs.
 5. User selectable controlled variable, set-point, and PI gains.
- I. Staggered Start Application:
1. Prevents all controlled equipment from simultaneously restarting after power outage.
 2. Order of equipment startup is user selectable.
- J. Anti-Short Cycling:
1. All binary output objects protected from short-cycling.
 2. Allows minimum on-time and off-time to be selected.
 3. Allows the number of times each piece of equipment may be cycled within any one-hour period.
- K. On-Off Control with Differential:
1. Algorithm allows binary output to be cycled based on a controlled variable and set-point.
 2. Algorithm to be direct-acting or reverse-acting incorporating an adjustable differential.
- L. Trending: Building controllers shall allow collection and delivery of (time, value) pairs.
- M. Totalization:
1. Run-Time Totalization:
 - a. Totalize run-times for all binary input objects.
 - b. Provides operator with capability to assign high run-time alarm.
 - c. Generates unique, user-specified messages when the limit is reached.
 - d. Resolution: Adjustable down to one minute.
 2. Pulse Totalization:
 - a. Totalize consumption for user-selected analog and binary pulse input-type objects.
 - b. Configurable for a daily, weekly, or monthly basis.
 - c. Provide calculation and storage accumulations of up to 9,999,999 units (e.g. KWH, gallons, KBTU, tons, etc.).
 - d. Resolution: Adjustable down to one minute.
 - e. Warning Limit: User definable. Generate unique, user-specified messages when the limit is reached.
 - f. The information available from the Pulse Totalization shall include, but not be limited to, the following:
 - 1) Peak Demand, with date and time stamp
 - 2) 24-hour Demand Log
 - 3) Accumulated KWH for day
 - 4) Sunday through Saturday KWH usage
 - 5) Sunday through Saturday Demand kW
 - 6) Demand kW annual history for past 12 periods
 - 7) KWH annual history for past 12 periods
 3. Event Totalization:
 - a. Count user-selected events, such as the number of times a pump or fan system is cycled on and off.
 - b. Provide storage accumulations of up to 9,999,999 events before reset.
 - c. Warning Limit: User definable. Generate unique, user-specified messages when the limit is reached.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify existing conditions before starting work.

- B. Verify that systems are ready to receive work.
- C. Beginning of installation means installer accepts existing conditions.
- D. Verify that conditioned power supply is available to the control units and to the operator work station. Verify that field end devices and wiring are installed prior to installation proceeding.
- E. Verify the integrity of control wiring, raceways, control panels, sensors, and control devices prior to reusing for the new work.
- F. Verify wiring insulation is defect free and test wiring for continuity and ground faults.

3.2 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.
- B. Coordination:
 1. The BAS Contractor shall execute his work in such a manner as to cause the minimum interference to the operation of the building.
 2. Cooperate with other contractors performing work on this project as necessary to achieve a complete and coordinated installation. Each Contractor shall consult the Drawings and Specifications for all trades to determine the nature and extent of others work.
 3. Where the BAS shall share a common network backbone via a VLAN, provide temporary network access for BAS construction, startup, and commissioning. Coordinate transition of network operation to Owner's IT group.
 4. Coordinate with the Owner to display additional virtual points on individual schematic graphic screens that are not directly associated with that system. Examples may include outdoor air temperature or global alarm conditions.
- B. Web Services Enabled Network:
 5. Provide an IP network data drop for connection of BAS into Owner's IP network. Coordinate final location of IP network data drop with the Owners' IT staff.
 6. If the Owner has no preference or not indicated on the drawings, locate data drop within the main BAS control panel.
 7. Coordinate with the Owner's IT department to implement proper security measures, including secure access to the network data drop and firewalls at all virtual access points to the internet to protect access to the BAS.
- C. General Workmanship:
 1. Install equipment, piping, and wiring/raceway parallel to building lines wherever possible.
 2. Install all equipment in readily accessible locations.
 3. Verify integrity of all wiring to ensure continuity and freedom from shorts and grounds.
 4. All installations shall comply with industry specifications and standards for performance, reliability, and compatibility and be executed in strict adherence to local codes and standard practices.
 8. Control wiring routed in wall cavities shall be installed in conduit.
 9. Install control units and other hardware in position on permanent walls where not subject to excessive vibration.
 10. Install software in control units and in operator work station. Implement all features of programs to specified requirements and appropriate to sequence of operation.
- C. Controllers:
 1. Install controllers in a locked control panel. Provide common keying for all controller covers.
 2. Provide a separate controller for each piece of controlled equipment, such as an AHU, FCU, VAV box, etc. A controller may control more than one piece of equipment provided that all points

associated with the equipment are assigned to the same BAS controller. Global points used for control loop reset are exempt from this requirement.

3. Select building controllers and custom application controllers to provide the required I/O point capacity required to monitor all of the hardware points listed on the control drawings.
4. Application specific controllers may be used where factory programming is capable of executing all control functions specified in the sequences of operation. Contractor shall add supplemental controllers, devices, and programming as required to execute the specified control function if the ASC cannot.

D. Wiring:

1. All control and interlock wiring shall comply with national and local electrical codes.
5. Wire all safety devices through both hand and auto positions of motor starting device to ensure 100 percent safety shut-off.
2. Provide interlock wiring between devices as indicated on the control drawings.
3. Provide electrical wiring for relays (including power feed) for temperature and pressure indication.
4. All NEC Class 1 (line voltage) wiring shall be UL listed in approved raceway according to NEC and Division 26 requirements.
5. All low-voltage wiring shall meet NEC Class 2 requirements. Low-voltage power circuits shall be sub-fused when required to meet Class 2 current limit.
6. Conceal all low voltage wiring in finished rooms.
7. Conceal all low voltage wiring in unfinished rooms below the elevation of the lights. Low voltage wiring above the elevation of the lights may be exposed.
8. Routing of low voltage wiring above working heights in equipment rooms and above accessible ceilings is acceptable subject to following criteria:
 - a. Wiring shall be plenum rated.
 - b. Do not lay wiring on ceiling tiles.
6. Where NEC Class 2 (current-limited) wires are in concealed and accessible locations, including ceiling return air plenums, approved cables not in raceway may be used provided that cables are UL listed for the intended applications.
7. All wiring in mechanical, electrical, service rooms, or where subject to mechanical damage, shall be installed in raceway at levels below 10 feet.
8. Do not install Class 2 wiring in raceway containing Class 1 wiring. Boxes and panels containing high voltage wiring and equipment may not be used for low-voltage wiring except for the purpose of interfacing the two wires (e.g., relays and transformers).
9. Where Class 2 wiring is run exposed, wiring shall be run parallel along a surface or perpendicular to it and neatly tied at 10 foot intervals.
10. Where plenum cables are used without raceway, they shall be supported from or anchored to structural members. Cables shall not be supported by or anchored to ductwork, electrical raceways, piping, or ceiling suspension systems.
11. All wire-to-device and wire-to-wire connections shall be made at a terminal block or terminal strip.
12. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.
13. Maximum allowable voltage for control wiring shall be 120 V. If only higher voltages are available, coordinate with Division 26 to provide step-down transformers.
14. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
15. Install plenum wiring in sleeves where it passes through floors and walls. Maintain fire rating at all penetrations.
16. Size of raceway and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendations and NEC requirements, except as noted elsewhere.
17. Include one pull string in each raceway 1 inch and larger.
18. Use coded conductors throughout with conductors of different colors.
19. Control and status relays shall be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.

20. Conceal all raceways, except within mechanical, electrical, or service rooms. Install raceway to maintain a minimum clearance of 6 inches from high-temperature equipment (e.g., steam pipes or flues).
21. Secure raceways with raceway clamps fastened to the structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.
22. Install insulated bushing on all raceway ends and openings to enclosures. Seal top end of all vertical raceways.
23. Terminate all control and/or interlock wiring and maintain updated (as-built) wiring diagrams with terminations identified at the job site.
24. Terminate BAS sensor input wiring cable shield by taping back at the field device and connect shield to the grounded control panel chassis or sub-panel.
25. Terminate BAS comm bus cable shield between controllers per manufacturer recommendations.
26. Terminate management level/enterprise level network wiring cable shield by wrapping the drain wire around the foil shield and connecting the ground strip to the drain wire.
27. Flexible metal raceways and liquid-tight, flexible metal raceways shall not exceed 3 feet in length and shall be supported at each end. Flexible metal raceway less than 1/2 inch electrical trade size shall not be used. In areas exposed to moisture, including chiller and boiler rooms, liquid-tight, flexible metal raceways shall be used.
28. Raceway shall be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections shall be joined with couplings (according to code). Terminations shall be made with fittings at boxes, and ends not terminating in boxes shall have bushings installed.

E. Communication Wiring:

1. Adhere to the items listed in the "Wiring" article in Part 3 of this specification in addition to the requirements listed below.
2. All cabling shall be installed in a neat and workmanlike manner. Follow manufacturer's installation recommendations for all communication wiring.
3. Do not install communication wiring in raceway and enclosures containing Class 1 or other Class 2 wiring.
4. Do not install power wiring, in excess of 30 Vac RMS, in conduit with communications wiring. In cases where signal wiring is run in conduit with communication wiring, use separate twisted shielded pairs with the shields grounded in accordance with the manufacturer's wiring practice.
5. Communication conduits shall not be installed closer than six feet from high power transformers or run parallel within six feet of electrical high power cables. Care shall be taken to route the cable as far from interference generating devices as possible.
6. Do not exceed maximum pulling, tension, and bend radius for cable installation, as specified by the cable manufacturer during installation.
7. Verify the integrity of the entire network following the cable installation. Use appropriate test measures for each particular cable.
8. When a cable enters or exits a building, install a lightning arrestor between the lines and ground. Install the lightning arrestor according to the manufacturer's instructions.
9. Ground (earth ground) all shields at one point only, to eliminate ground loops.
10. All runs of communications wiring shall be unspliced length when that length is commercially available.
11. Terminate shielded cable splices in accessible locations. Harness cables with cable ties.
12. Make all wire-to-device and wire-to-wire connections at a terminal block or terminal strip.
13. Label all communications wiring to indicate origination and destination data.
14. Ground coaxial cable in accordance with NEC regulations.
15. Install BACnet MS/TP communications wiring in accordance with ASHRAE/ANSI Standard 135
 - a. The network shall use shielded, twisted-pair cable with characteristic impedance between 100 and 120 ohms. Distributed capacitance between conductors shall be less than 100 pF per meter (30 pF per foot.)

- b. The maximum length of an MS/TP segment shall be 4000 ft with AWG 22 or 24 cable. The use of greater distances and/or different wire gauges shall comply with the electrical specifications of EIA-485.
- c. The maximum number of nodes per segment shall be 50. Additional nodes may be accommodated by the use of repeaters.
- d. An MS/TP EIA-485 network shall have no T connections.

F. Identification of Hardware and Wiring:

- 1. Label all wiring and cabling, including that within factory-fabricated panels, at each end within 2 inch of termination with the BAS address or termination number.
- 2. Permanently label or code each point of field terminal strips to show the instrument or item served.
- 3. Identify control panels with minimum 1/2 inch letters on laminated plastic nameplates.
- 4. Identify all other control components with permanent labels. Label all plug-in components such that removal of the component does not remove the label.
- 5. Identify room sensors related to terminal box or valves with nameplates.
- 6. Maintain manufacturers' nameplates and UL or CSA labels visible and legible after equipment is installed.
- 7. Identifiers shall match record documents.

3.3 STARTUP AND DEMONSTRATION

- A. Start and commission systems. Allow sufficient time for start-up and commissioning prior to placing the BAS in permanent operation.
- B. Contractor shall provide an on-site controls technician or programmer familiar with the project BAS installation and system programming to assist the Commissioning Agent as directed during all phases of system functional testing.
- C. Coordinate with Owner the setup of logins, passwords, and security level access for individuals requiring access to the BAS.
- D. BAS shall be set up and checked by factory trained technicians skilled in the setting and adjustment of the BAS equipment used in this project. Technicians shall be experienced in the type of HVAC systems associated with this project.
- E. Verify that all control wiring is properly connected and free of all shorts and ground faults. Verify that terminations are tight.
- F. Test each control device to ensure that it is operating properly and is calibrated to the appropriate operating requirements. Run each control device through its range of operation and sequence. Verify all normal positions are correct. Adjust and tune PID control constants to achieve proper system operation.
 - 1. As each control input and output is checked, a log shall be completed showing the date, technician's initials, and any corrective action taken or needed.
 - 2. Demand limiting. The Contractor shall supply a trend data output showing the action of the demand limiting algorithm. The data shall document the action on a minute-by-minute basis over at least a 30-minute period. Included in the trend shall be building kW, demand limiting set point, and the status of sheddable equipment outputs.
 - 3. Optimum start/stop. The Contractor shall supply a trend data output showing the capability of the algorithm. The change-of-value or change-of-state trends shall include the output status of all optimally started and stopped equipment, as well as temperature sensor inputs of affected areas.
 - 4. Any tests that fail to demonstrate the operation of the BAS shall be repeated at a later date. The Contractor shall be responsible for any necessary repairs or revisions to the hardware or software to successfully complete all tests.
- G. Test and verify control interfaces to other building systems integrated into the network.

- H. Verify all alarms and interlocks.
 1. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
 2. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
 3. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.
 4. Verify fire/smoke and smoke damper functionality. Verify that they respond to the proper fire alarm system general, zone, and/or detector trips.

- I. Document on system equipment schedules the final setting of controller PID constant settings, setpoints, manual reset values, maximum and minimum controller output, and ratio and bias settings in units and terminology specific to the controller. Store documentation with operator workstation.

- J. Demonstrate complete and operating system to Owner.
 1. Prior to acceptance, the BAS shall undergo a series of performance tests to verify operation and compliance with this specification. These tests shall occur after the Contractor has completed the installation, started up the system, and performed his/her own tests.
 2. The tests described in this section are to be performed in addition to the tests that the Contractor performs as a necessary part of the installation, start-up, and debugging process.
 3. The Contractor shall demonstrate actual field operation of each control and sensing point for all modes of operation including day, night, occupied, unoccupied, fire/smoke alarm, seasonal changeover, and power failure modes. Any test equipment required to provide the proper operation shall be provided by and operated by the Contractor.
 4. Demonstrate compliance with sequences of operation through all modes of operation.
 5. Demonstrate complete operation of operator interface.

- K. Acceptance:
 1. All tests described in this specification shall have been performed to the satisfaction of the Owner prior to the acceptance of the BAS as meeting the requirements of completion. Any tests that cannot be performed due to circumstances beyond the control of the Contractor may be exempt from the completion requirements if stated as such in writing by the Contractor and submitted for approval by the Owner. Such tests shall then be performed as part of the warranty.
 2. The BAS shall not be accepted until all forms and checklists completed as part of the demonstration are submitted and approved.

3.4 MAINTENANCE SERVICE

- A. Provide service and maintenance of energy management and control systems for one year from Date of Substantial Completion.

3.5 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of eight hours on the operation and maintenance of the equipment provided under this section.
- B. Organize the training into sessions or modules for different levels of operators. Owner designated personnel shall be trained based on the level of operator training described below.
- C. Day-to-day Operator Training:
 1. Overview of the system and/or equipment as it relates to the facility as a whole.
 2. Proficiently operate the BAS.
 3. Understand BAS architecture and configuration.
 4. Understand BAS components.

5. Understand system operation, including BAS control and optimizing routines (algorithms).
6. Operate the workstation and peripherals.
7. Log on and off the system.
8. Access graphics, point reports, and logs.
9. Adjust and change system set points, time schedules, and holiday schedules.
10. Recognize malfunctions of the system by observation of the printed copy and graphical visual signals.
11. Understand BAS drawings and Operation and Maintenance manual.
12. Understand the job layout and location of control components.
13. Access data from BAS controllers and ASCs.
14. Operate portable operator's terminals.
15. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.

D. Advanced Operator Training:

1. Make and change graphics on the workstation.
2. Create, delete, and modify alarms, including annunciation and routing of these.
3. Create, delete, and modify point trend logs and graph or print these both on an ad-hoc basis and at user-definable time intervals.
4. Create, delete, and modify reports.
5. Add, remove, and modify system's physical points.
6. Create, modify, and delete programming.
7. Add panels when required.
8. Add operator interface stations.
9. Create, delete, and modify system displays, both graphical and others.
10. Perform BAS field checkout procedures.
11. Perform BAS controller unit operation and maintenance procedures.
12. Perform workstation and peripheral operation and maintenance procedures.
13. Perform BAS diagnostic procedures.
14. Configure hardware including PC boards, switches, communication, and I/O points.
15. Maintain, calibrate, troubleshoot, diagnose, and repair hardware.
16. Adjust, calibrate, and replace system components.

E. System Manager/Administrator Training:

1. Maintain software and prepare backups.
2. Interface with job-specific, third-party operator software.
3. Add new users and understand password security procedures.

F. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."

G. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.

H. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15532 (232300) - REFRIGERANT PIPING

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Piping.
- B. Refrigerant.
- C. Moisture and liquid indicators.
- D. Filter-driers.
- E. Solenoid valves.
- F. Expansion valves.

1.2 SUBMITTALS

- A. Product Data: Provide general assembly of valves and specialties, including manufacturer's catalog information. Provide manufacturer's catalog data including load capacity.
- B. Shop Drawings showing layout of refrigerant piping, specialties, and fittings including, but not necessarily limited to, pipe and tube sizes, valve arrangements and locations, slopes of horizontal runs, wall and floor penetrations, and equipment connection details. Show interface and spatial relationship between piping and proximate to equipment.
- C. Test reports specified in Part 3 below.
- D. Manufacturer's Installation Instructions: Indicate support requirements, connection requirements and isolation requirements for servicing.
- E. Brazer's Certificates signed by Contractor certifying that brazers comply with requirements specified under "Quality Assurance" below.
- F. Maintenance Data: Include maintenance instructions for refrigerant valves and piping specialties, for inclusion in Operation and Maintenance manual.

1.3 QUALITY ASSURANCE

- A. Comply with Division 23 Section, "Basic Piping Materials and Methods."
- B. Installer Qualifications: Company specializing in performing the type of work specified in this section, with minimum three years of documented experience.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store piping and specialties in shipping containers with labeling in place.
- B. Protect piping and specialties from entry of contaminating material by leaving end caps and plugs in place until installation.

- C. Dehydrate and charge components such as piping and receivers, seal prior to shipment, and maintain sealed until connected into system.

PART 2 - PRODUCTS AND MATERIALS

2.1 REGULATORY REQUIREMENTS

- A. Comply with ASME/ANSI B31.5: ASME Code for Pressure Piping - Refrigerant Piping.
- B. Comply with ANSI/ASHRAE Standard 15: Safety Code for Mechanical Refrigeration.
- C. Comply with applicable Mechanical Code.
- D. Products Requiring Electrical Connection: Listed and classified by UL, as suitable for the purpose indicated.

2.2 PIPING

- A. Copper Tubing:
 - 1. ASTM B280, Type ACR, seamless, hard-drawn straight lengths and soft-annealed coils. Tubing shall be factory cleaned, ready for installation, and have ends capped to protect cleanliness of pipe interiors prior to shipping.
 - 2. ASTM B88, Type L, seamless, hard-drawn straight lengths and soft-annealed coils.
 - 3. ASTM B88, Type K, seamless, hard-drawn straight lengths and soft-annealed coils.
- B. Refrigerant Line Kits:
 - 1. Type ACR seamless copper roll of refrigerant tubing with pipe diameters as recommended by the manufacturer and of length as required for the installation.
 - 2. Factory or field installed flexible unicellular insulation:
 - a. Minimum thickness as required per Division 23 section "HVAC Insulation".
 - 3. Quick-connect flare tubing compression fittings or solder connections as required to match the connections of the condensing unit and evaporator coil.

2.3 FITTINGS

- A. Wrought-Copper Fittings for Solder-joint: ANSI B16.22, streamlined pattern.
- B. Mechanical Flared Fittings: ASME B16.26, Cast Copper Alloy Fittings for Flared Copper Tube.
- C. Press Fit Fittings:
 - 1. Acceptable Manufacturers:
 - a. Rapid Locking System (Zoomlock)
 - 2. Fittings shall be approved with copper tubing conforming to ASTM B280, B88 or B743.
 - 3. Fittings shall be approved with hard (drawn) and soft (annealed) copper tubing Type ACR, L and K.
 - 4. Fittings shall be rated for continuous operating temperature from -40 F to 250 F and maximum operating pressure of 700 psi.
 - 5. Fittings shall be compatible with the oils and lubricants used in the refrigerant.

2.4 JOINING MATERIALS

- A. Refer to Division 23 Section "Basic Piping Materials and Methods" for joining materials.

2.5 PIPE SUPPORTS

- A. Hanger, supports, and anchors are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."
- B. Pipe attachments shall be copper-plated or have nonmetallic coating for electrolytic protection where attachments are in direct contact with copper tubing. Provide plastic galvanic isolators for copper tubing where indicated.

2.6 REFRIGERANT

- A. Refrigerant: R- 410A, as defined in ASHRAE Standard 34.

2.7 MOISTURE AND LIQUID INDICATORS

- A. Manufacturers
 1. Emerson Electric.
 2. Henry Technologies.
 3. Parker Hannifin/Refrigeration and air Conditioning.
 4. Sporlan, Division of Parker Hannifin.
- B. Moisture/liquid Indicators: Single port type, UL listed, with forged brass body, solder ends, sight glass, color coded paper moisture indicator with removable element cartridge and plastic cap; rated for maximum temperature of 200 degrees F and maximum working pressure of 500 psi.

2.8 FILTER DRIERS

- A. Manufacturers:
 1. Danfoss.
 2. Emerson Electric
 3. Parker Hannifin/Refrigeration and air Conditioning.
 4. Sporlan, Division of Parker Hannifin.
- B. Filter-driers: 500 psig maximum operation pressure; steel shell, flange ring, and spring, ductile iron cover plate with steel cap screws, and wrought copper fittings for solder end connections. Furnish complete with replaceable filter-drier core kit, including gaskets, as follows:
 1. Standard capacity desiccant sieves to provide micron filtration.
- C. Suction Line Filter-Drier: 350 psig maximum operation pressure, 225 deg. F maximum operating temperature; steel shell, and wrought copper fittings for solder end connections. Permanent filter element shall be molded felt core surrounded by a desiccant for removal of acids and moisture for refrigerant vapor.
- D. Suction Line Filters: 500 psig maximum operation pressure; steel shell, flange ring, and spring, ductile iron cover plate with steel cap screws, and wrought copper fittings for solder end connections. Furnish complete with replaceable filter core kit, including gaskets.

2.9 SOLENOID VALVES

- A. Manufacturers:
 1. Danfoss.
 2. Emerson Electric.
 3. Parker Hannifin/Refrigeration and air Conditioning.
 4. Sporlan, Division of Parker Hannifin.

- B. Valves: 250 deg. F temperature rating, 500 psig working pressure; forged brass body, with Teflon valve seat, two-way straight through pattern, and solder end connections. Provide manual operator to open valve.
- C. Furnish complete with NEMA 1 solenoid enclosure with 1/2 inch conduit adapter, and 24 volt, 60 Hz. normally closed holding coil.

2.10 EXPANSION VALVES

- A. Manufacturers:
 1. Danfoss.
 2. Emerson Electric.
 3. Parker Hannifin/Refrigeration and air Conditioning.
 4. Sporlan, Division of Parker Hannifin.
- B. Thermal Expansion Valves: thermostatic adjustable, modulating type; size as required for specific evaporator requirements, and factory set for proper evaporator superheat requirements. Valves shall have copper fittings for solder end connections; complete with sensing bulb, and an external equalizer line.
- C. Select valve for maximum load at design operating pressure and minimum 10 degrees F superheat. Select valve to avoid being undersized at full load and excessively oversized at part load.

PART 3 - EXECUTION

3.1 PIPE APPLICATION SCHEDULE

- A. Above Grade:
 1. Type L or Type ACR tubing.
- B. If other than Type ACR tubing is used, clean and protect inside of tubing as specified in Article "CLEANING" below.
- C. At contractor's option, use refrigerant line kits for refrigerant systems of 5 tons and smaller capacity.

3.2 INSTALLATION, GENERAL

- A. Install products in accordance with manufacturer's instructions.
- B. Install piping to ASME B31.9 requirements.
- C. Reference Division 23 Section "Basic Piping Materials and Methods" for general piping installation requirements.
- D. Do not install PVC or non-plenum rated HDPE piping in return air plenums.

3.3 PIPING INSTALLATIONS

- A. General: Install refrigerant piping in accordance with ASHRAE Standard 15 - "The Safety Code for Mechanical Refrigeration" and the equipment manufacturer's installation requirements.
- B. Install piping in as short and direct arrangement as possible to minimize pressure drop.
- C. Install piping for minimum number of joints using as few elbows and other fittings as possible.

- D. Arrange piping to allow normal inspection and servicing of compressor and other equipment. Install valves and specialties in accessible locations to allow for servicing and inspection.
- E. Provide adequate clearance between pipe and adjacent walls and hanger, or between pipes for insulation installation. Use sleeves through floors, walls, or ceilings, sized to permit installation of full thickness insulation.
- F. Insulate piping per Division 23 Section “HVAC Insulation.”
 - 1. Do not install insulation until system testing has been completed and all leaks have been eliminated.
- G. Install branch tie-in lines to parallel compressors equal length, and pipe identically and symmetrically.
- H. Install copper tubing in rigid or flexible conduit in locations where copper tubing will be exposed to mechanical injury.
- I. Slope refrigerant piping as follows:
 - 1. Install horizontal hot gas discharge piping with 1/2 inch per 10 feet downward slope away from the compressor.
 - 2. Install horizontal suction lines with 1/2 inch per 10 feet downward slope to the compressor, with no long traps or dead ends which may cause oil to separate from the suction gas and return to the compressor in damaging slugs.
 - 3. Install traps and double risers where indicated, and where required to entrain oil in vertical runs.
 - 4. Liquid lines may be installed level.
- J. Make reductions in pipe sizes using eccentric reducer fittings installed with the level side down.
- K. Install unions to allow removal of solenoid valves, pressure regulating valves, expansion valves, and at connections to compressors and evaporators.

3.4 HANGERS AND SUPPORTS

- A. Comply with the requirements of Division 23 Section “Hangers and Supports for HVAC Piping and Equipment.”
- B. Install the following pipe attachments:
 - 1. Adjustable band hangers for individual horizontal runs of piping 2 inch and smaller.
 - 2. Adjustable steel clevis hangers for individual horizontal runs of piping larger than 2”.
 - 3. Spring hangers to support vertical runs.
 - 4. Provide insulation saddles and protection shields as specified in Section “Hangers & Supports for HVAC Piping & Equipment”. Provide insulation inserts as specified in Section “HVAC Insulation”.

- C. Install hangers with the following minimum rod sizes and maximum spacing:

<u>NOM. PIPE SIZE</u>	<u>MAX. SPAN-FT</u>	<u>MIN. ROD SIZE – INCHES</u>
Up to 3/4	5	3/8
1	6	3/8
1-1/4	7	3/8
1-1/2	8	3/8
2	8	3/8
2-1/2	9	1/2
3	10	1/2
4	12	1/2
6	14	5/8

- D. Support vertical runs at each floor. Support riser piping independently of connected horizontal piping.

- E. Install a support within one foot of each change of direction.
- F. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.

3.5 PIPE JOINT CONSTRUCTION

- A. Reference Division 23 Section, “Basic Piping Materials and Methods” for basic pipe joint construction.
- B. Press-Fit Joints: Installers of the press-fit joints shall be trained using manufacturers training tools prior to installing any press-fit joints.
 - 1. Prepare the copper tube in accordance with manufacturers instructions.
 - 2. Install fittings to minimum depth required by the fitting manufacturer.
 - 3. Crimp the fitting only using the crimping tools allowed by the manufacturer using the jaw size appropriate for the tube diameter.
 - 4. Verify the joint is properly installed using crimp gauges or manufacturer’s approved verification methods.

3.6 VALVE AND PIPING SPECIALTIES INSTALLATIONS

- A. General: Install refrigerant valves where indicated, and in accordance with manufacturer's instructions.
- B. Install solenoid valves ahead of each expansion valve . Install solenoid valves in horizontal lines with coil at the top.
 - 1. Electrical wiring for solenoid valves is specified in Division 26. Coordinate electrical requirements and connections.
- C. Thermostatic expansion valves may be mounted in any position, as close as possible to the evaporator.
 - 1. Where refrigerant distributors are used, mount the distributor directly on the expansion valve outlet.
 - 2. Install the valve in such a location so that the diaphragm case is warmer than the bulb.
 - 3. Secure the bulb to a clean, straight, horizontal section of the suction line using two bulb straps. Do not mount bulb in a trap or at the bottom of the line.
 - 4. Where external equalizer lines are required make the connection where it will clearly reflect the pressure existing in the suction line at the bulb location.
- D. Install flexible connectors at the inlet and discharge connection of compressors.

3.7 EQUIPMENT CONNECTIONS

- A. The Drawings indicate the general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow servicing and maintenance.

3.8 FIELD QUALITY CONTROL

- A. Inspect, test, and perform corrective action of refrigerant piping in accordance with ASME Code B31.5, Chapter VI. Provide test report summarizing the test procedures and results of the tests.
- B. Repair leaking joints using new materials, and retest for leaks.
- C. Field Test: Every refrigerant-containing part of every system that is erected on the premises, except safety devices, pressure gauges, control mechanisms, compressors, evaporators, and systems that are factory-tested, shall be tested and proved tight after complete installation and before operation. The high side and low side of each system shall be tested and proved tight at not less than the lower of the design pressure or the setting of the pressure-relief device protecting the high side and low side of the system, respectively.

- D. Testing Procedure: Tests shall be performed with dry nitrogen. The means used to build up the test pressure shall have either a pressure-limiting device or a pressure-reducing device and a gage on the outlet side. The pressure-relief device shall be set above the test pressure but low enough to prevent permanent deformation of the system's components.

3.9 CLEANING

- A. Before installation of copper tubing other than Type ACR tubing, clean the tubing and fitting using following cleaning procedure:
 1. Remove coarse particles of dirt and dust by drawing a clean, lintless cloth through the tubing by means of a wire or an electrician's tape.
 2. Draw a clean, lintless cloth saturated with trichloroethylene through the tube or pipe. Continue this procedure until cloth is not discolored by dirt.
 3. Draw a clean, lintless cloth, saturated with compressor oil, squeezed dry, through the tube or pipe to remove remaining lint. Inspect tube or pipe visually for remaining dirt and lint.
 4. Finally, draw a clean, dry, lintless cloth through the tube or pipe.

3.10 ADJUSTING AND CLEANING

- A. Verify actual evaporator applications and operating conditions, and adjust thermostatic expansion valve to obtain proper evaporator superheat requirements.
- B. Clean and inspect refrigerant piping systems in accordance with requirements of Division 23 Basic Mechanical Materials and Methods section "Pipes and Pipe Fittings".
- C. Adjust controls and safeties. Replace damaged or malfunctioning controls and equipment with new materials and products.

3.11 STARTUP

- A. Charge system using the following procedure:
 1. Install core in filter dryer after leak test but before evacuation.
 2. Evacuate refrigerant system with vacuum pump; until temperature of 35 deg F is indicated on vacuum dehydration indicator.
 3. During evacuation, apply heat to pockets, elbows, and low spots in piping.
 4. Maintain vacuum on system for minimum of 5 hours after closing valve between vacuum pump and system.
 5. Break vacuum with refrigerant gas, allow pressure to build up to 2 psi.
 6. Complete charging of system, using new filter dryer core in charging line. Provide full operating charge.
- B. Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance of refrigerant piping valves and refrigerant piping specialties.
- C. Review data in Operating and Maintenance Manuals. Refer to Division 01 section "Closeout Procedures."
- D. Schedule training with Owner through the Architect, with at least 7 days advance notice.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15891 (233113) - METAL DUCTS

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. This Section includes:
1. Rectangular, round, and flat-oval metal ducts and plenums for heating, ventilating, and air conditioning systems in pressure classes from minus 2 inches to plus 10 inches water gauge.
 2. Duct liner.
 3. Wire rope hanging system.
- B. Related Sections:
1. Division 7 Section "Penetrations Firestopping," for materials and methods for fire barrier penetrations.
 2. Division 7 Section "Joint Sealers," for materials and methods for sealing duct penetrations through basement and foundation walls.
 3. Division 23 Section "Identification for HVAC Piping & Equipment," for labeling and identification of metal ducts.
 4. Division 23 Section "Common Work Results for HVAC," for materials and methods for wall penetrations and equipment pads.
 5. Division 23 Section "Seismic Controls for Mechanical Systems," for seismic controls.
 6. Division 23 Section "Particulate Air Filtration" for filter requirements.

1.2 DEFINITIONS

- A. Sealing Requirements Definitions: For the purposes of duct systems sealing requirements specified in this Section, the following definitions apply:
1. Seams: A seam is defined as joining of two longitudinally (in the direction of airflow) oriented edges of duct surface material occurring between two joints. All other duct surface connections made on the perimeter are deemed to be joints.
 2. Joints: Joints include girth joints; branch and subbranch intersections; so-called duct collar tap-ins; fitting subsections; louver and air terminal connections to ducts; access door and access panel frames and jambs; duct, plenum, and casing abutments to building structures.

1.3 SYSTEM PERFORMANCE REQUIREMENTS

- A. The duct system design, as indicated, has been used to select and size air moving and distribution equipment and other components of the air system. Changes or alterations to the layout or configuration of the duct system must be specifically approved in writing. Accompany requests for layout modifications with calculations showing that the proposed layout will provide the original design results without increasing the system total pressure.

1.4 SUBMITTALS

- A. Product data including details of construction relative to materials, dimensions of individual components, profiles, and finishes for the following items:
1. Duct Liner.
 2. Sealing Materials.

3. Fire-Stopping Materials.
 4. Duct Cleaning Products.
- B. Shop drawings from duct fabrication shop, drawn to a scale not smaller than 1/4 inch equals 1 foot, on drawing sheets same size as the Contract Drawings, detailing:
1. Fabrication, assembly, and installation details, including plans, elevations, sections, details of components, and attachments to other work.
 2. Duct layout, indicating pressure classifications, duct gauge and sizes in plan view. For exhaust ducts systems, indicate the classification of the materials handled as defined in this Section.
 3. Fittings.
 4. Reinforcing details and spacing.
 5. Seam and joint construction details.
 6. Penetrations through fire-rated and other partitions.
 7. Terminal heating and cooling unit, coil, humidifier and duct silencer installations.
 8. Locations of fire and fire/smoke dampers and associated duct access doors.
 9. Locations of cleanout and access doors in grease exhaust ducts.
 10. Location of manual balancing dampers.
 11. Duct smoke detector locations. Refer to electrical drawings for general locations and coordinate locations with the electrical contractor.
 12. Hangers and supports, including methods for building attachment, vibration isolation, and duct attachment.
- C. Coordination drawings for ductwork installation in accordance with Division 23 Section "General Mechanical Requirements." In addition to the requirements specified in "General Mechanical Requirements" show the following:
1. Coordination with ceiling suspension members.
 2. Spatial coordination with other systems installed in the same space with the duct systems.
 3. Coordination of ceiling- and wall-mounted access doors and panels required to provide access to dampers and other operating devices.
 4. Coordination with ceiling-mounted lighting fixtures and air outlets and inlets.
- D. Record drawings including duct systems routing, fittings details, reinforcing, support, and installed accessories and devices, in accordance with Division 23 Section "General Mechanical Requirements" and Division 1.
- E. Duct Cleaning Plan: Submit written work plan including the following information:
1. Scope of work identifying components that will be cleaned.
 2. Identify specific environmental engineering controls required for area of work.
 3. Detail the cleaning work means and methods.
- 1.5 QUALITY ASSURANCE
- A. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code - Steel" for hangers and supports and AWS D9.1 "Sheet Metal Welding Code."
- B. Qualify each welder in accordance with AWS qualification tests for welding processes involved. Certify that their qualification is current.
- C. NFPA Compliance: Comply with the following NFPA Standards:
1. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems," except as indicated otherwise.
 2. NFPA 90B, "Standard for the Installation of Warm Air Heating and Air Conditioning Systems."

3. NFPA 96, "Standard for the Installation of Equipment for the Removal of Smoke and Grease-Laden Vapors for Commercial Cooking Equipment," Chapter 3, "Duct System," for kitchen hood duct systems, except as indicated otherwise.
 - D. Sheet Metal and Air Conditioning Contractors' National Association, Inc. (SMACNA): Provide ductwork systems in conformance with "HVAC Duct Construction Standards – Metal and Flexible," latest edition.
 - E. Underwriter's Laboratories (UL): Comply with the UL standards listed within this section. Provide mastic and tapes that are listed and labeled in accordance with UL 181A and marked according to type.
 - F. National Air Duct Cleaners Association, Inc. (NADCA): Clean ductwork systems in accordance with the standard Assessment, Cleaning and Restoration of HVAC Systems (ACR 2002).
- 1.6 PROTECTION AND REPLACEMENT
- A. Protect ductwork during shipping and storage from dirt, debris and moisture damage. Provide plastic covers over ends of ductwork during shipping, storage and installation.
 - B. Replace duct liner that is damaged and cannot be repaired satisfactorily, including insulation with vapor barrier damage and insulation that has been exposed to moisture during shipping, storage, or installation. Drying the insulation is not acceptable. Dry surfaces prior to installing new duct liner.

PART 2 - PRODUCTS AND MATERIALS

2.1 SHEET METAL MATERIALS

- A. Sheet Metal, General: Provide sheet metal in thickness indicated (minimum 26 gauge), packaged and marked as specified in ASTM A 700.
- B. Galvanized Sheet Steel: Lock-forming quality, ASTM A 653, Coating Designation G 90. Provide mill phosphatized or galvanealed finish for surfaces of ducts exposed to view that is to be field painted. Provide bright galvanized finish for ductwork that is exposed to view and not field painted.
- C. Reinforcement Shapes and Plates: Unless otherwise indicated, provide galvanized steel reinforcing where installed on galvanized sheet metal ducts.
- D. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for 36-inch length or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.2 DUCT LINER

- A. General:
 1. Comply with NFPA Standard 90A and North American Insulation Manufacturers Association (NAIMA) Standard AHC-101.
 2. Liner shall have a flame spread rating of not more than 25 without evidence of continued progressive combustion and a smoke developed rating of no higher than 50, when tested in accordance with ASTM E84 or UL 723.
 3. Duct sizes on mechanical plans indicate clear inside airflow dimensions. Sheet metal sizes for ductwork with duct liner shall be increased accordingly to account for liner thickness.

- B. Fiberglass: ASTM C 1071, Type I or II, glass fibers firmly bonded together with a thermosetting resin with surface exposed to airstream coated to prevent erosion of glass fibers. Liner surface shall serve as a barrier against infiltration of dust and dirt, shall meet ASTM C 1338 for fungi resistance and shall be cleanable using duct cleaning methods and equipment outlined by NAIMA Duct Cleaning Guide. Duct liner shall be rated for air velocity of 6,000 fpm.
1. Rectangular fiberglass duct liner shall be Certainteed ToughGard T, JohnsManville Linacoustic RC, Knauf Atmosphere, Owens Corning QuietR or approved equal.
 - a. Thickness and Density:
 - 1) 1 inch, 1-1/2 pounds.
 2. Round fiberglass duct liner shall be Certainteed ToughGard UltraRound, JohnsManville Spiracoustic Plus, Owens Corning QuietZone Spiral, or approved equal.
 - a. Thickness and Density:
 - 1) 1 inch, 4 pound.
 3. Thermal Performance: Meet minimum "K-Factor" equal to 0.28 (Btu-in/h-sq ft-F) or better, at a mean temperature of 75°F and rated in installed condition in accordance with ASTM C518 and/or ASTM C177.
 4. Noise Reduction Coefficient (NRC): Meet the following minimum NRC in accordance with ASTM C423 Type A Mounting:
 - a. 1 Inch Thick: NRC 0.65.
 5. Liner Adhesive: Comply with NFPA Standard 90A /UL 181 classified with flame spread/smoke development less than 25/50 and ASTM C 916. Adhesive shall be a minimum 50% solid content, water-based, non-oxidizing and have a service temperature of -20 to 200 F. Water-based adhesive shall be one of the following:
 - a. Armacell LLC Armaflex 520 BLV low VOC.
 - b. Design Polymerics DP 2502.
 - c. Duro Dyne WIT.
 - d. Foster 85-60.
 - e. Childers CP-127.
 - f. Johns Manville SuperSeal HV.
 - g. Hardcast 951.
 - h. United McGill Uni-Tack.
 6. Mechanical Fasteners: Galvanized steel, suitable for adhesive attachment, mechanical attachment, or welding attachment to duct.
 - a. Fastener Pin Length: As required for thickness of insulation, and without projecting more than 1/8 inch into the airstream.
 - b. Adhesive For Attachment of Mechanical Fasteners: Comply with the "Fire Hazard Classification" of duct liner system.

2.3 SEALING MATERIALS

- A. Joint and Seam Sealants, General:
1. The term sealant used here is not limited to materials of adhesive or mastic nature, but also includes tapes and combinations of open weave fabric strips and mastics.
 2. Duct tape shall not be used as a sealant on any ducts.
 3. Sealants used on metal duct systems shall comply with VOC limits under VOC table classifications as "other" per SCAQMD Rule #1168.
 4. Sealants shall be ASTM E84 or UL 723 listed with a flame spread index not more than 25 and a smoke-developed index not more than 50.
- B. Joint and Seam Tape: 2 inches wide, glass-fiber-reinforced fabric.
- C. Tape Sealing System: Woven-fiber tape impregnated with a gypsum mineral compound and a modified acrylic/silicone activator to react exothermically with the tape to form a hard, durable, airtight seal.

- D. Solvent-Based Joint and Seam Sealant: One-part, non-sag, solvent-release-curing, polymerized butyl sealant complying with FS TT-S-001657, Type I; formulated with a minimum of 70 percent solids.
 - 1. Manufacturers:
 - a. Childers CP-140.
 - b. Duro Dyne SGD.
 - c. Fosters 32-14.
 - d. Approved equal.

- E. Water-Based Joint and Seam Sealant, Non-Fibrated: UL 181 listed. Sealant shall be rated to ± 15 inches w.g. Sealant shall have a service temperature of -25 to 200 F and be freeze/thaw stable through 5 cycles.
 - 1. Manufacturers:
 - a. Childers CP-146.
 - b. Design Polymerics DP 1010.
 - c. Ductmate Proseal/Fiberseal.
 - d. Duro Dyne Duroseal.
 - e. Fosters 32-19
 - f. United Duct Sealer (Water Based).
 - g. Hardcast 601.

- F. Flanged Joint Mastics: One-part, acid-curing, silicone elastomeric joint sealants, complying with ASTM C 920, Type S, Grade NS, Class 25, Use O.

- G. Flanged Gasket Tapes: Butyl gasket shall be UL 181 classified. Gasket size shall be minimum $5/8$ inch x $3/16$ inch and have nominal 100 percent solid content. It shall be non-oxidizing, non-skinning and have a service temperature of -25 to 180 F.
 - 1. Manufacturers:
 - a. Design Polymerics DP 1040.
 - b. Ductmate 440.
 - c. Hardcast 1104.

2.4 FIRE-STOPPING

- A. Fire-Resistant Sealant: Two-part, foamed-in-place, fire-stopping silicone sealant formulated for use in a through-penetration fire-stop system for filling openings around duct penetrations through walls and floors, having fire-resistance ratings indicated as established by testing identical assemblies per ASTM E 814 by Underwriters Laboratory, Inc. or other testing and inspecting agency acceptable to authorities having jurisdiction.

- B. Fire-Resistant Sealant: One-part elastomeric sealant formulated for use in a through-penetration fire-stop system for filling openings around duct penetrations through walls and floors, having fire-resistance ratings indicated as established by testing identical assemblies per ASTM E 814 by Underwriters Laboratory, Inc. or other testing and inspecting agency acceptable to authorities having jurisdiction.

- C. Products: Subject to compliance with requirements, provide one of the following:
 - 1. "3M Fire Stop Foam"; 3M Corp.
 - 2. "SPECSEAL Pensil 200 Silicone Foam"; Specify Technology, Inc.
 - 3. 3M Fire Stop Sealant"; 3M Corp.
 - 4. "3M Fire Barrier Caulk CP-25"; Electrical Products Div./3M.
 - 5. "Fyre Putty"; Standard Oil Engineered Materials Co.
 - 6. "FS-ONE", Hilti, Inc.

2.5 HANGERS AND SUPPORTS

- A. Building Attachments: Concrete inserts, powder actuated fasteners, or structural steel fasteners appropriate for building materials. Do not use powder actuated concrete fasteners for lightweight aggregate concrete or for slabs less than 4 inches thick.
- B. Hangers: Galvanized sheet steel, or round, uncoated steel, threaded rod.
 - 1. Hangers Installed In Corrosive Atmospheres: Electro-galvanized, all-thread rod or hot-dipped-galvanized rods with threads painted after installation.
 - 2. Straps and Rod Sizes: Conform with SMACNA HVAC Duct Construction Standards, 2005 Edition, for sheet steel width and gauge and steel rod diameters.
- C. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- D. Trapeze and Riser Supports: Steel shapes conforming to ASTM A 36.
 - 1. Where galvanized steel ducts are installed, provide hot-dipped-galvanized steel shapes and plates.
- E. Pre-engineered roof or space lid duct supports:
 - 1. Manufacturers:
 - a. Cooper B-Line, Inc.
 - b. Elite Components.
 - c. ERICO/Caddy.
 - d. Ferguson/FNW.
 - e. Miro.
 - f. PHD Manufacturing.
 - g. PHP Systems/Design.
 - h. Roof Top Blox.
 - i. Unistrut, a brand of Atkore International Inc.
 - j. Zsi Foster.
 - 2. General: Pre-engineered devices with embedded duct support fixtures as specified.
 - 3. Pedestals: Steel pedestals with thermoplastic or rubber base with the following dimensions:
 - a. Up to 12 inch strut length support: 18 inch x 18 inch.
 - b. Up to 16 inch strut length support: 24 inch x 18 inch.
 - c. Up to 24 inch strut length support: 30 inch x 18 inch.
 - d. Thickness: Minimum 3/16 inch thick.
 - 4. Block Bases: Closed-cell polyethylene blocks with the following dimensions.
 - a. Length: Nominal 10 inch, 12 inch, 16 inch, or 24 inch
 - b. Width: Nominal 4 inches.
 - 5. Attachment/Support Fixtures: As recommended by manufacturer, with straps or crossbar over top of duct to prevent movement.
 - 6. Mounting Height: Provide minimum clearance of 6 inches under supported component to top of roofing.
- F. Wire Rope Hanging Systems:
 - 1. Manufacturers:
 - a. Anvil International.
 - b. Ductmate Industries, Inc; Clutcher Cable Hanging System.
 - c. Duro Dyne.
 - d. Gripple.
 - 2. General: Wire rope hanger system shall have a minimum 5 to 1 safety factor based upon the applied working load being supported.
 - 3. Source Limitations: Furnish associated fittings, accessories, and hardware produced by a single manufacturer.

4. Wire Rope: Zinc coated or galvanized steel, with wire thread type as required to support the applied working load being supported. Provide same size wire for all applications based on worst case loading.
5. Cable Lock: Cast zinc housing with steel spring with wedge grip, selected to meet the vertical load applied to the hanging system and wire thread. Do not exceed the working load limit.
6. Accessories: Hanger attachments and structural attachments shall be compatible with wire rope hanger system and shall be by the same manufacturer as the wire rope hanger system.
7. Seismic Applications: Wire rope hanger systems used for seismic supports shall be seismically tested according to ICC code guidelines EG284 with UL and SMACNA seismic approvals. Reference Division 23 Section "Seismic Controls for Mechanical Systems" for additional requirements.

2.6 RECTANGULAR DUCT FABRICATION

- A. General: Except as otherwise indicated, fabricate rectangular ducts with galvanized sheet steel, in accordance with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Tables 2-1 through 2-28, including their associated details. Conform to the requirements in the referenced standard for metal thickness, reinforcing types and intervals, tie rod applications, and joint types and intervals.
 1. Fabricate rectangular ductwork of minimum 26 gauge sheet metal.
 2. Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure classification.
 3. Provide materials that are free from visual imperfections such as pitting, seam marks, roller marks, stains, and discolorations.
- B. Crossbreaking or Cross Beading: Crossbreak or bead duct sides that are 19 inches and larger and are 20 gauge or less, with more than 10 sq. ft. of unbraced panel area, as indicated in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 2-9, unless they are lined or are externally insulated.
- C. Exterior Ductwork: Ductwork installed exterior to the building without weather-proof jacket or cladding shall be minimum #18 gauge with longitudinal and transverse joints welded or sealed airtight as specified under Paragraph "Seam and Joint Sealing".
- D. Field Painted Ductwork: Provide mill phosphatized finish on exposed surfaces of rectangular ductwork and duct fittings to be field painted.

2.7 RECTANGULAR DUCT FITTINGS

- A. Fabricate elbows, transitions, offsets, branch connections, and other duct construction in accordance with SMACNA "HVAC Metal Duct Construction Standard," 2005 Edition, Figures 4-1 through 4-8. Unless otherwise noted on drawings, provide prefabricated 45 degree, high efficiency, rectangular/round branch duct takeoff fittings with manual balancing damper, 3/8 inch square shaft, U-bolt, nylon bushings, locking quadrant, and 2 inch insulation build-out for branch duct connections and take-offs to individual diffusers, registers and grilles. 45 degree, high efficiency, rectangular/round branch duct takeoff fittings shall be Flexmaster STO with model BO3 damper or equal.
- B. Provide radius elbows, turns, and offsets with a minimum centerline radius of 1-1/2 times the duct width. Where space does not permit full radius elbows, provide short radius elbows with a minimum of two continuous splitter vanes. Vanes shall be the entire length of the bend. The use of square throat, radius heel elbows is prohibited. Remove and replace all installed elbows of this type with an approved elbow at no additional cost to the owner.
- C. Provide mitered elbows where space does not permit radius elbows, where shown on the drawings, or at the option of the contractor with the engineer's approval. The contractor shall obtain approval to substitute

mitered elbows in lieu of radius elbows prior to fitting fabrication. Mitered elbows less than 45 degrees shall not require turning vanes. Mitered elbows 45-degrees and greater shall have single thickness turning vanes of same material and gauge as ductwork, rigidly fastened with guide strips in ductwork. Vanes for mitered elbows shall be provided in all supply and exhaust ductwork and in return and outside air ductwork that has an air velocity exceeding 1000 fpm. Do not install vanes in grease ductwork. Refer to Section "Ductwork Accessories" for turning vane construction and mounting.

- D. Provide full radius elbows for ductwork installed in noise critical spaces. Refer to Section "Basic Mechanical Materials and Methods" for noise critical spaces. Where space does not permit the installation of radius elbows, provide mitered elbows with sound attenuating, acoustical turning vanes. Refer to Section "Ductwork Accessories" for acoustical turning vanes.

1.1 MODULAR DUCTWORK & FITTINGS

- A. Where indicated on drawings, modular pre-manufactured straight sections of ductwork can be provided instead of fabricated ductwork. Provide sections of modular ductwork with or without taps as required to meet the ductwork layout shown on the drawings.
- B. Ductwork and fittings shall meet construction requirements of Paragraphs "Rectangular Duct Fabrication" and "Rectangular Duct Fittings" of this section
- C. Ductwork shall be lined by the modular duct manufacturer or wrapped in the field as required to meet the insulation requirements specified for the project in this section or in Section "HVAC Insulation".
- D. Approved Manufacturer:
 - 1. U.S. Engineering
3433 Roanoke Rd
Kansas City, MO 64111

2.8 SHOP APPLICATION OF LINER IN RECTANGULAR DUCTS

- A. Adhere a single layer of indicated thickness of duct liner with 90 percent coverage of adhesive at liner contact surface area. Multiple layers of insulation to achieve indicated thickness is prohibited.
- B. Apply a coat of adhesive to liner facing in direction of airflow not receiving metal nosing.
- C. Butt transverse joints without gaps and coat joint with adhesive.
- D. Fold and compress liner in corners of rectangular ducts or cut and fit to assure butted edge overlapping.
- E. Longitudinal joints in rectangular ducts shall not occur except at corners of ducts, unless the size of the duct and standard liner product dimensions make longitudinal joints necessary.
 - 1. Apply an adhesive coating on longitudinal seams in ducts exceeding 2,500 FPM air velocity.
- F. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely around perimeter; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
- G. Secure transversely oriented liner edges facing the airstream with metal nosings that are either channel or "Z" profile or are integrally formed from the duct wall at the following locations:
 - 1. Fan discharge.

2. Intervals of lined duct preceding unlined duct.
 3. Upstream edges of transverse joints in ducts where duct velocity is greater than 2,500 FPM.
- H. Terminate liner with duct buildouts installed in ducts to attach dampers, turning vane assemblies, and other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to the duct wall with bolts, screws, rivets, or welds. Terminate liner at fire dampers at connection to fire damper sleeve through fire separation.

2.9 ROUND AND FLAT OVAL DUCT FABRICATION

- A. General: "Basic Round Diameter" as used in this article is the diameter of the size of round duct that has a circumference equal to the perimeter of a given sized of flat oval duct. Except where interrupted by fittings, provide round and flat oval ducts in lengths not less than 12 feet.
1. Fabricate round and flat oval ductwork of minimum 26 gauge sheet metal.
- B. Round Ducts: Fabricate round supply ducts using seam types identified in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 3-2, RL-1, RL-4, or RL-5 except where diameters exceed 72 inches. Seam Types RL-2 or RL-3 may be used for ducts smaller than 72 inches in diameter if spot-welded on 1-inch intervals. Fabricate ducts having diameters greater than 72 inches with longitudinal butt-welded seams. Comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Table 3-5 through 3-13 for galvanized steel gauges. For round duct with static pressure classification of 2 inches water gauge or lower, round supply ducts may be fabricated using snaplock seam types identified in SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 3-2, RL-6A, RL-6B, RL-7 or RL-8.
- C. Field Painted Ductwork: All round and flat oval ductwork and duct fittings to be field painted shall have galvanized metal primer applied in the shop after fabrication and prior to shipping.

2.10 ROUND AND FLAT OVAL SUPPLY AND EXHAUST FITTINGS FABRICATION

- A. 90-Degree Tees and Laterals and Conical Tees: Fabricate to conform to SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figures 3-5, 3-6 and 3-7 and with metal thickness specified for longitudinal seam straight duct.
- B. Diverging-Flow Fittings: Fabricate with a reduced entrance to branch taps with no excess material projecting from the body onto branch tap entrance.
- C. Elbows: Unless elbow construction type is indicated, provide elbows meeting the following requirements:
1. Fabricate in die-formed, gored, pleated, or mitered construction. Fabricate the bend radius of die-formed, gored, and pleated elbows 1.5 times the elbow diameter.
 - a. Elbows in Round Duct: Provide full radius elbows.
 - b. The use of square throat, radius heel elbows is prohibited. Remove and replace all installed elbows of this type with an approved elbow at no additional cost to the owner.
 - c. Provide full radius elbows for ductwork installed in noise critical spaces or where shown on the drawings. Refer to Section "Basic Mechanical Materials and Methods" for noise critical spaces.
 2. Mitered Elbows: Fabricate mitered elbows with welded construction in gauges specified below.
 - a. Mitered Elbows Radius and Number of Pieces: Unless otherwise indicated, construct elbow to comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Table 3-1.
 - b. Round Mitered Elbows: Solid welded and with metal thickness listed below for pressure classes from minus 2 inches to plus 2 inches:
 - 1) 3 to 26 inches: 24 gauge.
 - 2) 27 to 36 inches: 22 gauge.

- 3) 37 to 50 inches: 20 gauge.
- 4) 52 to 60 inches: 18 gauge.
- 5) 62 to 84 inches: 16 gauge.
- c. Round Mitered Elbows: Solid welded and with metal thickness listed below for pressure classes from 2 inches to 10 inches:
 - 1) 3 to 14 inches: 24 gauge.
 - 2) 15 to 26 inches: 22 gauge.
 - 3) 27 to 50 inches: 20 gauge.
 - 4) 52 to 60 inches: 18 gauge.
 - 5) 62 to 84 inches: 16 gauge.
- d. 90-Degree, 2-Piece, Mitered Elbows: Use only for supply systems, or exhaust systems for material handling classes A and B; and only where space restrictions do not permit the use of 1.5 bend radius elbows. Fabricate with a single-thickness turning vane.
- 3. Round Elbows - 8 Inches and Smaller: Die-formed elbows for 45- and 90-degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend angle configurations or 1/2-inch-diameter (e.g. 3-1/2- and 4-1/2-inch) elbows with gored construction.
- 4. Round Elbows - 9 Through 14 Inches: Gored or pleated elbows for 30, 45, 60, and 90 degrees, except where space restrictions require a mitered elbow. Fabricate nonstandard bend angle configurations or 1/2-inch-diameter (e.g. 9-1/2- and 10-1/2-inch) elbows with gored construction.
- 5. Round Elbows - Larger Than 14 Inches and All Flat Oval Elbows: Gored elbows, except where space restrictions require a mitered elbow.
- 6. Die-Formed Elbows for Sizes Through 8 Inches and All Pressures: 20 gauge with 2-piece welded construction.
- 7. Round Gored Elbows Gauges: Same as for non-elbow fittings specified above.
- 8. Pleated Elbows Sizes Through 14 Inches and Pressures Through 10 Inches: 26 gauge.

2.11 FACTORY-MANUFACTURED DUCTWORK

A. Manufacturers:

- 1. Hercules Industries.
- 2. Lewis & Lambert.
- 3. Lindab Safe.
- 4. Linx Industries, Inc.
- 5. Semco.
- 6. Approved equal.

B. General: At the Contractor's option, factory-manufactured ductwork can be provided instead of fabricated ductwork for round and oval ductwork. The round duct system shall consist of fittings that are factory fitted with a sealing gasket and spiral duct which, when installed according to the manufacturer's instructions, will seal the duct joints without the use of duct sealer.

C. Duct Construction

- 1. Unless otherwise noted, all duct and fittings shall be constructed from galvanized steel in accordance with SMACNA's Duct Construction Standards for +10" water gauge pressure with thickness as shown in the following tables:

Single Wall Round Duct:

Diameter (Inches)	Galvanized Spiral Duct	Galvanized Fittings
3-14	28	24
15-24	26	24
26-42	24	22
42-60	22	20

2. Duct shall be calibrated to manufacturer's published dimensional tolerance standard.
3. All duct 14" diameter and larger shall be corrugated for added strength and rigidity.
4. Spiral seam slippage shall be prevented by means of a flat seam and a mechanically formed indentation evenly spaced along the spiral seam.
5. Ducts shall be constructed using spiral lock seam sheet metal construction.
6. Ductwork to be installed in exposed locations shall have the surface prepared in the factory for field painting.

D. Fittings:

1. All fitting ends for round duct and transitions and divided flow fittings smaller than 50" diameter that convert oval duct to round duct shall come factory equipped with a double lipped, U-profile, EPDM rubber gasket. Gasket shall be manufactured to gauge and flexibility so as to insure that system will meet all of the performance criteria set forth in the manufacturer's literature. Gasket shall be classified by Underwriter's Laboratories to conform to ASTM E84-91a and NFPA 90A flame spread and smoke developed ratings of 25/50.
2. All fittings shall be calibrated to manufacturer's published dimensional tolerance standard and associated spiral duct.
3. All fitting ends from 5" to 60" diameter shall have rolled over edges for added strength and rigidity.
4. All elbows from 5" to 12" diameter shall be 2 piece die stamped and continuously stitch welded. All elbows 14" diameter and larger shall be standing seam gorelock construction and internally sealed.
5. The radius of all 90° and 45° elbows shall be 1.5 times the elbow diameter, unless otherwise noted on the contract documents to be 1.0. The radius of all 15°, 30° and 60° elbows shall be 1.0 times the elbow diameter.
6. All fittings that are of either spot welded or button punched construction shall be internally sealed. When contract documents require divided flow fittings, only full body fittings will be accepted. The use of duct taps is unacceptable except for retrofit installations.
7. All volume dampers shall be Lindab Safe type DRU, DSU or DTU or approved equal. Damper shall be fitting sized to slip into spiral duct. Damper shall have the following features:
 - a. Locking quadrant with blade position indicator.
 - b. 2" sheet metal insulation stand-off.
 - c. Integral shaft/blade assembly.
 - d. Shaft mounted, load bearing bushings.
 - e. Gasketed shaft penetrations to minimize leakage.

2.12 SNAP-LOCK DUCT SYSTEM

- A. General: At Contractor's option, snap-lock round ductwork can be provided instead of fabricated ductwork for round ductwork up to 14" in diameter in air systems with pressures between negative 1" and positive 2" w.c..
- B. Duct Construction:
 1. Material:
 - a. Galvanized steel conforming to ASTM A653 and A924 with G-60 galvanized coating conforming to ASTM A653 and ASTM A90.
 2. Duct shall be minimum 26 gauge. Duct shall be self-locking and incorporate a factory applied gasket in the longitudinal seam and the female end of the traverse joint to provide a system that meets SMACNA Seal Class A.
 3. Fittings: Minimum 26 gauge. All high-efficiency take-offs, conicals, and collars shall have a factory applied gasket along all rivets, co-latches, and flanges. Dampered fittings shall have low leakage hardware with closed-end bearings.
- C. Gaskets: Butyl and EPDM rubber that meets flame spread index of 25 and smoke spread index of 50 according to ASTM E84.

- D. Manufacturers:
 - 1. Ductmate GreenSeam.
 - 2. Approved equal.

PART 3 - EXECUTION

3.1 DUCT MATERIAL APPLICATION

- A. All ducts shall be galvanized steel.
 - 1. Exterior Ductwork: Ductwork installed exterior to the building shall be minimum #18 gauge with longitudinal and transverse joints welded or sealed airtight as specified under Paragraph "Seam and Joint Sealing".

3.2 DUCT LINER INSTALLATION

- A. Fiberglass Duct Liner:
 - 1. Attach fiberglass duct liner using fasteners that do not damage the liner when applied as recommended by the manufacturer, that do not cause leakage in the duct, and will indefinitely sustain a 50-pound tensile dead load test perpendicular to the duct wall.
- B. Application: Provide duct liner on the following interior air ducts and where specified on the drawings.
 - 1. Supply Ductwork:
 - a. Exposed rectangular ductwork.
 - b. Exposed round ductwork.
 - c. First 15 feet of ductwork downstream of equipment outlets.
 - 2. Return Ductwork:
 - a. Exposed rectangular ductwork except for return air from units serving drop boxes.
 - b. Exposed round ductwork.
 - c. First 15 feet of ductwork upstream of equipment outlets.

3.3 DUCT INSTALLATION, GENERAL

- A. Install products in accordance with manufacturer's instructions.
- B. Duct System Pressure Class: Construct and install each duct system except factory-manufactured ductwork for the specific duct pressure classification indicated. For factory-manufactured ductwork, refer to Paragraph "Factory-Manufactured Ductwork".
 - 1. Supply Air Ducts: 3 inches water gauge.
 - 2. Primary Supply Air Ducts (upstream of terminal boxes): 4 inches water gauge.
 - 3. Secondary Supply Air Ducts (downstream of terminal boxes): 2 inches water gauge
 - 4. Return and Outdoor Air Ducts: 2 inches water gauge, negative pressure.
 - 5. Exhaust Air Ducts: 2 inches water gauge, negative pressure.
- C. Install ducts with the fewest possible joints.
- D. Seal duct joints with the appropriate sealing material.
- E. Use fabricated fittings for all changes in directions, changes in size and shape, and connections.
- F. Install couplings tight to duct wall surface with projections into duct at connections kept to a minimum.

- G. Locate ducts, except as otherwise indicated, vertically and horizontally, parallel and perpendicular to building lines; avoid diagonal runs. Install duct systems in shortest route that does not obstruct useable space or block access for servicing building and its equipment.
- H. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- I. Cover ducts openings during construction with duct caps or three-mil plastic to protect inside of (installed and delivered) ductwork from exposure to dust, dirt, paint and moisture. Do not use duct tape on ducts that will be exposed or painted.
- J. Provide clearance of 1 inch where furring is shown for enclosure or concealment of ducts, plus allowance for insulation thickness, if any.
- K. Install insulated ducts with 1-inch clearance outside of insulation.
- L. Conceal ducts from view in finished and occupied spaces by locating in mechanical shafts, hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as specifically shown.
- M. Coordinate layout with suspended ceiling and lighting layouts and similar finished work.
- N. Exposed Ductwork: Exposed ductwork shall be free of defects, dents or blemished surfaces to provide a smooth, finished appearance. Any damaged material shall be replaced with new material. Ductwork that is to be field painted shall have surfaces wiped clean of lubricant, dirt, or fil prior to priming and painting. Apply primer and paint of type as recommended by paint manufacturer for duct material and finish.
- O. Electrical Equipment Spaces: Route ductwork to avoid passing through transformer vaults and electrical equipment spaces and enclosures.
- P. Non-Fire-Rated Partition Penetrations: Where ducts pass interior partitions and exterior walls, and are exposed to view, conceal space between construction opening and duct or duct insulation with sheet metal flanges of same gauge as duct. Overlap opening on 4 sides by at least 1-1/2 inches.
- Q. Acoustical Barrier Penetrations: Where a duct passes through a wall, ceiling or floor slab of a noise critical space, provide a clear annular space of 1-inch between the duct and the structure. Refer to Section "Common Work Results for HVAC" for noise critical spaces. The Contractor shall check the clearance and, if clearance is acceptable, shall install the duct and pack the voids full depth with mineral fiber batt insulation. Contractor shall caulk both ends with a non-aging, non-hardening sealant backed by a polyethylene foam rod or permanently flexible firestop material. Where there is insufficient clearance space, Contractor shall place a short stub duct in the wall, pack and caulk around it and then attach the inlet and outlet ducts to each end.

3.4 SEAM AND JOINT SEALING

- A. General: Seal duct seams and joints as follows:
 1. All transverse joints, longitudinal seams, and duct wall penetrations shall be sealed to meet SMACNA Seal Class A.
 2. Seal class shall apply to all supply, return, outdoor air, and exhaust ductwork, regardless if the duct is positively or negatively pressurized.
- B. Seal externally insulated ducts prior to insulation installation.

- C. Ductwork installed exterior to the building shall have longitudinal and transverse joints welded or sealed airtight with weatherproof heavy liquid sealant applied according to manufacturer's instructions.

3.5 HANGING AND SUPPORTING

- A. Install rigid round, rectangular, and flat oval metal duct with support systems indicated in Chapter 5 of the SMACNA "HVAC Duct Construction Standards", 2005 Edition.
- B. Installation of Wire Roper Hanger Systems:
 - 1. Install in accordance with manufacturer's instructions.
 - 2. Wire rope hanger spacing shall not exceed 8 feet. Supported load shall not exceed manufacturer's recommended load rating.
 - 3. Where approved by local code authority, the loop system may be swaged directly on to a seismic approved bracket or appropriate end fixing.
- C. Support horizontal ducts within 2 feet of each elbow and within 4 feet of each branch intersection.
- D. Support vertical ducts at a maximum interval of 16 feet and at each floor.
- E. Upper attachments to structures shall have an allowable load not exceeding 1/4 of the failure (proof test) load but are not limited to the specific methods indicated. Hangers and supports shall be fastened to building joists or beams. Do not attach hangers and supports to the above floor slab or roof with sheet metal screws.
- F. Install concrete insert prior to placing concrete.
- G. Install powder actuated concrete fasteners after concrete is placed and completely cured.
- H. Installation of Pre-Engineered Roof Duct or space lid Supports:
 - 1. Install pre-engineered roof duct supports to rest on the roofing membrane or space lid without attachment to the roof structure or penetration through the roofing assembly.
 - 2. Install pre-engineered roof duct supports anchored to the roof structure.
 - a. Install supports to meet the specified design criteria.
 - 1) Building Design Risk Category: [II][III or IV].
 - 2) Design Wind Speed: [XXX] mph.
 - b. Coordinate with the pre-engineered roof duct support manufacturer to anchor the duct supports directly to the roof structure in accordance with the manufacturer's installation instructions or provide intermediate duct supports engineered to meet the design criteria.
 - c. Submit design and installation requirements as a Deferred Submittal.
 - d. Pre-Engineered Duct Support Rails: Provide rigid backing material (e.g., insulation, wood, etc.) to maintain cant slope. Install supports to maintain continuous insulation on roof.
 - 3. Refer to Section "Seismic Controls for Mechanical" for seismic bracing requirements.

3.6 PENETRATIONS

- A. Fire Barrier Penetrations: Where ducts pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity.
- B. Exterior Wall Penetrations: Seal duct penetrations through exterior wall constructions with sleeves, packing, and sealant. Refer to Division 23 Section "Basic Piping Materials and Methods" for additional information.

- C. Elevated Floor Penetrations of Waterproof Membrane, Interior Penetrations of No-Fire Rated Walls and Concrete Slab on Grade Penetrations: Seal ducts that pass through waterproof floors, non-fire rated walls, partitions and ceilings or concrete slab on grade. Refer to Division 23 Section "Basic Piping Materials and Methods" for special sealers and materials.

3.7 CONNECTIONS

- A. Equipment Connections: Connect equipment with flexible connectors in accordance with Division 23 Section "Air Duct Accessories."
- B. Branch Connections: Comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figures 4-5 and 4-6.
- C. Outlet and Inlet Connections: Comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figures 7-6 and 7-7. Where a 90-degree elbow is required at the connection to air devices, provide a rigid duct elbow or, at Contractor's option, a flexible elbow assembly as specified in Division 23 Section "Air Duct Accessories."
- D. Fan Connections: Comply with SMACNA "HVAC Duct Construction Standards," 2005 Edition, Figure 7-8.

3.8 FIELD QUALITY CONTROL

- A. Remove temporary protection devices over ductwork prior to starting equipment and turning the system over to the owner.
- B. If permanent HVAC equipment is used during the construction period, provide temporary filters at all openings in the ductwork and at inside equipment to protect the system from dust, dirt, paint, and moisture. Replace and maintain filters when needed, but not less than every month. On the day of substantial completion, clean the duct system and provide a new set of filters in the HVAC unit.
 - 1. Refer to Division 23 Section 234100 Particulate Air Filtration for filter requirements.

3.9 ADJUSTING AND CLEANING

- A. Adjust volume control devices as required by the testing and balancing procedures to achieve required air flow. Refer to Division 23 Section "TESTING, ADJUSTING, AND BALANCING FOR HVAC" for requirements and procedures for adjusting and balancing air systems.
- B. Vacuum duct systems prior to final acceptance to remove dust and debris.

3.10 CLEANING NEW SYSTEMS

- A. Contractor shall clean the HVAC systems in accordance with NADCA.
- B. Mark position of dampers and air-directional mechanical devices before cleaning, and perform cleaning before air balancing.
- C. Use service openings, as required, for physical and mechanical entry and for inspection.
 - 1. Create other openings to comply with duct standards.
 - a. Do not degrade structural, thermal or functional system integrity of the duct.

- b. Provide access doors complying with UL 181 to cover new openings. Refer to Division 23 Section "Air Duct Accessories".
 - c. Seal openings with tape and sealant complying with UL 181A.
 - 2. Disconnect flexible ducts as needed for cleaning and inspection.
 - 3. Remove and reinstall ceiling sections to gain access during the cleaning process.
 - D. Vent vacuuming system to the outside. Provide filtration and/or containment systems to keep debris removed from HVAC systems from contaminating other spaces. Locate exhaust down wind and away from air intakes and other points of entry into building.
 - E. Clean the following metal duct systems by removing surface contaminants and deposits:
 - 1. Air outlets and inlets (registers, grilles, and diffusers).
 - 2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
 - 3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
 - 4. Coils and related components.
 - 5. Return air ducts, dampers, and actuators except in ceiling plenums and mechanical equipment rooms.
 - 6. Supply and outdoor air ducts, dampers, actuators, and turning vanes.
 - F. Mechanical Cleaning Methodology:
 - 1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
 - 2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
 - 3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
 - 4. Clean fibrous-glass duct liner with HEPA vacuuming equipment while the system is under negative pressure; do not permit duct liner to get wet.
 - 5. Clean coils and coil drain pans according to ACR 2002. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
 - G. Disposal: Debris collected from the HVAC system shall be disposed of in accordance with applicable federal, state and local requirements.
 - H. Cleanliness Verification:
 - 1. Visually inspect metal ducts for contaminants.
 - 2. Where contaminants are discovered, re-clean and re-inspect ducts.
- 3.11 CLEANING EXISTING SYSTEMS
- A. Contractor shall clean the HVAC systems in accordance with NADCA.
 - B. Use service openings, as required, for physical and mechanical entry and for inspection.
 - 1. Use existing service openings where possible.
 - 2. Create other openings to comply with duct standards.
 - a. Do not degrade structural, thermal or functional system integrity of the duct.
 - b. Provide access doors complying with UL 181 to cover new openings. Refer to Division 23 Section "Air Duct Accessories".
 - c. Seal openings with tape and sealant complying with UL 181A.
 - 3. Disconnect flexible ducts as needed for cleaning and inspection.

4. Reseal rigid fiberglass duct systems according to NAIMA recommended practices.
 5. Remove and reinstall ceiling sections to gain access during the cleaning process.
- C. Mark position of dampers and air-directional mechanical devices before cleaning, and restore to their marked position on completion.
- D. Particulate Collection and Odor Control:
1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron size (or larger) particles.
 2. When venting vacuuming system to the outside, use filtration to contain debris removed from HVAC system, and locate exhaust down wind and away from air intakes and other points of entry into building.
- E. Clean the following metal duct systems by removing surface contaminants and deposits:
1. Air outlets and inlets (registers, grilles, and diffusers).
 2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
 3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
 4. Coils and related components.
 5. Return-air ducts, dampers, and actuators except in ceiling plenums and mechanical equipment rooms.
 6. Supply and outdoor air ducts, dampers, actuators, and turning vanes.
 7. Dedicated exhaust and ventilation components and makeup air systems.
- F. Mechanical Cleaning Methodology:
1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
 2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
 3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
 4. Clean fibrous-glass duct liner with HEPA vacuuming equipment while the system is under negative pressure; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
 5. Clean coils and coil drain pans according to ACR 2002. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
 6. Provide operative drainage system for wash down procedures.
 7. Biocidal Agents and Coatings: Apply biocidal agents, Design Polymer DP 2545, Foster 40-20 or approved equal, if fungus is present. Apply biocidal agents according to manufacturer's written instructions after removal of surface deposits and debris.
- G. Disposal: Debris collected from the HVAC system shall be disposed of in accordance with applicable federal, state and local requirements.
- H. Cleanliness Verification:
1. Verify cleanliness after mechanical cleaning and before application of treatment, including biocidal agents and protective coatings.
 2. Visually inspect metal ducts for contaminants.
 3. Where contaminants are discovered, re-clean and re-inspect ducts.
- I. Gravimetric Analysis: At discretion and expense of Owner, sections of metal duct system, chosen randomly by Owner, may be tested for cleanliness according to NADCA vacuum test gravimetric analysis.

1. If analysis determines that levels of debris are equal to or lower than suitable levels, system shall have passed cleanliness verification.
 2. If analysis determines that levels of debris exceed suitable levels, system cleanliness verification will have failed and metal duct system shall be re-cleaned and re-verified.
- J. Verification of Coil Cleaning: Cleaning must restore coil pressure drop to within 10 percent of pressure drop measured when coil was first installed. If original pressure drop is not known, coil will be considered clean only if it is free of foreign matter and chemical residue, based on thorough visual inspection.

END OF SECTION

SECTION 15892 (233117) - FABRIC DUCTS

PART 1 - GENERAL REQUIREMENTS

1.1 DESCRIPTION OF WORK:

- A. Extent of fabric ductwork is indicated on drawings and by requirements of this section.
- B. Types of fabric ductwork required for project include the following:
 - 1. Fabric Air Dispersion Products.

1.2 QUALITY ASSURANCE

- A. Codes and Standards:
 - 1. Product must be classified by Underwriter's Laboratories in accordance with the 25/50 flame spread / smoke developed requirements of NFPA 90-A.
 - 2. Product must have an acceptable evaluation report from ICBO-ES.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's specifications on materials and manufactured products used for work of this section.
- B. Performance Data: Submit performance data for products specified in this section including airflow, static pressure, throw and sound data of diffusers.
- C. Color Samples: Submit color samples for selection of final color by Architect.
- D. Submit manufacturer's installation and maintenance instructions on materials and manufactured products for work of this section.

1.4 DELIVERY, STORAGE AND HANDLING:

- A. Protect fabric air dispersion systems from damage during shipping, storage and handling.
- B. Where possible, store products inside and protect from weather. Where necessary to store outside, store above grade and enclose with a vented waterproof wrapping.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURER:

- A. Subject to compliance with requirements, provide products manufactured in the United States, from one of the following:
 - 1. DuctSox
 - 2. FabricAir, Inc.

3. KE Fibertec
4. NanoSox
5. Q-Sox.

2.2 TEXTILE AIR DISPERSION SYSTEM:

- A. Air diffusers shall be constructed with both internal retention and external tensioning.
1. System shall consist of internal tensioning baskets with cable or track stops that externally tension the system off of the suspension system selected below along with 360 degree internal retention hoops that are spaced 5' on center between tensioning baskets.
 2. Tensioning baskets are designed to self-lock when tension is applied to the system.
 3. All straight sections utilize both internal retention hoops and external tensioning with the use of the tension baskets, all fittings (crosses, elbows, reducers, and tees) utilize internal retention hoops.
 4. Distance between consecutive tensioning baskets should not be more than 40'.
 5. System shall be installed with a one row suspension system located 1.5" above top-dead-center of the textile system.
 6. System attachment to cable or U-Track shall be made using Gliders spaced no further than 12 inches apart.
 7. One row suspension options (must specify if multiple on same project)
 - a. Cable suspension hardware to include cable, eye bolts, thimbles, cable clamps, and turnbuckle(s) as required.
 - 1) Galvanized steel cable suspension options
- B. TEXTILE
1. Textile Construction: Woven polyester with non-permeable coating, fire retardant in accordance with UL 2518.
 2. Weight: 5.5 oz./yd² per ASTM D3776
 3. Air Permeability: 0 CFM/ft² per ASTM D737, Frazier
 4. Warranty: 10 years
- C. TEXTILE SYSTEM FABRICATION REQUIREMENTS:
1. Textile system to be constructed in modular lengths (zippered) with proper radial securing clips (inlets, endcaps, and mid-sections) and top access zippers for tension lock attachments.
 2. Integrated air dispersion shall be specified and approved by manufacturer. (select only those that apply)
 - a. Orifices
 - 1) Air dispersion and extended throws are accomplished by orifices. Dispersion orifice sizing, up to 5 inch diameter (design dependent).
 - 2) Diameter, quantity, and location of orifices to be specified and approved by manufacturer.
 3. Inlet connection to metal duct via fabric draw band with anchor patches as supplied by manufacturer. Anchor patches to be secured to metal duct via. zip screw fastener – supplied by contractor.
 4. Inlet connection includes zipper for easy removal / maintenance.
 5. Lengths to include required intermediate zippers as specified by manufacturer.
 6. System to include Adjustable Flow Devices to balance turbulence, airflow and distribution as needed. Flow restriction device shall include ability to adjust the airflow resistance from 0.06 – 0.60 in w.g. static pressure.
 7. End cap includes zipper for easy maintenance.
 8. Each section of the textile shall include identification labels documenting order number, section diameter, section length, piece number, code certifications and other pertinent information.
- D. DESIGN PARAMETERS:
1. Textile air diffusers shall be designed from 0.25" water gage minimum to 3.1" maximum, with 0.5" as the standard.

2. Textile air diffusers shall be limited to design temperatures between 0 degrees F and 180 degrees F.
3. System overall design; diameter, length, airflow, operating static pressure and dispersion shall be designed or approved by the manufacturer.
4. Use textile air dispersion systems only for positive pressure air distribution components of the mechanical ventilation system.

PART 3 - EXECUTION

3.1 INSTALLATION OF FABRIC AIR DISPERSION SYSTEM:

- A. Install fabric air dispersion system including support system in accordance with the requirements of the manufacturer. Instructions for installation shall be provided by the manufacturer with product.

3.2 CLEANING AND PROTECTION

- A. Clean air handling unit and ductwork prior to the fabric duct system unit-by-unit as it is installed. Clean external surfaces of foreign substance which may cause corrosive deterioration of facing.
- B. Temporary Closure: At ends of ducts which are not connected to equipment or distribution devices at time of ductwork installation, cover with polyethylene film or other covering which will keep the system clean until installation is completed.
- C. If the fabric duct system becomes soiled during the installation, remove and clean the fabric duct system following the manufacturer's instructions.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15910 (233300) - AIR DUCT ACCESSORIES

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. Extent of ductwork accessories work is indicated on drawings and in schedules, and by requirements of this Section.
- B. Types of ductwork accessories required for project include the following:
 - 1. Dampers.
 - a. Low pressure manual dampers.
 - b. Counterbalanced backdraft dampers.
 - 2. Cable operated damper systems.
 - 3. Smoke Detectors
 - 4. Turning vanes.
 - 5. Duct hardware.
 - 6. Duct access doors.
 - 7. Flexible ductwork.
 - 8. Flexible elbow assembly.
 - 9. Metal duct connectors.
 - 10. Flexible duct connectors.
- C. Refer to other Division 23 Sections for testing, adjusting, and balancing of ductwork accessories; not work of this Section.

1.2 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of ductwork accessories, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 3 years.
- B. Codes and Standards:
 - 1. SMACNA Compliance: Comply with applicable portions of SMACNA "HVAC Duct Construction Standards, Metal and Flexible", 2005 Edition.
 - 2. Industry Standards: Comply with ASHRAE recommendations pertaining to construction of ductwork accessories, except as otherwise indicated.
 - 3. UL Compliance:
 - a. Construct, test, and label fire dampers in accordance with current edition of UL Standard 555 "Fire Dampers". Construct, test, and label smoke dampers in accordance with current edition of UL Standard 555S "Smoke Dampers".
 - b. Construct flexible ductwork in compliance with UL Standard 181 "Factory-Made Air Ducts and Connections".
 - c. Duct tape shall be labeled in accordance with UL Standard 181B and marked 181B-FX.
 - d. Duct clamps shall be labeled in accordance with UL Standard 181B and marked 181B-C.
 - e. Grease exhaust duct wrap shall meet the fire protection requirements defined by UL Standard 1479 "Fire Tests of Through-Penetration Firestops."
 - f. Fire rated duct wrap shall meet the fire protection requirements defined by UL Standard 1479 "Fire Tests of Through-Penetration Firestops."
 - 4. NFPA Compliance:
 - a. Comply with applicable provisions of NFPA 90A "Air Conditioning and Ventilating Systems", pertaining to installation of ductwork accessories. Comply with NFPA 90B "Standard for the Installation of Warm Air Heating and Air-Conditioning Systems."

- b. Comply with NFPA 96 “Ventilation Control and Fire Protection of Commercial Cooking Operations” for fire-rated grease exhaust ducts.
- 5. ASTM Compliance: Products shall have flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E 84 “Surface Burning Characteristics” (NFPA 255) method.
 - a. Duct silencers shall be tested for performance in accordance with ASTM E477 “Test Method for Measuring Acoustical and Airflow Performance of Duct Liner Materials and Prefabricated Silencers.”
 - b. Grease exhaust duct wrap shall be tested for performance in accordance with ASTM E 2336 “Standard Test Methods for Fire Resistive Grease Duct Enclosure Systems” and ASTM E814 “Standard Test Methods of Fire Resistance of Through-Penetration Fire Stops”.
 - c. Fire rated duct wrap shall be tested in accordance with ASTM E814 “Standard Test Methods of Fire Resistance of Through-Penetration Fire Stops”.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for each type of ductwork accessory including dimensions, capacities and materials of construction; and installation instructions. Submit performance data for duct silencers including insertion loss performance in octave bands from 63 Hz to 8,000 Hz and pressure drop at specified airflow.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawings for each type of ductwork accessory showing interfacing requirements with ductwork, method of fastening or support, and methods of assembly of components.
- C. Maintenance Data: Submit manufacturer's maintenance data including parts lists for each type of duct accessory. Include this data, product data, and shop drawings in maintenance manual; in accordance with requirements of Division 1.

1.4 SPARE PARTS

- A. Furnish extra fusible links to Owner, one link for every 10 installed of each temperature range; obtain receipt.

PART 2 - PRODUCTS AND MATERIALS

2.1 DAMPERS

- A. Low Pressure Manual Dampers: Provide dampers of single blade type or multi-blade type, constructed in accordance with SMACNA "HVAC Duct Construction Standards".
 - 1. Material: Galvanized steel for standard air systems, aluminum for wet or natatorium environments and stainless steel for corrosive environments.
 - 2. Construction: Bearings shall be corrosion resistant, molded synthetic and axles shall positively lock into the damper blade. Extended shafts and standoff bracket for insulation clearance shall be metal material. Provide with locking quadrant.
 - 3. Blade Seals: Where dampers are used for shutoff duty, provide Neoprene seals for round dampers and silicone for rectangular dampers.
 - 4. Dampers shall be Greenheck Model MBD Series, or approved equal.
- B. Control Dampers: Refer to Division 23 section Instrumentation and Control Devices for HVAC for control dampers; not work of this section.
- C. Counterbalanced Backdraft Dampers: Provide dampers with parallel blades, counterbalanced and factory-set to open at indicated static pressure. Construct frames and blades of minimum 16-ga aluminum. Provide minimum 1/2" diameter, corrosion-resistant bearings and 1/2" diameter, galvanized or stainless steel axles.

Blade edge seals shall be mechanically locked into blade edge. Blade seals shall be neoprene for round dampers. Blade seals shall be silicone or vinyl for rectangular dampers.

D. Manufacturer: Subject to compliance with requirements, provide dampers of one of the following:

1. Air Balance, Inc.
2. Arrow United Industries.
3. Cesco
4. Greenheck
5. Louvers & Dampers, Inc.
6. Nailor Industries, Inc.
7. Pottorff
8. Ruskin Mfg. Co.
9. TAMCO
10. Vent Products

2.2 CABLE OPERATED DAMPER SYSTEMS

A. General: Where access to dampers through a hard ceiling is required, provide a concealed, cable operated volume damper with remote operator.

1. Damper shall be adjustable through the diffuser face or frame with standard 1/4" nutdriver or flat screwdriver.
2. Cable assembly shall attach to damper as one piece with no linkage adjustment.
3. Positive, direct, two-way damper control shall be provided with no sleeves, springs or screw adjustments to come loose after installation.
4. Provide cable length as required to span the distance from the damper to the remote operator location.
5. Support cable assembly to avoid bends and kinks in cable.

B. Where approved by Architect, a ceiling cup with cover plate can be used for access to cable operator.

C. Manufacturer: Subject to compliance with requirements, provide cable operated damper systems of one of the following:

1. Metropolitan Air Technology, Inc. (Reference model is RT-250 for round ducts, RT-200 for rectangular ducts, with RT-WGA operator).
2. Young Regulator Co. (Reference model is 5020-1200 for round ducts, 820-1200 for rectangular ducts, with RT-270-275 operator).

2.3 TURNING VANES

A. Manufactured Turning Vanes: Provide turning vanes and runners fabricated from galvanized sheet metal, lock-forming quality, ASTM A 653, minimum Coating Designation G 60, of the same gauge thickness or greater as the ductwork in which they are installed. Vanes shall be rigidly fastened with guide strips to minimize noise and vibration. Vanes in ductwork over 30" deep shall be installed in multiple sections with vanes not over 30" long and shall be rigidly fastened. Turning vanes shall be constructed per SMACNA Duct Construction Standards Metal and Flexible – 2005 Edition, Figure 4-3 and set into side strips suitable for mounting in ductwork.

B. Acoustical Turning Vanes: Provide acoustical turning vanes constructed of airfoil shaped aluminum extrusion with perforated faces and fiberglass fill in systems serving noise critical spaces. Refer to Section "Common Work Results for HVAC".

C. Manufacturer: Subject to compliance with requirements, provide turning vanes of one of the following:

1. Aero Dyne Co.
2. Anemostat Products Div.; Dynamics Corp. of America.

3. Ductmate Industries.
4. Duro Dyne Corp.
5. Elgen Manufacturing Co., Inc.
6. Hart & Cooley Mfg. Co.
7. Register & Grille Mfg. Co., Inc.
8. Sheet Metal Connectors, Inc.

2.4 DUCT HARDWARE

- A. General: Provide duct hardware, manufactured by one manufacturer for all items on project, for the following:
 1. Test Holes: Provide in ductwork at fan inlet and outlet, and elsewhere as indicated, duct test holes, consisting of slot and cover, for instrument tests.
 2. Quadrant Locks: Provide for each damper, quadrant lock device on one end of shaft; and end bearing plate on other end for damper lengths over 12". Provide extended quadrant locks and end extended bearing plates for externally insulated ductwork.
- B. Manufacturer: Subject to compliance with requirements, provide duct hardware of one of the following:
 1. Ductmate Industries.
 2. Elgen Manufacturing Co., Inc.
 3. Ventfabrics, Inc.
 4. Young Regulator Co.

2.5 DUCT ACCESS DOORS

- A. General: Provide, where indicated on the drawings or where specified in Part 3 of this section, duct access doors of size allowable by duct dimensions with, unless otherwise noted on the drawings, minimum size of 10" by 10" and maximum size of 24" by 24". Provide removable section of duct where duct size is too small for a 10" by 10" access door. Construct access doors in accordance with SMACNA "HVAC Duct Construction Standards – Metal and Flexible" and as specified herein. Label access doors for fire and smoke dampers as specified in Paragraph "Installation of Ductwork Accessories.
- B. Construction: Construct of same or greater gage as ductwork served, provide insulated doors for insulated ductwork. Provide flush frames for uninsulated ductwork, extended frames for externally insulated duct. Provide one size hinged, other side with one handle-type latch for doors 12" high and smaller, 2 handle-type latches for larger doors.
- C. Manufacturer: Subject to compliance with requirements, provide duct access doors of one of the following:
 1. Air Balance Inc.
 2. Ductmate Industries.
 3. Duro Dyne Corp.
 4. Greenheck.
 5. Register & Grille Mfg. Co., Inc.
 6. Ruskin Mfg. Co.
 7. Ventifabrics, Inc.
 8. Vent Products.
 9. Zurn Industries, Inc.; Air Systems Div.

2.6 FLEXIBLE DUCT.

- A. Construction: Provide flexible ductwork conforming to UL 181-Class I, NFPA 90A and NFPA 90B and as follows. Duct types of manufacturers are indicated for reference in regards to required quality of construction and materials. Flexible duct shall have fire retardant polyethylene or reinforced metalized protective vapor barrier as follows:

1. Low pressure (duct pressure class up to and including 2" w.g.) and medium pressure (duct pressure class greater than 2" up to and including 6" w.g.)
 - a. Fire retardant polyethylene vapor barrier
 - 1) Flexmaster Type 5B
 - 2) JPL Type PR Series
 - 3) Thermaflex Type G-KM
 - b. Reinforced metalized vapor barrier
 - 1) ATCO 30 Series
 - 2) Flexmaster Type 5M
 - 3) JPL Type MHP Series
 - 4) Thermaflex Type M-KE
 2. Flexible ductwork shall have CPE liner with steel wire helix mechanically locked or permanently bonded to the liner.
 3. Provide acoustical, fiberglass insulated duct with minimum R-value of R-6.0.
- B. Manufacturer: Subject to compliance with requirements, provide flexible ductwork of one of the following:
1. ATCO Rubber Products.
 2. Flexmaster.
 3. JPL (J.P. Lamborn Co)
 4. Thermaflex.

2.7 FLEXIBLE ELBOW ASSEMBLY

- A. General: At Contractors option, in lieu of rigid sheet metal elbows at connections to air inlets and outlets in concealed spaces, provide flexible elbow assembly to air devices requiring a 90 degree elbow connection.
- B. Flexible elbow assembly shall be constructed of durable composite material and UL listed for use in return air plenums with a turning radius of not less than 3 inches.
- C. Flexible elbow assembly shall be FlexFlow Elbow as manufactured by Flexible Technologies, Inc., FlexRight Elbow as manufactured by Build Right Products or approved equal.

2.8 METAL DUCT CONNECTORS

- A. Description: Factory-fabricated, slide-on transverse flange connectors, corners, cleats, gaskets, and components. Material, gauge, and shape shall match the connecting ductwork.
- B. Manufacturers: Subject to compliance with requirements, provide duct connectors by one of the following or approved equal:
 1. Ductmate Industries.
 2. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

2.9 FLEXIBLE DUCT CONNECTORS

- A. Fabric Material: Flame-retardant or noncombustible fabrics compliant with NFPA 701.
 1. Metal-Edged Connectors: Factory fabricated with a fabric strip minimum 3-1/2 inches wide attached to two strips of minimum 24 gauge galvanized sheet steel or 0.032-inch- thick aluminum sheets. Provide metal compatible with connected ducts.
 2. Indoor System, Flexible Connector Fabric: Glass fabric coated with neoprene.
 - a. Minimum Weight: 26 oz./sq. yd.
 - b. Minimum Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
 - c. Service Temperature: Minus 40 to plus 200 deg F.
 3. Outdoor System, Flexible Connector Fabric: Glass fabric coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
 - a. Minimum Weight: 24 oz./sq. yd.

- b. Minimum Tensile Strength: 225 lbf/inch in the warp and 300 lbf/inch in the filling.
 - c. Service Temperature: Minus 40 to plus 250 deg F.
- B. Coatings and Adhesives: Comply with UL 181, Class 1.
- C. Flexible connectors shall have flame-spread index of 25 or less, and smoke-developed index of 50 or less, as tested by ASTM E 84 (NFPA 255) method.
- D. Manufacturer: Subject to compliance with requirements, provide flexible connections of one of the following:
 - 1. Ductmate Industries.
 - 2. Duro Dyne Corp.
 - 3. Elgen Manufacturing Co., Inc.
 - 4. Ventfabrics, Inc.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine areas and conditions under which ductwork accessories will be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 INSTALLATION OF DUCTWORK ACCESSORIES

- A. Install ductwork accessories in accordance with manufacturer's installation instructions, with applicable portions of details of construction as shown in SMACNA standards, and in accordance with recognized industry practices to ensure that products serve intended function.
- B. Install backdraftdampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.
- C. Provide balancing dampers at branch takeoffs from main ducts. Unless otherwise noted on drawings, provide prefabricated 45 degree, high efficiency, rectangular/round branch duct takeoff fittings with manual balancing damper and locking quadrant for branch duct connections and take-offs to individual diffusers, registers and grilles.
- D. Coordinate all smoke and fire/smoke damper installation, wiring, and checkout to ensure that the dampers function properly and that they respond to the proper fire alarm system signal.
- E. Install ceiling radiation dampers per manufacturer's instructions. Support damper assembly from structure.
- F. Duct Smoke Detectors: Comply with NFPA 72, and NFPA 90A where adopted by the local AHJ. Install sampling tubes so they extend the full width of the duct. Tubes more than 36 inches long shall be supported at both ends.
 - 1. Do not install smoke detector in duct smoke detector housing during construction. Install detector only during system testing and prior to system turnover.
 - 2. Air handling units with smoke detection that serve fan-powered terminal units:
 - a. Provide duct detection and shutdown fan-powered terminal units that are less than 2,000 cfm when the respective air handling unit shuts down.
 - b. Provide individual duct detection and shutdown for each fan-powered terminal unit exceeding 2,000 cfm.
 - 3. Provide duct detection and shutdown for air distribution systems exceeding 2,000 cfm.

- G. Provide turning vanes, of same gauge as ductwork, rigidly fastened with guide strips in ductwork having an offset of 45 degrees or more. Vanes shall be provided in all supply and exhaust ductwork and in return and outside air ductwork that has an air velocity exceeding 1000 fpm. Do not install vanes in grease ductwork.
- H. Provide duct access doors to maintain and/or clean components internal to ductwork including, but not limited to, coils, airflow stations, motorized and backdraft dampers, humidifiers, etc, and equipment at the following locations: Install access doors to open against system air pressure, with latches operable from either side, except outside only where duct is too small for person to enter.
 - 1. At each change in direction and at maximum 50-foot (15-m) spacing.
 - 2. Upstream from turning vanes.
 - 3. Upstream or downstream from duct silencers.
- I. Provide duct access door(s) as scheduled below, at each fire and smoke damper within 12 inches of the device to allow for testing and maintenance. Label each door (with minimum 1" lettering) indicating which damper type is served. Door should be capable of being fully opened or provide removable door.

DUCT ACCESS DOOR SCHEDULE

Duct Width/Depth	Door Size	Quantity
10" TO 12"	10 X 10	1
14" TO 18"	12 X 12	1
20" TO 36"	14 X 14	1
38" TO 54"	18 X 18	1
56" TO 72"	18 X 18	2 (1 EACH END)
74" TO 96"	20 X 20	2 (1 EACH END)

- J. Install flexible duct in accordance with manufacturer's instructions. At a minimum, install two wraps of duct tape around the inner core connection and a metallic or non-metallic clamp over the tape and two wraps of duct tape or a clamp over the outer jacket.
 - 1. Flexible duct runs shall not exceed 5 feet in length. Utilize the minimum length of duct to make the connections.
 - 2. Flexible ductwork shall be installed straight as possible avoiding tight turns with a maximum of one 90 degree bend in any length. Install flexible duct fully extended minimizing compression.
 - 3. Provide continuous length with no intermediate joints.
 - 4. Support flexible duct from structure and not from ceiling tile, light fixtures or air terminals. Support for maximum sag of 1/2-inch per foot.
 - 5. Avoid incidental contact with metal fixtures, water lines, pipes, or conduit.
 - 6. Support straps/saddles shall be minimum 1-1/4" wide. Use of wire hanging systems shall utilize strap and connect wire to strap.
 - a. Factory installed suspension systems are acceptable
 - 7. Ductwork shall not be crimped against joist or truss members, pipes, conduits, etc.
 - 8. The bend radius at the center line shall be equal to or greater than one duct diameter.
 - a. Support bends approximately one duct diameter on both sides of bends.
 - 9. Connections to ductwork and air devices shall have at least 1" overlap.
- K. Provide rigid duct elbow or flexible elbow assembly where a 90 degree elbow is required at connection to air devices.
- L. Provide flexible duct connections wherever ductwork connects to vibrating equipment and when transitioning between two different metallic duct materials (e.g., aluminum to galvanized steel). Construct flexible connections of fabric crimped into duct flanges for attachment to duct and equipment. Make airtight joint. Provide adequate joint flexibility to allow for thermal, axial, transverse, and torsional movement, and also capable of absorbing vibration of connected equipment.

- M. Coordinate with other work, including ductwork, as necessary to interface installation of ductwork accessories properly with other work.

3.3 FIELD QUALITY CONTROL

- A. Operate installed ductwork accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leakproof performance.

3.4 ADJUSTING AND CLEANING

- A. Adjusting: Adjust ductwork accessories for proper settings, install fusible links in fire dampers and adjust for proper action.
- B. Label access doors in accordance with Division-23 section "Identification for HVAC Piping and Equipment".
- C. Final positioning of manual dampers is specified in Division-23 section "Testing, Adjusting, and Balancing for HVAC".
- D. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

END OF SECTION

SECTION 15865 (233413) - AXIAL HVAC FANS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Circulation fans.
- B. High Volume Low Speed (HVLS) fans.

1.2 REFERENCE STANDARDS

- A. AMCA 99 – Standards Handbook.
- B. AMCA 204 – Balance Quality and Vibration Levels for Fans.
- C. AMCA 210 – Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating.
- D. AMCA 230 – Laboratory Methods of Testing Air Circulation Fans for Rating and Certification.
- E. AMCA 300 – Reverberant Room method for Sound Testing of Fans.
- F. AMCA 301 – Certified Ratings Program Product Rating manual for Fan Sound Performance.
- G. AMCA 311 – Certified Ratings Program Product Rating Manual for Fan Sound Performance.
- H. UL 705 – Power Ventilators; Current Edition Including all Revisions.
- I. UL 762 – Outline of Investigation for Power Roof Ventilators for Restaurant Exhaust Appliances; Current Edition Including all Revisions.

1.3 SUBMITTALS

- A. General: Submit data in accordance with Conditions of Contract and Division 1 Specification Sections.
- B. Product Data: Provide data on fans and accessories including fan curves with specified operating point clearly plotted, power, RPM, sound power levels at rated capacity, and electrical characteristics and connection requirements. Include the following:
 - 1. For fans with factory-furnished starters or variable frequency drives, include short circuit current ratings.
 - 2. Materials gages and finishes, including color charts.
 - 3. Dampers, including housings, linkages, and operators.
- C. Shop Drawings: Shop drawings from manufacturer detailing equipment assemblies and indicating dimensions, weights, required clearances, components, and location and size of field connections.
- D. Wiring Diagrams: Wiring diagrams that detail power, signal, and control wiring. Differentiate between manufacturer-installed wiring and field-installed wiring.
- E. Maintenance Data: Include instructions for lubrication, motor and drive replacement and spare parts list.
- F. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.

1. Extra Fan Belts: One set for each individual fan.

1.4 QUALITY ASSURANCE

A. AMCA Compliance:

1. Provide HVLS fans that are tested and labeled in accordance with AMCA 230.
2. Testing Requirements: The following factory tests are required for propeller, tubeaxial, mixed flow and vaneaxial fans:
 - a. Sound Power Level Ratings: Comply with AMCA Standard 301 "Method for Calculating Fan Sound Ratings From Laboratory Test Data." Test fans in accordance with AMCA Standard 300 "Test Code for Sound Rating." Fans shall be licensed to bear the AMCA Certified Sound Ratings Seal.
 - b. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210/ASHRAE Standard 51 - Laboratory Methods of Testing Fans for Rating.

B. UL Compliance: Fans and components shall be UL listed and labeled.

C. Nationally Recognized Testing Laboratory and NEMA Compliance (NRTL): Fans and components shall be NRTL listed and labeled. The term "NRTL" shall be as defined in OSHA Regulation 1910.7.

D. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

E. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect motors, shafts, and bearings from weather and construction dust.

1.6 FIELD CONDITIONS

A. Permanent fans may not be used for ventilation during construction.

PART 2 - PRODUCTS AND MATERIALS

2.1 FANS, GENERAL

A. General: Provide fans that are factory fabricated and assembled, factory tested, and factory finished with indicated capacities and characteristics.

B. Fans and Shafts: Statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower.

1. Fan Shaft: Turned, ground, and polished steel designed to operate at no more than 70 percent of the first critical speed at the top of the speed range of the fan's class.

C. Belt Drives: Factory mounted, with final alignment and belt adjustment made after installation.

1. Service Factor: 1.5.

D. Belts: Oil-resistant, non-sparking, and non-static.

E. Motors: Refer to Section "Common Motor Requirements for HVAC Equipment" for requirements.

- F. Motor and Fan Wheel Pulleys: Adjustable pitch for use with motors through 15 HP; fixed pitch for use with motors larger than 15 HP. Select pulley so that pitch adjustment is at the middle of the adjustment range at fan design conditions.
 - 1. Belt Guards: Provide OSHA compliant steel belt guards for motors mounted on the outside of the fan cabinet.
- G. Hazardous Duty: Provide fans with spark resistant construction and explosion proof motor where specified in the schedule.

2.2 CIRCULATION FANS

- A. Manufacturers:
 - 1. Big Ass Fans.
 - 2. Greenheck
 - 3. Leading Edge Fans
- B. Minka-Air General Description: Propeller-type fans less than 6 feet in diameter consisting of fan blades, hub, mounting system, motor, and fan controller.
- C. Fan Blades: Aluminum alloy or custom material as scheduled on the drawings.
- D. Hub: Cast aluminum alloy.
- E. Motor and Frame: High efficiency, brushless DC or EC motor with digital inverter drive.
- F. Mounting System: Designed for secure mounting of fan from overhead support structure.

2.3 HVLS FANS

- A. Manufacturers:
 - 1. Big Ass Fans.
 - 2. Entrematic.
 - 3. Kelley Company
 - 4. Macro Air Technology
- B. General Description: Propeller-type fans 6 feet in diameter and larger consisting of fan blades, hub, mounting system, bevel gear reducer drive, motor, and fan controller.
 - 1. Acceptable alternate to bevel gear reducer drive, motor and VFD as specified herein is a gearless, direct drive fan to motor connection and radial flux, permanent magnet AC motor as furnished by MacroAir.
- C. Fan Blades: Aluminum alloy, airfoil design.
- D. Hub: Cast aluminum alloy incorporating 1/4" or greater steel safety clips to restrain the hub/airfoil assembly in case of shaft failure.
- E. Bevel Gear Reducer: High efficiency, helical gear reducer with a cast iron housing, designed for low noise and long service life with a backlash of less than 20 arc-minutes. Output shaft shall be stainless steel. Gear reducer shall be permanently lubricated and be assembled with double lip seals to prevent contamination or oil leakage.
- F. Motor and Frame: 1750 RPM, 208-230/460 VAC, 60 Hz, 3 phase, inverter rated with class F insulation, 40 degrees C Ambient-Continuous. Provide HP as scheduled or as applicable. Motor frame and mount shall be constructed of minimum 3/16" powder-coated steel.

- G. Mounting System: Designed for secure mounting of fan from overhead support structure with extension rod. Mount shall be constructed of minimum 3/16" powder-coated steel. Provide minimum 1/4" 7x19 steel safety cable to secure fan assembly to structure.
- H. Fan Controller:
 - 1. Auxiliary contacts to shutdown fan upon notification from fire alarm system.
 - 2. Industrial Control Panel constructed per UL 508A and NEC.
 - 3. Factory programmed Variable Frequency Drive (VFD) for soft start and infinite speed control.
 - 4. Size VFD for motor full load amp rating.
 - 5. Provide overload relay for each motor when VFD controls multiple fans.
 - 6. Provide load reactors for 460 VAC multi-fan control.
 - 7. Provide fan on/off/auto switch, speed control potentiometer, safety disconnect and properly sized fuse block.
 - 8. Provide NEMA Type 1 controls enclosure.

PART 3 - EXECUTION

3.1 SEQUENCING AND SCHEDULING

- A. Coordinate the size and location of structural steel support members.

3.2 INSTALLATION

- A. Install fans level and plumb, in accordance with manufacturer's written instructions.
- B. Support units using the vibration control devices indicated and specified in Division 23 Section "Vibration Isolation for HVAC Piping and Equipment."
- C. Arrange installation to provide access space around fans for service and maintenance.
- D. Install extension rod to maintain minimum 3 feet vertical clearance between HVLS fan blades and sprinkler deflectors according to NFPA 13.

3.3 ADJUSTING, CLEANING, AND PROTECTING

- A. Adjust damper linkages for proper damper operation.
- B. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel and cabinet.

3.4 STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
 - 1. Remove shipping blocking and bracing.
 - 2. Verify fan assembly is secure on mountings and supporting devices and that connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
 - 3. Perform cleaning and adjusting specified in this Section.
 - 4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
 - 5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
 - 6. Verify manual and automatic volume control, and fire and smoke dampers in connected ductwork systems are in the full-open position.

7. Disable automatic temperature control operators.

B. Starting procedures for fans:

1. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
 - a. Replace fan and motor pulleys as required to achieve design conditions.
 - b. Measure and record motor electrical values for voltage and amperage.
 - c. Shut unit down and reconnect automatic temperature control operators.
 - d. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.

3.5 DEMONSTRATION

A. Demonstration Services: Train Owner's maintenance personnel on the following:

1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals specified in Division 1 Section "Closeout Procedures" and Division 23 Section "General Mechanical Requirements."

B. Schedule training with at least 7 days' advance notice.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15860 (233416) - CENTRIFUGAL HVAC FANS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Centrifugal fans for indoor installations

1.2 REFERENCE STANDARDS

- A. AMCA 99 – Standards Handbook.
- B. AMCA 204 – Balance Quality and Vibration Levels for Fans.
- C. AMCA 210 – Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating.
- D. AMCA 300 – Reverberant Room Method for Sound Testing of Fans.
- E. AMCA 301 – Certified Ratings Program Product Rating manual for Fan Sound Performance.
- F. UL 705 – Power Ventilators; Current Edition Including all Revisions.

1.3 SUBMITTALS

- A. General: Submit data in accordance with Conditions of Contract and Division 1 Specification Sections.
- B. Product Data: Provide data on fans and accessories including fan curves with specified operating point clearly plotted, power, RPM, sound power levels at rated capacity, and electrical characteristics and connection requirements. Include the following:
 - 1. For fans with factory-furnished starters or variable frequency drives, include short circuit current ratings.
 - 2. Materials gages and finishes, including color charts.
 - 3. Dampers, including housings, linkages, and operators.
- C. Shop Drawings: Shop drawings from manufacturer detailing equipment assemblies and indicating dimensions, weights, required clearances, components, and location and size of field connections.
- D. Wiring Diagrams: Wiring diagrams that detail power, signal, and control wiring. Differentiate between manufacturer-installed wiring and field-installed wiring.
- E. Maintenance Data: Include instructions for lubrication, motor and drive replacement and spare parts list.
- F. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
 - 1. Extra Fan Belts: One set for each individual fan.

1.4 QUALITY ASSURANCE

- A. AMCA Compliance: Provide products that meet performance requirements and are licensed to use the AMCA Seal.
- B. UL Compliance: Fans and components shall be UL listed and labeled.
- C. Nationally Recognized Testing Laboratory and NEMA Compliance (NRTL): Fans and components shall be NRTL listed and labeled. The term "NRTL" shall be as defined in OSHA Regulation 1910.7.
- D. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.
- E. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."
- F. UL 705 – Standard for Power Ventilators, Underwriter’s Laboratory, most current edition.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Protect motors, shafts, and bearings from weather and construction dust.

1.6 FIELD CONDITIONS

- A. Permanent fans may not be used for ventilation during construction.

PART 2 - PRODUCTS AND MATERIALS

2.1 FANS, GENERAL

- A. General: Provide fans that are factory fabricated and assembled, factory tested, and factory finished, with indicated capacities and characteristics.
- B. Fans and Shafts: Statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower.
 - 1. Fan Shaft: Turned, ground, and polished steel, designed to operate at no more than 70 percent of the first critical speed at the top of the speed range of the fan's class.
- C. Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210.
- D. Sound Ratings: Comply with AMCA 301. Test fans in accordance with AMCA Standard 300.
- E. Belt Drives: Factory mounted, with final alignment and belt adjustment made after installation.
 - 1. Service Factor: 1.4.
- F. Belts: Oil-resistant, nonsparking, and nonstatic.
- G. Motors: Refer to Section “Common Motor Requirements for HVAC Equipment” for requirements.

- H. Motor and Fan Wheel Pulleys: Adjustable pitch for use with motors through 15 HP; fixed pitch for use with motors larger than 15 HP. Select pulley so that pitch adjustment is at the middle of the adjustment range at fan design conditions.
 - 1. Belt Guards: Provide OSHA compliant steel belt guards for motors mounted on the outside of the fan cabinet.
- I. Hazardous Duty: Provide fans with spark resistant construction and explosion proof motor where specified in the schedule.
- J. Factory Finish: The following finishes are required:
 - 1. Sheet Metal Parts: Prime coating prior to final assembly.
 - 2. Exterior Surfaces: Baked-enamel finish coat after assembly.

2.2 CENTRIFUGAL FANS

- A. Manufacturers:
 - 1. Acme Engrg. & Mfg. Corp.
 - 2. Bayley Fan Group.
 - 3. Chicago Blower Corp.
 - 4. Cook (Loren) Co.
 - 5. Greenheck Fan Corp.
 - 6. Hartzell Fan, Inc.
 - 7. PennBarry.
 - 8. RuppAir Management Systems
 - 9. Trane Co.
 - 10. Twin City Fan Company
- B. General Description: Belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, and support structure.
- C. Housings:
 - 1. Fabricate from formed and reinforced galvanized steel panels to form curved scroll housings, spot welded for AMCA 99 class I and II fans and continuously welded for AMCA Class III fans.
 - 2. Factory finish before assembly to manufacturer's standard. For fans handling air downstream of humidifiers, provide two additional coats of paint. Prime coating on aluminum parts is not required.
 - 3. Inlet Cones: Spun metal.
 - 4. Duct Connections: Flanged.
 - 5. Panel Bracing: Steel angle-or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
- D. Fan Wheels: Single-width single-inlet and/or double-width double-inlet, welded to cast-iron or cast-steel hub and spun steel inlet cone, with hub keyed to the shaft. Provide inlet flange and back plate for rigid attachment of blades.
 - 1. Blade Materials: Steel or aluminum.
 - 2. Blade Type: Backward-curved, flat-plate or airfoil type; forward-curved, airfoil type or radial.
- E. Bearings and Drives
 - 1. Bearings: Provide type indicated, having a median life "Rating Life" ABMA L(50) of 400,000, calculated in accordance with ABMA Standard 9 for ball bearings and ABMA Standard 11 for roller bearings
 - a. Prelubricated and sealed, self-aligning, pillow-block-type ball bearings.
 - b. Grease-lubricated, self-aligning, pillow-block type; tapered roller bearings with double-locking collars and two-piece, cast-iron housing. Provide Zerk fittings for lubrication.

- c. Grease-lubricated, self-aligning, pillow-block type, with double spherical roller bearings with adapter mount and two-piece cast-iron housing. Provide Zerk fittings for lubrication.
 - 2. Shafts: Hot rolled steel, ground and polished, with keyway, protectively coated with lubricating oil, and shaft guard.
 - 3. Belt Drive: Cast iron or steel sheaves, dynamically balanced, keyed. Variable and adjustable pitch sheaves for motors 15 hp and under, selected so required rpm is obtained with sheaves set at mid-range. Fixed sheave for 20 hp and over, matched belts, and drive rated as recommended by manufacturer or minimum 1.5 times nameplate rating of the motor.
 - 4. Belt Guard: Fabricate to SMACNA (DCS); 0.106 inch thick, 3/4 inch diamond mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation, with provision for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
 - 5. Direct Drive: Provide support stand and enclosure for direct connection of motor to fan wheel.
- F. Accessories: Provide the following accessories:
- 1. Discharge Dampers: Opposed blade heavy duty steel damper assembly with blades constructed of two plates formed around and welded to shaft, channel frame, sealed ball bearings, with blades linked out of air stream to single control lever.
 - 2. Inlet/Outlet Screens: Heavy wire mesh screens, mounted inside of shaft bearings for fan openings without duct connections.
 - 3. Access Doors: Latch-type handles; flush-mounted for uninsulated housings and raised-mounted for insulated housings.
 - 4. Drain Connections: Threaded, 3/4-inch NPS, capped nipple installed at lowest point of housing.
 - 5. Shaft Cooler: Metal disc between bearings and fan wheel, designed to dissipate heat from shaft.
 - 6. Spark-Resistant Construction: AMCA construction option A, B, or C as indicated.
 - 7. Shaft Seals: Air-tight seals installed around shaft on drive side of single-width fans.

PART 3 - EXECUTION

3.1 SEQUENCING AND SCHEDULING

- A. Coordinate the size and location of concrete equipment pads. Cast anchor bolt inserts into pad.
- B. Coordinate the size and location of structural steel support members.

3.2 INSTALLATION

- A. Install fans level and plumb, in accordance with manufacturer's written instructions.
- B. Support units using the vibration control devices indicated and specified in Division 23 Section "Vibration Isolation for HVAC ."
- C. Arrange installation to provide access space around fans for service and maintenance.

3.3 ADJUSTING, CLEANING, AND PROTECTING

- A. Adjust damper linkages for proper damper operation.
- B. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel and cabinet.

3.4 STARTUP

- A. Final checks before start-up: Perform the following operations and checks before start-up:
 - 1. Remove shipping, blocking, and bracing.
 - 2. Verify fan assembly is secure on mountings and supporting devices and that connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
 - 3. Perform cleaning and adjusting specified in this Section.
 - 4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
 - 5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
 - 6. Verify manual and automatic volume control and that fire and smoke dampers in connected ductwork systems are in the full-open position.
 - 7. Disable automatic temperature control operators.

- B. Starting procedures for fans:
 - 1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
 - a. Replace fan and motor pulleys as required to achieve design conditions.
 - b. Measure and record motor electrical values for voltage and amperage.
 - c. Shut unit down and reconnect automatic temperature control operators.
 - d. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.

3.5 DEMONSTRATION

- A. Demonstration Services: Train Owner's maintenance personnel on the following:
 - 1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
 - 2. Familiarization with contents of Operating and Maintenance Manuals specified in Division 1 Section "Closeout Procedures" and Division 23 Section "General Mechanical Requirements."

- B. Schedule training with at least 7 days' advance notice.

PAGE INTENTIONALLY LEFT BLANK

SECTION 15870 (233423) - HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Roof ventilators.
- B. Cabinet exhaust fans.
- C. Upblast roof exhausters.
- D. Inline centrifugal fans.

1.2 REFERENCE STANDARDS

- A. AMCA 99 – Standards Handbook.
- B. AMCA 204 – Balance Quality and Vibration Levels for Fans.
- C. AMCA 210 – Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating.
- D. AMCA 300 – Reverberant Room method for Sound Testing of Fans.
- E. AMCA 301 – Certified Ratings Program Product Rating manual for Fan Sound Performance.
- F. AMCA 311 – Certified Ratings Program Product Rating Manual for Fan Sound Performance.
- G. NFPA 96 – Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations.
- H. UL 705 – Power Ventilators; Current Edition Including all Revisions.
- I. UL 762 – Outline of Investigation for Power Roof Ventilators for Restaurant Exhaust Appliances; Current Edition Including all Revisions.

1.3 SUBMITTALS

- A. General: Submit data in accordance with Conditions of Contract and Division 1 Specification Sections.
- B. Product Data: Provide data on fans and accessories including fan curves with specified operating point clearly plotted, power, RPM, sound power levels at rated capacity, and electrical characteristics and connection requirements. Include the following:
 - 1. For fans with factory-furnished starters or variable frequency drives, include short circuit current ratings.
 - 2. Materials gages and finishes, including color charts.
 - 3. Dampers, including housings, linkages, and operators.

- C. Shop Drawings: Shop drawings from manufacturer detailing equipment assemblies and indicating dimensions, weights, required clearances, components, and location and size of field connections.
- D. Wiring Diagrams: Wiring diagrams that detail power, signal, and control wiring. Differentiate between manufacturer-installed wiring and field-installed wiring.
- E. Maintenance Data: Include instructions for lubrication, motor and drive replacement and spare parts list.
- F. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
 - 1. Extra Fan Belts: One set for each individual fan.

1.4 QUALITY ASSURANCE

- A. AMCA Compliance: Provide products that meet AMCA certified performance and sound ratings and are licensed to use the AMCA Seal.
- B. UL Compliance: Fans and fan motors shall be designed, manufactured, and tested in accordance with UL 705 "Power Ventilators."
- C. Kitchen Hood Exhaust Fans: Kitchen hood exhaust fans and components shall comply with requirements of UL 762 and NFPA 96.
- D. Nationally Recognized Testing Laboratory and NEMA Compliance (NRTL): Fans and components shall be NRTL listed and labeled. The term "NRTL" shall be as defined in OSHA Regulation 1910.7.
- E. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.
- F. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Protect motors, shafts, and bearings from weather and construction dust.

1.6 FIELD CONDITIONS

- A. Permanent fans may not be used for ventilation during construction.

PART 2 - PRODUCTS AND MATERIALS

2.1 POWER VENTILATORS - GENERAL

- A. General: Provide fans that are factory fabricated and assembled, factory tested, and factory finished; with indicated capacities and characteristics.
- B. Statically and Dynamically Balanced: Fans and shafts shall be statically and dynamically balanced and designed for continuous operation at the maximum rated fan speed and motor horsepower.
 - 1. Fan Shaft: Turned, ground, and polished steel designed to operate at no more than 70 percent of the first critical speed at the top of the speed range of the fan's class.

- C. Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings in accordance with AMCA Standard 210.
- D. Sound Ratings: Comply with AMCA 301. Test fans in accordance with AMCA Standard 300.
- E. Fabrication: Comply with AMCA 99.
- F. Belt Drives: Factory mounted, with final alignment and belt adjustment made after installation.
 - 1. Service Factor: 1.4.
- G. Belts: Oil-resistant, non-sparking, and non-static.
- H. Motors: Refer to Section “Common Motor Requirements for HVAC Equipment” for requirements.
- I. Motor and Fan Wheel Pulleys: Adjustable pitch for use with motors through 15 HP; fixed pitch for use with motors larger than 15 HP. Select pulley so that pitch adjustment is at the middle of the adjustment range at fan design conditions.
 - 1. Belt Guards: Provide steel belt guards for motors mounted on the outside of the fan cabinet.
- J. Hazardous Duty: Provide fans with spark resistant construction and explosion proof motor where specified in the schedule.
- K. Factory Finish: The following finishes are required:
 - 1. Sheet Metal Parts: Prime coating prior to final assembly.
 - 2. Exterior Surfaces: Baked-enamel finish coat after assembly.

2.2 ROOF VENTILATORS

- A. Manufacturers:
 - 1. Accurex.
 - 2. Acme Engrg. & Mfg. Corp.
 - 3. Carnes Company, Inc.
 - 4. Cook (Loren) Co.
 - 5. Greenheck Fan Corp.
 - 6. Hartzell Fan, Inc.
 - 7. PennBarry.
 - 8. RuppAir Management Systems.
 - 9. Twin City Fan Company.
- B. Fan Unit: Belt-driven or direct-drive as indicated, centrifugal or axial fan, consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
- C. Housing: Heavy-gage, removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.
- D. Roof Curbs: Refer to Section “Hangers and Supports for HVAC” for pre-engineered roof equipment supports .
- E. Fan Wheel: Aluminum hub and wheel.
- F. Belt-Driven Drive Assembly: Resiliently mounted to the housing, with the following features:

1. Pulleys: Cast-iron, adjustable-pitch.
2. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
3. Fan Shaft: Turned, ground, and polished steel drive shaft keyed to wheel hub.
4. For centrifugal fans, fan and motor shall be isolated from exhaust air stream.

G. Accessories: Provide the following items as indicated:

1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
2. Bird Screens: Maximum 1/2-inch mesh, 16-gage, aluminum or brass wire.
3. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base, factory set to close when fan stops.
4. Automatic Belt Tensioner: Automatic device that adjusts for correct belt tension for single drives.

2.3 WALL EXHAUSTERS

A. Manufacturers

1. Accurex.
2. Acme Engrg. & Mfg. Corp.
3. Carnes Company, Inc.
4. Cook (Loren) Co.
5. Greenheck Fan Corp.
6. Hartzell Fan, Inc.
7. PennBarry.
8. RuppAir Management Systems
9. Twin City Fan Company

B. Fan Unit: Belt-driven or direct-drive as indicated, centrifugal or axial fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, and accessories.

C. Housing: Heavy-gage, removable, spun-aluminum, dome top and outlet baffle; venturi design fan inlet cone.

D. Fan Wheel: Aluminum hub and wheel.

E. Belt-Driven Drive Assembly: Resiliently mounted to the housing, with the following features:

1. Pulleys: Cast-iron, adjustable-pitch.
2. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
3. Fan Shaft: Turned, ground, and polished steel drive shaft keyed to wheel hub.
4. For centrifugal fans, fan and motor shall be isolated from exhaust air stream.

F. Accessories: Provide the following items as indicated:

1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
2. Bird Screens: Maximum 1/2-inch mesh, 16-gage aluminum or brass wire.
3. Dampers: Counterbalanced, parallel-blade backdraft dampers mounted in curb base, factory set to close when fan stops.
4. Automatic Belt Tensioner: Automatic device that adjusts for correct belt tension for single drives.

2.4 CABINET EXHAUST FANS

A. Manufacturers:

1. Acme Engrg. & Mfg. Corp.
2. Carnes Company, Inc.

3. Cook (Loren) Co.
 4. Greenheck Fan Corp.
 5. PennBarry.
 6. RuppAir Management Systems.
 7. Twin City Fan Company
- B. Centrifugal Fan Unit: Centrifugal fan designed for installation in ceiling, wall, or concealed inline applications.
- C. Housing: Galvanized steel lined with acoustical insulation.
- D. Fan Wheel: Centrifugal wheels directly mounted on motor shaft. Fan shrouds, motor, and fan wheel shall be removable for service.
- E. Electrical Requirements: Junction box for electrical connection on housing and receptacle for motor plug-in.
- F. Grille: Molded white plastic], louvered grille with flange on intake and thumbscrew attachment to fan housing.
- G. Sheaves: Cast iron or steel, dynamically balanced, bored to fit shafts and keyed; variable and adjustable pitch motor sheaves selected so required rpm is obtained with sheaves set at mid-position; fan shaft with self-aligning pre-lubricated ball bearings.
- H. Accessories: Provide the following items as indicated:
1. Remote Fan Speed Control: Solid state, capable of controlling fan speed from full speed to approximately half speed.
 2. Manufacturer's standard roof jack, wall cap, and transition fittings for exhaust termination as indicated.

2.5 UPBLAST ROOF EXHAUSTERS

- A. Manufacturers:
1. Accurex.
 2. Acme Engrg. & Mfg. Corp.
 3. Carnes Company, Inc.
 4. Cook (Loren) Co.
 5. Greenheck Fan Corp.
 6. Hartzell Fan, Inc.
 7. PennBarry.
 8. RuppAir Management Systems
 9. Twin City Fan Company
- B. General Description: Belt-driven or direct-drive as indicated, consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
- C. Fan Wheel:
1. Type: Non-overloading centrifugal, propeller or axial blades as scheduled
 2. Material: Aluminum ,
- D. Housing:
1. Construct of heavy-gage aluminum including curb cap, windband and motor compartment..

2. Rigid internal support structure.
 3. One-piece fabricated or fully welded curb-cap to windband for leak proof construction.
 4. Wind Band and Base: Reinforced and braced aluminum, containing aluminum butterfly dampers and rain trough, motor and drive assembly, and fan wheel.
 - a. Dampers Rods: Steel with bronze or nylon bearings.
 5. Provide breather tube for fresh air motor cooling and wiring.
- E. Shafts and Bearings:
1. Fan Shaft:
 - a. Ground and polished steel with anti-corrosive coating.
 - b. First critical speed at least 25 percent over maximum cataloged operating speed.
 2. Bearings
 - a. Permanently sealed or pillow block type.
 - b. Minimum L10 life in excess of 50,000 hours.
- F. Drive Assembly: Resiliently mounted to the housing, with the following features:
1. Belts, pulleys, and keys oversized for a minimum of 150 percent of driven horsepower.
 2. Belts: Static free and oil resistant.
 3. Pulleys: Cast-iron, adjustable-pitch, keyed and securely attached to the wheel and motor shafts..
- G. Roof Curbs: Refer to Section "Hangers and Supports for HVAC" for pre-engineered roof equipment supports.
- H. Drain Trough: Provides single point drainage for water or other residue.
- I. Accessories: Provide the following items as indicated:
1. Disconnect Switch: Nonfusible type, with thermal overload protection mounted inside fan housing, factory-wired through an internal aluminum conduit.
 2. Bird Screens: Maximum 1/2-inch mesh, 16-gage aluminum or brass wire.
 3. Dampers: Counter-balanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
 4. Dampers: Motor-operated, parallel-blade, volume control dampers mounted in curb base.
 - a. Blades: Die-formed sheet aluminum.
 - b. Frame: Extruded aluminum, with waterproof, felt blade bumpers.
 - c. Linkage: Nonferrous metals.
 - d. Operators: Manufacturer's standard electric actuator.
 - e. Operators: Manufacturer's standard pneumatic actuator.
 5. Automatic Belt Tensioner: Automatic device that adjusts for correct belt tension for single drives.

2.6 INLINE CENTRIFUGAL FANS

- A. Manufacturers:
1. Acme Engrg. & Mfg. Corp.
 2. Carnes Company, Inc.
 3. Cook (Loren) Co.
 4. Greenheck Fan Corp.
 5. PennBarry.
 6. RuppAir Management Systems.
 7. Twin City Fan Company
- B. Fan Unit: Inline, belt or direct driven, centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, drive assembly, motor and disconnect switch, mounting brackets, and accessories.

- C. Housing: Galvanized steel or split, spun-aluminum housing, with straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.
- D. Wheel: Aluminum, forward curved, backward inclined or airfoil blades welded to aluminum hub.
- E. Direct-Drive Units: Motor encased in housing out of air stream, factory-wired to disconnect located on outside of fan housing.
- F. Belt-Drive Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing. Provide self-aligning pre-lubricated ball bearings.
- G. Accessories: Provide the following accessories as indicated:
 1. Volume Control Damper: Manual operated with quadrant lock, located in fan outlet.
 2. Companion Flanges: For inlet and outlet duct connections.
 3. Fan Guards: Expanded metal in removable frame.
 4. Speed Control: Variable speed switch with on-off control and speed control for 100 to 50 percent of fan air delivery.

PART 3 - EXECUTION

3.1 SEQUENCING AND SCHEDULING

- A. Coordinate the size and location of structural steel support members.

3.2 INSTALLATION

- A. Install fans level and plumb, in accordance with manufacturer's written instructions.
- B. Secure roof-mounted fans to pre-engineered roof equipment supports in accordance with the requirements specified in Section "Hangers and Supports for HVAC Piping and Equipment."
- C. Cabinet Units: Suspend units from structural steel support frame using steel wire or metal straps.
- D. Install vibration isolation for equipment as specified in Division 23 Section "Vibration Isolation for HVAC Piping and Equipment."
- E. Arrange installation to provide access space around fans for service and maintenance.

3.3 ADJUSTING, CLEANING, AND PROTECTING

- A. Adjust damper linkages for proper damper operation.
- B. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel and cabinet.

3.4 STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:

1. Remove shipping blocking and bracing.
2. Verify fan assembly is secure on mountings and supporting devices and that connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
3. Perform cleaning and adjusting specified in this Section.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
6. Verify manual and automatic volume control and that fire and smoke dampers in connected ductwork systems are in the full-open position.
7. Disable automatic temperature control operators.

B. Starting procedures for fans:

1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
 - a. Replace fan and motor pulleys as required to achieve design conditions.
2. Measure and record motor electrical values for voltage and amperage.
3. Shut unit down and reconnect automatic temperature control operators.
4. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for air-handling-system testing, adjusting, and balancing.

3.5 DEMONSTRATION

A. Demonstration Services: Train Owner's maintenance personnel on the following:

1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals specified in Division 1 Section "Closeout Procedures" and Division 23 Section "General Mechanical Requirements."

B. Schedule training with at least 7 days' advance notice.

END OF SECTION

SECTION 15933 (233600) - AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Variable Air Volume Terminal Units
 - 1. Shutoff Single Duct
 - 2. Reheat

1.2 REFERENCE STANDARDS

- A. AHRI 410 – Standard for Forced-Circulation Air-Cooling and Air-Heating Coils.
- B. AHRI 880 – Performance Rating of Air Terminals.
- C. AHRI 885 – Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets.
- D. ASHRAE Std 130 – Methods of Testing Air Terminal Units.
- E. NFPA 90A – Standard for the Installation of Air-Conditioning and Ventilating Systems.
- F. UL 181 – Standard for Factory-Made Air Ducts and Air Connectors.
- G. UL 94 – Tests for Flammability of Plastic Materials for Parts in Devices and Appliances.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data, including performance data for each size and type of air terminal furnished; certified sound power data for each unit; schedule showing drawing designation, room location, number furnished, model number, size, and accessories furnished.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawings indicating dimensions, weight loadings, required clearances, methods of assembly of components and electrical characteristics and connection requirements.
- C. Certificates: Certify that coils are tested and rated in accordance with AHRI 410.
- D. Wiring Diagrams: Submit ladder-type wiring diagrams for electric power and control components, clearly indicating required field electrical connections.
- E. Nameplate Data: Nameplate data shall be submitted in a timely manner so as to allow proper coordination with the Electrical Contractor. Submittals that do not have nameplate data will be rejected.
- F. Manufacturer's Installation Instructions: Indicate support and hanging details, installation instructions, recommendations, and service clearances required.

- G. Project Record Documents: Record actual locations of units and locations of access doors required for access of valving.
- H. Operation and Maintenance Data: Include manufacturer's descriptive literature, operating instructions, maintenance and repair data, and parts lists. Include this data, product data, shop drawings, and maintenance data in maintenance manual; in accordance with requirements of Division 1.

1.4 QUALITY ASSURANCE

- A. ADC Compliance: Provide air terminals which have been tested and rated in accordance with ADC standards, and bear ADC Seal.
- B. UL/ETL Compliance: Air terminal units shall be UL or ETL listed as a complete assembly. All electrical components shall be UL listed and installed in accordance with the National Electric Code.
- C. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
- D. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

1.5 SPARE PARTS

- A. If HVAC equipment is used during construction, the contractor is fully responsible for it's cleaning just before substantial completion prior to testing and balancing.

PART 2 - PRODUCTS

2.1 VARIABLE AND CONSTANT AIR VOLUME TERMINAL UNITS

- A. Manufacturers:
 - 1. Carnes Co.
 - 2. Carrier Corp.; Sub. of United Technologies Corp.
 - 3. Environmental Technologies, Inc.
 - 4. Johnson Controls, Inc.
 - 5. Krueger Mfg. Co.
 - 6. Metalaire.
 - 7. Nailor Industries, Inc.
 - 8. Price Industries.
 - 9. Tempmaster Corp.
 - 10. Titus Products Div.; Philips Industries, Inc.
 - 11. Trane (The) Co.
- B. Construction
 - 1. Casings: Construct of galvanized sheet metal of minimum 22 gauge thickness or die-cast aluminum of minimum 20 gauge thickness.
 - a. Assembled with longitudinal lock seam construction.
 - b. Construct casings such that when subjected to 0.5-in w.g. pressure for low pressure units, and 3.0-in w.g. pressure for high pressure units, total leakage does not exceed 2% of specified air flow capacity with outlets sealed and inlets wide open.

2. Air Inlet Collar: Provide round, suitable for standard flexible duct sizes or rectangular where needed to meet airflow requirements.
 3. Unit Discharge: Rectangular, with slip-and-drive connections.
 4. Acceptable Liners:
 - a. Linings: Line inside surfaces of casings with fiberglass, lining material to provide acoustic performance, thermal insulation, and to prevent condensation on outside surfaces of casing. Provide minimum thickness of 1/2". Secure lining to prevent delamination, sagging, or settling.
 5. Access: Provide removable panels in casings to permit access to air dampers, fans and other parts requiring service, adjusting, or maintenance.
 - a. Provide airtight gasket and quarter-turn latches.
 6. Provide hanger brackets for attachment of supports.
 7. Multiple Duct Connectors: For air terminals serving more than one air outlet, provide lined outlet plenum with duct collar, butterfly-type damper, and locking device in each outlet.
- C. Primary Air Damper Assembly
1. Heavy-gauge, galvanized steel or extruded aluminum construction with solid steel, nickel-plated shaft pivoting on HDPE, self-lubricating bearings.
 2. Provide integral position indicator or alternative method for indicating damper position over full range of 90 degrees.
 3. Incorporate low leak damper blades for tight airflow shutoff.
 - a. Air Leakage Past Closed Damper: Maximum two percent of unit maximum airflow at 3 inch wg inlet static pressure, tested in accordance with ASHRAE Std 130.
- D. Electric Heating Coil:
1. Listed, open-coil design, factory-installed and slip-in-type, fully wired including integral control box.
 2. 80/20 nickel-chrome heating elements.
 3. Integral Control Panel: NEMA 250, Type 2 enclosure with hinged access door for access to all controls and safety devices.
 4. Mercury contactors.
 5. Secondary/primary over temperature protection.
 6. Airflow switch.
 7. Step Controller: Magnetic contactor (3-phase units only).
 8. Disconnect switch (non-interlocking).
 9. Fuses.
 10. Provide SCR (Silicon Controlled Rectifier) controller where indicated on the equipment schedule.
- E. Electrical Requirements:
1. Single-point power connection.
 2. Equipment wiring to comply with requirements of NFPA 70.
 3. All electrical components shall be UL or ETL listed or recognized and installed in accordance with the National Electrical Code.
 4. All electrical components shall be mounted in a control box.
 5. The entire assembly shall be UL or ETL listed (cETL in Canada) and so labeled.
- F. Control Transformers: Factory supplied and mounted for electric and electronic control applications.
- G. Controls: Provide controls accurate to 1.5 degrees F and adjustable from 65 degrees F to 85 degrees F. Provide air flow measurement station at terminal unit inlet. Provide control type as indicated below.
1. DDC (Direct Digital Control): Provide direct digital controls, compatible with direct digital control system specified in other Division 23 sections.
 - a. The unit level controller to include the following:
 - 1) 24 VAC power terminal or RJ-12 Power connection.

- 2) Port for thermostat connection.
- 3) Service Port for diagnostic equipment.
- 4) Damper actuator.
- 5) LED indication for troubleshooting.
- 6) Heating output signal(s).
- 7) Cooling output signal(s).
- 8) Supply air temperature sensor input.
- 9) Contact closure input.
- 10) BACNET communication capability.
- b. Include a factory-installed, unit-mounted direct-digital controller.
- c. Bi-directional Damper Actuator: 24 volt, powered closed, spring return open.
- d. Microprocessor-Based Controller: Air volume controller, pressure-independent with electronic airflow transducers, factory-calibrated maximum and minimum CFM's.
 - 1) Occupied and unoccupied operating mode.
 - 2) Remote reset of temperature or CFM set points.
 - 3) Proportional, plus integral control of room temperature.
 - 4) Monitoring and adjusting with portable terminal.
 - 5) Time-proportional reheat coil control.
- e. Room Sensor:
 - 1) Compatible with temperature controls specified.
 - 2) Wall-mounted, system powered, with temperature set-point adjustment including connection access for portable operator terminal.
2. Airflow Sensor: Differential pressure airflow device measuring total, static, and wake pressures.
 - a. Sensor Requirements:
 - 1) Plastic parts shall be fire-resistant, complying with UL 94.
 - 2) Control tubing shall be protected by grommets at the wall of the air flow sensor's housing.
 - 3) Furnished with multiple total and static pressure sensing ports and a center averaging chamber that amplifies the sensed air flow signal.
 - 4) Provide sensor with a pressure transducer to interface with the building control system.
 - b. Signal accuracy: Provide accuracy within 5 percent throughout the terminal unit operating range.
- H. Identification: Provide label on each unit indicating Plan Number, cfm range, cfm factory-setting, and calibration curve (if required).

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that conditions are suitable for installation.
- B. Verify that field measurements are as indicated on drawings.

3.2 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.
- B. Install the inlets of air terminal units and air flow sensors a minimum of three duct diameters from elbows, transitions, and duct takeoffs.

- C. Provide ceiling access doors or locate units above easily removable ceiling components.

3.3 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Reset volume with damper operator attached to assembly allowing flow range modulation from 100 percent of design flow to scheduled minimum flow.

3.4 FIELD QUALITY CONTROL

- A. Upon completion of installation and prior to initial operation, test and demonstrate that air terminals, duct connections to air terminals, and water coils are leak-tight.
 - 1. Leak Test:
 - a. Repair or replace air terminals and duct connections as required to eliminate leaks, and retest to demonstrate compliance.
 - b. Repair water leaks and retest until no leaks exist.
 - 2. Operational Test:
 - a. After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - b. Test and adjust controls and safeties.
 - c. Replace damaged and malfunctioning controls and other equipment.

3.5 CLEANING

- A. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15932 (233713) - DIFFUSERS, REGISTERS AND GRILLES

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Ceiling air diffusers.
- B. Registers and grilles.
- C. Drop box diffusers.
- D. Louvers.

1.2 REFERENCE STANDARDS

- A. ADC 1062 – Certification, Rating and Test Manual.
- B. AHRI 880 – Performance Rating of Air Terminals.
- C. AHRI 885 – Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets (with Addendum 1)
- D. AMCA 500 – Test Method for Louvers, Dampers and Shutters.
- E. ASHRAE 70 – Method of Testing the Performance of Air Outlets and Inlets.
- F. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
- G. NFPA 90A – Standard for the Installation of Air Conditioning and Ventilating Systems.
- H. NFPA 90B – Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.
- I. UL 723 – Standard for Test for Surface Burning Characteristics of Building Materials.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data for air outlets and inlets including the following:
 - 1. Schedule of air outlets and inlets indicating drawing designation, room location, number furnished, model number, size, and accessories furnished.
 - 2. Data sheet for each type of air outlet and inlet, and accessory furnished; indicating construction, finish, and mounting details. Indicate selections on product data.
 - 3. Performance data for each type of air outlet and inlet furnished, including aspiration ability, temperature and velocity traverses; throw and drop; and noise criteria ratings at specified airflows.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawing for each type of air outlet and inlet, indicating materials and methods of assembly of components.
- C. Maintenance Data: Submit maintenance data, including cleaning instructions for finishes, and spare parts lists. Include this data, product data, and shop drawings in maintenance manuals; in accordance with requirements of Division 1.

- D. Coordination Drawings: Reflected ceiling plans and wall elevations drawn to scale to show locations and coordination of diffusers, registers, and grilles with other items installed in ceilings and walls.
- E. Color Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for diffusers, registers, and grilles with factory-applied color finishes.

1.4 QUALITY ASSURANCE

- A. Test and rate air outlets and inlets in accordance with ASHRAE 70.
- B. Test and rate air outlets and inlets in certified laboratories under requirements of ADC 1062.
- C. Provide air outlets and inlets bearing ADC Certified Rating Seal.
- D. Test and rate sound data for air outlets and inlets in accordance with AHRI 885.
- E. Install air outlets and inlets in accordance with NFPA 90A.
- F. Test and rate louvers in accordance with AMCA 500.

1.5 SPARE PARTS

- A. Furnish to Owner, with receipt, 3 operating keys for each type of air outlet and inlet that require them.

PART 2 - PRODUCTS

2.1 CEILING AIR DIFFUSERS

- A. Manufacturers
 - 1. Carnes Co.
 - 2. Krueger Mfg. Co.
 - 3. Metalaire; Metal Industries, Inc.
 - 4. Nailor Industries, Inc.
 - 5. Price Industries, Inc.
 - 6. Titus HVAC
 - 7. Tuttle & Bailey; Div. of Air Systems Components, Inc.
- B. General: Except as otherwise indicated, provide manufacturer's standard ceiling air diffusers where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide ceiling air diffusers that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device as listed in manufacturer's current data.
- D. Ceiling Compatibility: Provide diffusers with border styles that are compatible with adjacent ceiling systems, and that are specifically manufactured to fit into ceiling module with accurate fit and adequate support. Refer to general construction drawings and specifications for types of ceiling systems which will contain each type of ceiling air diffuser.
- E. Types: Provide ceiling air diffusers of type, capacity, and with accessories and finishes as scheduled on the drawings.

2.2 REGISTERS AND GRILLES

- A. Manufacturers
 - 1. Carnes Co.
 - 2. Krueger Mfg. Co.
 - 3. Metalaire; Metal Industries, Inc.
 - 4. Nailor Industries, Inc.
 - 5. Price Industries, Inc.
 - 6. Titus HVAC
 - 7. Tuttle & Bailey; Div. of Air Systems Components, Inc.
- B. General: Except as otherwise indicated, provide manufacturer's standard registers and grilles where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide registers and grilles that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device and listed in manufacturer's current data.
- D. Ceiling Compatibility: Provide registers and grilles with border styles that are compatible with adjacent ceiling systems, and that are specifically manufactured to fit into ceiling module with accurate fit and adequate support. Refer to general construction drawings and specifications for types of ceiling systems which will contain each type of register and grille.
- E. Wall Compatibility: Provide registers and grilles with border styles that are compatible with adjacent wall systems, and that are specifically manufactured to fit into wall construction with accurate fit and adequate support. Refer to general construction drawings and specifications for types of wall construction which will contain each type of wall register and grille.
- F. Types: Provide registers and grilles of type, capacity, and with accessories and finishes as scheduled on the drawings.

2.3 DROP BOX DIFFUSERS

- A. Manufacturers
 - 1. AES Industries
 - 2. Carnes Co.
 - 3. EP Custom Products
 - 4. Kees
 - 5. Plenums Inc.
 - 6. Ruskin
- B. General: Except as otherwise indicated, provide manufacturer's standard drop box diffusers where shown; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.
- C. Performance: Provide drop box diffusers that have, as minimum, temperature and velocity traverses, throw and drop, and noise criteria ratings for each size device and listed in manufacturer's current data.
- D. Construction: Drop box diffusers shall be minimum 22 gauge galvanized steel construction, factory assembled and welded, and provided with standard duct connections and mounting brackets for field installation. Diffusers shall have double deflection grilles or drum louvers that are individually adjustable to customize horizontal and vertical throws and factory installed air diverters or turning vanes.
- E. Diffusers shall be insulated with 1" thick, 1.5 lb duct liner insulation.

F. Diffusers shall have be factory primed and painted, color as selected by the Architect.

2.4 LOUVERS

A. Manufacturers: Subject to compliance with requirements, provide louvers of one of the following:

1. American Warming & Ventilating Inc.
2. Arrow United Industries, Inc.
3. Carnes Co.; Div. of Wehr Corp.
4. Cesco
5. Greenheck
6. Industrial Louvers, Inc.
7. Louvers & Dampers, Inc.
8. Nailor Industries, Inc.
9. Pottorff
10. Ruskin Mfg. Co.
11. Tampco.

B. General: Except as otherwise indicated, provide manufacturer's standard louvers as scheduled or indicated on the drawings; of size, shape, capacity and type indicated; constructed of materials and components as indicated, and provided with accessories as required for a complete installation.

C. Performance: Provide louvers that have minimum free area, and maximum pressure drop of each type as listed in manufacturer's current data, complying with louver schedule.

1. Structural Performance: Louvers shall withstand the effects of gravity loads and wind and/or seismic loads as defined in the applicable building code for the installed location without permanent deformation of louver components, noise or metal fatigue caused by louver-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.
2. Seismic Performance: Louvers, including attachments to other construction, shall withstand the effects of earthquake motions to meet seismic requirements specified on the drawings or in Division 23 Section 230548 "Seismic Controls for Mechanical Systems". Component importance factor shall be 1.0.

D. Substrate Compatibility: Provide louvers with frame and sill styles that are compatible with adjacent substrate, and that are specifically manufactured to fit into construction openings with accurate fit and adequate support, for weatherproof installation. Refer to general construction drawings and specifications for types of substrate which will contain each type of louver.

E. Materials: Construct of aluminum extrusions, ASTM B 221, Alloy 6063-T52. Weld units or use stainless steel fasteners.

F. Louver Screens: On inside face of exterior louvers, provide 1/2" square mesh anodized aluminum wire bird screens mounted in removable extruded aluminum frames.

G. Louver Supports: Louver design shall limit span between visible mullions to 10' and shall incorporate structural supports required to withstand a wind load of 20 lbs. per sq. ft.

H. Intermediate Blade Supports: Where needed blade supports shall be provided by louver manufacturer on the rear of blade only.

I. Louver Blank-Off Panels: Blank off any unused portions of louver with lined galvanized sheet metal panels and seal airtight. Back of panels shall be insulated with 1" thick, 3 lb. density duct liner.

J. Special Considerations:

- 1.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine areas and conditions under which air outlets and inlets are to be installed for compliance with installation tolerances and conditions that would affect the performance of the equipment. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General: Install air outlets and inlets in accordance with manufacturer's written instructions, design drawings, referenced standards, and in accordance with recognized industry practices to ensure that products serve intended function.
- B. Coordinate with other work, including ductwork and duct accessories, to interface installation of air outlets and inlets with other work.
- C. Where a 90-degree elbow is required at the connection to air devices, provide a rigid duct elbow or, at Contractor's option, a flexible elbow assembly as specified in Division 23 section "Air Duct Accessories".
- D. Locate ceiling air diffusers, registers, and grilles, as indicated on general construction "Reflected Ceiling Plans". Unless otherwise indicated, locate units in center of acoustical ceiling module.
- E. Linear Slot Diffuser Installation:
 - 1. For installations in a hard ceiling, install diffuser prior to installation of drywall. Use manufacturer's hard ceiling clips for mounting to ceiling framing. Screws through face of diffuser are not acceptable.

3.3 ADJUSTING

- A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before beginning air balance.

3.4 CLEANING

- A. After installation of diffusers, registers, and grilles, inspect exposed finish. Clean exposed surfaces to remove dirt and smudges. Replace any air device that has damaged finishes.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15885 (234100) - PARTICULATE AIR FILTRATION

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. Extent of air cleaning work required by this Section is indicated on drawings and schedules, and by requirements of this Section.
- B. Types of air cleaning equipment specified in this Section include the following:
 - 1. Air Filters
 - a. Cleanable (washable)
 - b. Replaceable (throwaway) panel and pleated
 - 2. Filter Holding Systems
 - a. Front and Rear Access Filter Frames
 - b. Side Servicing Housings
- C. Filter sections of packaged air handling units are work of this section.

1.2 QUALITY ASSURANCE

- A. Codes and Standards:
 - 1. NFPA Compliance: Comply with applicable portions of NFPA 90A and 90B, and NEC pertaining to installation of air filters and associated electric wiring and equipment.
 - 2. UL Compliance: Comply with UL Standards pertaining to safety performance of air filter units.
 - 3. ASHRAE Compliance: Comply with provisions of ASHRAE Standard 52 for method of testing, and for recording and calculating air flow rates.
 - 4. AHRI Compliance: Comply with provisions of AHRI Standard 850 pertaining to test and performance of air filter units.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data including, dimensions, weights, required clearances and access, flow capacity including initial and final pressure drop at rated air flow, efficiency and test method, fire classification, and installation instructions.
- B. Shop Drawings: Submit manufacturer's assembly-type shop drawings for filter rack assemblies indicating dimensions, materials, and methods of assembly of components.
- C. Maintenance Data: Submit maintenance data and spare parts lists for each type of filter and rack required. Include this data, product data, shop drawings, and wiring diagrams in maintenance manual; in accordance with requirements of Division 1.

1.4 SPARE PARTS

- A. Provide one complete spare set of filters of each type required for each air handling system. Obtain receipt from Owner that spare filters have been provided. In addition to the spare set of filters, install new filters at completion of air handling system work, and prior to testing, adjusting, and balancing work.

PART 2 - PRODUCTS AND MATERIALS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide air cleaning equipment of one of the following:
 - 1. Air Filters
 - a. AAF/Flanders.
 - b. Bioclimatic Air Systems
 - c. Columbus Industries, Inc..
 - d. Camfil Farr.
 - e. Filtration Group
 - f. Koch Filter Corp.
 - g. Research Products Corp.

2.2 AIR FILTERS

- A. Replaceable (Throwaway) Panel Filters: Provide factory-fabricated, viscous-coated, panel type replaceable air filters with holding frames; as indicated, in sizes indicated or sized for maximum velocity indicated, with 2" thick UL Class 2 throwaway media material; construct media of interlaced glass fibers, spray with non-flammable adhesive, frame in throwaway fiberboard casings, and sandwich between perforated metal grilles. Construct ductwork-holding frames of 20-ga galvanized steel, capable of holding media and media frame in place, and gasketed to prevent unfiltered air by-passing between media frames and holding members. Provide filters with rated face velocity of 500 fpm, initial resistance of not greater than 0.30" w.g., final rated resistance of 0.90" w.g., and average arrestance of 80 percent.
- B. Replaceable (Throwaway) Pleated Filters: Provide factory-fabricated, pleated type, replaceable air filters with holding frames; as indicated, in sizes indicated or sized for maximum velocity indicated, with 2 inch thick UL Class 2 throwaway media material. Construct filter of a synthetic media, framed in throwaway fiberboard casings with diagonal bracing to adequately support the media on the entering and exiting side of the filter. Provide media support grid of welded wire construction coated with rust inhibitor. Construct ductwork-holding frames of 20-ga galvanized steel, capable of holding media and media frame in place, and gasketed to prevent unfiltered air by-passing between media frames and holding members. Provide 2 inch filters with initial resistance of not greater than 0.40 inches w.g. for 2 inch thick at 500 fpm. Filters shall have final rated resistance of 0.9 inches w.g. or greater, average efficiency of 85 percent and average arrestance of 98 percent. The minimum MERV when tested under ASHRAE 52.2 shall be no less than MERV 13.

2.3 FILTER HOLDING SYSTEMS

- A. Front and Rear Access Filter Frames: Provide filter bank framing system, constructed of aluminum framing members having minimum thickness of 0.09". Design system for either upstream (front) or downstream (rear) filter servicing. Cut to size and pre-punch members for each assembly into modules of size and capacity or maximum velocity as scheduled or noted on drawings. Provide permanently gasketed framing members to prevent bypass of unfiltered air. If vertical support members are required to prevent deflection of horizontal members, install so as not to interfere with either installation or operation of filters. Incorporate separate track for prefilters, removable from front, or removable from back after removal of after-filters. Provide factory-installed positive sealing device for each row of filters, to insure seal between gasketed filter elements. Provide hardware necessary for field assembly.
- B. Side Servicing Housings: Provide factory-assembled side servicing housings with flanges for insertion into ductwork system as indicated. Construct of 16-ga galvanized steel. Provide integral pre-filter tracks to accommodate 2" throw-away or cleanable filters. Provide access doors with continuous gasketing on

perimeter and positive locking devices. Incorporate positive-sealing gasket material on channels to seal top and bottom of filter cartridge frames to prevent bypass. Arrange so filter cartridge can be loaded from either access door.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install products in accordance with manufacturer's instructions and comply with installation requirements as specified elsewhere in these specifications pertaining to air filters housing/casings, and associated supporting devices.
- B. Install air filters and holding devices of types indicated, and where shown; in accordance with air filter manufacturer's written instructions and with recognized industry practices; to ensure that filters comply with requirements and serve intended purposes.
- C. Locate each filter unit accurately in position indicated, in relation to other work. Position unit with sufficient clearance for normal service and maintenance. Anchor filter holding frames securely to substrate.
- D. Coordinate with other work including ductwork and air handling unit work, as necessary to interface installation of filters properly with other work.
- E. Install filters in proper position to prevent passage of unfiltered air.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15792 (238126) - SPLIT SYSTEM AIR-CONDITIONERS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Section includes split-system air-conditioning and heat-pump units consisting of separate evaporator-fan and compressor-condenser components.
 - 1. Indoor evaporator fan coil units.
 - 2. Outdoor condenser units.

1.2 RELATED REQUIREMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division1 Specification Sections apply to this Section.
- B. Section 221300 - Plumbing Piping for condensate drains.
- C. Section 230500 – Common Work Results for HVAC for concrete, reinforcement, and formwork requirements.
- D. Section 230529 – Hangers and Supports for HVAC Piping and Equipment.
- E. Section 230550 – Vibration Isolation for HVAC Piping and Equipment.
- F. Section 230593 - Testing, Adjusting, and Balancing for HVAC for unit balancing.
- G. Section 230913 - Instrumentation and Control Devices for HVAC: Thermostats, humidistats, timeclocks.
- H. Section 230923 – Direct Digital Control for HVAC for installing external control components.
- I. Section 232300 – Refrigerant Piping for refrigerant piping connecting the system.
- J. Section 233113 – Metal Ducts for ductwork connecting to units.
- K. Section 262717 – Equipment Wiring: Electrical characteristics and wiring connections.
- L. Section 233300 – Air Duct Accessories.

1.3 REFERENCE STANDARDS

- A. AHRI 210/240 - Standard for Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment; most current edition.
- B. ASHRAE Std 15 - Safety Standard for Refrigeration Systems; most current edition.
- C. NFPA 70 – National Electric Code.

1.4 SUBMITTALS

- A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power

characteristics, motor requirements, type of refrigerant used, refrigerant pipe sizing, and electrical characteristics. Provide short circuit current rating of units with factory mounted starter or variable frequency drive.

- B. Shop Drawings: Provide drawings that indicate size, profile, dimensions, weights, loadings, required clearances, method of field assembly, components, and location and size of each field connection.
- C. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring.
- D. Operation and Maintenance Data: Include start-up instructions, maintenance data, parts lists, controls, accessories, and trouble-shooting guide.
 - 1. Include manufacturer's recommended maintenance schedule of units installed in a seacoast application, within 5 miles of the coast.
- E. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

- A. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Code for Mechanical Refrigeration."
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Units shall be designed to operate with HCFC-free refrigerants.
- D. Units shall be tested by a Nationally Recognized Testing Laboratory (NRTL), in accordance with ANSI/UL 1995 and bear the Listed Mark.
- E. The system components shall be rated in accordance with AHRI Standard 210/240, Performance Rating of Unitary Air-Conditioning & Air-Source Heat Pump Equipment.

1.6 COORDINATION

- A. Coordinate layout and installation of units and suspension components with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.
- B. Coordinate installation of roof curbs, equipment supports, and roof penetrations with roof construction and actual equipment provided. Roof specialties are specified in Division 7 Sections. Concrete, reinforcement and formwork are specified in Division 3 Sections.

1.7 WARRANTY

- A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: A written warranty, executed by the manufacturer and signed by the Contractor, agreeing to replace components that fail in materials or workmanship within the specified warranty period, provided manufacturer's written instructions for installation, operation, and maintenance have been followed.
 - 1. Warranty Period, Compressors: Manufacturers standard, but not less than 5 years after date of Substantial Completion.

1.8 SPARE PARTS

- A. General: Furnish to Owner, with receipt, the following spare parts described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
1. Fan Belts: One set for each belt-drive fan.
 2. Gaskets: One set for each access door.
 3. One set of spare filters of each type required for each unit.
 4. If HVAC equipment is used during the construction period, Contractor shall provide one set of filters (if system is designed to include pre-filters and after-filters, provide only pre-filters) when the unit is started and replace filters when needed, but not less than every month. On the day of substantial completion, the Contractor shall clean the unit and provide a new set of filters at each location in the unit.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carrier.
 2. Daikin US Corporation.
 3. Friedrich Air Conditioning Company.
 4. Lennox Industries, Inc..
 5. LG.
 6. Mitsubishi Electric & Electronics USA, Inc.
 7. Panasonic.
 8. Trane.
 9. York.

2.2 INDOOR UNITS

- A. General: Self-contained, packaged, factory assembled, pre-wired unit consisting of cabinet, supply fan, heating and cooling element(s), controls, and accessories; wired for single power connection with control transformer.
- B. Cabinet: Steel with baked enamel finish, easily removed and secured access doors with safety interlock switches, glass fiber insulation with reflective liner.
- C. Supply Fan: Centrifugal type rubber mounted with direct or belt drive with adjustable variable pitch motor pulley.
- D. Motor: Comply with NEMA designation temperature rating, service factor, enclosure type, and efficiency requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
- E. Air Filters: Washable type for wall-mount units, minimum 1 inch thick throwaway type for all other units, unless scheduled otherwise.
- F. Evaporator Coils: Copper tube aluminum fin assembly, galvanized or polymer drain pan sloped in all directions to drain, drain connection, refrigerant piping connections, restricted distributor or thermostatic expansion valve.
- G. Electric Heating Coil: Nickel-chrome, resistance-wire heating elements; with refractory ceramic support bushings, automatic-reset thermal cutout, built-in magnetic contactors, manual-reset thermal cutout, airflow proving device, and one-time fuses in terminal box for overcurrent protection.

- H. Gas Furnace: Atmospheric burner, gas valve with 100 percent safety gas shut-off; pressure regulation, safety pilot, manual set (On-Off), pilot filtration, and automatic electric valve.
 - 1. Burner Safety Controls:
 - a. Thermocouple Sensor: Prevents opening of gas valve until pilot flame is proven and stops gas flow on ignition failure.
 - b. Flame Rollout Switch: Installed on burner box and prevents operation.
 - c. Vent Safety Shutoff Sensor: Temperature sensor installed on draft hood and prevents operation, manual reset.
 - d. Limit Control: Fixed stop at maximum permissible setting, de-energizes burner on excessive bonnet temperature, automatic reset.
- I. Controls: Unit-mounted panel with contactors, control transformer with circuit breaker, solid-state temperature- and humidity-control modules, time-delay relay, and thermostat.
- J. Where scheduled on the drawings, provide condensate lift pump with a built-in safety cutoff switch and integral check valve on discharge.

2.3 OUTDOOR UNITS

- A. General: Self-contained, packaged, pre-wired unit consisting of cabinet, with compressor and condenser.
- B. Air-Cooled Condenser:
 - 1. General: Aluminum fin and copper tube coil, AHRI 520 with direct drive axial propeller fan resiliently mounted, galvanized fan guard.
 - 2. Casing: Steel, baked enamel finish, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.
 - 3. Compressor: Hermetic scroll-type with resilient suspension system, oil strainer, crankcase heater, start capacitor, relay, contactor, and internal motor overload protection.
 - 4. Accessories:
 - a. Liquid line filter drier.
 - b. High pressure switch (manual reset).
 - c. Low pressure switch (automatic reset).
 - d. Service valve with gauge ports.
 - e. Thermometer well in liquid line.
 - f. Low-ambient kit where scheduled.
 - g. Compressor short-cycling controls.
 - h. Reversing valve for heat pump units.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine area for compliance with requirements for installation tolerances and other conditions affecting performance of units. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Verify that flooring or ceiling system is ready to receive work and opening dimensions are as indicated on Shop Drawings.
- C. Verify that power supply is available and of the correct characteristics.

3.2 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.

- B. Install unit level and plumb.
- C. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.
- D. Install roof-mounted, compressor-condenser components on roof equipment supports with vibration isolation. Anchor units to supports with removable, cadmium-plated fasteners.
- E. Install ground-mounted, compressor-condenser components on cast-in-place concrete equipment base or polyethylene mounting base with vibration isolators.

3.3 CONNECTIONS

- A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate the general arrangement of piping. The following are specific connection requirements:
 1. Arrange piping installations adjacent to units to allow unit servicing and maintenance.
 2. Connect piping to air-handling units with flexible connectors.
 3. Connect water supply piping to the air leaving side of water coils.
 4. Connect hydronic piping to supply and return coil connections with shutoff-duty valve and union or flange on the supply connection and with throttling-duty valve and union or flange on the return connection.

- B. Where piping is installed adjacent to unit, allow space for service and maintenance of unit.
- C. Route unit condensate drain to location shown on the drawings or, if not shown, to nearest indirect waste connection. Provide trap at drain pan, minimum of 1 inch deeper than fan pressure in inches of water, and install cleanouts at changes in direction. Size condensate drain piping in accordance with local code and the following:

<u>Piping Length</u>	<u>Size</u>
Less than 10 feet	Same size as unit connection
More than 10 feet	One pipe size larger than unit connection

- D. Duct Connections: Duct installation requirements are specified in Section 233113 "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect ductwork to units with flexible duct connectors. Flexible duct connectors are specified in Section 233300 "Air Duct Accessories." Provide transitions to exactly match unit duct connection size.

3.4 ADJUSTING, CLEANING, AND PROTECTING

- A. Adjust fan for required airflow in accordance with Section "Testing, Adjusting and Balancing." Tighten belts as required for proper operation.
- B. Adjust water coil flow, with control valves to full coil flow, to indicated gpm.
- C. Adjust damper linkages for proper damper operation.
- D. Set initial temperature and humidity set points.
- E. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, intake plenum cabinet, heat exchange surfaces, cooling/heating coil sections, filter sections, access sections, etc.

3.5 STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:

1. Remove shipping, blocking, and bracing.
 2. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects. Verify vibration isolation and flexible connections are installed correctly.
 3. Perform cleaning and adjusting specified in this Section.
 4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
 5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
 6. Set outside-air and return-air mixing dampers to minimum outside-air setting.
 7. Comb coil fins for parallel orientation.
 8. Install new filters at completion of installation and prior to testing, adjusting, and balancing. Do not operate air handling unit without pre-filters installed.
 9. Verify manual and automatic volume control, and fire and smoke dampers in connected ductwork systems are in the full-open position.
 10. Disable automatic temperature control operators.
- B. Start-Up Services: Start-up units in accordance with manufacturer's written start-up instructions. Do not operate units without filters installed. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
1. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
 - a. Replace fan and motor pulleys as required to achieve design conditions.
 - b. Measure and record motor electrical values for voltage and amperage.
 - c. Shut unit down and reconnect automatic temperature control operators.
 - d. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for system testing, adjusting, and balancing.

3.6 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.
- D. Prepare test and inspection reports.

3.7 DEMONSTRATION

1. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of two hours on the operation and maintenance of the equipment provided under this section.
2. Content: Training shall include but not be limited to:
 - a. Overview of the system and/or equipment as it relates to the facility as a whole.
 - b. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.

- c. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
3. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.
4. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 15787 (238149) - ROOFTOP HEAT PUMP UNITS

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. Section includes package rooftop heating and cooling heat pump units.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data, including rated capacities of selected model clearly indicated, dimensions, required clearances, weights, furnished specialties and accessories; and installation and start-up instructions. Provide short circuit current rating of units with factory mounted starter or variable frequency drive.
- B. Shop Drawings:
 - 1. Submit manufacturer's assembly-type shop drawings indicating dimensions, required clearances, and methods of assembly of components
 - 2. Submit shop drawings detailing the mounting, securing, and flashing of the roof curb to the roof structure. Indicate coordinating requirements with roof membrane system.
- C. Wiring Diagrams: Submit wiring diagrams detailing the manufacturer's electrical requirements for power supply wiring for rooftop heating and cooling heat pump units. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
- D. Operation and Maintenance Data: Submit maintenance data and parts list for each heat pump unit, including "trouble-shooting" maintenance guide, servicing guide and preventative maintenance schedule and procedures. Include this data in maintenance manual; in accordance with requirements of Division 1.

1.3 QUALITY ASSURANCE

- A. Codes and Standards:
 - 1. Testing and rating of rooftop units of 135,000 btu/hr capacity or over shall be in accordance with AHRI 360 "Standard for Commercial and Industrial Unitary Air-Conditioning Equipment".
 - 2. Testing and rating of rooftop units under 135,000 btu/hr capacity shall be in accordance with AHRI 210 "Standard for Unitary Air-Conditioning Equipment", and provide Certified Rating Seal. Sound testing and rating of units shall be in accordance with AHRI 270 "Standard for Sound Rating of Outdoor Unitary Equipment". Units shall bear Certified Rating Seal.
 - 3. Refrigerating system construction of rooftop units shall be in accordance with ASHRAE 15 "Safety Code for Mechanical Refrigeration".
 - 4. Energy Efficiency Ratio (EER) of rooftop units shall be equal to or greater than prescribed by ASHRAE 90.1-2004 "Energy Standard For Buildings Except Low-Rise Residential Buildings".
 - 5. Rooftop units shall be listed by UL and have UL label as a unit.
 - 6. Rooftop units shall be designed, manufactured, and tested in accordance with UL requirements.

1.4 SPARE PARTS

- A. Extra Materials: Furnish to Owner, with receipt, the following spare parts for each rooftop heating and cooling heat pump unit:
 - 1. One set of matched fan belts for each belt-driven fan.

2. One set of spare filters of each type required for each unit. Obtain receipt from Owner that spare filters have been provided. In addition to the spare set of filters, install new filters at completion of installation work, and prior to testing, adjusting, and balancing work.
3. If HVAC equipment is used during the construction period, Contractor shall provide one set of filters (if system is designed to include pre-filters and after-filters, provide only pre-filters) when the unit is started and replace filters when needed, but not less than every month. On the day of substantial completion, the Contractor shall clean the unit and provide a new set of filters at each location in the unit.

1.5 SPECIAL WARRANTY

- A. Warranty on Compressor and Heat Exchanger: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, compressors and heat exchangers with inadequate and defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement is limited to component replacement only, and does not include labor for removal and reinstallation.
 1. Warranty Period: 5 years from date of substantial completion.

PART 2 - PRODUCTS AND MATERIALS

2.1 ROOFTOP HEAT PUMP UNITS LESS THAN 20 TONS

- A. Manufacturers: Subject to compliance with requirements, provide rooftop heat pump units of one of the following:
 1. Aaon, Inc.
 - a. Rob Teis – Sales Engineer, AAON Inc., robt@aaon.com, p: 918-382-6134
 2. Lennox Industries, Inc.
 - a. Eddie Chavez – Strategic Account Manager, Lennox International,
- B. General Description: Units shall be factory-assembled and tested, designed for roof installation, and consisting of compressors, condensers, evaporator coils, condenser and evaporator fans, refrigeration and temperature controls, filters, and dampers. Capacities and electrical characteristics are scheduled on the Drawings.
- C. Casing: Manufacturer's standard casing construction, having corrosion protection coating, and exterior finish. Casings shall have removable panels or access doors for inspection and access to internal parts, a minimum of 1/2" thick thermal insulation, knockouts for electrical and piping connections and an exterior condensate drain connection and lifting lugs.
- D. Roof Curbs: Refer to Section "Vibration Isolation for HVAC Piping and Equipment" for vibration isolation curbs. Curb shall be sloped to match roof structure to enable the rooftop unit to be installed level.
- E. Evaporator Fans: Forward-curved, centrifugal, belt-driven fans with adjustable sheaves or direct-driven fans; and permanently lubricated motor bearings.
- F. Condenser Fans: Propeller-type, direct-driven fans with permanently lubricated bearings.
- G. Motors: Refer to Section "Common Motor Requirements for HVAC Equipment" for requirements.
- H. Coils:
 1. General: Aluminum plate fin and seamless copper tube type. Fins shall have collars drawn, belled and firmly bonded to the tubes by means of mechanical expansion of the tubes. No soldering or tinning shall be used in the bonding process. Coils shall have a galvanized steel casing. Coils shall

- be mounted in the coil casing with same end connections accessible for service. Coils shall be removable from the unit through the roof or through the piping enclosure. Coil section shall be completely insulated.
2. Water Coils: Continuous tube type, designed for 200 psi working pressure and pressure tested to 300 psig with air pressure under water.
 3. Refrigerant Cooling Coils: Coils shall have an equalizing type vertical distributor to ensure each coil circuit receives the same amount of refrigerant. Coils shall be designed for 300 psig working pressure and pressure tested at 450 psig., then cleaned, dehydrated, and sealed with a holding charge of refrigerant. Provide 1 inch factory installed flexible elastomeric insulation around the suction and liquid lines not directly located above a condensate drain pan. If any piping is exposed to sunlight, provide UV protective coating.
- I. Compressors: Provide serviceable, semi-hermetic, or fully hermetic compressors, complete with integral vibration isolators and crankcase heaters.
1. For heat pump units, provide reversing valve, suction line accumulator, flow control check valve, and solid state defrost control utilizing thermistors.
- J. Safety Controls: Provide manual reset type for:
1. Low pressure cutout;
 2. High pressure cutout;
 3. Compressor motor overload protection.
- K. Electric Heat Sections: Provide electric heat coils, of manufacturer's standard construction, factory-wired for single point wiring connection, complete with over-current and over-heat protection devices.
- L. Dampers:
1. General: Dampers and their operators shall comply with performance requirements specified in Division 23 Section "Instrumentation and Control Devices for HVAC."
 2. Outdoor Air Damper:
 - a. Provide outside air damper constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals. Damper blades shall be gear driven.
 - b. Refer to schedules on the drawings for capacity and control method of the outdoor air damper of each unit.
- M. Economizer Control:
1. Provide economizer system complete with return and outside air dampers, outside air filter, fully modulating electric control system with dry bulb or enthalpy economizer control as scheduled on the drawings, and adjustable mixed-air thermostat.
 2. System shall have 100 percent outside air capability.
 3. Provide automatic changeover through adjustable control device.
- N. Relief Control:
1. Power Exhaust Fan: Direct drive, propeller type designed for low tip speed. Motors shall be open drip-proof with internal motor protection and permanently lubricated ball bearings.
 2. Damper: Include a relief damper with control type as scheduled on the drawings.
- O. Filters Section: Provide 1" thick for units 7-1/2 tons and smaller, 2" thick for units larger than 7-1/2 tons, throwaway pleated filters, Farr 30/30 or approved equal, in filter rack, with maximum face velocity of 400 fpm. Filters shall have minimum MERV rating per ASHRAE 52.2 of MERV 7.
- P. Electrical: Units shall have a 115 VAC convenience outlet, separately fused, for unit service. Unit power connection shall be either through unit cabinet or within roof curb perimeter. Rooftop units shall be designed to meet the minimum short-circuit withstand rating specified on the drawings.

- Q. Accessories: Units shall include the following accessories:
1. Low ambient control head pressure control, designed to operate at temperatures down to 25 deg F, where indicated on schedule.
 2. Thermostat: Assembly shall provide for staged heating and cooling with manual or automatic changeover on standard subbase. Refer to controls specification, Section 17110.
 3. Provide guards to protect the condenser coil from hail or other damage.
 4. Provide birdscreens on outside air inlets to unit.

2.2 ROOFTOP HEAT PUMP UNITS 20 TONS AND LARGER

- A. Manufacturers: Subject to compliance with requirements, provide rooftop units of one of the following:
1. Aaon, Inc.
 - a. Rob Teis – Sales Engineer, AAON Inc., robt@aaon.com, p: 918-382-6134
 2. Lennox Industries, Inc.
 - a. Eddie Chavez – Strategic Account Manager, Lennox International,
- B. General Description: Rooftop unit shall be factory-assembled and tested, designed for roof installation and, consisting of compressors, condensers, evaporator coils, condenser and evaporator fans, refrigeration and temperature controls, filters, and dampers. Capacities and electrical characteristics are scheduled on the Drawings.
- C. Casing shall be manufacturer's standard casing construction, having corrosion protection coating, and exterior finish. Casings shall have removable panels or access doors for inspection and access to internal parts, a minimum of 1" thick thermal insulation, knockouts for electrical and piping connections, and an exterior condensate drain connection, and lifting lugs.
- D. Roof Curbs: Refer to Section "Vibration Isolation for HVAC Piping and Equipment" for vibration isolation curbs. Curb shall be sloped to match roof structure to enable the rooftop unit to be installed level.
1. Overall Roof Curb Height: Minimum 12 inches for roofs with no insulation, 15" for roofs with insulation or as scheduled on the drawings.
- E. Evaporator Fans: Forward-curved, centrifugal, belt-driven fans with adjustable sheaves; and permanently lubricated motor bearings.
- F. Condenser Fans: Propeller-type, direct-driven fans with permanently lubricated bearings.
- G. Motors: Refer to Section "Common Motor Requirements for HVAC Equipment" for requirements.
- H. Coils:
1. General: Aluminum plate fin and seamless copper tube type. Fins shall have collars drawn, belled and firmly bonded to the tubes by means of mechanical expansion of the tubes. No soldering or tinning shall be used in the bonding process. Coils shall have a galvanized steel casing. Coils shall be mounted in the coil casing with same end connections accessible for service. Coils shall be removable from the unit through the roof or through the piping enclosure. Coil section shall be completely insulated.
 2. Continuous tube type, and proof (300 psig) and leak (200 psig) tested with air pressure under water.
 3. Refrigerant Cooling Coils: Coils shall have an equalizing type vertical distributor to ensure each coil circuit receives the same amount of refrigerant. Coils shall be proof (450 psig) and leak (300 psig) tested with air pressure under water, then cleaned, dehydrated, and sealed with a holding charge of refrigerant. Provide 1 inch factory installed flexible elastomeric insulation around the suction and liquid lines not directly located above a condensate drain pan. If any piping is exposed to sunlight, provide UV protective coating.

- I. Compressors: Provide serviceable, semi-hermetic, or hermetic compressors with integral vibration isolators, and crankcase heaters which de-energize during compressor operation. Units shall also have:
 - 1. Cylinder unloaders for capacity control, with minimum steps as scheduled.
 - 2. For heat pump units, provide reversing valve, suction line accumulator, flow control check valve, and solid state defrost control utilizing thermistors.
 - 3. Thermal expansion valves, filter dryers, sight glasses, compressor service valves, liquid line service valves; minimum of 2 refrigerant circuits for units having 2 or more compressors; and fan-cycling control for low ambient control to 25 deg F (2 deg C).

- J. Safety Controls: Provide the following:
 - 1. Low pressure cutout, manual reset;
 - 2. High pressure cutout, manual reset;
 - 3. Compressor motor overload protection, manual reset;
 - 4. Anti-recycling timing device;
 - 5. Adjustable low-ambient lockout;
 - 6. Oil pressure switch.

- K. Electric Heat Sections: Provide manufacturer's standard construction electric heat coils, factory-wire for single point wiring connection, complete with over-current and over-heat protection devices.

- L. Dampers:
 - 1. General: Dampers and their operators shall comply with performance requirements specified in Division 23 Section "Instrumentation and Control Devices for HVAC."
 - 2. Outdoor Air Damper:
 - a. Provide outside air damper constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals. Damper blades shall be gear driven.
 - b. Refer to schedules on the drawings for capacity and control method of the outdoor air damper of each unit.

- M. Economizer Control:
 - 1. Provide economizer system complete with return and outside air dampers, outside air filter, fully modulating electric control system with dry bulb or enthalpy economizer control as scheduled on the drawings, and adjustable mixed-air thermostat.
 - 2. System shall have 100 percent outside air capability.
 - 3. Provide automatic changeover through adjustable control device.

- N. Relief Control:
 - 1. Power Exhaust Fan: Direct drive, propeller type designed for low tip speed. Motors shall be open drip-proof with internal motor protection and permanently lubricated ball bearings.
 - 2. Damper: Include a relief damper with control type as scheduled on the drawings.

- O. Filters Section: 2" thick throwaway pleated filters, Farr 30/30 or approved equal, in filter rack, with maximum face velocity of 400 fpm. Filters shall have MERV rating per ASHRAE 52.2 of MERV 7.

- P. Variable Air Volume Control: Provide variable frequency drive to modulate fan to meet specified sequence of operation. Refer to Division 23 Section "Variable Frequency Drives".

- Q. Electrical: Units shall have a 115 VAC convenience outlet, separately fused, for unit service. Unit power connection shall be either through unit cabinet or within roof curb perimeter. Rooftop units shall be designed to meet the minimum short-circuit withstand rating specified on the drawings.

- R. Temperature Control: Provide factory-installed, demand-oriented solid-state control system with minimum of 2 cooling steps and 2 heating steps. Controls shall include solid-state thermostats with dead-band, and sub-base with system and fan switches. Other control features include:
 - 1. Discharge temperature reset capability with space temperature override;
- S. Accessories: Units shall include the following accessories:
 - 1. Anti-recycling control to automatically prevent compressor restart for 5-minutes after shutdown.
 - 2. Low ambient control head pressure control, designed to operate at temperatures down to 25 deg F, where indicated on schedule.
 - 3. Thermostat: Assembly shall provide for staged heating and cooling with manual or automatic changeover on standard subbase. Coordinate with control system specification section.
 - 4. Provide guards to protect the condenser coil from hail or other damage.
 - 5. Provide birdscreens on outside air inlets to units.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions under which rooftop units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 INSTALLATION OF ROOFTOP HEATING AND COOLING HEAT PUMP UNITS

- A. General: Install units in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances.
- B. Support: Support units on roof curb.
- C. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer's wiring diagram submittal to electrical installer.
 - 1. Verify that electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division-26 sections. Do not proceed with equipment start-up until wiring installation is acceptable to equipment Installer.
- D. Ductwork: Refer to Division-23 section "Metal Ducts". Connect supply and return ducts to unit with flexible duct connections. Provide transitions to exactly match unit duct connection size.
- E. Piping: Piping installation requirements are specified in other Division 23 sections. The Drawings indicate the general arrangement of piping, valves, fittings, and specialties. The following are specific connection requirements:
 - 1. Condensate Drain Piping: Route condensate drain to nearest roof drain or to location shown on the drawings. Provide trap, minimum of 1" deeper than fan pressure in inches of water, at drain pan connection and install cleanouts at changes in direction (refer to manufacturer's recommendations for any additional requirements). Size condensate drain piping in accordance with local code and the following:

<u>Piping Length</u>	<u>Size</u>
Less than 10 feet	Same size as unit connection
More than 10 feet	One pipe size larger than unit connection

3.3 ADJUSTING, CLEANING, AND PROTECTING

- A. Adjust fan for required airflow in accordance with Section "Testing, Adjusting and Balancing for HVAC." Tighten belts as required for proper operation.

- B. Adjust damper linkages for proper damper operation.
- C. Clean the entire unit including cabinet interiors just prior to substantial completion to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, intake plenum cabinet, heat exchange surfaces, cooling/heating coil sections, filter sections, access sections, etc.

3.4 STARTUP

- A. Final Checks Before Start-Up: Perform the following operations and checks before start-up:
 - 1. Remove shipping, blocking, and bracing.
 - 2. Verify unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
 - 3. Perform cleaning and adjusting specified in this Section.
 - 4. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
 - 5. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
 - 6. Set outside-air and return-air mixing dampers to minimum outside-air setting.
 - 7. Comb coil fins for parallel orientation.
 - 8. Install clean filters. Do not operate air handling unit without pre-filters installed.
 - 9. Verify manual and automatic volume control, and fire and smoke dampers in connected ductwork systems are in the full-open position.
 - 10. Disable automatic temperature control operators.
- B. Start-Up Services: Provide the services of a factory-authorized service representative to start-up rooftop heat pump units in accordance with manufacturer's written start-up instructions. Do not operate units without filters installed. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
 - 1. Energize motor, verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated RPM.
 - a. Replace fan and motor pulleys as required to achieve design conditions.
 - b. Measure and record motor electrical values for voltage and amperage.
 - c. Shut unit down and reconnect automatic temperature control operators.
 - d. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for procedures for system testing, adjusting, and balancing.

3.5 TRAINING

- A. General: At a time mutually agreed upon between the Owner and Contractor, provide the services of a factory trained and authorized representative to train Owner's designated personnel for a minimum of two hours on the operation and maintenance of the equipment provided under this section.
- B. Content: Training shall include but not be limited to:
 - 1. Overview of the system and/or equipment as it relates to the facility as a whole.
 - 2. Operation and maintenance procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance and appropriate operator intervention.
 - 3. Review data included in the operation and maintenance manuals. Refer to Division 1 Section "Operating and Maintenance Data."
- C. Certification: Contractor shall submit to the Engineer a certification letter stating that the Owner's designated representative has been trained as specified herein. Letter shall include date, time, attendees and subject of training. The certification letter shall be signed by the Contractor and the Owner's representative indicating agreement that the training has been provided.

D. Schedule: Schedule training with Owner with at least 7 days' advance notice.

END OF SECTION

PART 1 - SECTION 16525 (25 5630) - SITE LIGHTING

PART 2 - GENERAL

2.1 SUMMARY

A. Section Includes:

1. Owner furnished exterior site lighting luminaires for installation by Contractor.
2. Owner furnished site lighting poles for installation by Contractor.
3. Site lighting accessories provided by Contractor.

B. Related Requirements:

1. Section 02300 - Earthwork: Trenching, backfill, and compaction for utilities.
2. Section 03311 – Site Structural Concrete: Concrete, reinforcement, and testing for light pole base.
3. Section 05120 – Structural Steel: Anchor bolts light pole base.
4. Section 16050 - Basic Electrical Materials and Methods: Grounding and bonding.
5. Section 16100 - Wiring Methods: Conduit, wire and cable.
6. Appendix A – Products and Work By Owner or Separate Contractor
 - a. General procedures related to Owner furnished products and transport, handle, store and protect products.(Formerly included in Section 01640)
 - b. Manufacturers, suppliers, and vendor contacts and product names and numbers related to Owner furnished products. (Formerly included in Section 01645)
7. Appendix B – Testing, Inspection, and Observation by Owner.

2.2 DELIVERY, STORAGE AND HANDLING

- A. Receive Owner furnished products in compliance with the requirements of Appendix A.
- B. Report substantial damage which will require pole replacement immediately to Wal-Mart Construction Manager.
- C. Handle, store, and protect products in compliance with the requirements of Section 01600 and manufacturer's recommendations.
- D. Do not use cutting instruments (i.e. knives) to remove pole packaging material.

PART 3 - PRODUCTS

3.1 OWNER FURNISHED PRODUCTS

- A. Owner's Site Lighting Vendor (hereinafter referred to as "vendor") will furnish lighting fixtures, lamps, and poles, as indicated on Drawings and as specified in Appendix A (Section 16525), for installation by Contractor.

3.2 SITE LIGHTING POLE ACCESSORIES (CONTRACTOR FURNISHED AND INSTALLED)

- A. Light Pole Base Pull Box (poles with security cameras): PVC, UL listed, CSA certified, NEMA 4X. Carlon E1212C24 with E1212DIV field installable divider. In the case of damage, provide Carlon replacement E1212L24.
- B. Light Pole Junction Box (poles with security cameras): NEMA 4, Hoffman A.
- C. Paved Area Pull Box: Quazite PG1730BA28 box 17" x 30" x 28" with PG1730HH00.

- D. Concrete: Concrete and reinforcement for light pole bases shall conform to the requirements specified in Section 03311. Anchor bolts shall conform to the requirements specified in Section 05120.

PART 4 - EXECUTION

4.1 INSTALLATION

- A. Install Owner and Contractor furnished site lighting products in accordance with manufacturers' recommendations and as indicated on Drawings.
- B. Apply touch-up paint to site lighting poles.
- C. Provide electrical system for site lighting including wiring, conduit and exterior coating GRC bends and elbows for underground conduit as specified in Section 16100.
- D. Comply with the requirements for trenching and backfilling specified in Section 02300.
- E. Provide grounding of pole and fixture as indicated on Drawings and as specified in Section 16050.

4.2 MAINTENANCE AND REPLACEMENT DURING CONSTRUCTION

- A. Maintain lighting fixtures, lamps, ballast/drivers and poles during construction, possession, and until store Grand Opening. Coordinate replacement of defective, lost, or damaged equipment with site lighting vendor.
- B. Contractor Responsibility:
 - 1. Provide Performance Testing at least four weeks prior to Substantial Completion.
 - 2. Coordinate vendor on-site evaluation of abnormal component failures of ballast/driver and lamps at least two weeks prior to Substantial Completion. Provide labor for routine and normal maintenance of equipment including troubleshooting and determination of lighting failure.
 - 3. Provide material and labor for replacement of loss, breakage, or other damage due to fault of Contractor including lamps.
 - 4. Contact vendor to order replacement parts in time to have fixtures fully operational three weeks prior to Grand Opening.
- C. Replacement Procedure – General:
 - 1. Immediately notify vendor and request replacement of damaged fixtures, ballast/drivers, or lamps delivered to the jobsite.
 - 2. If shipping damage is concealed, notify carrier and vendor within 15 days of acceptance of freight. Provide vendor a copy of the written notification sent to the carrier.
- D. Additional Ballast/Driver Replacement Procedure:
 - 1. Order replacement ballast/driver from vendor. Request Return Authorization number from vendor to return defective ballast/driver no later than Grand Opening.
 - 2. Return all defective ballast/drivers to vendor. Vendor will arrange pickup and return, including shipping costs, of defective ballast/driver. Cost for ballast/driver not returned within the specific time frame or returned but not defective will be charged to the Contractor.
- E. Owner Responsibility:
 - 1. Costs for replacement by Owner is specified in Appendix A.

4.3 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Except for specified mandatory testing, field quality control testing and inspection shall be at the discretion of the Contractor as necessary to assure compliance with Contract requirements. Owner T&I specified in Appendix B shall not be considered a substitute for the Contractor's responsibility to perform similar routine, necessary, and customary testing and inspection of the methods and frequency suitable for the type of work involved.

- B. Performance Testing: Conduct parking lot lighting test at least four weeks prior to Substantial Completion consisting of dusk to dawn operation of luminaires and lamps for 100 hours. Do not energize fixtures during daylight hours to avoid liability for heat damage to fixtures. Witness and certify continuous operation and time duration of test. Replace defective components with replacement Owner furnished components in accordance with Appendix A. Reinstall components at least three weeks prior to Grand Opening.
- C. END OF SECTION

END OF DIVISION 16 (26) TABLE OF CONTENTS

PAGE INTENTIONALLY LEFT BLANK

SECTION 16100 (260010) - GENERAL ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this section and to all following sections within Division 26.

1.2 SECTION INCLUDES

- A. This Division requires providing complete functioning systems, and each element thereof, as specified, indicated, or reasonably inferred, on the Drawings and in these Specifications, including every article, device, or accessory (whether or not specifically called for by item) reasonably necessary to facilitate each system's functioning as indicated by the design and the equipment specified. Elements of the Work include, but are not limited to, materials, labor, supervision, supplies, tools, equipment, transportation and utilities.
- B. Division 26 of these Specifications, and Drawings numbered with prefixes E, generally describe these systems, but the scope of the electrical work includes all such work indicated in all of the Contract Documents, including, but not limited to: Instructions to Bidders; Proposal Form; General Conditions; Supplementary General Conditions; Architectural, Structural, Mechanical, Plumbing and Electrical Drawings and Specifications; and Addenda.
- C. Drawings are graphic representations of the Work upon which the Contract is based. They show the materials and their relationship to one another, including sizes, shapes, locations, and connections. They also convey the scope of work, indicating the intended general arrangement of the equipment, fixtures, outlets and circuits without showing all of the exact details as to elevations, offsets, control lines, and other installation requirements. Use the Drawings as a guide when laying out the Work and to verify that materials and equipment will fit into the designated spaces, and which, when installed per manufacturers' requirements, will ensure a complete, coordinated, satisfactory and properly operating system.
- D. Specifications define the qualitative requirements for products, materials, and workmanship upon which the Contract is based.

1.3 DEFINITIONS

- A. Whenever used in these Specifications or Drawings, the following terms shall have the indicated meanings:
 - 1. Furnish: "To supply and deliver to the project site, ready for unloading, unpacking, assembling, installing, and similar operations."
 - 2. Install: "To perform all operations at the project site, including, but not limited to, and as required: unloading, unpacking, assembling, erecting, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, testing, commissioning, starting up and similar operations, complete, and ready for the intended use."
 - 3. Provide: "To furnish and install complete, and ready for the intended use."
 - 4. Furnished by Owner (or Owner-Furnished) or Furnished by Others: "An item furnished by the Owner or under other Divisions or Contracts, and installed under the requirements of this Division, complete, and ready for the intended use, including all items and services incidental to the Work necessary for proper installation and operation. Include the installation under the warranty required by this Division.
 - 5. Engineer: Where referenced in this Division, "Engineer" is the Engineer of Record and the Design Professional for the Work under this Division.
 - a. [A Consultant to, and an authorized representative of, the Architect, as defined in the General and/or Supplementary Conditions. When used in this Division, it means increased

involvement by, and obligations to, the Engineer, in addition to involvement by, and obligations to, the "Architect".]

6. Contract Administrator: Where referenced in this Division, "Contract Administrator" is the primary liaison between the Owner and the Contractor. Specifically, for this project this is [the "Owner's Representative.
 7. AHJ: The local code and/or inspection agency (Authority) Having Jurisdiction over the Work.
 8. CLCATT: Certified Lighting Controls Acceptance Test Technician. A professional certified to perform acceptance tests and complete the documentation required for nonresidential acceptance tests as required by the California Building Energy Efficiency Standards. Technician shall be certified by an authorized lighting controls acceptance test technician certification provider.
 9. NRTL: Nationally Recognized Testing Laboratory, as defined and listed by OSHA in 29 CFR 1910.7 (e.g., UL, ETL, CSA, etc.), and acceptable to the Authority having Jurisdiction (AHJ) over this project. Nationally Recognized Testing Laboratories and standards listed are used only to represent the characteristics required and are not intended to restrict the use of other NRTLs that are acceptable to the AHJ, and standards that meet the specified criteria.
 10. Substitution: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. Substitutions include Value Engineering proposals.
 - a. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
 - b. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Contractor or Owner.
 11. Value Engineering: A systematic method to improve the "value" of goods and services by using an examination of function. Value, as defined, is the ratio of function to cost. Value can therefore be increased by either improving the function or reducing the cost. The goal of VE is to achieve the desired function at the lowest overall cost consistent with required performance.
 12. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified
- B. When 'furnish', 'install', 'perform', or 'provide' is not used in connection with services, materials, or equipment in a context clearly requiring an obligation of Contractor, "provide" is implied.
- C. The terms "approved equal", "equivalent", or "equal" are used synonymously and shall mean "accepted by or acceptable to the Engineer as equivalent to the item or manufacturer specified". The term "approved" shall mean labeled, listed, or both, by an NRTL, and acceptable to the AHJ over this project.
- D. Manufacturers: The listing of specific manufacturers does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed are not relieved from meeting these specifications in their entirety.
 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
 3. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference, unless otherwise noted.
- E. The following definitions apply to excavation operations:
 1. Additional Excavation: Where excavation has reached indicated sub-grade elevations, if unsuitable bearing materials are encountered, continue excavation until suitable bearing materials are reached. The Contract Sum may be adjusted by an appropriate Contract Modification.
 2. Sub-base: as used in this section refers to the compacted soil layer used in pavement systems between the sub-grade and the pavement base course material.

3. Sub-grade: as used in this section refers to the compacted soil immediately below the slab or pavement system.
4. Unauthorized excavation consists of removal of materials beyond indicated sub-grade elevations or dimensions without specific direction from the Contract Administrator.

1.4 REFERENCE STANDARDS

- A. Execute all work in accordance with, and comply at a minimum with, National Fire Protection Association (NFPA) codes, state and local building codes, and all other applicable codes and ordinances in force, governing the particular class of work involved, for performance, workmanship, equipment, and materials. Additionally, comply with rules and regulations of public utilities and municipal departments affected by connection of services. Where conflicts between various codes, ordinances, rules, and regulations exist, comply with the most stringent. Wherever requirements of these Specifications, Drawings, or both, exceed those of the above items, the requirements of these Specifications, Drawings, or both, shall govern. Code compliance, at a minimum, is mandatory. Construe nothing in these Construction Documents as permitting work not in compliance, at a minimum, with these codes. Bring all conflicts observed between codes, ordinances, rules, regulations and these documents to the Contract Administrator's and Engineer's attention in sufficient time, prior to the opening of bids, to prepare the Supplementary Drawings and Specifications Addenda required to resolve the conflict.
- B. If the conflict is not reported timely, prior to the opening of bids, resolve the conflict and provide the installation in accordance with the governing codes and to the satisfaction of the Contract Administrator and Engineer, without additional compensation. Contractor will be held responsible for any violation of the law.
- C. Obtain timely inspections by the constituted authorities having jurisdiction; and, upon final completion of the Work, obtain and deliver to the Owner executed final certificates of acceptance from these authorities having jurisdiction.
- D. All material, manufacturing methods, handling, dimensions, methods of installation, and test procedures shall conform to industry standards, acts, and codes, including, but not limited to the following, except where these Drawings and Specifications exceed them:

IBC	International Building Code
CBC	California Building Code
CEC	California Energy Code
ADA	Americans with Disabilities Act
AIA	Guidelines for Design and Construction of Hospital and Healthcare Facilities
AEIC	Association of Edison Illuminating Companies
ANSI	American National Standards Institute
ASTM	American Society of Testing Materials
AWS	American Welding Society
AWWA	American Water Works Association
ICEA	Insulated Conductors Engineers Association
IEEE	Institute of Electrical and Electronics Engineers
IES	Illuminating Engineering Society
NBFU	National Board of Fire Underwriters
NEC	National Electrical Code, NFPA 70
NECA	National Electrical Contractors Association
NEMA	National Electrical Manufacturers' Association
NETA	InterNational Electrical Testing Association
NFPA	National Fire Protection Association
OSHA	Occupational Safety and Health Act
UL	Underwriter's Laboratories

- E. Comply with rules and regulations of public utilities and municipal departments affected by connections of services.
- F. Perform all electrical work in compliance with applicable safety regulations, including OSHA regulations. All safety lights, guards, and warning signs required for the performance of the electrical work shall be provided by the Contractor.
- G. Obtain and pay for all permits, licenses and fees that are required by the governing authorities for the performance of the electrical work.

1.5 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate with other divisions for electrical work included in them but not listed in Division 26 or indicated on electrical Drawings.
- B. Visit the site and ascertain the conditions to be encountered in installing the Work under this Division, verify all dimensions and locations before purchasing equipment or commencing work, and make due provisions for same in the bid. Failure to comply with this requirement shall not be considered justification for omission, alteration, and incorrect or faulty installation of any of the Work under this Division or for additional compensation for any work covered by this Division.
- C. Refer to Drawings and divisions of the other trades and to relevant equipment drawings and shop drawings to determine the extent of clear spaces. Make all offsets required to clear equipment, beams and other structural members, and to facilitate concealing conduit in the manner anticipated in the design.
- D. Coordinate the work with other trades to avoid placement of ductwork, piping, equipment, or other potential obstructions within the dedicated equipment spaces and working clearances for electrical equipment required by NFPA 70.
- E. Provide materials with trim that will fit properly the types of ceiling, wall, or floor finishes installed.
- F. Coordinate construction activities to ensure that operations are carried out with consideration given to conservation of energy, water, and materials. Coordinate use of temporary utilities to minimize waste.
- G. Maintain an electrical foreman on the jobsite at all times to coordinate this work with other trades so that various components of the electrical systems is installed at the proper time, fits the available space, and allows proper service access to all equipment. Carry on the Work in such a manner that the Work of the other trades will not be handicapped, hindered, or delayed at any time.
- H. Work of this Division shall progress according to the "Construction Schedule" as described in Division 01 and as approved by the Contract Administrator. Cooperate in establishing these schedules and perform the Work under this Division, in a timely manner in conformance with the construction schedule so as to ensure successful achievement of all schedule dates.
- I. Measurements and Layouts: The Drawings are schematic in nature but show the various components of the systems approximately to scale and attempt to indicate how they are to be integrated with other parts of the Work. Figured dimensions take precedence to scaled dimensions. Determine exact locations by job measurements, by checking the requirements of other trades, and by reviewing all Contract Documents. Correct, at no additional costs to the Owner, errors that could have been avoided by proper checking and inspection.

1.6 COORDINATION DRAWINGS

- A. Coordination Drawings, General: Prepare coordination drawings according to the requirements of individual Sections. Additionally, prepare coordination drawings as required scope of installation is not

completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one trade.

1. Information shall be project specific and drawn accurately to a scale large enough to resolve conflicts. Do not base coordination drawings on standard dimensional data.
 2. Prepare floorplans, sections, elevations, and details as needed to adequately describe relationship of various systems and components.
 3. Clearly indicate functional and spatial relationships of components of all systems specified in the Contract Documents, including but not limited to: architectural, structural, civil, mechanical, electrical, fire protection, and specialty systems.
 4. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
 5. Show location and size of access doors required for access to concealed equipment, fittings, controls, terminations, and cabling.
 6. Indicate required installation sequence to minimize conflicts between entities.
 7. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to Contract Administrator indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.
 8. The details of the coordination are the responsibility of the Contractor and, where indicated on the Drawings, minor adjustments in raceway routing, device placement, device type, or equipment arrangement are not to be considered changes to the Contract.
- B. Equipment Room Coordination Drawings: In accordance with the submittal procedures outlined within these Specifications, provide dimensioned layouts of electrical equipment locations within electrical rooms/closets, mechanical rooms, generator rooms, and fire pump rooms with equipment drawn to scale and identified therein.
1. Clearly identify all required working clearances and access provisions required for installation and maintenance.
 2. Equipment layouts should be arranged accounting for considerations for required door openings and the clearances required by the equipment manufacturer.
 3. Indicate path to allow for the future removal of each large piece of equipment (up to and including generators and unit sub-station transformers) without removal of non-related equipment or architectural elements.
 4. Include work provided by others routed through the equipment rooms.
- C. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:
1. File Preparation Format: Same digital data software program, version, and operating system as original Drawings.
 2. BIM File Incorporation: Develop and incorporate coordination drawing files into Building Information Model established for Project.
 - a. Perform three-dimensional component conflict analysis as part of preparation of coordination drawings. Resolve component conflicts prior to submittal. Indicate where conflict resolution requires modification of design requirements by Contract Administrator.
 3. Where Henderson Engineer's digital data files are provided to the Contractor for use in preparing coordination digital data files, Henderson Engineers makes no representations as to the accuracy or completeness of digital data files as they relate to the Drawings or Specifications.
 4. Submit coordination drawings in accordance with the submittal procedures outlined within these Specifications.

1.7 SUBMITTALS

- A. Refer to Division 01 and General Conditions for submittal requirements in addition to requirements specified herein.

- B. Refer to Division 01 for acceptance of electronic submittals. If not specified by Division 01, provide electronic submittals. If Division 01 requires paper submittals, provide the quantity of submittals required, but no fewer than seven (7) sets.
- C. For electronic submittals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Architect and Engineer that the submittals have been posted. If electronic submittal procedures are not defined in Division 01, Contractor shall include the website, username and password information needed to access the submittals. For submittals sent by e-mail, Contractor shall copy the Architect and Engineer's designated representatives. Contractor shall allow for the Engineer Review Time as specified. Contractor shall submit only the documents required to purchase the materials and/or equipment in the submittal.
- D. Engineer Review Time: Transmit submittals as early as required to support the project schedule. Allow two weeks for Engineer review time plus to/from mailing time via the Architect, plus a duplication of this time for resubmittal if required. Transmit submittals as soon as possible after Notice to Proceed and before Mechanical construction starts.
- E. Submittals and shop drawings shall not contain the firm name, logo, seal, or signature of the Engineer. They shall not be copies of the work product of the Engineer. If the Contractor desires to use elements of such product, the license agreement for transfer of information obtained from the Engineer must be used.
- F. Assemble and submit for review manufacturer product literature for material and equipment to be furnished and/or installed under this Division. Literature shall include shop drawings, manufacturer product data, performance sheets, samples, and other submittals required by this Division as noted in each individual Section. General product catalog data not specifically noted to be part of the specified product will be rejected and returned without review.
- G. Separate submittals according to individual specification sections. Only resubmit those sections requested for resubmittal.
- H. Provide submittals in sufficient detail so as to demonstrate compliance with these Contract Documents and the design concept. Highlight, mark, list or indicate the materials, performance criteria and accessories that are being proposed. Illegible submittals will be rejected and returned without review.
- I. Refer to individual Sections for additional submittal requirements.
- J. Before transmitting submittals and material lists, verify that the equipment submitted is mutually compatible with and suitable for the intended use. Verify that the equipment will fit the available space and maintain manufacturer recommended service clearances. If the size of equipment furnished makes necessary any change in location, or configuration, submit a shop drawing showing the proposed layout.
- K. Submittals shall contain the following information:
 - 1. The project name.
 - 2. The applicable specification section and paragraph.
 - 3. Equipment identification acronym as used on the drawings.
 - 4. The submittal date.
 - 5. The Contractor's stamp, which shall certify that the stamped drawings have been checked by the Contractor, comply with the Drawings and Specifications, and have been coordinated with other trades.
 - 6. Submittals not so identified will be returned to the Contractor without action.
- L. The checking and subsequent acceptance by the Engineer and/or Architect of submittals shall not relieve responsibility from the Contractor for (1) deviations from Drawings and Specifications; (2) errors in dimensions, details, sizes of equipment, or quantities; (3) omissions of components or fittings; and (4) not

coordinating items with actual building conditions and adjacent work. Contractor shall request and secure written acceptance from the Engineer and Architect prior to implementing any deviation.

M.

1.8 SUBSTITUTIONS

- A. Refer to Division 01 and General Conditions for substitutions in addition to requirements specified herein.
- B. Materials, products, equipment, and systems described in the Bidding Documents establish a standard of required function, dimension, appearance and quality to be met by the proposed substitution.
- C. The base bid shall include only the products from manufacturers specifically named in the drawings and specifications.
- D. Request for Substitution:
1. Complete and send the Substitution Request Form attached at the end of this section for each material, product, equipment, or system that is proposed to be substituted.
 2. The burden of proof of the merit of the proposed substitution is upon the proposer.
 3. Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the [Engineer, Architect, Construction Manager, and Owner] the following:
 - a. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
 - b. Proposed substitution is consistent with the Contract Documents and will produce indicated results, including functional clearances, maintenance service, and sourcing of replacement parts.
 - c. Proposed substitution has received necessary approvals of the Authorities Having Jurisdiction.
 - d. Same warranty will be furnished for proposed substitution as for specified Work.
 - e. If accepted substitution fails to perform as required, Contractor shall replace substitute material or system with that originally specified and bear costs incurred thereby.
 - f. Coordination, installation and changes in the Work as necessary for accepted substitution will be complete in all respects.
- E. Substitution Consideration:
1. No substitutions will be considered unless the Substitution Request Form is completed and attached with the appropriate substitution documentation.
 2. Prior to receipt of Bids: No substitutions will be considered prior to receipt of bids unless written request for approval to bid has been received by the Engineer at least ten (10) calendar days prior to the date for receipt of bids.
 - a. If the proposed substitution is approved prior to receipt of bids, such approval will be stated in an addendum. Bidders shall not rely upon approvals made in any other manner. Verbal approval will not be given.
 3. After receipt of Bids: No substitutions will be considered after receipt of Bids and before award of the Contract.
 4. After award of Contract: No substitutions will be considered after the Contract is awarded unless specifically provided in the Contract Documents.

1.9 ELECTRONIC DRAWING FILES

- A. In preparation of shop drawings or record drawings, Contractor may, at their option, obtain electronic drawing files in AutoCAD or DXF format from the Engineer for a shipping and handling fee of \$200 for a drawing set up to 12 sheets and \$15 per sheet for each additional sheet.

- B. Contractor shall request and complete the Electronic File Release Agreement form from the Engineer. Send the form along with a check made payable to Henderson Engineers, Inc. Contractor shall indicate the desired shipping method and drawing format on the attached form.
- C. Contact the Contract Administrator for written authorization.
- D. The following must be received before electronic drawing files will be sent:
 - 1. Contract Administrator's written authorization
 - 2. Engineer's release agreement form
 - 3. Payment

1.10 QUALITY ASSURANCE

- A. Execute all work under this Division in a thorough and professional manner by competent and experienced workmen duly trained to perform the work specified.
- B. Install all work in strict conformance with all manufacturers' requirements and recommendations, unless these Documents exceed those requirements. Install all equipment and materials in a neat and professional manner, aligned, leveled, and adjusted for satisfactory operation, in accordance with NECA guidelines.
- C. Unless indicated otherwise on the Drawings, provide all material and equipment new, of the best quality and design, free from defects and imperfections and with markings or a nameplate identifying the manufacturer and providing sufficient reference to establish quality, size and capacity. Provide all material and equipment of the same type from the same manufacturer whenever practicable.
- D. Unless specified otherwise, manufactured items of the same types specified within this Division shall have been installed and used, without modification, renovation, or repair for not less than one year prior to date of bidding for this Project.

1.11 OPERATION AND MAINTENANCE MANUALS

- A. Refer to Division 01 and General Conditions for Operation and Maintenance Manuals in addition to requirements specified herein.
- B. Submit manuals prior to requesting the final punch list and before all requests for Substantial Completion.
- C. Instruct the Owner's permanent personnel in the proper operation of, startup and shutdown procedures and maintenance of the equipment and components of the systems installed under this Division.
- D. Prior to Substantial Completion of the project, furnish to the Contract Administrator, for Engineer's review, and for the Owner's use, four (4) copies of Operation and Maintenance Manuals in labeled, hard-back three-ring binders, with cover, binding label, tabbed dividers and plastic insert folders for Record Drawings. Include local contacts, complete with address and telephone number, for equipment, apparatus, and system components furnished and installed under this Division of the specifications.
- E. Each manual shall contain equipment data, approved submittals, shop drawings, diagrams, capacities, spare part numbers, manufacturer service and maintenance data, warranties and guarantees.
- F. Refer to Division 01 for acceptance of electronic manuals for this project. For electronic manuals, Contractor shall submit the documents in accordance with this Section and the procedures specified in Division 01. Contractor shall notify the Contract Administrator and Engineer that the manuals have been posted. If electronic manual procedures are not defined in Division 01, Contractor shall include the website, username and password information needed to access the manuals. For manuals sent by e-mail, Contractor shall copy the Contract Administrator's and Engineer's designated representatives.

1.12 SPARE PARTS

- A. Provide to the Owner the spare parts specified in the individual sections of this Division

1.13 RECORD DRAWINGS

- A. Refer to Division 01 and General Conditions for Record Drawings in addition to requirements specified herein.
- B. A set of work prints of the Contract Documents shall be kept on the jobsite during construction for the purpose of noting changes. During the course of construction, the Contractor shall indicate on these Documents changes made from the original Contract Documents. Particular attention shall be paid to those items which need to be located for servicing. Underground utilities shall be located by dimension from column lines.
- C. At the completion of the project, the Contractor shall obtain, at their expense, reproducible copies of the final drawings and incorporate changes noted on the jobsite work prints onto these drawings. These changes shall be done by a skilled drafter. Each sheet shall be marked "Record Drawing", along with the date. These drawings shall be delivered to the Contract Administrator.

1.14 DELIVERY, STORAGE AND HANDLING

- A. Refer to Division 01 and General Conditions for Delivery, Storage and Handling in addition to requirements specified herein.
- B. Deliver equipment and material to the job site in their original containers with labels intact, fully identified with manufacturer's name, make, model, model number, type, size, capacity and Underwriter's Laboratories, Inc. labels and other pertinent information necessary to identify the item.
- C. Deliver, receive, handle and store equipment and materials at the job site in the designated area and in such a manner as to prevent equipment and materials from damage and loss. Store equipment and materials delivered to the site on pallets and cover with waterproof, tear resistant tarp or plastic or as required to keep equipment and materials dry. Follow manufacturer's recommendations, and at all times, take every precaution to properly protect equipment and material from damage, including the erection of temporary shelters to adequately protect equipment and material stored at the Site. Equipment and/or material which becomes rusted or damaged shall be replaced or restored by the Contractor to a condition acceptable to the Contract Administrator.
- D. Be responsible for the safe storage of tools, material and equipment.

1.15 WARRANTIES

- A. Refer to Division 01 and General Conditions for Warranties in addition to requirements specified herein.
- B. Organize warranty documents into an orderly sequence based on the table of contents of the Project Manual.
- C. Warrant each system and each element thereof against all defects due to faulty workmanship, design or material for a period of 12 months from date of Substantial Completion, unless specific items are noted to carry a longer warranty in these Construction Documents or manufacturer's standard warranty exceeds 12 months. Remedy all defects, occurring within the warranty period(s), as stated in the General Conditions and Division 01.
- D. Also warrant the following additional items:
 - 1. All raceways are free from obstructions, holes, crushing, or breaks of any nature.
 - 2. All raceway seals are effective.

3. The entire electrical system is free from all short circuits and unwanted open circuits and grounds.
- E. The above warranties shall include labor and material. Make repairs or replacements without any additional costs to the Owner.
- F. Perform the remedial work promptly, upon written notice from the Contract Administrator or Owner.
- G. At the time of Substantial Completion, deliver to the Owner all warranties, in writing and properly executed, including term limits for warranties extending beyond the one year period, each warranty instrument being addressed to the Owner and stating the commencement date and term.

1.16 TEMPORARY FACILITIES

- A. Refer to Division 01 and General Conditions for Temporary Facilities requirements in addition to requirements specified herein.
- B. Temporary Utilities: The types of services required include, but are not limited to, electricity, telephone, and internet. When connecting to existing franchised utilities for required services, comply with service companies' recommendations on materials and methods, or engage service companies to install services. Locate and relocate services (as necessary) to minimize interference with construction operations.
- C. Construction Facilities: Provide facilities reasonably required to perform construction operations properly and adequately.
 1. Enclosures: When temporary enclosures are required to ensure adequate workmanship, weather protection and ambient conditions required for the work, provide fire-retardant treated lumber and plywood; provide tarpaulins with UL label and flame spread of 15 or less; provide translucent type (nylon reinforced polyethylene) where daylighting of enclosed space would be beneficial for workmanship, and reduce use of temporary lighting.
 2. Heating: Provide heat, as necessary, to protect work, materials and equipment from damage due to dampness and cold. In areas where building is occupied, maintain a temperature not less than 65 degrees F. Use steam, hot water, or gas from piped distribution system where available. Where steam, hot water or piped gas are not available, heat with self-contained LP gas or fuel oil heaters, bearing UL, FM or other approval labels appropriate for application. Use electric-resistance space heaters only where no other, more energy-efficient, type of heater is available and allowable.
 - a. Vent and exhaust fuel-burning heaters per SMACNA Guidelines for Source Control and equip units with individual-space thermostatic controls.
 - b. If permanent HVAC systems are used during construction, provide HVAC Protection and replace all filtration prior to occupancy in accordance with SMACNA Guidelines.

1.17 FIELD CONDITIONS

- A. :
- B. Conditions Affecting Excavations: The following project conditions apply:
 1. Maintain and protect existing building services that transit the area affected by selective demolition.
 2. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by excavation operations.
- C. Site Information: Subsurface conditions were investigated during the design of the Project. Reports of these investigations are available for information only; data in the reports are not intended as representations or warranties of accuracy or continuity of conditions. The Owner will not be responsible for interpretations or conclusions drawn from this information.
- D. Use of explosives is not permitted[, unless otherwise specified or allowed for powder-actuated tools].

- E. Environmental Conditions: Apply joint sealers under temperature and humidity conditions within the limits specified by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.

PART 2 - PRODUCTS AND MATERIALS

(Not Used)

2.1 SOIL MATERIALS

- A. Sub base Material: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, crushed slag, or natural or crushed sand.
- B. Drainage Fill: Washed, evenly graded mixture of crushed stone, or crushed or uncrushed gravel, with 100 percent passing a 1-1/2-inch sieve, and not more than 5 percent passing a No. 4 sieve.
- C. Backfill and Fill Materials: Materials complying with ASTM D2487 soil classification groups GW, GP, GM, SM, SW, and SP; free of clay, rock, or gravel larger than two inches in any dimension; debris; waste; frozen materials; and vegetable and other deleterious matter.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

- A. Install in accordance with manufacturer's instructions.

3.2 EXISTING CONDITIONS

- A. Existing conditions indicated on the Drawings are taken from the best information available from the Owner, existing record drawings, and from limited, in-situ, visual site observations; and, they are not to be construed as "AS BUILT" conditions. The information is shown to help establish the extent of the new work.
- B. Verify all actual existing conditions at the project site and perform the Work as required to meet the existing conditions and the intent of the Work indicated.
- C. Notify Contract Administrator immediately of any dangerous conditions that exist on the job site, as they are discovered, before demolition, during selective demolition or before remodel work begins.

3.3 EXISTING UTILITIES

- A. Prepare and submit a schedule of anticipated utility outages indicating dates and duration. Schedule
- B. Schedule and coordinate with the utility companies, Owner and with the Contract Administrator all connections to, relocation of, or discontinuation of normal utility services from any existing utility line. Include all premium time required for all such work in the bid.
- C. Repair all existing utilities damaged due to construction operations to the satisfaction of the Owner or utility companies without additional cost.
- D. Do not leave utilities disconnected at the end of a workday or over a weekend unless authorized by representatives of the Owner or Contract Administrator.
- E. Make repairs and restoration of utilities before workers leave the project at the end of the workday in which the interruption takes place.

- F. Include in bid the cost of furnishing temporary facilities to provide all services during interruption of normal utility service.

3.4 WORK IN EXISTING FACILITIES

- A. The Drawings describe the general nature of remodeling to the existing facilities; however, visit the site prior to submitting a bid, to determine the nature and extent of work involved.
- B. Schedule work in the existing facility with the Owner.
- C. Certain demolition work shall be performed prior to the remodeling. Perform the demolition that involves electrical systems, fixtures, conduit, wiring, equipment, equipment supports or foundations and materials.
- D. Remove all of these articles that are not required for the new work. Unless otherwise indicated, each item removed during this demolition shall be removed from the premises and disposed of in accordance with all state and local regulations.
- E. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner, or others, unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
 - 1. Notify Contract Administrator and the Owner no fewer than 7 days in advance of proposed interruption of electrical service.
 - 2. Do not proceed with interruption of electrical service without Contract Administrator and the Owner's written permission.
 - 3. Owner reserves the right to require Contractor to cease work in any area Owner requires access to on an emergency basis.
 - 4. Make every effort to schedule outages during non-business or off-peak business hours to minimize disruptions to business operations.
- F. Relocate and reconnect all electrical facilities that must be relocated in order to accomplish the remodeling shown in the Drawings or indicated in the Specifications. Where electrical fixtures or equipment are removed, cap all unused raceways behind the floor line or wall line to facilitate restoration of finish, and, remove all existing wiring from abandoned raceways.
- G. Finish materials are specified in other divisions.
- H. Where removal of existing wiring interrupts electrical continuity of circuits that are to remain in use, provide necessary wiring, raceways, junction boxes, etc., to ensure continued electrical continuity.
- I. Penetrate roofs, channel walls and floors as required to produce the desired result; however, obtain permission from the Contract Administrator for all penetrations and channeling not specifically noted on the Drawings.
- J. Provide new, typewritten card directory for distribution equipment (including but not limited to load centers, panelboards, switchboards and switchgear) where changes occur under this scope of work. Indicate exact loads served by each existing circuit breaker or switch. Where circuit designations are not specifically indicated on the Drawings, provide a unique identifier for each updated circuit within the directory.
- K. Coordinate work with Architectural phasing drawings to properly stage transitions of work to provide power to existing, new and temporary loads. Monitor loads on distribution system to ensure shifting of loads does not overload electrical equipment.
 - 1. .

3.5 PERMITS

- A. Secure and pay for all permits required in connection with the installation of the Electrical Work. Arrange with the various utility companies for the installation and connection of all required utilities for this facility and pay all charges associated therewith including connection charges and inspection fees, except where these services or fees are designated to be provided by others.

3.6 TEMPORARY ELECTRICAL SERVICE AND WIRING

- A. Provide 208Y/120 volt, three-phase, four-wire, temporary electrical service and temporary lighting system to facilitate construction.
- B. In existing facilities, with Owner's approval, Contractor may utilize the existing electrical system as the source of temporary power. Coordinate the point of connection and method of connection to the existing system with the Owner's Representative.
- C. [Pay all charges made by the Electric Utility, with respect to installation and energy charges for temporary services.]
- D. [The Owner will pay all charges made by the Electrical Utility, with respect to installation and energy charges for temporary services.]
- E. Work for the temporary power shall consist of all labor and materials, including, but not limited to conduit, wiring, panelboards, fuse blocks, fused disconnecting switches, fuses, pigtails, receptacles, wood panel switch supports, and other miscellaneous materials required to complete the power system.
- F. Install all temporary wiring in accordance with applicable codes, and maintain in an OSHA-approved manner.
- G. Provide an adequate number of GFCI type power distribution centers, rated 208Y/120V, four-wire, and not less than 60A, with sufficient fuse blocks or breakers for lighting and hand tool circuits, 60A four-wire feeders, all mounted within pre-fabricated enclosures UL listed for this application or on suitable wood panels bolted to columns or upright wood supports as required.
- H. Install circuits to points on each level of each building so that service outlets can be reached by a 50-foot extension cord for 120V power and a 100-foot extension cord for 208V power (or as required by OSHA or local authorities).
- I. Provide one lighting outlet per 30 linear feet of corridor and at least one light in each room and for every 800 square feet of floor area. Temporary lighting shall comply with OSHA requirements.
- J. If additional service is required for cranes, electrical welders or for electric motors over 1/2 HP per unit, such additional service shall become the responsibility of the trade involved.
- K. When the permanent wiring for lighting and power is installed, with approval of the Contract Administrator and Owner, the permanent system may be used, provided the Contractor assumes full responsibility for all electrical material, equipment, and devices contained in the systems and provided that roof drainage system and roofing are complete.
- L. When directed by the Contract Administrator, remove all temporary services, lighting, wiring and devices from the property.

3.7 EXCAVATION AND BACKFILLING

- A. Refer to Division 01, Division 02 and General Conditions for Excavation and Backfilling in addition to the requirements specified herein.
- B. Perform excavation of every description, of whatever substance encountered and to the depth required in connection with the installation of the work under this division. Excavation shall be in conformance with applicable Divisions and sections of the Specifications.
- C. Restore roads, alleys, streets and sidewalks damaged during this work to the satisfaction of Authorities Having Jurisdiction.
- D. Do not excavate trenches close to walks or columns without prior consultation with the Contract Administrator.
- E. Erect barricades around excavations, for safety, and place an adequate number of amber lights on or near the work and keep those burning from dusk to dawn. Be responsible for all damage that any parties may sustain in consequence of neglecting the necessary precautions in prosecuting the work.
- F. Slope sides of excavations to comply with local, state, and federal codes and ordinances. Shore and brace as required for stability of excavation.
- G. Shoring and Bracing: Establish requirements for trench shoring and bracing to comply with local, state, and federal codes and authorities. Maintain shoring and bracing in excavations regardless of time period excavations will be open.
 - 1. Remove shoring and bracing when no longer required. Where sheeting is allowed to remain, cut top of sheeting at an elevation of 30 inches below finished grade elevation.
- H. Install sediment and erosion control measures in accordance with local codes and ordinances.
- I. Dewatering: Prevent surface water and subsurface or ground water from flowing into excavations and from flooding project site and surrounding area.
 - 1. Do not allow water to accumulate in excavations. Remove water to prevent softening of bearing materials. Provide and maintain dewatering system components necessary to convey water away from excavations.
 - 2. Establish and maintain temporary drainage ditches and other diversions outside excavation limits to convey surface water to collecting or run-off areas. Do not use trench excavations as temporary drainage ditches. In no case shall sewers be used as drains for such water.
- J. Material Storage: Stockpile satisfactory excavated materials where directed, until required for backfill or fill. Place, grade, and shape stockpiles for proper drainage.
 - 1. Locate and retain soil materials away from edge of excavations. Do not store within drip-line of trees indicated to remain.
 - 2. Remove and legally dispose of excess excavated materials and materials not acceptable for use as backfill or fill.
- K. Excavation for Underground Tanks and Structures: Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot; plus a sufficient distance to permit placing and removal of concrete formwork, installation of services, other construction, and for inspection.
 - 1. Excavate, by hand, areas within drip-line of large trees. Protect the root system from damage and dry-out. Maintain moist conditions for root system and cover exposed roots with burlap. Paint root cuts of one inch in diameter and larger with emulsified asphalt tree paint.
 - 2. Take care not to disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed.

- L. Trenching: Excavate trenches for electrical installations as follows:
1. Excavate trenches to the uniform width, sufficiently wide to provide ample working room and a minimum of six to nine inches clearance on both sides of raceway and cables.
 2. Excavate trenches to depth indicated or required for raceway and cables to establish slope, away from buildings and indicated elevations. Beyond building perimeter, excavate trenches to an elevation below frost line.
 3. Limit the length of open trench to that in which raceway and cables can be installed, tested, and the trench backfilled within the same day.
 4. Where rock is encountered, carry excavation below required elevation and backfill with a layer of crushed stone or gravel prior to installation of raceway and cables. Provide a minimum of six inches of stone or gravel cushion between rock bearing surface and raceway and cables.
 5. Excavate trenches for raceway, cables, and equipment with bottoms of trench to accurate elevations for support of raceway and cables on undisturbed soil.
- M. Cold Weather Protection: Protect excavation bottoms against freezing when atmospheric temperature is less than 35 degrees F.
- N. Backfilling and Filling: Place soil materials in layers to required subgrade elevations for each area classification listed below, using materials specified in Part 2 of this Section.
1. Under walks and pavements, use a combination of subbase materials and excavated or borrowed materials.
 2. Under building slabs, use drainage fill materials.
 3. Under raceway and cables, use subbase materials where required over rock bearing surface and for correction of unauthorized excavation.
 4. ~~For raceway and cables less than 30 inches below surface of roadways, provide 4 inch thick concrete base slab support. After installation and testing of raceway and cables, provide a 4 inch thick concrete encasement (sides and top) prior to backfilling and placement of roadway subbase.~~
 5. Other areas use excavated or borrowed materials.
- O. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Inspection, testing, approval, and locations of underground utilities have been recorded.
 2. Removal of concrete formwork.
 3. Removal of shoring and bracing, and backfilling of voids.
 4. Removal of trash and debris.
- P. Placement and Compaction: Place backfill and fill materials in layers of not more than 8 inches in loose depth for material compacted by heavy equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
1. For vertical and diagonal raceway installations, thoroughly support raceways from permanent structures or undisturbed earth at no less than 10-foot intervals, while placing backfill materials, so that raceways are not deflected, crushed, broken, or otherwise damaged by the backfill placement.
- Q. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification specified below. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
- R. Place backfill and fill materials evenly adjacent to structures, piping, and equipment to required elevations. Prevent displacement of raceways and equipment by carrying material uniformly around them to approximately same elevation in each lift.
- S. Compaction: Control soil compaction during construction, providing minimum percentage of density specified for each area classification indicated below:

1. Percentage of Maximum Density Requirements: Compact soil to not less than the following percentages of maximum density for soils which exhibit a well-defined moisture-density relationship (cohesive soils), determined in accordance with ASTM D 1557 and not less than the following percentages of relative density, determined in accordance with ASTM D 2049, for soils which will not exhibit a well-defined moisture-density relationship (cohesionless soils).
 - a. Areas Under Structures, Building Slabs and Steps, Pavements: Compact top 12 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
 - b. Areas Under Walkways: Compact top 6 inches of subgrade and each layer of backfill or fill material to 90 percent maximum density for cohesive material, or 95 percent relative density for cohesionless material.
 - c. Other Areas: Compact top 6 inches of subgrade and each layer of backfill or fill material to 85 percent maximum density for cohesive soils, and 90 percent relative density for cohesionless soils.
2. Moisture Control: Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water. Apply water in minimum quantity necessary to achieve required moisture content and to prevent water appearing on surface during, or subsequent to, compaction operations.

T. Subsidence: Where subsidence occurs at mechanical installation excavations during the period 12 months after Substantial Completion, remove surface treatment (i.e., pavement, lawn, or other finish), add backfill material, compact to specified conditions, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent areas.

3.8 CUTTING AND PATCHING

- A. Cut walls, floors, ceilings, and other portions of the facility as required to install work under this Division.
- B. Obtain permission from the Architect prior to cutting. Do not cut or disturb structural members without prior approval from the Architect and Structural Engineer.
- C. For post-tension slabs, x-ray slab and closely coordinate all core drill locations with Architect and Structural Engineer prior to performing any work. Obtain approval from Architect and Structural Engineer for all core drills and penetrations at least four days prior to performing work.
- D. Penetrations shall be made as small as possible while maintaining required clearances between the building element penetrated and the system component.
- E. Patch around openings to match adjacent construction, including fire ratings, if applicable.
- F. Repair and refinish areas disturbed by work to the condition of adjoining surfaces in a manner satisfactory to the Architect.

3.9 PAINTING

- A. Refer to Division 09 Section "Painting" for painting requirements.
- B. .
- C. Paint exposed ferrous surfaces, including, but not limited to, hangers, equipment stands and supports using materials and methods as specified under individual sections and Division 09 of the Specifications; colors shall be as selected by the Contract Administrator.

- D. Re-finish all field-threaded ends of galvanized conduits and field-cut ends of galvanized supports with a cold-galvanizing compound approved for use on conductive surfaces. Follow closely manufacturer's instructions for pre-cleaning surfaces and application.
- E. Factory finishes and shop priming and special finishes are specified in the individual equipment Specification sections.
- F. Where factory finishes are provided and no additional field painting is specified, touch up or refinish, as required by, and to the acceptance of, the Contract Administrator, marred or damaged surfaces so as to leave a smooth, uniform finish. If, in the opinion of the Contract Administrator, the finish is too badly damaged to be properly re-finished, replace the damaged equipment or materials at no additional costs to the Owner.

3.10 CLEANING

- A. Remove dirt and refuse, resulting from the performance of the Work, from the premises as required to prevent accumulation. Cooperate in maintaining reasonably clean premises at all times.
- B. Immediately prior to the final inspection, the Electrical Contractor shall clean material and equipment installed under the Electrical Contract. Dirt, dust, plaster, stains, and foreign matter shall be removed from surfaces including components internal to equipment.
- C. Damaged finishes shall be touched-up and restored to their original condition

3.11 ACCEPTANCE TESTING REQUIREMENTS

- A. Perform acceptance test procedures in accordance with the specifications listed in the Reference Joint Appendices for the Building Energy Efficiency Standards of California. Reference the Non-Residential Certificate of Compliance (NRCC) forms on the drawings for the systems that shall be tested.
- B. .

3.12 ADJUSTING, ALIGNING AND TESTING

- A. Adjust, align and test all electrical equipment furnished and/or installed under this Division.
- B. Check motors for alignment with drive and proper rotation, and adjust as required.
- C. Check and test protective devices for specified and required application, and adjust as required.
- D. Check, test and adjust adjustable parts of all light fixtures and electrical equipment as required to produce the intended performance.
- E. Verify that completed wiring system is free from short circuits, unintentional grounds, low insulation impedances, and unintentional open circuits.
- F. After completion, perform tests for continuity, unwanted grounds, and insulation resistance in accordance with the requirements of NFPA 70 and NETA.
- G. Be responsible for the operation, service and maintenance of all new electrical equipment during construction and prior to acceptance by the Owner of the complete project under this Contract. Maintain all electrical equipment in the best operating condition including proper lubrication.
- H. Notify the Contract Administrator immediately of all operational failures caused by defective material, labor or both.

- I. Maintain service and equipment for all testing of electrical equipment and systems until all work is approved and accepted by the Owner.
- J. Keep a calibrated voltmeter and ammeter (true RMS type) available at all times. Provide service for test readings when and as required.
- K. Refer to individual sections for additional and specific requirements.

3.13 START-UP OF SYSTEMS

- A. Prior to start-up of electrical systems, check all components and devices, lubricate items appropriately, and tighten all screwed and bolted connections to manufacturers' recommended torque values using appropriate torque tools.
- B. Each power, lighting and control circuit shall be energized, tested and proved free of breaks, short-circuits and unwanted grounds.
- C. Adjust taps on each transformer for rated secondary voltages.
- D. Balance all single phase loads at each panelboard, redistributing branch circuit connections until balance is achieved to plus or minus 10 percent.
- E. Replace all burned-out lamps. Replace the lamps of all light fixtures that use incandescent, halogen or quartz lamp sources that are installed as part of the finished building, but are used by the Contractor during construction, with new lamps of appropriate type and wattage prior to turning the facility over to the Owner.
- F. After all systems have been inspected and adjusted, confirm all operating features required by the Drawings and Specifications and make final adjustments as necessary.
- G. Demonstrate that all equipment and systems perform properly as designed per Drawings and Specifications.
- H. At the time of final review and tests of the power and lighting systems, all equipment and system components shall be in place and all connections at panelboards, switches, circuit breakers, and the like, shall be complete. All fuses shall be in place, and all circuits shall be continuous from point of service connections to all switches, receptacles, outlets, and the like.

3.14 TEST REPORTS

- A. Perform tests as required by these Specifications and submit the results to the Contract Administrator, for Engineer's review. Record the results, date and time of each test and the conditions under which the test was conducted. Include a copy of the finalized test results, with corrections made, in the operations and maintenance manuals. The tests shall establish the adequacy, quality, safety, and reliability for each electrical system installed. Notify the Contract Administrator and Engineer two working days prior to each test.
- B. For specific testing requirements of special systems, refer to the Specification section that describes that system. The Contractor shall provide the following to facilitate the testing of the electrical systems:
 - 1. Perform tests as described in the individual sections;
 - 2. Engage the services of a 3rd Party testing agency to perform tests as noted below, or;
 - a. Agent may be an employee of the contractor but shall be NETA certified to perform electrical testing.
 - 3. The Owner will engage a 3rd Party agency to perform tests as noted below.
 - a. Provide assistance by making equipment available as required to perform the testing and notifying the appropriate Party(ies).

- C. Upon completing each test, record the results, date and time of each test and the conditions under which the test was conducted. Submit to the Contract Administrator, for Engineer's review, in duplicate, the test results for the following electrical items:
 - 1. Building service entrance voltage and amperes at each phase.
 - 2. Electrical service grounding conditions and grounding resistance.
 - 3. Proper phasing throughout the entire system.
 - 4. Voltages (phase-to-phase and phase-to-neutral) and amperes at each phase for each panelboard, switchboard, and the like.
 - 5. Phase voltages and amperes at each three-phase motor.
 - 6. Test all wiring devices for electrical continuity and proper polarity of connections.

- D. Promptly correct all failures or deficiencies revealed by these tests in accordance with the manufacturer's recommendations and as determined by the Engineer.

3.15 SUBSTANTIAL COMPLETION REVIEW

- A. Prior to requesting a site observation for "CERTIFICATION OF SUBSTANTIAL COMPLETION", complete the following items:
 - 1. Submit complete Operation and Maintenance Data.
 - 2. Submit complete Record Drawings.
 - 3. Perform all required training of Owner's personnel.
 - 4. Turn over all spares and extra materials to the Owner, along with a complete inventory of spares and extra materials being turned over.
 - 5. Perform start-up tests of all systems.
 - 6. Remove all temporary facilities from the site.
 - 7. Comply with all requirements for Substantial Completion in the Division 01 and General Conditions.

- B. Request in writing a review for Substantial Completion. Give the Contract Administrator at least seven (7) days notice prior to the review.

- C. State in the written request that the Contractor has complied with the requirements for Substantial Completion.

- D. Upon receipt of a request for review, the Contract Administrator will either proceed with the review or advise the Contractor of unfilled requirements.

- E. If the Contractor requests a site visit for Substantial Completion review prior to completing the above-mentioned items, he shall reimburse the Contract Administrator and Engineer for time and expenses incurred for the visit.

- F. Upon completion of the review, the Contract Administrator will prepare a "final list" of outstanding items to be completed or corrected for final acceptance.

- G. Omissions on the "final list" shall not relieve the Contractor from the requirements of the Contract Documents.

- H. Prior to requesting a final review, submit a copy of the final list of items to be completed or corrected. State in writing that each item has been completed, resolved for acceptance or the reason it has not been completed.

END OF SECTION

SUBSTITUTION REQUEST FORM

To Project Engineer: _____ Request # (GC Determined): _____

Project Name: _____

Project No/Phase: _____ Date: _____

Specification Title: _____

Section Number: _____ Page: _____ Article/Paragraph: _____

Proposed Substitution: _____

Manufacturer: _____ Model No.: _____

Address: _____ Phone: _____

History: New product 1-4 years old 5-10 years old More than 10 years old

Differences between proposed substitution and specified Work: _____

Point-by-point comparative data attached – REQUIRED BY ENGINEER

Comparative data may include but not be limited to performance, certifications, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements. Include all information necessary for an evaluation.

Supporting Data Attached: Drawings Product Data Samples
 Tests Reports Other: _____

Reason for not providing specified item: _____

Similar Installation:

Project: _____ Architect: _____

Address: _____ Owner: _____

_____ Date Installed: _____

Proposed substitution affects other parts of Work: No Yes; explain: _____

Substitution Certification Statement:

Unless stated otherwise in writing to the Engineer by the Contractor, Contractor warrants to the Engineer, Architect, and Owner that the:

- ▲ A. Proposed substitution has been fully investigated and determined to meet or exceed the specified Work in all respects.
- B. Proposed substitution is consistent with the Contract Documents and will produce indicated results.
- C. Proposed substitution does not affect dimensions and functional clearances.
- D. Proposed substitution has received necessary approvals of authorities having jurisdiction.
- E. Same warranty will be furnished for proposed substitution as for specified Work.
- F. Same maintenance service and source of replacement parts, as applicable, is available.
- G. Proposed substitution will not adversely affect other trades or delay construction schedule.
- H. Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

Submitting Contractor Date Company

Manufacturer's Certification of Equal Quality:

I _____ represent the manufacturer of the Proposed Substitution item and hereby certify and warrant to Architect, Engineer, and Owner that the function and quality of the Proposed Substitution meets or exceeds the Specified Item.

PAGE INTENTIONALLY LEFT BLANK

SECTION 16050 (260500) – COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes limited scope general construction materials and methods, electrical equipment coordination, and common electrical installation requirements as follows:
 - 1. Access doors in walls, ceilings, and floors for access to electrical materials and equipment.
 - 2. Sleeves and seals for electrical penetrations.
 - 3. Joint sealers for sealing around electrical materials and equipment, and for sealing penetrations in fire and smoke barriers, floors, and foundation walls.
 - 4. Sealing penetrations through noise critical spaces.

1.2 DEFINITIONS

- A. The following abbreviations apply to this and other Sections of these Specifications:
 - 1. AHJ: Authority(ies) having Jurisdiction
 - 2. ATS: Acceptance Testing Specifications
 - 3. EPDM: Ethylene-propylene-diene monomer rubber
 - 4. MC: Metal Clad
 - 5. NBR: Acrylonitrile-butadiene rubber
 - 6. NRTL: Nationally Recognized Testing Laboratory
 - 7. PCF: Pounds per Cubic Foot
- B. The following definitions apply to this and other Sections of these Specifications:
 - 1. Homerun: That portion of an electrical circuit originating at a junction box, termination box, receptacle or switch with termination at an electrical panelboard. Note: Where MC Cable is utilized for receptacle and/or lighting branch circuiting loads, the originating point of the homerun shall be at the first load in the circuit or at a junction box in an accessible ceiling space immediately above the first load.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate arrangement, mounting, and support of electrical equipment:
 - 1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
 - 2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
 - 3. To allow right of way for piping, ducts, and other systems installed at required slopes and/or elevations.
 - 4. So connecting raceways, cables, and wireways will be clear of obstructions and of the working and access space of other equipment.
- B. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.
- C. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed.
- D. Coordinate electrical testing of electrical, mechanical, and architectural items, so equipment and systems that are functionally interdependent are tested to demonstrate successful interoperability.

1.4 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
1. Product data for the following products:
 - a. Sleeve seals.
 - b. Through and membrane penetration firestopping systems.
 - c. Joint sealers
 2. Shop drawings for:
 - a. Detailed fabrication drawings of access panels and doors.
 3. Through and Membrane Penetration Firestopping Systems Product Schedule: Provide UL listing, location, wall or floor rating and installation drawing for each penetration fire stop system.
 - a. Where Project conditions require modification to qualified testing and inspecting agency’s illustrations for a particular firestopping condition, submit illustration, with modifications marked, approved by penetration firestopping manufacturer’s fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.
 - b. Qualifications data for testing agency.
 4. Record Drawings: Submit Record Drawings as required by Division 1 and Division 26
 - a. Accurately record actual locations of firestopped penetrations and access panel/door locations. Indicate dimensions from fixed structural elements.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
- B. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference.

2.2 ACCESS TO EQUIPMENT

- A.]Manufacturers:
1. Bar-Co., Inc.
 2. Elmdor Stoneman.
 3. JL Industries
 4. Jay R. Smith Mfg. Co.
 5. Karp Associates, Inc.
 6. Milcor
 7. Nystrom Building Products
 8. Wade
 9. Zurn
- B. Access Doors:
1. Provide access doors for all concealed equipment, except where above lay-in ceilings. Refer to Section “Identification for Electrical Systems” for labeling of access doors.

2. Access doors shall be adequately sized for the devices served with a minimum size of 18 inches x 18 inches, furnished by the respective Contractor or Subcontractor and installed by the General Contractor.
3. Access doors must be of the proper construction for type of construction where installed.
4. The exact location of all access doors shall be verified with the Contract Administrator prior to installation.
5. Steel Access Doors and Frames: Factory-fabricated and assembled units, complete with attachment devices and fasteners ready for installation. Joints and seams shall be continuously welded steel, with welds ground smooth and flush with adjacent surfaces.
6. Frames: 16-gauge steel, with a 1-inch-wide exposed perimeter flange for units installed in unit masonry, pre-cast, or cast-in-place concrete, ceramic tile, or wood paneling.
 - a. For installation in masonry, concrete, ceramic tile, or wood paneling: 1-inch-wide exposed perimeter flange and adjustable metal masonry anchors.
 - b. For installation in gypsum wallboard or plaster: perforated flanges with wallboard bead.
 - c. For installation in full-bed plaster applications: galvanized, expanded metal lath and exposed casing bead, welded to perimeter of frame.
7. Flush Panel Doors: 14-gauge sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees; factory-applied prime paint.
 - a. Fire-Rated Units: Insulated flush panel doors, with continuous piano hinge and self-closing mechanism.
8. Locking Devices: Flush, screwdriver-operated cam locks.

2.3 SLEEVES

- A. Steel sleeves for raceways and cables
 1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends and drip rings.
- B. Cast iron wall pipe sleeves for raceways and cables
 1. Manufacturers
 - a. Josam Mfg. Co.
 - b. Smith (Jay R) Mfg. Co.
 - c. Tyler Pipe/Wade Div.; Subs of Tyler Corp.
 - d. Watts Industries, Inc.
 - e. Zurn Industries, Inc.; Hydromechanics Div.
 2. Cast-iron sleeve with integral clamping flange with clamping ring, and nuts for membrane flashing.
 - a. Underdeck Clamp: Clamping ring with setscrews.
 3. Sleeves for rectangular openings: Galvanized sheet steel with minimum 0.052- or 0.138- inch thickness as indicated and of length to suit application.
 4. Coordinate sleeve selection and application with selection and application of firestopping to be used.

2.4 SEALANTS

- A. SLEEVE SEALS
 1. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
 2. Manufacturers:
 - a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Metraflex Co.
 - d. O-Z/Gedney
 - e. Pipeline Seal and Insulator, Inc.
 3. Sealing Elements: Interlocking or solid sealing links shaped or pre-drilled to fit surface of cable or raceway. Include type and number required for material and size of raceway or cable.
 - a. EPDM

- b. NBR
- c. Neoprene
- 4. Pressure Plates: Include two for each sealing element. For multi-phase circuits, use slotted pressure plates if metal.
 - a. Plastic
 - b. Carbon steel
 - c. Stainless steel
 - d. PVC-coated steel
- 5. Connecting Bolts and Nuts: of length required to secure pressure plates to sealing elements. Include one for each sealing element.
 - a. Carbon steel with corrosion-resistant coating
 - b. Stainless steel

B. JOINT SEALERS

- 1. General: Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
- 2. Colors: As selected by the Contract Administrator from manufacturer's standard colors.
- 3. Elastomeric Joint Sealers: Provide the following types:
 - a. One-part, nonacid-curing, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for masonry, glass, aluminum, and other substrates recommended by the sealant manufacturer.
 - b. One-part, mildew-resistant, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, and nonporous joint substrates; formulated with fungicide; intended for sealing interior joints with nonporous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes.
 - c. Products: Subject to compliance with requirements, provide one of the following:
 - 1) One-Part, Nonacid-Curing, Silicone Sealant:
 - a) "Dow Corning 790," Dow Corning Corp.
 - b) "Dow Corning 795," Dow Corning Corp.
 - c) "Silglaze N SCS 2801," General Electric Co.
 - d) "Silpruf SCS 2000," General Electric Co.
 - e) "864," Pecora Corp.
 - f) ".Omniseal," Sonneborn Building Products Div
 - g) "Spectrem 1," Tremco, Inc.
 - h) "Spectrem 2," Tremco, Inc.
 - 2) One-Part, Mildew-Resistant, Silicone Sealant:
 - a) "Dow Corning 786," Dow Corning Corp.
 - b) "Sanitary 1700," General Electric Co.
 - c) "898 Silicone Sanitary Sealant," Pecora Corp.
 - d) "OmniPlus," Sonneborn Building Products Div.
 - e) "Tremsil 600 White," Tremco Corp.
- 4. Acrylic-Emulsion Sealants: One-part, non-sagging, mildew-resistant, paintable complying with ASTM C 834 recommended for exposed applications on interior and protected exterior locations involving joint movement of not more than plus or minus 5 percent.
 - a. Products: Subject to compliance with requirements, provide one of the following:
 - 1) "Chem-Calk 600," Bostik
 - 2) "AC-20," Pecora Corp.
 - 3) "Sonolac," Sonneborn Building Products Div.
 - 4) "Tremflex 834," Tremco, Inc.

C. FIRESTOPPING

- 1. Sealants and accessories shall have fire-resistance ratings indicated, as established by testing identical assemblies in accordance with UL 2079 or ASTM E 814, by Underwriters' Laboratories, Inc., or other NRTL acceptable to AHJ.

- a.]Manufacturers:
 - 1) Hilti, Inc.
 - 2) RectorSeal.
 - 3) Specified Technologies Inc.
 - 4) 3M Corp.
 - 5) United States Gypsum Company.

PART 3 - EXECUTION

3.1 COMMON REQUIREMENTS FOR ELECTRICAL INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Penetration Firestopping".
- C. Coordinate seals with wall, ceiling, roof or floor materials and rating of the surface (sound, fire, waterproofing, etc.)
- D. Comply with NECA 1.
- E. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items, unless indicated otherwise.
- F. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.
- G. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.
- H. Right of Way: Yield to raceways and piping systems installed at a required slope.

3.2 ACCESS DOORS

- A. Coordinate with architectural finishes to set frames accurately in position and securely attached to supports, with face panels plumb and level in relation to adjacent finish surfaces.
- B. Adjust hardware and panels after installation for proper operation.
- C. Label all access doors with a nameplate as described in Division 26 Section "Identification for Electrical Systems".

3.3 SLEEVES AND SLEEVE SEALS

- A. Electrical penetrations occur when raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, or fire-rated floor and wall assemblies.
- B. Provide sleeves for required openings in all concrete and masonry construction and fire, smoke, or both, partitions, for all electrical work that passes through such construction. Coordinate with all other trades and divisions to dimension and lay out all such openings.
- C. Only those openings specifically indicated on the Architectural or Structural Drawings will be provided under other divisions.

- D. New Construction:
 - 1. Coordinate with Divisions 03 and 04 for installation of sleeves and sleeve seals integrally in cast-in-place, precast, and masonry walls and horizontal slabs where indicated on the Drawings or as required to support raceway penetrations.
- E. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls. Do not cut or core drill new construction without written approval from the Contract Administrator and Structural Engineer.
- F. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
- G. Rectangular Sleeve Minimum Metal Thickness:
 - 1. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, thickness shall be 0.052 inch.
 - 2. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, thickness shall be 0.138 inch.
- H. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.
- I. Install pipe and rectangular sleeves in above-grade walls and slabs, where penetrations are not subject to hydrostatic water pressures. Ensure that drip ring is fully encased and sealed within the wall or slab.
- J. Cut sleeves to length for mounting flush with both surfaces of walls.
- K. Extend sleeves installed in floors 2 inches above finished floor level.
- L. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed; in which case, size sleeves as recommended by the seal manufacturer.
- M. Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies.
- N. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint
- O. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway and cable penetrations. Install sleeves and seal raceway and cable penetration sleeves with firestop materials.
- P. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- Q. Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (or larger, if required by the seal manufacturer) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- R. Above Grade Concrete or Masonry Penetrations
 - 1. Provide sleeves for cables or raceways passing through above grade concrete or masonry walls, concrete floor or roof slabs. Sleeves are not required for core drilled holes in existing masonry walls, concrete floors or roofs. Provide sleeves as follows:
 - a. Install schedule 40 galvanized steel pipe for sleeves smaller than 6 inches in diameter.
 - b. Install galvanized sheet metal for sleeves 6 inches in diameter and larger, thickness shall be 0.138 inches.

- c. Install galvanized sheet metal for rectangular sleeves
 - d. Schedule 40 PVC pipe sleeves are acceptable for use in areas without return air plenums.
- 2. Seal elevated floor, exterior wall and roof penetrations watertight and weather tight with non-shrink, non-hardening commercial sealant. Pack with mineral wool and seal both ends with minimum of ½” of sealant.
- S. Underground, Exterior-Wall Penetrations: Install cast-iron wall pipes for sleeves. Size sleeves to allow for 1-inch (or larger, if required by the mechanical sleeve manufacturer) annular clear space between sleeve and cable or raceway. Provide mechanical sleeve seal.
 - 1. Use type and number of sealing elements recommended by manufacturer for pipe material and size. Position pipe in center of sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
 - 2. Inspect installed sleeve and sleeve-seal installation for damage and faulty work. Verify watertight integrity of sleeves and seals installed below grade to seal against hydrostatic pressure.
- T. Elevated Floor Penetrations of waterproof membrane:
 - 1. Provide cast-iron wall pipes for sleeves. Size wall pipe for minimum ½” annular space between wall pipe and cable or raceway.
 - 2. Pack with mineral wool and seal both ends with minimum of ½” of waterproof sealant.
 - 3. Secure waterproof membrane flashing between clamping flange and clamping ring.
 - 4. Extend bottom of wall pipe below floor slab as required and secure underdeck clamp to hold wall pipe rigidly in place.
- U. Interior Foundation Penetration: Provide sleeves for horizontal raceway passing through or under foundation. Sleeves shall be cast iron soil pipe two normal pipe sizes larger than the pipe served.
- V. Interior Penetrations of Non-Fire-Rated Walls: Seal annular space between sleeve and cable or raceway, using joint sealant appropriate for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of ½” of sealant.
- W. Exterior Wall Penetrations: Seal annular space between sleeve and raceway or duct, using joint sealant for size, depth, and location of joint. Pack with mineral wool and seal both ends with minimum of ½” of waterproof sealant.
- X. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- Y. Sleeve-Seal Installation
 - 1. Install sleeve seals for all underground raceway penetrations through walls at elevations below finished grade. Additionally, install seals inside raceways, after conductors or cables have been installed, in all raceway penetrations through walls at elevations below finished grade.
 - 2. Use type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- Z. Inspect installed sleeve and sleeve-seal installations for damage and faulty work. Verify watertight integrity of sleeves and seals installed below grade and above grade where installed to seal against hydrostatic pressure.

3.4 FIRESTOPPING

- A. Apply firestopping to electrical penetrations of fire/smoke-rated floor and wall assemblies to restore original fire-resistance rating of assembly.

3.5 JOINT SEALERS

A. Preparation for Joint Sealers

1. Clean surfaces of penetrations, sleeves, or both, immediately before applying joint sealers, to comply with recommendations of joint sealer manufacturer.
2. Apply joint sealer primer to substrates as recommended by joint sealer manufacturer. Protect adjacent areas from spillage and migration of primers, using masking tape. Remove tape immediately after tooling without disturbing joint seal.

B. Application of Joint Sealers

1. General: Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
 - a. Comply with recommendations of ASTM C 962 for use of elastomeric joint sealants.
 - b. Comply with recommendations of ASTM C 790 for use of acrylic-emulsion joint sealants.
2. Tooling: Immediately after sealant application and prior to time shining or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

C. Installation of Fire-Stopping Sealant: Install sealant, including forming, packing, and other accessory materials, to fill openings around electrical raceways penetrating floors and walls, to provide fire-stops with fire-resistance ratings indicated for floor or wall assembly in which penetration occurs. Comply with installation requirements established by testing and inspecting agency.

3.6 ACOUSTICAL PENETRATIONS

A. Do not allow direct contact of raceways with shaft walls, floor slabs and/or partitions. Sleeve, pack and seal airtight with foam rod, non-hardening sealant and/or packing material, as described herein, for all penetrations by raceway, through surfaces that encompass or are between noise critical spaces. Seal and pack with caulking for the full depth of the penetration all openings around raceways in the structure surrounding the electrical equipment and surrounding noise-critical spaces. This includes all slab penetrations and penetrations of noise critical walls.

B. Where a raceway passes through a wall, ceiling or floor slab of a noise critical space, cast or grout a metal sleeve into the structure. The internal diameter or dimensions of the sleeve shall be 2 inches larger than the external diameter or dimensions of the raceway passing through it. After all of the raceways are installed in that area, check the clearances and correct, if necessary, to within 1/2-inch. Pack the voids full depth with packing material sealed at both ends, 1-inch deep, with non-hardening sealant backed by foam rod.

END OF SECTION

SECTION 16180 (260502) - EQUIPMENT WIRING SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes limited scope for electrical connections to equipment specified under other sections or divisions, or furnished under separate contracts or by the Owner.

1.2 ADMINISTRATIVE REQUIREMENTS

- A. Unless otherwise noted, perform all electrical work required for the proper installation and operation of equipment, furnishings, devices and systems specified in other divisions of these Specifications, furnished under other contracts, and/or furnished by the Owner for installation under this contract.
- B. Obtain and review shop drawings, product data, and manufacturer's instructions for equipment furnished under other sections.
- C. Determine connection locations and rough-in requirements based on shop drawings.
- D. Sequence rough-in of electrical connections to coordinate with installation schedule for equipment.
- E. Sequence electrical connections to coordinate with start-up schedule for equipment.

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section "General Electrical Requirements".
- B. Product data for the following products for:
 - 1. Special connectors
 - 2. Special conductors or cable assemblies.
- C. Shop drawings for:
 - 3. Detailing electrical characteristics, wiring diagrams, fabrication and installation for wiring systems.

1.4 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories:
 - 4. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to Authorities Having Jurisdiction.
 - 5. Marked for intended use.
- B. Comply with NFPA 70.

PART 2 - PRODUCTS AND MATERIALS

2.1 CORDS AND CAPS

- A. Attachment Plugs: Conform to NEMA WD 1.
- B. Configuration: NEMA WD 6, matching receptacle configuration at outlet provided for equipment, or as required by the equipment manufacturer.
- C. Cord: See Paragraph "Flexible Cords" in Division 26 Section "Low-voltage Electrical Power Conductors and Cables".
- D. Provide cord size suitable for connected load of equipment, length of cord, and rating of branch circuit overcurrent protection.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify conditions of equipment and installation prior to beginning work.
- B. Verify that equipment is ready for connecting, wiring, and energizing.

1.2 INSTALLATION, GENERAL

- A. Install in accordance with manufacturer's instructions.
- C. Provide fire-resistive protective assembly or an electrical circuit protective system for feeders and control circuit conductors and cables having a fire-resistance rating of not less than 2 hours where required by NFPA or local building codes. Types of systems requiring a fire-resistive protective assembly include, but are not limited to:
 - 1. Feeders for Emergency Power systems
 - 2. Smokeproof Enclosure Pressurization systems
 - 3. Smoke Removal systems
 - 4. Fire service and Occupant Evacuation Elevator systems

3.2 ELECTRICAL DEVICES

- A. Install disconnect switches, controllers, control stations, and control devices (other than temperature control devices) as indicated, specified in other divisions of these Specifications, furnished under other contracts, and/or furnished by the Owner for installation under this Contract.

3.3 ELECTRICAL CONNECTIONS

- A. Make electrical connections in accordance with equipment manufacturers' instructions.
- B. Make conduit connections to equipment using flexible conduit. Use liquid tight flexible conduit with watertight connectors in damp or wet locations.

- C. Make wiring connections using conductors and cable with insulation suitable for temperatures encountered in heat producing equipment.
- D. Provide receptacle outlet where connection with attachment plug is indicated. Provide cord and cap where field-supplied attachment plug is indicated on the Drawings.
- E. Provide suitable strain-relief clamps and fittings for cord connections at outlet boxes and equipment connection boxes.
- F. Provide interconnecting conduit and wiring between devices and equipment where indicated on the Drawings.

3.4 EQUIPMENT

- A. When equipment is delivered in separate parts and field assembled, internal wiring, indicated on Shop Drawings as field wiring, will be provided by the equipment supplier, unless otherwise noted.
- B. Provide power connection to all equipment as required and as indicated in the equipment supplier's installation drawings.
- C. Provide all control and interlock wiring for all equipment that is not included within the responsibility of Division 22 or 23.
- D. Motorized Damper: Provide lockable toggle, pilot lighted disconnect switch in an accessible location at each motor actuator, or group of motor actuators.

3.5 DOOR OPERATORS AND HARDWARE

- A. Provide electrical connections to automatic entry doors, automatic corridor doors, electrically held door latches, remote release doors, and all other required electrical connections for door systems included in other sections of these specifications.
- B. Provide power connection to all equipment as required and as indicated in the equipment supplier's installation drawings.
- C. Provide all control wiring and conduit for all equipment that is not included within the responsibility of the door hardware installer. Provide connection from junction boxes to the door operators or hardware and from door operators to actuation devices as required. Install key operated switches, push pad switches, and other electrically controlled door operation devices furnished by other divisions within this contract.
- D. Provide fire alarm devices and wiring as required for proper operation of door systems in accordance with the NFPA codes.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16421 (260504) - PROVISIONS FOR ELECTRIC UTILITY SERVICE

PART 1 - GENERAL

1.1 SUMMARY

- A. Provisions for Underground Secondary Electrical Service.

1.2 GENERAL REQUIREMENTS

- A. Utility service voltage:
 - 1. [As indicated on the Drawings.]
- B. Utility service ampacity: As indicated on the Drawings.
- C. The extent of Work for the secondary electrical service includes providing the following:
 - 1. Raceways
 - 2. Provisions for Metering
 - 3. Grounding and Bonding
 - 4. [Concrete pad for service transformer]
 - 5. [Service lateral]
 - 6. [Service drop]
 - 7. [Primary raceways]

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Product data for the following products for:
 - a. Meter bases
 - b. Current transformer cabinets
 - 2. Shop drawings for:
 - a. Utility Company prepared installation drawings
 - b. Cast-in-place concrete pads
- B. Where equipment or materials are specified to comply with utility standards and are listed above as required submittals, obtain approval from the serving utility before submitting to the Contract Administrator.
- C. Record Drawings: Submit Record Drawings as required by Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Accurately record actual routing of interior conduits two-inch and larger trade size and all exterior buried raceway, including coordination with other surrounding utilities and underground structures. Provide scaled plans and sections that Indicate dimensions from finished grade or other fixed structural elements.

1.4 QUALITY ASSURANCE

- A. Perform all work in accordance with Utility Company installation drawings and service standards.
- B. Maintain one copy of Utility Company installation drawings and service standards at the site.

- C. Prior to commencing work in this Section, meet with the Utility Company representative to review service entrance requirements and details.
- D. Verify that field measurements are as indicated on Utility Company drawings.
- E. Electrical Components, Devices, and Accessories:
 - 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that are acceptable to authorities having jurisdiction.
 - 2. Marked for intended use.
- F. Comply with NFPA 70.

PART 2 - EXECUTION

2.1 SECONDARY SERVICE ENTRANCE UNDERGROUND

- A. Provide an underground secondary service lateral from the pad mounted transformer in accordance with NFPA 70 Article 230 and the Utility Company standards. Reference the Drawings for service lateral conductor and raceway quantities, sizes, and types.
- B. The Utility Company will provide the service transformer.
- C. Provide a concrete pad, complying with the Utility Company standards, for transformer mounting, and set coated GRS conduit elbows and riser(s), with grounding bushing(s), to receive primary and secondary raceways. Where direct burial primary is used, set coated GRS conduit elbow(s) and riser(s), with grounding bushing(s), to receive primary cables.
- D. Make connections to the secondary terminals of the transformer as required and in conformance with Utility Company requirements. Utility Company will provide primary conductors and terminal connections unless otherwise directed by the Utility Company.
- E. Provide underground raceways for primary cables from the transformer pad to the property line, and provide pull cord, per Utility Company standards, for the Utility Company's use in pulling primary conductors. Install raceways a minimum of 24 inches below finished grade line unless otherwise indicated on the Drawings or directed by the Utility Company. Provide excavation and backfill as required to accomplish the installation.

2.2 METERING

- A. [Provide a 1-1/4-inch empty GRS conduit, with pull cord, from the current transformer compartment of service entrance equipment to the meter location indicated on the Drawings, or as directed by the Utility Company.]
- B. The Utility Company will provide the meter and meter wiring.

2.3 UTILITY SERVICE CHARGES

- A. It shall be the responsibility of the Division 26 contractor to apply for the electrical service, including the preparation and completion of all forms. Submit the completed application along with all other required documentation for the new or modified service.
- B. The Owner will pay all charges of the Utility Company for the electrical service.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16426 (260510) – COMMON WORK RESULTS FOR COMMUNICATIONS

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. This Section includes general construction materials and methods, communications equipment coordination, and common communications installation requirements as follows:
 - 1. Pathways for Communications Systems
 - a. Conduits and Backboxes
 - b. Floor Boxes and Poke Throughs
 - c. Cable Trays
 - d. Access doors
 - e. Fire Stop System Assemblies for Communications Systems
 - f. Sleeves entering noise critical spaces
 - 2. Telecommunications Backboards
 - 3. Grounding and Bonding for Communications Systems

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING

- A. Division 07 Section “Penetration Firestopping” for fire stopping materials and installation at penetrations through walls, ceilings, and other fire-rated elements.
- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section “Common Work Results for Electrical” for electrical systems coordination.
- C. Division 26 Section “Grounding and Bonding for Electrical Systems” for electrical systems coordination.
- D. Division 26 Section “Hangers and Supports for Electrical Systems” for electrical systems coordination.
- E. Division 26 Section “Raceways and Boxes for Electrical System” for electrical systems coordination.
- F. Division 26 Section “Cable Tray” electrical systems coordination.
- G. Division 26 Section “Underfloor Raceways for Electrical Systems” electrical systems coordination.
- H. Division 26 Section “Underground Ducts and Raceways for Electrical Systems” for electrical systems coordination.
- I. Division 26 Section “Seismic Controls for Electrical”.
- J. Division 26 Section “Vibration and Seismic Controls for Electrical Systems” for electrical systems coordination.

1.3 CODES, REFERENCES, AND STANDARDS

- A. Follow all applicable codes, references, and standards listed in Division 26 Section “General Electrical Requirements”.
- B. The references to the following standards and guidelines represent the most current and up-to-date revisions or printing as of the issue of this document including all sections, parts and their addenda. The Contractor is responsible for following the correct revision or printing (UON).

1. TIA-569 – “Telecommunications Pathways and Spaces”
2. TIA-607B – “Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises”
3. ANSI/NECA/BICSI 607-2011 – Standard for Telecommunications Bonding and Grounding Planning and Installation Methods for Commercial Buildings
4. BICSI Telecommunications Distribution Methods Manual (TDMM)
 1. NEMA VE 1-1998 – “Metallic Cable Tray Systems”
 2. NEMA VE 2-2000 – “Cable Tray Installation Guidelines”
 3. ASTM E 814 and ANSI/UL1479 – “Fire Tests Through Penetration Firestops”
5. Telecommunications Service Provider Pathway Requirements

1.4 QUALITY ASSURANCE

- A. Personnel Qualifications: All pathways shall be reviewed prior to submittal of shop drawings and installation, as well as during construction, by a Registered Communications Distribution Designer (RCDD) for conformance to referenced codes, standards and guidelines.
 1. Any deficiencies encountered prior to and during installation shall be corrected under the direction of this RCDD by the installing contractor.
- B. All cable supports shall be manufactured by a company which produces cable supports. No field made apparatus will be accepted without prior written approval.

1.5 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
 1. Personnel Qualification – submit copy of RCDD’s certificate
 2. Product data for the following products:
 - a. Floor Boxes and Poke Throughs
 - b. Cable Trays
 - c. Fire Stop Materials and Systems
 - 1) At a minimum firestop cut-sheets shall provide the following information for each system to be installed:
 - a) Documentation from UL catalog for each system proposed. This documentation shall include the following information:
 - i) Firestop manufacturer
 - ii) UL system number
 - iii) F, T, and L Ratings
 - iv) The complete description of the firestop system; To include what specific construction the system is intended to pass through such as a wall or floor assembly, the penetrating items allowed to pass through the opening in the wall or floor assembly, and the materials designed to prevent the spread of fire through the openings.
 - d. Telecommunications ground bars and connectors
 3. Shop Drawings for:
 - a. Submit for review scaled layout drawings showing the routing of all pathways and firestop locations (with quantity and NRTL system number identified), Each pathway shall be identified by type and size on the drawings.
 - b. Unless otherwise required by these specifications, it is permissible to show different pathways systems (conduit, cable tray, auxiliary supports, etc.) on the same shop drawing.
 4. Record Documents:
 - a. Resubmittal of approved product submittals, with installation and O&M manuals.
 - b. Floor plans shall show the routing of all pathways and firestop locations (with quantity and NRTL system number identified) as actually installed. Each pathway shall be identified by type and size on the drawings.

- c. Letter stating that the Telecommunications Grounding and Bonding System has been installed in accordance with the referenced standards and contract documents, including testing requirements.

1.6 DEFINITIONS

- A. Bonding Conductor for Telecommunications (BCT) – the conductor that bonds the TMGB to the service equipment (power) ground.
- B. Communications Room - means the location of a floor-serving facility for housing telecommunication equipment, and potentially other low-voltage systems such as audio-visual, security and fire alarm (electronic safety and security) equipment. Also known as Telecommunications Room, Telecom Room, IT Room, MDF, or IDF.
- C. IDF – Intermediate Distribution Frame, secondary Communications Room(s) for a building
- D. IMC – Intermediate Metal Conduit
- E. MDF – Main Distribution Frame, the Main Communications Room for a building
- F. Point of Entrance (Building Entrance) – The point within a building where the Outside Plant (OSP) communications cabling emerges from an external wall, a concrete floor slab, or IMC/RMC. If Communications Point of Entrance isn't identified on the drawings, assume the Main Communications Room (MDF) also acts as the Point of Entrance.
- G. RCDD – Registered Communications Distribution Designer as certified by BICSI
- H. RMC – Rigid Metal Conduit
- I. STC – Sound Transmission Class, a single number decibel rating of the transmission loss properties of an assembly. Measured transmission loss data is plotted versus frequency and compared with standard contours according to rules outlined in ASTM E 90 and ASTM E 413.
- J. Telecommunications Bonding Backbone (TBB) – A conductor that interconnects the telecommunications main grounding busbar (TMGB) to the telecommunications grounding busbar (TGB).
- K. Telecommunications Grounding Busbar (TGB) – A common point of connection for telecommunications system and equipment bonding to ground, and located in the telecommunications room or space.
- L. Telecommunications Main Grounding Busbar (TMGB) – A busbar placed in a convenient and accessible location in the MDF and bonded by means of the bonding conductor for telecommunications, to the building service equipment (power) ground.

1.7 COORDINATION

- A. Coordinate arrangement, mounting, and support of communications equipment with Telecommunications equipment furnished by Owner and Telecommunications service providers.
- B. Coordinate arrangement, mounting, and support of communications equipment:
 - 1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
 - 2. To allow right of way for piping, ducts, and other systems installed at required slopes and/or elevations.
 - 3. So connecting raceways, cables, and wireways will be clear of obstructions and of the working and access space of other equipment.

- C. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.
- D. Coordinate location of access panels and doors for communications items that are behind finished surfaces or otherwise concealed.
- E. Coordinate testing of electrical, mechanical, and architectural items, so equipment and systems that are functionally interdependent are tested to demonstrate successful interoperability.

1.8 NOISE CRITICAL SPACES

- A. For Noise –critical spaces, provide Acoustic Pathway Devices as needed and attenuating measures and acoustical sealants as indicated in Division 26, “ Common Work Results for Electrical”.

PART 2 - PARTS AND MATERIALS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
 - 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
- B. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference.

2.2 PATHWAYS FOR COMMUNICATIONS SYSTEMS

- A. Raceways and Boxes for Communications Systems
 - 1. General Requirements
 - a. Refer to Division 26, “Raceways and Boxes for Electrical Systems” for Available Manufacturers and other specific product, material and installation requirements.
 - b. Outlet boxes located in plenum accessible ceiling space shall be listed for installation in a plenum.
 - c. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified in the following paragraphs. Manufacturers and model numbers listed are used only to represent the characteristics required and are not intended to restrict the use of other Available Manufacturers models that meet the specified criteria.
 - 2. Back boxes for Telecommunications Systems (Telephone, Data, and Multi-Service Outlets) installed in stud walls:
 - a. Requirements:
 - 1) Minimum size of 4-11/16 inches (119.1 mm) width by 4-11/16 inches (119.1 mm) height by 2-1/8 inches (54 mm) depth
 - 2) with a single-gang raised cover/extension ring a minimum of 3/8” deep. Depth shall match that of wall gypsum board(s)
 - b. Manufacturer shall be:
 - 1) Appleton 4SJD-1 series with single gang extension ring
 - 2) RACO 258/259 series with single gang extension ring
 - 3) Randl T-55017 with single gang extension ring

3. Back boxes for Telecommunications Systems (Telephone, Data, and Multi-Service Outlets) installed in masonry construction:
 - a. Requirements:
 - 1) Minimum size shall be single gang, a minimum of 3-1/2 inches deep.
 - b. Manufacturer shall be:
 - 1) Single gang
 - a) RACO 695/8695 or equivalent
 - b) Appleton MI-250 series or MI-350 series.
 - c) RACO 690 series or 695 series.
 - d) Steel City GW series.
4. Back boxes for Audio Visual outlets
 - a. Refer to AV drawings and specifications for exact requirements. When there are no AV drawings/specifications, meet the requirements of this section:
 - b. Requirements
 - 1) Dual-gang
 - 2) Depth shall be 3-1/2 inches.
 - c. Manufacturer shall be:
 - 1) Extron JB series (3.5" deep)
 - 2) Or equivalent from Available Manufacturers
 - 3) Or Approved Equivalent
5. Pull Boxes
 - a. Specifications
 - 1) Refer to drawings for sizing requirements.
 - 2) Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
 - 3) Cast-Metal Pull and Junction Boxes: NEMA FB 1, cast aluminum with gasketed cover.
 - b. The following manufacturers are Conditionally Approved.
 - 1) Hoffman
 - 2) Refer to Manufacturers in Boxes, Enclosures and Cabinets section of Division 26 "Raceways and Boxes for Electrical Systems".

B. Floor Boxes

1. General:
 - a. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified in the tables below. Manufacturers and model numbers listed are used only to represent the characteristics required and are not intended to restrict the use of other Manufacturers listed above and models that meet the specified criteria.
 - b. Floor boxes used for power: Include a minimum of one normal 20A, 125V NEMA 5-20R duplex receptacle unless noted or scheduled otherwise on the Drawings. Wiring device color: Refer to Division 26 Section "Wiring Devices", or as indicated on the Drawings.
 - c. Floor boxes utilized for communications: Include provisions for mounting communications faceplate and connectors in accordance with the requirements of the communications systems provider.
 - d. Telecommunications pathways back to serving Communications Room – See detail on drawings for pathway requirements.
2. **Floor-mounted Telecommunications Outlet (Telephone and/or Data connections only):** For slab on grade: watertight, Class 1, fully adjustable, cast iron box with removable partition. For slab above grade: concrete-tight, fully adjustable, stamped galvanized steel box. Brass cover plate and brass carpet ring. Provide aluminum cover plate and trim in lieu of brass when directed by Architect. Shallow slab-on-grade depths necessitate use of Box Type E. Shallow above-grade slabs necessitate use of Poke-Through Outlet. Conduits shown on plans are minimum size; select appropriate floorbox based on slab type, thickness, and minimum conduit size.

<u>MFR</u>	<u>CAST IRON</u> <u>BOX</u>	<u>STAMPED</u> <u>STEEL BOX</u>	<u>COVER</u> <u>PLATE</u>	<u>CARPE</u> <u>T TRIM</u>	<u>Coordination</u>
Steel City	600 2SC(accepts up to (4) 2" conduits)	68 D (accepts up to (4) 1" conduits)	P60-DS or P60-1/2-2 for Furniture Feeds	P60-CP	Coordinate with Owner/Telecommunications installer – requires that they install Duplex Insert for floor outlets.
Wiremold	889B (accepts up to (2) 1-1/4" conduits)	886B (only accepts (1) 1" conduit)	895GFI (Carpet) / 895TGFI (Tile) or 896CK (Carpet) / 896TCK-1 (Tile) for Furniture Feed	n/a	Coordinate with Owner/Telecommunications installer – requires that they install Decora Insert for floor outlets
Hubbell	For 4" slabs – B253641 (accepts up to (4) 1" conduits) For 4.75+" slabs, B2506 (accepts up to (4) 1-1/4" conduits)	For 4" slabs only – B2527 (accepts up to (1) 1-1/4" conduit and (1) 1" conduit)	S3925 or S2725 for Furniture Feed	S3182	Coordinate with Owner/Telecommunications installer – requires that they install Duplex Insert for floor outlets.

3. **Box Type E - Multi-Service (2 compartment):** For slab on grade: watertight, Class 1, fully adjustable, cast iron. For slab above grade: concrete-tight, Class 2, fully adjustable, stamped galvanized steel. Two compartments - one side plate with knockouts for communications faceplate and connectors; one side plate with provisions for one duplex receptacle. Furnish polycarbonate or nylon cover and flange piece with standard color as directed by Architect. Conduits shown on plans are minimum size; select appropriate floorbox based on slab type, thickness, and minimum conduit size. Shallow above-grade slabs necessitate use of Poke-Through Outlet.

<u>MFR</u>	<u>CAST IRON</u> <u>BOX</u>	<u>STAMPED</u> <u>STEEL BOX</u>	<u>RECEP</u> <u>TACLE</u> <u>PLATE</u>	<u>BLANK PLATE</u>	<u>COVER</u>
Steel City	664-CI (accepts (3) 1" conduits in Communications compartment)	664	664-RP, 664-GP (Decorat or Style)	664-BP	664-CST Series
Wiremold	RFB2-OG	RFB2-SS	RFB2DP , RFB2B (Decorat or Style)	RFB2B	FP Series
Hubbell	3SFBC (accepts (1) 1-1/4" conduit in Communications compartment)	3SFBSS (accepts (1) 1" conduit in Communications compartment)	3SFBRP , 3SFBDS (Decorat or Style)	3SFBB	3SFBCxxA Series

4. **Box Type F / AV - Multi-Service (3 or 4 compartment):**

- a. Refer to Audio/Video drawings and specifications for exact floorbox requirements. If there are no AV drawings and specifications, then the following requirements apply:
- 1) For slab on grade: watertight, Class 1, fully adjustable, cast iron, unless otherwise noted. For slab above grade: concrete-tight, Class 2, fully adjustable, stamped galvanized steel.
 - 2) Three to four compartments, 3-1/2-inch maximum overall depth, and provisions for power receptacles and communications faceplate and connectors. Furnish hinged cover and nylon or polycarbonate flanged trim with standard color as directed by Architect.
 - 3) Conduits shown on plans are minimum size; select appropriate floorbox based on slab type, thickness, and minimum conduit size.

<u>MFR</u>	<u>SLAB-ON- GRADE BOX</u>	<u>STAMPED STEEL BOX</u>	<u>ELECTRICAL RECEPTACLE PLATE</u>	<u>BLANK PLATE</u>	<u>COVER</u>
FSR	FL-500P-3" (accepts up to (4) 1-1/4" conduits) with Pour Pan (concrete-tight, acceptable only when used with Pour Pan)	FL-500P-3" (accepts up to (4) 1-1/4" conduits)	FL-P3"- DECORA	FL-P3"	FL-500P Series
Steel City	665-CI	665	665-RP, 665- GP (Decorator Style)	665-BP	665-CST Series
Wiremol d	RFB4-CI	RFB4	RFB-DR, RFB- GFI (Decorator Style)	RFB-B	FP Series
Hubbell	HBLCFB401C B	HBLCFB30 1BASE	HBLST302SGY , HBLDE301SG Y (Decorator Style)	HBLBL300SGY	HBLTCGNT Series

5. **Box Type G - Access Floor Small Service Module:** Nominal 8-inch x 8-inch drop-in service module for installation in raised access floors. Galvanized steel or cast aluminum construction, hinged outer cover with flip-lid for cable egress, and nylon or polycarbonate trim with standard color as directed by Architect. Minimum of two (2) compartments with provisions for power receptacles and communications faceplate and connectors as scheduled or noted on the Drawings.

<u>MFR</u>	<u>BOX AND COVER</u>	<u>RECEPTACLE PLATE</u>	<u>BLANK PLATE</u>
Steel City	AFM-4	AFP-4A, AFP-4GFCI (Decorator Style)	AFP-4B
Wiremold	AF1	SGT-DP	SGT-B
Hubbell	HBLAFB401 (Base)/ HBLTCGNT (Cover)	ST302, DE301 (Decorator Style)	BL300

6. **Box Type H / AV - Access Floor Large Service Module:**

- a. Refer to Audio/Video drawings and specifications for exact floorbox requirements. If there are no AV drawings and specifications, then the following requirements apply:
- 1) Nominal 8-inch x 10-inch drop-in service module for installation in raised access floors. Galvanized steel or cast aluminum construction, hinged outer cover with flip-lid for cable egress, and nylon or polycarbonate trim with standard color as directed by Architect. Minimum of two (2) compartments with provisions for power receptacles and communications faceplate and connectors as scheduled or noted on the Drawings.

<u>MFR</u>	<u>BOX AND COVER</u>	<u>ELECTRICAL RECEPTACLE PLATES</u>	<u>BLANK PLATE</u>
FSR	FL-540P-4" (accepts up to (4) 1-1/2" conduits)	Standard 1-gang or 2-gang decora wall plate	Standard 2-gang, 3-gang and/or 4-gang blank plates to cover remaining openings.
Steel City	AFM-6	AFP-6A, AFP-6Q, AFP-6GFCI (Decorator Style)	AFP-6B
Walker	AF3	SGT-DP, SGB-DP	SGT-B, SGB-B
Hubbell	AFB301 (Base)/HBLTCGN T (Cover)	HPWST302SGY, HPWDE301SGY (Decorator Style)	HPWBL300SGY

C. Poke-Through Outlets (Multi-Service)

1. General
 - a. UL listed and UL Fire Classified, flush type, with one- to four-hour fire rating, as required by floor rating and type.
 - b. Telecommunications pathways back to serving Communications Room – See detail on drawings for pathway requirements.
2. Type A – Flush: Dual Service for Power and Telecommunications only, with outlets flush in the floor
 - a. Capable of supporting, at a minimum, a duplex 20A/125V receptacle (or equivalent), and one decora style opening / mounting plate for telecommunications.
 - b. Coordinate cover type and color with Architect.
 - c. Manufacturer shall be:
 - 1) Wiremold 6ATC Series with 6DEC Mounting Plate.
 - 2) Hubbell S1PT Series
3. Type B – Furniture Feed: Dual Service for Power and Telecommunications only, with cables to extend through flexible conduit into modular furniture.
 - a. Poke Thru and cover plate shall support 3/4" trade size screw plug opening for electrical and 1-1/4" trade size screw plug opening for telecommunications.
 - b. Coordinate cover finish with Architect.
 - c. Manufacturer shall be:
 - 1) Wiremold 6ATCFF Series
 - 2) Hubbell S1PTFF Series
4. Type C – Flush (with AV): Multiple Service for Power, Telecommunications, and AV
 - a. Capable of supporting, at a minimum, a duplex 20A/125V receptacle (or equivalent), pre-wired to a junction box, and one decora style opening / mounting plate for telecommunications.
 - b. Coordinate cover type and color with Architect.
 - c. Manufacturer shall be:
 - 1) Wiremold 8ATC Series with (2) 68REC-25 Duplex Receptacles for power and (1) 8DEC Mounting Plate for telecommunications. Coordinate with Owner / AV installer for other required inserts; if direction is not given in a timely manner, provide blank inserts for remaining of openings.

- 2) FSR SmartFit 8” Series with (2) SF8-SPO3 Duplex Receptacles for power and (1) SF8-SPC4 decora style opening / mounting plate for telecommunication. Coordinate with Owner / AV installer for other required inserts; if direction is not given in a timely manner, provide blank inserts for remaining of openings.

D. Cable Tray

1. Flexible cable tray
 - a. Manufacturers:
 - 1) Chatsworth
 - 2) Cooper B-Line
 - 3) Hoffman
 - 4) Legrand/Cablofil
 - 5) MPHusky
 - 6) Schneider Electric/WIBE
 - 7) Snake Tray
 - 8) Thomas & Betts
 - 9) WBT LLC
 - b. Specifications
 - 1) Cable Tray Size: Size identified on drawings indicate minimum width and depth size. Provide cable tray of sufficient size to accommodate a maximum calculated fill ratio of 50% for all Division 27 and 28 cabling, to include all cables installed plus 25% growth.
 - 2) Cable tray systems shall be pre-fabricated structures for supporting and routing cables or conductors that are pulled or laid in place after the pathway has been installed as a complete system.
 - 3) Flexible cable tray systems shall consist of straight sections, fittings, and accessories as necessary for a complete, continuously grounded system.
 - 4) Wire basket shall be made of high strength steel wires and formed into a standard 2 inch by 4 inch wire mesh pattern with intersecting wires welded together. All wire ends along wire basket sides (flanges) shall be rounded during manufacturing for safety of cables and installers.
 - 5) Cable Tray Materials: Steel rod and/or wire; corrosion resistant to the degree suitable for the environment where it is to be installed; field-bendable.
 - 6) Cable Tray Types:
 - a) Wire cable tray: a cable tray manufactured from metal wire welded at all intersections and is formed to provide a channel for the cables.
2. Rigid Cable Tray
 - a. Manufacturers:
 - 1) Chatsworth
 - 2) Cooper B-Line
 - 3) Hoffman
 - 4) Legrand/Cablofil
 - 5) MPHusky
 - 6) Schneider Electric/WIBE
 - 7) Thomas & Betts
 - 8) WBT LLC
 - b. Specifications
 - 1) Refer to Electrical Division 26 for specific product and material information.
 - a) Sizes, methods, and more stringent requirements shall be adhered to when specified in this Division.
 - 2) Cable Tray Size: Provide cable tray with the loading depth and loading width as shown on the drawings.
 - 3) Cable tray systems shall be pre-fabricated structures for supporting and routing cables or conductors that are pulled or laid in place after the pathway has been installed as a complete system.

- 4) Cable trays shall be designed to accommodate a maximum calculated fill ratio of **50%**, to include all cables installed with **25%** growth.
- 5) Interior cable trays shall be striped, traced, colored, or marked with color in no less than **5 feet (1.5 m)** increments by permanent means using appropriate methods to assist in identifying its purpose to installers and the Owner in the future.
 - a) Methods such as spray painting conduits or sections of pathways are acceptable but shall be done prior to installation.
 - b) The support span for cable support systems shall be determined in accordance with the manufacturer's maximum recommended load capacity for a given span. These systems may be supported by three basic methods: cantilever brackets from a wall, trapeze or individual rod supports from the ceiling, or directly from the floor.
 - c) Cable tray supports shall be located where practicable so that connections between sections of the tray fall between the support point and $\frac{1}{4}$ the distance of the span. A support should be placed within **24 inches (609.6 mm)** on each side of any connection to a bend, tee, or cross. See the NEMA-VE2 Metal Cable Tray Installation Guidelines for additional cable tray support and installation recommendations.
- 6) Cable tray systems shall consist of straight sections, fittings, and accessories as defined in NEMA VE-1 and UL classified as equipment grounding conductors. Provide radiused elbows, tees, crosses, splice plates, wall and overhead supports, and other fittings necessary for a complete, continuously grounded system.
 - a) Fittings and connectors shall be used to connect straight sections and change direction or size. Fittings include horizontal bends, vertical bends, reducers, crosses and tees. Connectors may include splice plates, splice clamps, and tee clamps. Accessories may include such items as covers, conduit adapters and barriers.
- 7) Cable Tray Materials and Finishes:
 - a) Aluminum: Straight sections and fitting side rails and rungs shall be extruded from Aluminum Association Alloy 6063. All fabricated parts shall be made from Aluminum Association Alloy 5052. Splice plates shall be of wedge lock design, using four square neck carriage bolts and serrated flange locknuts
 - b) Pre-Galvanized Steel: Straight sections and fitting side rails, rungs and covers shall be made from steel meeting the minimum mechanical properties and mill galvanized in accordance with ASTM A653 SS, Grade 33, coating designation G90. Splice plates shall be manufactured from high strength steel, using ribbed carriage bolts and serrated flange locknuts
 - c) Hot Dipped Galvanized After Fabrication Steel: Straight sections, fitting side rails and rungs shall be made from steel meeting the minimum mechanical properties of ASTM A1011 SS, Grade 33 for 14 gauge and heavier, ASTM A1008, Grade 33, Type 2 for 16 gauge and lighter, and shall be hot-dip galvanized after fabrication in accordance with ASTM A123. All covers and splice plates shall also be hot-dip galvanized after fabrication; mill galvanized covers are not acceptable for hot-dipped galvanized cable tray. All hot-dip galvanized after fabrication steel cable trays shall be returned to point of manufacture after coating for inspection and removal of all oxides and excess zinc. Failure to do so can cause damage to cables and/or injury to installers
 - d) Stainless Steel: Straight sections, fitting side rails and rungs shall be manufactured from AISI Type 304 or Type 316 stainless steel. Transverse members (rungs) or corrugated bottoms shall be welded to the side rails with Type 316 stainless steel welding wire
- 8) Rigid Cable Tray Types:
 - a) Ladder: Ladder type tray shall be a pre-fabricated structure consisting of two longitudinal members (side rails) with transverse members (rungs) welded to the side rails, for supporting and routing cables or conductors within the structure. Rungs shall be spaced on [**6 inches (152.4 mm)**][**9 inches (228.6**

mm)][12 inches (304.8 mm)][18 inches (457.2 mm)] on center. Rung spacing in radiused fittings shall be 9 inches measured at the center of the trays width. Rungs shall have a minimum cable bearing surface of 3/4 inch (19.1 mm) with radiused edges. No portion of the rungs shall protrude below the bottom plane of the side rails

- b) Ventilated-bottom or ventilated-trough cable tray: Ventilated trough type trays shall consist of three piece construction consisting of two longitudinal members (side rails) with a corrugated bottom welded to the side rails. The peaks of the corrugated bottom shall have a minimum flat cable bearing surface of 2-3/4 inches (69.9 mm) and shall be spaced 6 inches (152.4 mm) on center. To provide ventilation in the tray, the valleys of the corrugated bottom shall have 2-1/4 inch (57.2 mm) x 4 inch (101.6 mm) rectangular holes punched along the width of its bottom
- c) Solid-bottom or Solid Trough: Solid bottom trough type trays shall be of three piece construction consisting of two longitudinal members (side rails) with a solid corrugated bottom welded to the side rails. The peaks of the solid corrugated bottom shall have a minimum flat cable bearing surface of 2-3/4 inches (69.9 mm) and shall be spaced 6 inches (152.4 mm) on center.

3. Ladder Rack (inside Communications Rooms)

- a. Color: black
- b. UL Classified
- c. Provide ladder rack components such as inside radius bend, outside radius bend, and corner bracket for a complete system meeting drawings and manufacturer instructions.
- d. Provide ladder rack supports such as wall angle support kit, triangular support bracket, center support kit, threaded rod, I-beam clamp, threaded ceiling kit, cabinet elevation kit, foot kit, rack mounting plate, rack elevation kit for a complete system meeting drawings and manufacturer instructions.
- e. Provide ladder rack accessories such as cross member radius drop, end caps, and dividers for a complete system meeting drawings and manufacturer instructions.
- f. The following manufacturers are Conditionally Approved:
 - 1) Cooper B-Line
 - 2) Chatsworth
 - 3) Middle Atlantic

E. Access Doors for Communications Systems

- 1. Refer to Execution section for location requirements.
- 2. Refer to Division 26, "Common Work Results for Electrical" for specific product and material information.

F. Fire stop System Assemblies for Communications Systems

- 1. General
 - a. Communications cable tray shall not continue through a fire-rated wall. Stop the tray, install multiple Fire-Rated Pathway Devices for Communications (capacity shall match that of cable tray cross-sectional area), and continue tray on the other side. Ensure grounding of the tray is continuous through the wall.
 - b. Minimum performance requirements: Shall meet testing requirements of ASTM E-814 or U.L. 1479; Shall be installed in accordance with the NRTL. Provide fire stop systems appropriate for the specific application and in accordance with manufacturer's instructions.
 - c. Shall be a pre-fabricated and zero-maintenance solution which requires no action to activate the fire and smoke protective characteristics of the device.
- 2. Fire-Rated Pathway Device for Communications - for sleeves through a single penetration (wall or floor)
 - a. Allows the installation and removal of cables without the need to remove or add any materials.
 - b. Used to seal penetrations of cables through fire rated partitions.

- c. Manufacturer shall be:
 - 1) EZ-Path family of products by Specified Technologies Inc.
 - 2) Wiremold Flamestopper
 - 3) Or equivalent from Conditionally Approved manufacturer.
- 3. Through-Floor Firestopping Sleeve for Communications
 - a. Used to seal penetrations of cables through fire rated floor.
 - b. Manufacturer shall be:
 - 1) EZ-Path Series 44 - where (4) sleeves are shown together, provide grid system – STI EZG444
- 4. Firestopping for Communications Backboxes in Fire-Rated Walls
 - a. Specifications
 - 1) Used to seal communications backboxes in fire rated partitions.
 - 2) Minimum performance requirements: Shall meet UL testing requirements of UL 263 and classified as Wall Opening Protective Material (QCSN or CLIV); Shall be installed in accordance with the NRTL. Shall meet or exceed the ratings of the wall or floor that it is located in.
 - 3) Provide fire stop systems appropriate for the specific application and in accordance with manufacturer’s instructions.
 - b. Manufacturer shall be:
 - 1) Specified Technologies Inc., SpecSeal Power Shield
 - 2) Or equivalent from
 - a) 3M
 - b) Hilti
- 5. Firestopping for Thru-Wall (or Floor) Communications Conduit Penetrations and Other Applications
 - a. For fire-rated penetrations where the pathway extends beyond a single fire-rated partition/floor, and other required firestopping applications required by Communications Pathways not previously addressed in this specification.
 - b. Specifications:
 - 1) Shall be UL listed for the specific application;
 - 2) Shall meet or exceed the ratings of the wall or floor that it penetrates.
 - c. Manufacturer shall be:
 - 1) Specified Technologies Inc., SpecSeal Power Shield
 - 2) Or equivalent from
 - a) 3M
 - b) Hilti

G. Sleeves Entering Noise Critical Spaces – Acoustic Pathway Device

- 1. Where walls or ceiling-mounted Communications Devices are located inside Noise Critical Spaces, and/or for Communications System sleeves through acoustically-rated (non-fire-rated) walls at or above STC-50, provide Acoustic Pathway Device(s) to support low-voltage telecommunications/AV/security cabling.
- 2. Specifications:
 - a. Shall maintain STC Rating of the penetrated wall.
 - b. Shall accommodate cable loads from 0 to 100% visual fill.
 - c. Shall be zero-maintenance, meaning no action is required by cabling technician to open/close pathway for cable moves, adds, or changes.
 - d. Shall be engineered such that cables can
 - e. Where more than one Acoustic Pathway Device is needed, they shall be ganged together with manufacturer supplied grid.
- 3. Manufacturer shall be:
 - a. Specified Technologies EZ-Path Smoke & Acoustical Pathway (NEZ33)

2.3 TELECOMMUNICATIONS BACKBOARD

A. Telecommunications Backboard

1. A minimum of one wall shall be covered with **0.75 in (19 mm)** plywood, UON on drawings.
2. The backboard shall be 4 ft (1.2 m) x 8ft (2.4 m) sheets, mounted vertically, with the bottom of the plywood mounted **6 in (150 mm)** above the finished floor with the best side toward the room.
3. Plywood shall be A/C grade and finished with two coats of fire-retardant paint.
4. Plywood shall be painted prior to installation of any equipment; mask out one stamp on each sheet of plywood prior to painting.
5. Plywood shall be permanently fastened to the wall by means of wall anchors utilizing galvanized, zinc plated, or stainless steel hardware with a flat head. Finished installation shall have flush appearance with countersunk screw heads to prevent splitting of the plywood. Drywall screws are not acceptable.

2.4 GROUNDING AND BONDING FOR TELECOMMUNICATIONS SYSTEM

A. General

1. Provide a Telecommunications Grounding and Bonding System in accordance with the TIA 607B Standard and these construction documents. Where these differ, the more stringent requirement applies.
2. Component Manufacturers:
 - a. Chatsworth
 - b. Cooper B-Line
 - c. Erico
 - d. Harger
 - e. Hoffman
 - f. Panduit
3. Conductor Manufacturers
 - a. Shall be from the list of Component Manufacturers; or
 - b. Shall be from the list of Manufacturers in Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".

B. Telecommunications Main Ground Bar (TMGB)

1. Specifications
 - a. All busbars shall have a clear cover installed to protect connections
 - b. Cover shall be:
 - 1) Plexiglass or plastic
 - 2) Cover shall be printed with 1" lettering "TMGB" (or "TGB") using appropriate labels.
 - 3) Of the same manufacturer as the ground bar
 - c. A predrilled Electroplated copper busbar provided with holes for use with standard sized lugs
 - d. Have minimum dimensions of **1/4 inch (6.4 mm)** thick x **4 inches (101.6 mm)** wide x **20 inches (508 mm)** long.
 - e. Provide enough length for all connections with 25% growth.
 - f. Provided with insulators to electrically isolate busbar from mounting surface.
 - g. Provided with a minimum of **2-inches (50.8 mm)** clearance from wall or other mounting surfaces for access.
2. Manufacturer shall be
 - a. Harger TGBI144(**)TMGB
 - b. Chatsworth 40158-20
 - c. Or equivalent from Component Manufacturer

C. Telecommunications Ground Bar (TGB)

1. Specifications
 - a. Be a predrilled Electroplated copper busbar provided with holes for use with standard sized lugs

- b. Have minimum dimensions of 1/4 inch (6.4 mm) thick x 4 inches (101.6 mm) wide x 12 inches (304.8 mm) long
 - 1) Provide enough length for all connections with 25% growth
 - c. Provided with insulators to electrically isolate busbar from mounting surface
 - d. Provided with a minimum of 2-inches (50.8 mm) clearance from wall or other mounting surfaces for access.
 - 2. Manufacturer shall be
 - a. Harger TGBI142(**)TGB
 - b. Chatsworth # 40156-012
 - c. Or equivalent from Component Manufacturer
 - D. Ground Wire for TBB
 - 1. Specifications
 - a. All grounding and bonding connectors shall be listed by a Nationally Recognized Testing Laboratory (NRTL) as required by the NEC.
 - b. All grounding and bonding conductors shall be copper and may be insulated UON. When conductors are insulated, they shall be listed for the application (i.e. Plenum, riser, outside plant, etc.)
 - c. Ground Wire for TBB: Non-Insulated grounding wire with a minimum conductor size as indicated on drawings. Wire Shall be UL listed.
 - d. Cable jacket marking: Shall be legible and shall contain the following information:
 - 1) Manufacturer's name.
 - 2) Copper Conductor Gauge.
 - 3) UL listing.
 - e. Cable jacket shall be green with black lettering.
- E. Bonding Conductor (To main Electrical service ground) for Telecommunications (BCT): Insulated grounding wire with a minimum copper conductor size equal to that of the TBB, with PVC insulation. Shall be UL listed.
 - 1. Specifications
 - a. Insulated grounding wire with PVC insulation
 - b. A minimum copper conductor size equal to that of the largest TBB or other bonding conductor connected to the TMGB, UON.
 - c. Cable jacket marking: Shall be legible and shall contain the following information:
 - 1) Manufacturer's name
 - 2) Copper Conductor Gauge
 - 3) NRTL listing information
 - d. Cable jacket shall be green with black lettering
 - e. A minimum conductor size as indicated on drawings
- F. Ground Wire (for connections within each Telecommunications Room and to Cable Tray)
 - 1. Specifications
 - a. When *not* routed through plenum or other air-handling space: Insulated grounding wire with a minimum copper conductor size of number 6 AWG, with PVC insulation. Shall be UL listed.
 - b. When routed through plenum or other air-handling space: *Non-Insulated* grounding wire with a minimum copper conductor size of number 6 AWG. Shall be UL listed.
 - c. Cable jacket marking: Shall be legible and shall contain the following information:
 - 1) Manufacturer's name.
 - 2) Copper Conductor Gauge.
 - 3) UL listing.
 - d. Cable jacket shall be green with black lettering.
- G. Connectors
 - 1. Specifications

- a. All connections between cables and the joining or mating of cables to connectors shall be done by exothermic weld or irreversible compression connector.
- b. Connector Terminal: Heavy duty, high copper alloy terminal for joining cable to grounding bus bar.
- c. Twin clamping elements for cable; two holes for attachment to grounding bar, etc
- 2. Connector Terminal
 - a. Specifications
 - 1) Medium duty, high copper alloy terminal for joining cable to equipment racks, cable racking and cable tray.
 - 2) Twin clamping elements for cable; one (or more) holes for attachment to rack, tray, etc.
 - b. Manufacturer:
 - 1) Submit product data from Connector Manufacturer
- 3. Cable to cable connector
 - a. Specifications
 - 1) Heavy duty, permanent connection between two or more copper conductors; splice “T” or cross, as indicated on the drawings and as required.
 - b. Manufacturer:
 - 1) Submit product data from Connector Manufacturer

PART 3 - EXECUTION

3.1 PATHWAYS FOR COMMUNICATIONS SYSTEMS

A. General

- 1. Unless otherwise noted, pathway routing shown on the Drawings is illustrative only and meant to indicate the general configuration of the work. Install pathways so that adequate clearances and offsets between pathways and other trades are provided. Coordinate all pathways with other trades prior to installation.
- 2. Permanently mark or tag each raceway at intervals of not more than **75 feet (22.86 m)**, and each junction box and pull box. Permanently mark or tag each raceway that is stubbed into the ceiling space from an outlet box. Identifying them as “TELECOM” or “AV” as appropriate.
- 3. Coordinate the following with cable-installing contractor.
 - a. All supports shall be specifically designed to support the required cable weight and volume. Field manufactured supports will not be accepted.
 - b. All pathways shall include empty space for a minimum of 25% growth beyond initial installation of cabling.
 - c. Provide all communications pathways:
 - 1) So that cables are allowed to be pulled in accordance with referenced standards and guidelines.
 - 2) So that cables are allowed to be pulled without damage to conductors, shield, armor, or jacket.
 - 3) So that cables are not forced or allowed to exceed minimum allowed bend radius by manufacturer or referenced standards and guidelines
 - 4) So that the maximum allowable pulling tension is not exceeded
 - 5) To meet the requirements of the structure and the requirements of all other Work on the Project.
 - 6) Within or passing through the concrete structure in such a manner so as not to adversely affect the integrity of the structure. Become familiar with the Architectural and the Structural Drawings and their requirements affecting the raceway installation. If necessary, consult with the Architect.
 - 7) Parallel or perpendicular to building lines or column lines.
 - 8) When concealed, with a minimum of bends in the shortest practical distance, considering type of building construction and obstructions, unless otherwise indicated.

- d. Follow manufacturer's recommendations for allowable fill capacity. Do not exceed load ratings specified by manufacturer.
- 4. Access to pathways and associated equipment
 - a. Care shall be taken to ensure that other building components (e.g., air conditioning ducts, pipes, conduits) do not restrict access. Locate all cable trays, open hanger cable supports, j-hooks, pull boxes, junction boxes and fire stopping systems so as to provide easy access for operation, service inspection and maintenance.
 - b. Provide an access door where equipment or devices are located above inaccessible ceilings.
 - c. Pathways requiring access such as open hanger cable supports, j-hooks, and cable trays shall have an access door or other means of direct access at a minimum of **10 feet (3 m)** intervals.
 - d. Cables or cable pathways requiring access such as open hanger cable supports, j-hooks, and cable trays may not change directions above an inaccessible ceiling unless complete access to the change of direction in pathway or cable route is within arms reach **3 feet (0.9 m)** from adjacent accessible point.

B. Conduits and Backboxes for Communications

- 1. Bond and ground all metallic conduits and boxes in accordance with national or local requirements and owner Standards (if applicable).
- 2. Ream all conduit ends and fit them with an insulated bushing to eliminate sharp edges that can damage cables during installation or service.
- 3. Conduits which enter telecommunications rooms shall extend **1 inch (25.4 mm)** to **3 inches (76.2 mm)** AFF.
- 4. Flexible conduits may only be used where specifically allowed by these contract documents.
 - a. Flexible conduit sections shall be less than **20 feet (6.1 m)** in length and shall be increased by (1) trade size
- 5. No continuous section of a conduit may exceed **100 feet (30.5 m)** without a pullbox.
- ~~6. Conduit runs shall not exceed a total of **150 feet (45.7 m)**.~~
- 7. No more than (2) **90°** bends, or equivalent will be allowed between pullboxes.
 - a. Each and any offset shall be considered a **90°** bend.
 - b. A pullbox is required wherever a reverse bend is installed.
- 8. The minimum bend radius for conduits is
 - a. (6) times the inside diameter for **2 inches (50.8 mm)** conduits or less.
 - b. (10) times the inside diameter for conduits greater than **2 inches (50.8 mm)**.
- 9. Install a pull cord in each pathway (empty or not) for installation of new wires or cables. Use polypropylene or monofilament plastic line with not less than 200 lb (90.7 kg) tensile strength. Leave at least 12 inches (**304.8 mm**) of slack at each end of pull cord.
- 10. Provide appropriately sized sleeves where cables are required to pass through non-rated full-height partitions. Rated partitions shall be provided with appropriately rated firestop systems. Where allowed, sleeves shall extend a minimum of **3 inches (76.2 mm)** beyond the partition surface on both sides, and shall be rigidly supported to support the weight of cables. Sleeves shall be sized so that no more than 50% of the cross-sectional area is utilized by the cabling to be installed. The minimum inside diameter of each sleeve shall be nominal **2 inches (50.8 mm)**.
- 11. PullBoxes
 - a. Pullboxes shall be placed in Conveniently Accessible locations.
 - b. Coordinate the location and installation of all pullboxes to ensure adequate access is provided.
 - c. Pullboxes above an accessible ceiling shall:
 - 1) Be aligned directly over the ceiling grid to allow access
 - 2) Be installed with a minimum of **3 inches (76.2 mm)** clearance to ceiling grid and tiles
 - d. No directional changes shall be allowed in pullboxes. Conduit Shall continue in the same direction as it enters and then change direction via an appropriately sized bend in the conduit.
 - e. Size pullboxes according to the following chart:

Conduit Trade Size	Width	Length	Depth	Width Increase for Additional Conduit (of same size)
--------------------	-------	--------	-------	--

3/4" or smaller	4"	4"	2-1/8"	Not applicable
1"	4"	16"	3"	2"
1-1/4"	6"	20"	3"	3"
1-1/2"	8"	28"	4"	4"
2"	8"	36"	4"	5"
2-1/2"	10"	42"	5"	6"
3"	12"	48"	5"	6"
4"	16"	60"	8"	6"

12. Provide an empty EMT raceway from each outlet box into the ceiling space above and terminate with a nylon bushing. In rooms with a non-accessible ceiling, install raceways to the nearest accessible corridor ceiling or as indicated on the Drawings.
13. Contractor may, as an option, stub conduits into the ceiling space on the floor below in multi-story, single-tenant spaces.
14. No outlet boxes shall be located back-to-back in a wall cavity.
 - a. Where possible offset to next stud cavity, but no less than a 6 inches (152.4 mm) separation.
15. Outlet boxes shall be within 3 feet (0.9 m) of nearest electrical outlet.
16. Provide appropriate plaster/mud ring as indicated on the drawings.
17. Provide conduit as indicated on the Drawings or required by this Specification. Minimum communications conduit size shall be 1 inch (25.4 mm). Provide a polypropylene or monofilament plastic line with not less than 200-lb (90.7 kg) tensile strength in each empty conduit. Permanently mark or tag each conduit or pull box, identifying it as Communications, at intervals of not more than 75 feet (22.9 m). Each conduit that is stubbed into the ceiling space from an outlet box shall be permanently marked or tagged.

C. Cable Tray

1. Cable trays shall be installed in accordance with manufacturer installation instructions, applicable electrical code, and standards. Comply with recommendations in NEMA VE 2.
2. Install as a complete system, including all necessary fasteners, hold-down clips, splice-plate support systems, barrier strips, hinged horizontal and vertical splice plates, elbows, reducers, tees, and crosses.
3. Fasten cable tray supports to building structure and install seismic restraints.
 - a. Design each fastener and support to carry load indicated by seismic requirements and to comply with seismic-restraint details according to Division 26 Section " Seismic Controls for Electrical Systems."
 - b. Place supports so that spans do not exceed maximum spans on schedules.
 - c. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.
 - d. Support bus assembly to prevent twisting from eccentric loading.
 - e. Manufacture center-hung support, designed for 60 percent versus 40 percent eccentric loading condition, with a safety factor of 3.
 - f. Locate and install supports according to NEMA FG 1.
4. The inside of the cable support system shall be free of burrs, sharp edges or projections that can damage cable insulation. Abrasive supports (e.g., threaded rod) installed within the cable fill area shall have that portion within the tray rigidly protected with a smooth, non-scratching covering so that cable can be pulled without physical damage such as appropriately rated (plenum) plastic tubing.
5. A minimum of 12 inches (300 mm) access headroom shall be provided and maintained above a cable tray system or cable runway.
6. Test cable tray systems to ensure electrical continuity of bonding and grounding connections, and to demonstrate compliance with maximum grounding resistance.

D. Ladder Rack

1. Seismic Requirements:

- a. Provide seismic support and bracing, as required, for all cable racking and cable trough installed under this work. Structurally design the cable racking and cable trough installations to accommodate cable loads. No other support mechanism will be supplied. Comply with Division 1 and Division 20 of these Specifications. Provide seismic design calculations and seismic design drawings prepared by the contractor's structural engineer for coordination and approval by Owner prior to fabricating or installing any supports. In general, provide support only from floor slabs, beams, columns, or structural walls (such as shear walls). Do NOT use existing or new partitions to provide either vertical or lateral support UNLESS the seismic design calculations and drawings demonstrate that the partition, either with or without reinforcement, is able to support the seismic and other loads. Any proposed reinforcement to be the responsibility of the Contractor. Coordinate seismic design with architectural, structural, mechanical, electrical, plumbing, fire protection, and other trades. (The General Contractor's office has a copy of structural plans. These should be referred to during entire project.)
- 2. Installation and configuration shall conform to the requirements of the ANSI/TIA Standards 568C & 569, NFPA 70 (National Electrical Code), NEMA VE2, and applicable local codes.
- 3. Install cable ladder racking level and plumb according to manufacturer's written instructions, Coordination Drawings, original design, and referenced standards.
- 4. Install cable ladder racking where indicated in the drawings and as required by these Specifications. At a minimum, provide the following:
 - a. Locate Ladder Rack from wall-to-wall over each anticipated row of Communications equipment racks/cabinets.
 - b. Locate additional horizontal Ladder Rack along the sides of the Communication Room walls as needed to continuously support Communications Cabling from the through-wall sleeves to any (anticipated) equipment rack/cabinet location.
 - 1) Where the through-wall sleeves are located more than 18" above the horizontal Ladder Rack, locate additional vertically-mounted Ladder Rack from the sleeves to the horizontal Ladder Rack.
- 5. Corner clamp brackets shall be used to join sections of cable ladder rack that are perpendicular to each other.
- 6. Cable ladder rack stringers shall be attached to plywood backboards with angle brackets and "J" bolts.
- 7. End supports and stringer junction brackets shall be used to attach vertical cable ladder segments to the floor.
- 8. Stringer junction brackets shall be used to attach end to end horizontal cable ladder rack segments.
- 9. Open ended stringer segments shall be closed with corner clamps and end bars.
- 10. Mounting plates and "J" bolts shall be used to attach the cable ladder racking to the relay racks or equipment cabinets.
- 11. A support shall also be placed within 24 in. on each side of any connection to a fitting.

E. Fire stop System Assemblies for Communications Systems

- 1. Provide systems as identified on the drawings and specified herein. At locations where the cabling routing encounters a fire-rated barrier provide an adequately sized fire stop device for the quantities and types for all cables to be installed plus 25% growth.
- 2. Provide fire-resistant materials of a type and composition necessary to restore fire ratings to all wall, floor or ceiling penetrations; including membrane penetrations. All materials shall be classified or listed as a complete system by approved NRTL by the AHJ and meet NEC and local codes. The use of partial systems or components of systems is not allowed unless specifically identified in the documents.
- 3. All penetrations through fire rated floors and walls shall be sealed to prevent the passage of smoke, flame, toxic gas or water through the penetration before, during or after a fire. The fire rating (F and T) of the penetration seal shall be at least that of the floor or wall into which it is installed, so that the original fire rating of the floor or wall is maintained as required by referenced building codes and National Electric Code.
- 4. Provide a label on both sides of fire rated assembly at all fire stop locations indicating:
 - a. Fire stop Manufacturer

- b. Installer and company
- c. Date installed
- d. UL system number with all relevant ratings indicated

3.2 TELECOMMUNICATIONS BACKBOARD

- A. Mount Telecommunications Ground Bars (TMGB and TGBs) to telecommunications backboard.

3.3 GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

A. General:

1. Install telecommunications bonding and grounding conductors (wire) without splices or mechanical couplers installed between the wire points of origin and termination except as shown on the Drawings and/or specified herein. Where splices are necessary, the number of splices should be a minimum and they shall be accessible and located in Telecommunications rooms (spaces). Joined segments of a TBB shall be connected using exothermic welding, irreversible compression-type connectors, or equivalent. All joints shall be adequately supported and protected from damage. "Daisy chaining" of Telecommunications ground bus bars back to the TMGB will not be accepted unless specifically indicated on the Telecommunications drawings or specified herein.
2. Unless otherwise noted, all ground wires shall be routed through the Telecommunications cable management pathways so as to achieve a "coupled bonding conductor" effect.
3. Where insulated conductors are necessary provide adequately rated insulation jackets or pathways to meet all required building codes. (I.e. Plenum, riser, outside plant, run entirely in conduit, etc.).
4. Grounding and bonding conductors should not be placed in ferrous metallic conduit. If it is necessary to place grounding and bonding conductors in ferrous metallic conduit that exceeds **3 feet (1 meter)** in length, the conductors shall be bonded to each end of the conduit using a grounding bushing or a No. 6 AWG conductor, minimum.
5. The bonding conductor for Telecommunications (BCT), each Telecommunications bonding backbone (TBB) conductor, and each grounding equalizer (GE), shall be green or marked with a distinctive green color.
 - a. Marking with a distinctive green color Shall be done at a minimum of every **1 foot (0.3 meter)** by appropriate methods.

B. Required Grounding Connections:

1. Provide and install one individual ground wire from each equipment rack/cabinet/frame (installed under this work) to the TGB in the room. Each conductor is to be "home run"; do not "daisy chain" the connections, except as may be indicated on the drawings.
2. Provide and install one individual ground wire from the raised floor system (provided by another specification section) to the TMGB. Conductor is to be "home run"; do not "daisy chain" the connections, except as may be indicated on the drawings.
3. Provide and install one individual ground wire from the overhead ladder rack (installed under this work) to the TGB in the room.
4. Where electrical panel(s) are located within or dedicated to the TR (installed under this work) install one individual ground wire from each ground bus bar to each electrical panel ground bus
5. Where structural steel is available for connection install one individual ground wire to the nearest structural steel for connection.
6. Provide and install all grounding connections as required by Telecommunications set of drawings (if available).

C. Connector Installation:

1. Provide all ground wire connectors as shown on the Drawings or as indicated herein, unless otherwise noted.
2. Follow the connector manufacturer's instructions for installing the connector to the cable and the connector to the cabinet/rack, ground bar, etc. Use the appropriate tools for the job, tighten nuts/bolts to proper torque, remove paint, insulation, oxidation as needed to assure good metal to metal contact,

etc. If the manufacturer does not provide tightening specifications, follow the recommendations of UL Standard 486.

D. Cable Identification:

1. Label both ends of each ground conductor within **6 inches (152.4 mm)** of a connector terminal or splice. Label the grounding conductors as shown on the Drawings or specified herein. All labels shall include the following in addition to specific labeling requirements for each conductor.

**IF THIS CONNECTOR OR CABLE IS
LOOSE OR MUST BE REMOVED,
PLEASE CALL THE BUILDING
TELECOMMUNICATIONS
MANAGER**

E. Quantities of Ground Wire

1. Location and placement of grounding and bonding wires and components shall be as shown on the Drawings or defined herein.
2. Quantities of ground wires, bonding components, etc. shown on the drawings are illustrative only and are meant to indicate the general configuration of the work. Provide the correct quantities of materials to construct a grounding and bonding system that meets the intent of these Specifications and the relevant codes.

F. Testing

1. Test the grounding conductor and the terminal connectors for total resistance between the equipment item being grounded and the main telecommunications grounding point in the room. This resistance shall be less than 0.10 Ohm.
2. Recommended test equipment:
 - a. An ohmmeter capable of indicating resistance down to 10 milli-ohms or below.

G. Record Drawings

1. The Project Record Drawings shall show the types and locations of installed grounding and bonding conductors.

END OF SECTION

SECTION 16465 (260513) - MEDIUM-VOLTAGE CABLES

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Cables rated over 600V.
- B. Splice Kits
- C. Solid Terminations
- D. Separable Insulated Connectors
- E. Arc-Proofing Materials
- F. Fault Indicators

1.2 DEFINITIONS

- A. The following abbreviations apply to this and other Sections of these specifications:
 - 1. NETA ATS: Acceptance Testing Specification.

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section "General Electrical Requirements".
 - 1. Product data for the following products:
 - a. Cables
 - b. Splice Kits
 - c. Solid Terminations
 - d. Separable Insulated Connectors
 - e. Arc-Proofing Materials
 - f. Fault Indicators
 - 2. Samples:
 - a. 16-inch (400-mm) lengths of each type of cable indicated.
 - b. <
- B. Product Data: Provide manufacturer's standard catalog pages and data sheets for conductors and cables, including detailed information on materials, construction, ratings, listings, and available sizes, configurations, and stranding.
- C. Sustainable Design Documentation: Submit manufacturer's product data on conductor and cable showing compliance with specified lead content requirements.
- D. Qualification Data:
 - 1. For Installer.
 - 2. For testing agency.
- E. Material Certificates: For each cable and accessory type, signed by manufacturers.
- F. Source quality-control test reports.

- G. Field quality-control test reports in accordance with NETA ATS.
 - 1. Shield continuity test for each power cable.
 - 2. Insulation resistance test for each power cable.
 - 3. Resistance measurements through all bolted connections.
 - 4. dc High-Potential test on all power cables.
- H. Project Record Documents: Record actual installed circuiting arrangements. Record actual routing for underground circuits.
- I. Operation and Maintenance Data: For cable and all accessories to include in operation and maintenance manuals.
- J. Follow-up service reports.

1.4 QUALITY ASSURANCE

- A. Installer: Engage a cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable.
- B. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 3 years.
- C. Provide products listed and classified by Underwriters Laboratories, Inc (UL) as suitable for the purpose specified and indicated.
- D. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
 - 1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- E. Test Equipment Suitability and Calibration: Comply with NETA ATS, "Suitability of Test Equipment" and "Test Instrument Calibration."
- F. Source Limitations: Obtain cables and accessories through one source from a single manufacturer.
- G. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- H. Comply with [NFPA 70

1.5 PROJECT CONDITIONS

- A. Interruption of Existing Electric Service: Do not interrupt electric service to occupied facilities. Refer to Division 26 Section "General Electrical Requirements" for allowable outages.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. Manufacturers:
 - 1. Cables:

- a. General Cable Technologies Corporation.
- b. Hendrix-Kerite Co. (The); a Marmon Wire Company.
- c. Okonite Company (The).
- d. Prysmian
- e. Southwire Company.
- 2. Cable Splicing and Terminating Products and Accessories:
 - a. Engineered Products Company.
 - b. G&W Electric Company.
 - c. MPHusky.
 - d. Raychem Corp.; Telephone Energy and Industrial Division; Tyco International Ltd.
 - e. RTE Components; Cooper Power Systems, Inc.
 - f. Scott Fetzer Co. (The); Adalet.
 - g. Thomas & Betts Corporation.
 - h. Thomas & Betts Corporation/Elastimold.
 - i. 3M; Electrical Products Division.

2.2 CABLES

- A. Cable Type: MV90
- B. Comply with UL 1072, AEIC CS 8, ICEA S-93-639, and ICEA S-97-682 and ICEA S-94-649.
- C. Conductor: Aluminum.
 - 1. Conductor Stranding: Compact round
 - 2. Provide conductor material with lead content less than 300 parts per million.
- D. Strand Filling: Conductor interstices are filled with impermeable compound.
- E. Conductor Insulation] [Crosslinked polyethylene].
 - 1. Voltage Rating: 15kV.
 - 2. Insulation Thickness: [133] percent insulation level.
- F. Neutral Conductor: [Full neutral]
- G. Shielding: [Copper tape]
- H. Shielding and Jacket: Corrugated copper drain wires embedded in extruded, chlorinated, polyethylene jacket.
- I. Three-Conductor Cable Assembly: Three insulated, shielded conductors cabled together with ground conductors.
 - 1. Circuit Identification: Color-coded tape (black, red, blue) under the metallic shielding.
- J. Cable Jacket: Chlorinated polyethylene, CPE

2.3 SPLICE KITS

- A. Connectors and Splice Kits: Comply with IEEE 404; type as recommended by cable or splicing kit manufacturer for the application.
- B. Splicing Products: As recommended, in writing, by splicing kit manufacturer for specific sizes, ratings, and configurations of cable conductors. Include all components required for complete splice, with detailed instructions.

1. Combination tape and cold-shrink-rubber sleeve kit with re-jacketing by cast-epoxy-resin encasement or other waterproof, abrasion-resistant material.
2. Heat-shrink splicing kit of uniform, cross-section, polymeric construction with outer heat-shrink jacket.
3. Pre-molded, cold-shrink-rubber, in-line splicing kit.
4. Pre-molded EPDM splicing body kit with cable joint sealed by interference fit of mating parts and cable.

2.4 SOLID TERMINATIONS

- A. Multi-conductor Cable Sheath Seals: Type recommended by seal manufacturer for type of cable and installation conditions, including orientation.
 1. Cold-shrink sheath seal kit with preformed sleeve openings sized for cable and insulated conductors.
 2. Heat-shrink sheath seal kit with phase- and ground-conductor re-jacketing tubes, cable-end sealing boot, and sealing plugs for unused ground-wire openings in boot.
 3. Cast-epoxy-resin sheath seal kit with wraparound mold and packaged, two-part, epoxy-resin casting material.
- B. Shielded-Cable Terminations: Comply with the following classes of IEEE 48. Insulation class is equivalent to that of cable. Include shield ground strap for shielded cable terminations.
 1. Class 1 Terminations: Modular type, furnished as a kit, with stress-relief tube; multiple, molded-silicone rubber, insulator modules; shield ground strap; and compression-type connector.
 2. Class 1 Terminations: Heat-shrink type with heat-shrink inner stress control and outer non-tracking tubes; multiple, molded, non-tracking skirt modules; and compression-type connector.
 3. Class 1 Terminations: Modular type, furnished as a kit, with stress-relief shield terminator; multiple-wet-process, porcelain, insulator modules; shield ground strap; and compression-type connector.
- C. Non-shielded-Cable Terminations: Kit with compression-type connector. Include silicone-rubber tape, cold-shrink-rubber sleeve, or heat-shrink plastic-sleeve moisture seal for end of insulation whether or not supplied with kits.

2.5 SEPARABLE INSULATED CONNECTORS

- A. Description: Modular system, complying with IEEE 386, with disconnecting, single-pole, cable terminators and with matching, stationary, plug-in, dead-front terminals designed for cable voltage and for sealing against moisture.
- B. Terminations at Distribution Points: Modular type, consisting of terminators installed on cables and modular, dead-front, terminal junctions for interconnecting cables.
- C. Load-Break Cable Terminators: Elbow-type units with 200-A load make/break and continuous-current rating; coordinated with insulation diameter, conductor size, and material of cable being terminated. Include test point on terminator body that is capacitance coupled.
- D. Dead-Break Cable Terminators: Elbow-type unit with 600-A continuous-current rating; designed for de-energized disconnecting and connecting; coordinated with insulation diameter, conductor size, and material of cable being terminated. Include test point on terminator body that is capacitance coupled.
- E. Dead-Front Terminal Junctions: Modular bracket-mounted groups of dead-front stationary terminals that mate and match with above cable terminators. Two-, three-, or four-terminal units as indicated, with fully rated, insulated, watertight conductor connection between terminals and complete with grounding lug, manufacturer's standard accessory stands, stainless-steel mounting brackets, and attaching hardware.
 1. Protective Cap: Insulating, electrostatic-shielding, water-sealing cap with drain wire.

- 2. Portable Feed-Through Accessory: Two-terminal, dead-front junction arranged for removable mounting on accessory stand of stationary terminal junction.
 - 3. Grounding Kit: Jumpered elbows, portable feed-through accessory units, protective caps, test rods suitable for concurrently grounding three phases of feeders, and carrying case.
 - 4. Standoff Insulator: Portable, single dead-front terminal for removable mounting on accessory stand of stationary terminal junction. Insulators suitable for fully insulated isolation of energized cable-elbow terminator.
- F. Test-Point Fault Indicators: Applicable current-trip ratings and arranged for installation in test points of load-break separable connectors, and complete with self-resetting indicators capable of being installed with shotgun hot stick and tested with test tool.

G. Tool Set: Shotgun hot stick with energized terminal indicator, fault-indicator test tool, and carrying case.

2.6 ARC-PROOFING MATERIALS

- A. Tape for First Course on Metal Objects: 10-mil- (250-micrometer-) thick, corrosion-protective, moisture-resistant, PVC pipe-wrapping tape.
- B. Arc-Proofing Tape: Fireproof tape, flexible, conformable, intumescent to 0.3 inch (8 mm) thick, compatible with cable jacket.
- C. Glass-Cloth Tape: Pressure-sensitive adhesive type, 1/2 inch (13 mm) wide.

2.7 FAULT INDICATORS

- A. Indicators: Automatically reset fault indicator with inrush restraint feature, arranged to clamp to cable sheath and provide a display after a fault has occurred in cable. Instrument shall not be affected by heat, moisture, and corrosive conditions and shall be recommended by manufacturer for installation conditions.
- B. Resetting Tool: Designed for use with fault indicators, with moisture-resistant storage and carrying case.

2.8 SINGLE CONDUCTOR IDENTIFICATION

- A. Over 600 Volts, insulated conductors as noted above shall be color-coded as follows, unless noted otherwise:

PHASE

A	Black
B	Red
C	Blue
Neutral	White
Equipment Ground	Green

2.9 SOURCE QUALITY CONTROL

- A. Test and inspect cables according to ICEA S-97-682 [ICEA S-94-649 before shipping.
- B. Test strand-filled cables for water-penetration resistance according to ICEA T-31-610, using a test pressure of 5 psig (35 kPa).

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install cables according to IEEE 576.
- C. Pull Conductors: Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
 - 1. Where necessary, use manufacturer-approved pulling compound or lubricant that will not deteriorate conductor or insulation.
 - 2. Use pulling means, including fish tape, cable, rope, and basket-weave cable grips that will not damage cables and raceways. Do not use rope hitches for pulling attachment to cable.
- D. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.
- E. Support cables according to Division 26 Section "Common Work Results for Electrical."
- F. Install direct-buried cables on leveled and tamped bed of 3-inch- (76-mm-) thick, clean sand. Separate cables crossing other cables or piping by a minimum of 4 inches (100 mm) of tamped earth. Install permanent markers at ends of cable runs, changes in direction, and buried splices.
- G. Install "buried-cable" red-warning tape with tracer wire 12 inches (305 mm) above cables.
- H. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by the longest route from entry to exit and support cables at intervals adequate to prevent sag.
- I. Install cable splices at pull points and elsewhere as indicated; use standard kits.
- J. Install terminations at ends of conductors and seal multi-conductor cable ends with standard kits.
- K. Install separable insulated-connector components as follows:
 - 1. Protective Cap: At each terminal junction, with one on each terminal to which no feeder is indicated to be connected.
 - 2. Portable Feed-Through Accessory: Three.
 - 3. Standoff Insulator: Three.
- L. Arc Proofing: Unless otherwise indicated, arc proof medium-voltage cable at locations not protected by conduit, direct burial, or termination materials. In addition to arc-proofing tape manufacturer's written instructions, apply arc proofing as follows:
 - 1. Clean cable sheath.
 - 2. Wrap metallic cable components with 10-mil (250-micrometer) pipe-wrapping tape.
 - 3. Smooth surface contours with electrical insulation putty.
 - 4. Apply arc-proofing tape in one half-lapped layer with coated side toward cable. Extend arc-proofing tape 1 inch (25 mm) into raceway or duct.
 - 5. Band arc-proofing tape with 1-inch- (25-mm-) wide bands of half-lapped, adhesive, glass-cloth tape at 36 inches (1-meter) o.c. Apply banding at start and stop of arc proof tape, where conductors enter and exit enclosures or pulling points, and at both ends and the middle of splice points.
- M. Seal around cables passing through fire-rated elements according to Division 07 Section "Penetration Firestopping."

- N. Install fault indicators on each phase where indicated.
- O. Ground shields of shielded cable at terminations, splices, and separable insulated connectors. Ground metal bodies of terminators, splices, cable and separable insulated-connector fittings, and hardware.
- P. Identify cables according to Division 26 Section "Identification for Electrical Systems."

3.2 IDENTIFICATION

- A. Identify field-installed wiring and components and provide warning signs as specified in Division 26 Section "Identification for Electrical Systems."
- B. Power-Circuit Conductor Identification: For primary and secondary conductors in vaults, pull and junction boxes, manholes, and handholes identify voltage, source and circuit number of each set of conductors. For single conductor cables, identify phase in addition to the above.

3.3 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.
 - 2. After installing medium-voltage cables and before electrical circuitry has been energized, test for compliance with requirements.
- B. Remove and replace malfunctioning units and retest as specified above.
- C. Test Reports: Prepare written reports to record the following:
 - 1. Test procedures used.
 - 2. Test results that comply with requirements.
 - 3. Test results that do not comply with requirements and corrective actions taken to achieve compliance with requirements.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16402 (260519) – LOW VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes:
 - 1. Conductors, cables, and cords rated 600V and less.
 - 2. Connectors and terminations rated 600V and less.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section “Common Work Results for Electrical” for sleeves and seals for electrical penetrations.
- C. Division 26 Section “Grounding and Bonding for Electrical Systems” for conductors and connectors for grounding systems.
- D. Division 26 Section “Equipment Wiring Systems” for electrical connections to equipment specified under other Sections, Divisions, or furnished by the Owner.
- E. Division 23 Section “Direct-Digital Control for HVAC” for temperature control wiring.

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
- B. Qualification Data: For testing agency.
- C. Field Quality-Control Test Reports.

1.4 ABBREVIATIONS AND DEFINITIONS

- A. The following abbreviations apply to this and other Sections of these specifications:
 - 1. MC: Metal Clad
 - 2. NBR: Acrylonitrile-butadiene rubber
- B. The following definitions apply to this and other Sections of these Specifications:
 - 1. HOMERUN: That portion of an electrical circuit beginning at a junction box, termination box, receptacle or switch with termination at an electrical panelboard. Note: Where MC Cable is allowed to be utilized for receptacle and/or lighting branch circuiting loads, the originating point of the homerun shall be at the first load in the circuit or at a junction box in an accessible ceiling space immediately above the first (most upstream) load.

1.5 QUALITY ASSURANCE

- A. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 3 years.

- B. Test Equipment Suitability and Calibration: Comply with NETA ATS, "Suitability of Test Equipment" and "Test Instrument Calibration."
- C. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to AHJ.
- D. Electrical Components, Devices, and Accessories:
 - 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to AHJ.
 - 2. Marked for intended use.
- E. Comply with NFPA 70.

1.6 COORDINATION

- A. Coordinate electrical testing of electrical, mechanical, and architectural items, so equipment and systems that are functionally interdependent are tested to demonstrate successful interoperability.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
- B. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference.

2.2 CONDUCTORS AND CABLES

- A. General
 - 1. Manufacturers:
 - a. AFC Cable Systems, Inc.
 - b. Alan Wire
 - c. Cerrowire
 - d. Colonial Wire & Cable
 - e. Encore Wire Corporation
 - f. General Cable
 - g. Northern Cables Inc.
 - h. Okonite Company
 - i. Southwire Company
 - 2. Conductor Material: Annealed (soft) copper complying with ICEA S-95-658/NEMA WC70 and UL Standards 44 or 83, as applicable; solid conductor for No. 10 AWG and smaller; concentric, compressed stranded for No. 8 AWG and larger and stranded for all flexible cords, cables, and control wiring or as noted otherwise below.
 - 3. Conductor Insulation Types: Type THW THHN/THWN-2 and/or XHHW-2 complying with ICEA S-95-658/NEMA WC70 or as noted otherwise below.
 - 4. Sizes of conductors and cables indicated or specified are American Wire Gage (Brown and Sharpe).
 - 5. Unless indicated otherwise, special purpose conductors and cables, such as low voltage control and shielded instrument wiring, shall be as recommended by the system equipment manufacturer.

6. Refer to Part 3 "Conductor and Insulation Applications" Article for insulation type, cable construction, and ratings.
- B. Metal Clad Cable, Type MC (for non-patient care areas only. Do not use for life safety or critical systems.)
1. MC Cable (with insulated green grounding conductor, no bonding conductor):
 - a. Manufacturers:
 - 1) AFC Cable Systems, Inc (MC Lite)
 - 2) Encore Wire Corporation (MC)
 - 3) Kaf-Tech
 - 4) Southwire Company (Amorlite)
 - b. 600V, Unjacketed and/or PVC-jacketed UL Standard 83, UL Standard 1569 for Type MC, UL Standard 1685, Federal Specification A-A59544, IEEE 1202 Vertical Cable Tray Flame Test and the NEC. Type MC Cable shall be listed for use in UL 1, 2, and 3 Hour Through-Penetration Firestop Systems.
 - c. Armor Assembly: Aluminum interlocked armor (aluminum color).
 - d. Phase Conductors: Solid soft-drawn copper, THHN-insulated single conductors, color code: ICEA Method 1.
 - e. Grounding Conductor: Solid soft-drawn copper, THHN/THWN-2 green insulated grounding conductor sized per NEC Table 250.122.
 - f. Marking: Cable markings shall comply with the requirements on NEC ART. 310.11.
 2. MC Cable (with 0-10V dimming control wiring):
 - a. Manufacturers:
 - 1) AFC Cable Systems, Inc (MC- PCS)
 - 2) Encore Wire Corporation (MC- LED)
 - 3) Southwire Company (MC – PCS Duo)
 - b. 600V, Unjacketed and/or PVC-jacketed UL Standard 83, UL Standard 1569 for Type MC, UL Standard 1685, Federal Specification A-A59544, IEEE 1202 Vertical Cable Tray Flame Test and the NEC. Type MC Cable shall be listed for use in UL 1, 2, and 3 Hour Through-Penetration Firestop Systems.
 - c. Armor Assembly: Aluminum interlocked armor (aluminum color).
 - d. Phase Conductors: Solid soft-drawn copper, THHN-insulated single conductors, color code: ICEA Method 1.
 - e. Grounding Conductor: Solid soft-drawn copper, THHN/THWN-2 green insulated grounding conductor sized per NEC Table 250.122.
 - f. Control Conductors: color coded class2/class3 twisted jacketed pairs
 - g. Marking: Cable markings shall comply with the requirements of NEC Art 310 .11(1).
 3. MC Cable Fittings:
 - a. Manufacturer & Model:
 - 1) Arlington (4010 AST snap-in type): (SG38 saddle type)
 - 2) Crouse-Hinds (QLK Quick-Lok Series, Saddle type); ACB Series; set-screw, saddle type)
 - 3) O-Z Gedney (AMC-50 speed-lok, saddle type)
 - 4) Thomas & Betts (XC-730 Series cable-lok, saddle type); 3110 Series Tite-Bite)
 - b. Fittings used for connecting Type MC cable to boxes, cabinets, or other equipment shall be UL listed and identified for such use with an MCI-A marking on the fitting carton or package.
 - c. Fittings shall be insulated type not requiring the use of anti-short bushings.
 - d. Romex style, clamp type fittings are not acceptable.
- C. Single Conductors
1. 600V, THW-,THHN/THWN-2 and/or XHHW-insulated conductors, color-coded as follows:

PHASE	120/240V	240Δ/120V	208Y/120V	480Y/277V
A	Black	Black	Black	Brown
B	Red	Orange	Red	Orange
C	N/A	Red	Blue	Yellow
Neutral	White	White	White	Gray**
Equipment Ground	Green	Green	Green	Green
Isolated Ground	N/A	N/A	Green/Yellow Stripe	N/A

**Except as provided in NFPA 70.]

2. Where local amendments dictate color-coding of conductors, local amendments shall supersede these color-coding requirements.
3. Conductors shall not be smaller than No. 12 AWG, except that wiring for signal and pilot control circuits and pre-manufactured whips for light fixtures may be No. 14 AWG.

D. Flexible Cords

1. 600V, multi-conductor (2, 3, or 4 as indicated on the Drawings), oil-resistant black or yellow jacket, extra-hard-usage; Type SEO, SO, or STO for indoor dry and damp locations; [SEOW,] [SOW,] [or] [STOW] for damp, wet, and outdoor locations

E. Control Wiring

1. Refer to Division 23 Section "Direct-Digital Control for HVAC"
2. Unless otherwise noted, all control wiring will be the responsibility of the Section or Division in which the control system is specified.

F. Connectors

1. Manufacturers:
 - a. AMP; Tyco
 - b. FCI-Burndy
 - c. Gould
 - d. Ideal Industries, Inc.
 - e. IlSCO
 - f. NSi Industries, Inc.
 - g. O-Z/Gedney
 - h. Panduit
 - i. Thomas and Betts
 - j. 3-M Electrical Products Division
2. Compression connectors for conductors No. 8 AWG and larger: Long-barreled, UL 486-listed, bare copper, circumferential compression type (Burndy "Hylug", or equal), insulated with clamp-on, cold-shrink, or molded covers, or wrapped with multiple over-lapping layers of 3-M Scotch electrical tape.
 - a. Termination fittings: 1-hole pad and inspection port.
3. Mechanical connections for conductors No. 8 AWG and larger: UL-listed, bare copper, dual-rated, mechanical type, insulated with clamp-on, cold-shrink, or molded covers, or wrapped with multiple over-lapping layers of 3-M Scotch electrical tape.
 - a. Termination fittings: 1-hole pad and inspection port.
4. Connectors for solid conductors No. 10 AWG and smaller: Insulated winged wire nuts. Color-coded for size, except use green only for grounding connections.
5. Connectors for stranded conductors No. 10 AWG and smaller: Tinned copper, insulated-sleeve, compression type, UL-listed, with wire insulation grip. Terminations: ring-tongue type.
6. Connectors and terminations for aluminum conductors and cables No. 1 and larger: UL 486B listed and marked AL7CU for 75 deg C rated conductors and AL9CU for 90 deg C rated conductors.

PART 3 - EXECUTION

3.1 CONDUCTORS AND CABLES

A. General:

1. Unless otherwise indicated on the Drawings or in other Sections, install all conductors in raceway. Install continuous conductors between outlets, devices and boxes without splices or taps. Do not pull connections into raceways. Leave at least 8 inches of conductor at outlets for fixture or device connections.
2. Use manufacturer-approved pulling compound or lubricant where necessary; compound used shall not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
3. Use pulling means, including fish tape, cable, rope, and basket weave conductor/cable grips that will not damage conductors/cables or raceway.
4. Electrical conductor and cable work is schematically represented on the Drawings. Unless otherwise indicated, conductor sizes shown on the Drawings are based on not more than three single current-carrying conductors in a raceway in free air. Current ratings are based on copper at 75 degrees C temperature rating for all power circuits. Modify raceway and conductor sizing as may be necessitated by any deviation from these conditions. Do not decrease the indicated conductor size due to the use of conductors having a temperature rating of 90 degrees C.
5. Conductor sizes shown are minimum based on code requirements, voltage drop, and/or other considerations. Where approved by the Engineer and at no extra cost to the Owner, larger conductor sizes may be installed at Contractor's option in order to utilize stock sizes, provided raceway sizes are increased where necessary to conform with NFPA 70 (determine the effect of the use of larger conductors on the short circuit current ratings of the electrical equipment, and provide increased short circuit current rated equipment as required).
6. Where parallel conductors are shown, install each set of conductors in separate raceways of essentially the same length.
7. Seal around cables penetrating fire-rated elements according to Division 07 Section "Penetration Firestopping".
8. Identify and color-code conductors and cables according to Division 26 Section "Identification for Electrical Systems".
9. Wiring at Outlets: Install conductors at each outlet with at least 6 inches of slack.
10. Common or Shared Neutrals are not allowed unless shown on the plans or specifically noted to be allowed.
11. Multi-wire branch circuits (i.e., shared neutral) shall be provided with a means that will simultaneously disconnect all ungrounded conductors at the point the branch circuit originates. Multi-pole breakers or 3 single pole breakers with a handle tie are two examples.
12. When multiple home runs are combined into a single raceway such that the number of conductors exceeds four (conductor count is made up of any combination of phase and neutral conductors), the following restrictions apply, which are in addition to those in NFPA 70:
 - a. Emergency Power Circuits – includes all circuits covered under Articles 700, 701 and 702.
 - 1) Maximum of eight conductors in a single raceway. Minimum raceway size: ¾-inch. Do not install any other type of circuit in this raceway.
 - 2) Only 15A and 20A branch circuit homeruns may be combined into one raceway.
 - b. Normal or Non-Essential circuits.
 - 1) Maximum of 16 conductors in a single raceway. For up to eight conductors in a raceway, minimum raceway size: 3/4 inch. For greater than eight conductors, minimum raceway size: 1 inch. Do not install any other type of circuit in this raceway.
 - 2) The minimum wire size for all conductors in this raceway: No. 10 AWG.
 - 3) Only 15A and 20A branch circuit homeruns may be combined into one raceway.
 - c. GFCI-protected circuits.
 - 1) Do not use multi-conductor circuits, with a shared neutral, for any GFCI circuit breaker or receptacle circuit.
 - d. Isolated Ground (IG) Circuits:

- 1) Do not use multi-conductor or MC cables.
 - 2) Do not share neutrals between separate circuits.
 - 3) Do not share the isolated grounding conductor with more than one device (i.e., each device on an IG circuit shall have its own dedicated IG conductor back to the branch panelboard IG bus).
 - 4) The equipment grounding conductor may be shared between IG circuits sharing a common raceway.
13. For branch circuits fed from GFCI circuit breakers, limit the one-way conductor length to 100 feet between the panelboard and the most remote receptacle or load on the GFCI circuit.
 14. Where the number of conductors for branch circuits is not shown on the Drawings, determine the number of conductors in accordance with NFPA 70. Provide adequate conductors so as to allow performance of all functions of the device.
 15. Provide all conductors with 600V insulation of the following types, unless otherwise noted on the Drawings or in these Specifications:
 - a. Wet or dry locations, in raceways:
 - 1) Service entrance: Type THWN, THHN/THWN-2, or XHHW.
 - 2) Feeders and branch circuits: Type THWN, THHN/THWN-2, or XHHW.
 - 3) Conductors No. 6 AWG and smaller: Types THWN or THHN/THWN-2.
 - b. Direct buried:
 - 1) Service entrance: USE.
 - 2) Feeders and branch circuits: UF or USE.
 - c. Fluorescent light fixtures or conductors within three feet of high temperature equipment such as heaters: Type THHN, XHHW, or higher temperature insulation as required for the use.

B. Aluminum Conductor Option:

1. Terminations: Tinned, [mechanical] [compression] type only; UL-listed for copper and aluminum conductors at 75 degrees C minimum.
2. Increase the raceway size as required, at no additional cost to the Owner, to accommodate the increased size of the aluminum conductors.
3. Aluminum conductor size shall meet or exceed the ampere rating of the scheduled copper conductors at 75 degrees C.
4. Option applies only for the following feeders or services No. 2 AWG and larger (based on copper conductors):
 - a. Service entrance conductors
 - b. Feeders to switchboards
 - c. Feeders to panelboards
 - 1) Exception: Apartment unit load center feeder conductors shall be copper; aluminum is not acceptable.
 - d. Feeders to motor control centers
 - e. Feeders to transformers
5. Where aluminum conductors terminate existing panelboards, switchboards or switchgear that utilize compression connections use hydraulic-compression type connectors with a zinc base, anti-oxidizing compound. Use compression tools of the type that will not release unless the correct pressure has been applied.
6. Measure the temperature of all aluminum conductors at all splices and terminations. Make each test under typical building load conditions after the building is occupied and in operation for a minimum of two weeks. Replace all joints or splices indicating excessive heating.
7. Take measurements with a non-contact type infrared thermometer, with target size not exceeding one inch at five feet and an accuracy of two percent or better. Submit the meter specifications and calibration date with the test results.

C. Metal Clad Type MC Cable:

1. Securing and Supporting:
 - a. Support per Art 330 for MC cable
 - b. Secure cable within 12 inches of every box or fitting.

- c. Secure/supporting intervals shall not exceed six (6) feet for MC cable.
 - d. Utilize steel cable hangers, Arlington SMC series or equivalent, for MC cable support wherever possible so as to provide for cable routing in a neat and workmanship like manner.
2. Type MC cable may only be used:
- a. In lieu of flexible conduit and wiring from light fixtures in accessible ceilings to junction boxes (attached to building structure) above the ceiling. Provide cable whips of sufficient lengths to allow for relocating each light fixture within a 5-foot radius of its installed location, but not exceeding 6 feet in unsupported lengths.
 - b. For vertical drops [and horizontal wiring] in stud walls.
3. MC Cable shall not be used for any use not listed in the paragraph above. Examples of those uses include, but are not limited to:
- a. In locations not permitted by the NEC.
 - b. When specifically not allowed by the local AHJ [and/or Owner/Landlord].
 - c. Homeruns to panelboards. Note: where metal clad cable is utilized for receptacle, lighting, and/or miscellaneous load branch circuiting, the originating point of the homerun shall be at the first (most upstream) load in the circuit or at a junction box located in the accessible ceiling space immediately above the first (most upstream) load. Reference definitions in this section for definition on "Homerun".
 - d. Where exposed to view.
 - e. Where subject to physical damage.
 - f. Corrosive or Hazardous locations.
 - g. Wet locations.
 - h. Emergency systems (life safety and critical branches) of Health Care facilities accept as allowed by Art 517.30(C)(3).
 - i. Emergency circuits covered by NFPA Art 700 Emergency Systems
 - j.

D. Flexible Cords

- 1. Refer to Division 26 Section, "Equipment Wiring Systems", for electrical connections to equipment.

E. Control Wiring

- 1. Unless otherwise indicated on the Drawings or in other sections, install all control wiring in raceway, regardless of voltage. A qualified Electrician shall install all control wire operating at 120V nominal and above. Control wiring operating at less than 120V (e.g., 12V and 24V) may be installed under the Division furnishing it.
- 2. Open wiring in air-handling plenums: UL listed and classified for use in air plenums without raceway. Where indicated on the Drawings or specified, and permitted by local codes, only cable for communication or fire alarm systems and low voltage control wiring may be installed without raceways.

F. Connections:

- 1. Apply a zinc based, anti-oxidizing compound to connections.
- 2. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
- 3. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
- 4. Use oxide inhibitor in each splice and tap conductor for aluminum conductors.
- 5. Use only resin pressure splices and splicing kits that totally encapsulate the splice for splices in underground junction boxes. Arrange the splicing kit to minimize the effects of moisture.
- 6. Connect conductors No. 6 AWG and larger to panelboards and apparatus by means of approved mechanical lugs or compression connectors.
- 7. Do not use terminals on wiring devices to feed through to the next device.

3.2 FIELD QUALITY CONTROL

- A. Testing: Perform the following field quality-control testing:
 - 1. After installing conductors and cables and before electrical circuitry has been energized, test for compliance with requirements. Test all wiring prior to energizing to ensure that it is free from unintentional grounds and shorts, is properly phased, and that all connectors are tight.
 - 2. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.3. Certify compliance with test parameters.

- B. Test Reports: Prepare a written report to record the following:
 - 1. Test procedures used.
 - 2. Test results that comply with requirements.
 - 3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

END OF SECTION

SECTION 16170 (260526) – GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes grounding of electrical systems and equipment. Grounding requirements specified in this Section may be supplemented by special requirements of systems described in other Sections.
- B. This Section includes:
 - 1. Grounding Electrodes
 - 2. Ground Bars
 - 3. Grounding Conductors
 - 4. Connector Products
 - 5. Equipotential Grounding System
 - 6. Miscellaneous Grounding Materials and Products

1.2 DEFINITIONS

- A. The following apply to this and other Sections of these Specifications:
 - 1. Ground ring: Bare underground grounding conductor encircling the building or structure.
 - 2. NETA ATS: Acceptance Testing Specification.
 - 3. PSF: Pounds per Square Foot
 - 4. EMT: Electrical metallic tubing.
 - 5. ENT: Electrical nonmetallic tubing.
 - 6. FMC: Flexible metal conduit.
 - 7. GRS: Galvanized Rigid Steel Conduit
 - 8. IMC: Intermediate metal conduit.
 - 9. LFMC: Liquidtight flexible metal conduit.
 - 10. LFNC: Liquidtight flexible nonmetallic conduit.
 - 11. RAC: Rigid Aluminum Conduit
 - 12. RMC: Rigid Metal Conduit
 - 13. RNC: Rigid nonmetallic conduit.

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Product data for the following products:
 - a. Electrodes, mechanical and compression connectors, and exothermic connectors .

1.4 QUALITY ASSURANCE

- A. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 3 years.
- B. Test Equipment Suitability and Calibration: Comply with NETA ATS, "Suitability of Test Equipment" and "Test Instrument Calibration."
- C. Electrical Components, Devices, and Accessories:
 - 1. Listed and labeled as defined in NFPA 70, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
 - 2. Marked for intended use.

3. Comply with UL 467.
- D. Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system.
- E. Comply with NFPA 70.

PART 2 - PRODUCTS AND MATERIALS

2.1 GROUNDING CONDUCTORS, CONNECTORS, AND ELECTRODES:

- A. Manufacturers:
 1. ABB, Inc.
 2. Advanced Lightning Technology (ALT)
 3. AFL Global
 4. Boggs, Inc.
 5. Burndy; Hubbell.
 6. Cooper Power; Eaton.
 7. Copperweld Corp.
 8. ECN/Korns; Division of Robroy Industries.
 9. Erico; nVent.
 10. Galvan Industries, Inc.
 11. Greaves Corp.
 12. Harger.
 13. Hastings Fiber Glass Products, Inc.
 14. Heary Brothers Lightning Protection Co.
 15. Ideal Industries, Inc.
 16. ILSCO.
 17. Lightning Master Corp.
 18. Lyncole XIT Grounding; Division of VFC.
 19. O-Z/Gedney Co.; Emerson.
 20. Panduit, Inc
 21. RACO; Hubbell, Inc.
 22. Robbins Lightning, Inc.
 23. Superior Grounding Systems, Inc.

2.2 GROUNDING ELECTRODES

- A. Ground Rods: UL-listed:
 1. Copper-clad steel; bonded copper electrolytically-applied to minimum thickness of 10 mils.
 2. Hot-dip galvanized steel; minimum zinc thickness specified per ASTM A-123.
 3. Size: 3/4 inch by 10 feet. Provide sectional types when longer rods are indicated.
- B. Ground Ring:
 1. Bare copper grounding conductor, size as noted on Drawings but not less than #2/0 AWG.

2.3 GROUND BARS

- A. General
 1. Ground bars described in this section are intended to be wall mounted bars used for grounding and bonding. Equipment ground buses for switchboards, panelboards and miscellaneous equipment are described in the individual equipment sections.
 2. Supports: Minimum of two each 1-1/2-inch insulators and 1-inch stainless steel offset mounting brackets.

- B. Electrical Room Ground Bars
 - 2. Rectangular Ground Bars: bare, 1/4 inch thick, electrolytic, tough pitch copper bar, 4 inches wide. Length as indicated on the Drawings but not less than 24 inches long. Hole spacing as required for conductor lugs.
- C. Telecommunications Main Grounding Busbar (TMGB)
 - 1. Rectangular Ground Bars: UL & cUL Listed to UL467 & C22.2 respectively, pre-drilled per TIA/EIA Standard 607A, bare, 1/4 inch thick, electrolytic, tough pitch copper bar, 4 inches wide. Length as indicated on the Drawings but not less than 24 inches long.
- D. Telecommunications Grounding Busbar (TGB)
 - 1. Rectangular Ground Bars: UL & cUL Listed to UL467 & C22.2 respectively, pre-drilled per TIA/EIA Standard 607B, bare, 1/4 inch thick, electrolytic, tough pitch copper bar, 2 inches wide. Length as indicated on the Drawings but not less than 24 inches long.

2.4 GROUNDING CONDUCTORS

- A. For insulated conductors, comply with Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".
- B. Material:
 - 3. Aluminum.
 - 4. Copper-clad aluminum.
 - 5. Copper.
- C. Equipment Grounding Conductors: Insulated and identified as indicated in Part 3 of this section.
- D. Isolated Ground Conductors: Insulated and identified as indicated in Part 3 of this section.
- E. Grounding Electrode Conductors: Bare, stranded, unless otherwise indicated.
- F. Underground Conductors:
 - 6. Tinned-copper conductor.
 - 7. No. 2/0 AWG minimum
 - 8. Solid, unless otherwise indicated.
- G. Bare Copper Conductors:
 - 1. Solid Conductors: Comply with Conductors: ASTM B 8.
 - 2. Tinned Conductors: Comply with ASTM B 33.
- H. Copper Bonding Conductors:
 - 1. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG copper conductor, 1/4 inch in diameter.
 - 2. Bonding Conductor: No. 4 or No. 6 AWG, stranded copper conductor.
 - 3. Bonding Jumper: Bare copper tape, braided bare copper conductors, terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
 - 4. Tinned Bonding Jumper: Tinned-copper tape, braided copper conductors, terminated with copper ferrules; 1-5/8 inches (wide and 1/16 inch thick).
- I. Aluminum Bonding Conductors:
 - 1. Bonding Cable: 10 strands of No. 14 AWG aluminum conductor, 1/4 inch in diameter.
 - 2. Bonding Conductor: No. 4 or No. 6 AWG, stranded aluminum conductor.
 - 3. Bonding Jumper: Aluminum tape, braided bare aluminum conductors, terminated with aluminum ferrules; 1-5/8 inches wide and 1/16 inch thick.

J. Ground Ring:

9. Bare copper grounding conductor, size as noted on Drawings but not less than #2/0 AWG.

K. Ground Conductor and Conductor Protector for Wood Poles: As follows:

1. No. 4 AWG minimum, soft-drawn copper conductor.
2. Conductor Protector: Half-round PVC or wood molding. If wood molding is utilized, use pressure-treated fir, or cypress or cedar.

2.5 CONNECTOR PRODUCTS

- A. Comply with IEEE 837 and UL 467; listed for use for specific types, sizes, and combinations of conductors and connected items.
- B. Bolted Connectors: Bolted-pressure-type connectors.
- C. Compression Connectors: Burndy Hyground, or equal, permanent, pure, wrought copper, meeting ASTM 8 1 87, essentially the same as the conductors being connected; clearly and permanently marked with the information listed below:
 10. Company symbol and/or logo.
 11. Catalog number.
 12. Conductors accommodated.
 13. Installation die index number or die catalog number is required.
 14. Underwriters Laboratories "Listing Mark:".
 15. The words "Suitable for Direct Burial" or, where space is limited, "Direct Burial" or "Burial" per UL Standard ANSI/UL467.
- D. Cast connectors: copper base alloy according to ASTM B 30.
- E. Welded Connectors: Exothermic-welded type, in kit form, and selected per manufacturer's written instructions.

2.6 MISCELLANEOUS

- A. Test Wells:
 1. Traffic Areas: Polymer concrete reinforced with heavy weave fiberglass; H-20 load rating; minimum 24 inches deep.
 2. Non-traffic Areas: High density polyethylene; 350 PSF minimum load rating; minimum 10.25 inches deep.
 3. Cover: Factory-identified by permanent means with word "GROUND".
- B. Ground Enhancing Backfill: Provide low-resistivity, ground-enhancing backfill material recommended by the electrode manufacturer.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Examine areas and conditions under which electrical grounding connections are to be made and notify the Contract Administrator and the Engineer in writing of conditions detrimental to proper completion of the work. Do not proceed with Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:

16. Provide all materials, labor and equipment for an electrical grounding system in accordance with applicable portions of NFPA 70 and NECA. Coordinate electrical work as necessary to interface installation of electrical grounding systems with other work.
17. Accomplish grounding and bonding of electrical installations and specific requirements for systems, circuits and equipment required to be grounded for both temporary and permanent construction.
18. Where the size of the grounding conductors are not shown, size in accordance with NFPA 70 Route along shortest and straightest paths possible, unless otherwise indicated. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

B. Application:

19. Use only copper conductors for both insulated and bare grounding conductors in direct contact with earth, concrete, masonry, crushed stone, and similar materials.
20. Underground Grounding Conductors: Unless noted otherwise, bury at least 36 inches below grade, or 6 inches below the official frost line, whichever is greater, or when crossing a duct bank, bury 12 inches above duct bank.

B. Grounding Electrode System: Provide connection to required and supplemental grounding electrodes indicated to form grounding electrode system.

1. Provide continuous grounding electrode conductors without splice or joint.
2. Install grounding electrode conductors in raceway where exposed to physical damage. Bond grounding electrode conductor to metallic raceways at each end with bonding jumper.
3. Ground Rod Electrodes:
 - a. Install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes.
 - b. Unless otherwise indicated, install ground rod electrodes vertically.
 - 1) Outdoor Installations: Unless otherwise indicated, install with top of rod 6 inches below finished grade.
 - 2) Indoor Installations: Unless otherwise indicated, install with 4 inches of top of rod exposed.
 - c. Where encountered rock prohibits vertical installation, install at 45 degree angle or bury horizontally in trench at least 30 inches (750 mm) deep in accordance with NFPA 70. If depth is unachievable, notify Contract Administrator and Engineer.
 - d. Interconnect ground rods with grounding electrode conductors. Use exothermic welds, except at test wells and as otherwise indicated. Make connections without exposing steel or damaging copper coating.
 - e. Verify that final backfill and compaction has been completed before driving rod electrodes.
 - f. Install one test well for each service at the ground rod electrically closest to the service entrance. Set top of well flush with finished grade, pavement, or floor.
4. Ground Plate Electrodes: Unless otherwise indicated, install ground plate electrodes at a depth of not less than 30 inches. Use exothermic weld to secure grounding electrode conductor.
5. Ufer Ground (Concrete-Encased Grounding Electrode): Fabricate according to NFPA 70, using a minimum of 20 feet of bare, tinned copper conductor not smaller than No. 4 AWG. If concrete foundation is less than 20 feet long, coil excess conductor within the base of the foundation. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor above footer and foundation and connect to building structural steel or other grounding electrode external to concrete.
6. Metal Water Service Pipe: Provide insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes by grounding clamp connectors. Where a dielectric main water fitting is installed, connect grounding conductor to street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
7. Ground Ring Electrode (Counterpoise):

- a. Provide a ground ring encircling the building or structure, in direct contact with earth., installed at a depth of not less than 18 inches or 6 inches below the official frost line, whichever is greater.
 - b. Locate ground ring conductor at least 24 inches outside building perimeter foundation, unless noted otherwise on the Drawings.
 - c. Provide ground enhancement material around conductor where indicated.
 - 8. Metal In-Ground Support Structures: Provide connection to metal in-ground support structure that is in direct contact with earth in accordance with NFPA 70.
 - 9. Metal Poles Supporting Outdoor Luminaires: Provide a grounding electrode in addition to installing a separate equipment grounding conductor with supply branch-circuit conductors.
- C. Equipment Grounding Conductors:
- 1. Comply with NFPA 70, for types, sizes, and quantities of equipment grounding conductors, unless specific types, larger sizes, or more conductors than required by NFPA 70 are indicated.
 - 2. Install equipment grounding conductors in all feeders and branch circuits.
 - 3. In branch circuit and feeder raceways, use insulated equipment grounding conductors.
 - 4. Air-Duct Equipment Circuits: Install an equipment grounding conductor to duct-mounted electrical devices operating at 120V and more, including air cleaners and heaters. Bond conductor to each unit and to air duct.
 - 5. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate equipment grounding conductor to each electric water heater, heat-tracing, and antifrost heating cable. Bond conductor to heater units, piping, connected equipment, and components. On water heaters, bond metal hot and cold water pipes together, across the heater tank.
 - 6. Busway Supply Circuits: Install an insulated equipment grounding conductor from the grounding bus in the switchgear, switchboard, or distribution panelboard to the equipment grounding bar terminal on the busway, if a direct bus-to-bus connection is not factory provided.
 - 7. Computer Outlet Circuits: Install insulated equipment grounding conductor in branch-circuit runs from computer-area power panelboards or power-distribution units.
 - 8. Metallic Cable Tray Systems: Install equipment grounding conductor in each cable tray. Do not use metal cable tray system as sole equipment grounding conductor.
 - a. Equipment Grounding Conductor for Steel Cable Tray: Use bare or insulated copper conductor.
 - b. Equipment Grounding Conductor for Aluminum Cable Tray: Use insulated copper conductor only; do not use bare copper conductor.
 - c. Minimum Equipment Grounding Conductor Size: 6 AWG copper.
 - 9. Nonmetallic Raceways: Install an equipment grounding conductor in nonmetallic raceways unless they are designated for telephone or data cables.
- D. Ground Bars:
- 1. Install in electrical and telephone equipment rooms, in rooms housing service equipment, and elsewhere as indicated on the Drawings.
 - a. Use insulated spacers and mounting brackets, and support from wall 2 feet above finished floor, unless otherwise indicated.
- C. Signal and Communication Systems: For telephone, alarm, voice and data, and other communication systems, provide No. 6 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
- 2. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a ground bar.
 - 3. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.
- D. Separately Derived Systems: Bond the derived neutral (grounded) conductor of all separately derived system (e.g., transformers, generators, UPS) to the nearest available grounding electrode, or back to the service grounding electrode if no approved electrodes are readily available. Size the grounding

electrode conductor and bonding jumpers as indicated on the Drawings or as required by NFPA 70, whichever is larger.

- E. Bonding: Provide bonding for equipment grounding conductors, equipment ground busses, metallic equipment enclosures, metallic raceways and boxes, device grounding terminals, and other normally non-current-carrying conductive materials enclosing electrical conductors/equipment or likely to become energized as indicated and in accordance with NFPA 70:
 - 1. Bonding Straps and Jumpers: Install so vibration by equipment mounted on vibration isolation hangers and supports is not transmitted to rigidly mounted equipment. Use exothermic-welded connectors for outdoor locations, unless a disconnect-type connection is required; then, use a bolted clamp. Bond straps directly to the basic structure taking care not to penetrate any adjacent parts. Install straps only in locations accessible for maintenance.
 - 2. Bond each aboveground portion of gas piping system upstream from equipment shutoff valve.
 - 3. Bond interior metal piping systems and metal air ducts to equipment grounding conductors of associated pumps, fans, blowers, electric heaters, and air cleaners. Use braided-type bonding straps.
 - 4. Bond metallic elements likely to become energized or where indicated on the Drawings, including but not limited to fences around electrical equipment and metal drain bodies near pools or electrical equipment.
 - 5. Bond raised flooring systems and static control flooring.
 - 6. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with grounding clamp connectors.
 - 7. Common Ground Bonding with Lightning Protection System: Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in PVC conduit.
 - 8. Pole Mounted Luminaires: Bond metal enclosures and components of pole mounted luminaires to the grounding system per the Manufacturer's requirements.
 - 9. Bond the components within the following systems to the building grounding system:
 - a. Metallic Cable Tray Systems.
 - b. Photovoltaic Systems.
- E. Isolated Ground (IG) Receptacle Circuits:
 - 10. Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate grounding conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.
 - 11. Do not use multi-conductor or MC cables.
 - 12. Do not share neutrals between separate circuits.
 - 13. Do not share the isolated grounding conductor with more than one device (i.e., each device on an IG circuit shall have its own dedicated IG conductor back to the branch panelboard IG bus).
 - 14. The equipment grounding conductor may be shared between IG circuits sharing a common raceway
- F. Isolated Equipment Enclosure Circuits:
 - 1. For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate equipment grounding conductor. Isolate equipment grounding conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.
 - a.

1.2 CONNECTIONS

- A. General: Make connections so galvanic action or electrolysis possibility is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically

compatible. Provide electrical bonding plates, connectors, terminals, lugs and clamps as recommended by the manufacturers for indicated applications. Provide electrical insulating tape, heat-shrinkable insulating tubing, welding materials, and bonding straps as recommended by the manufacturers for types of service indicated.

1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer to order of galvanic series.
 2. Make connections with clean, bare metal at points of contact.
 3. Make aluminum-to-steel connections with stainless-steel separators and mechanical clamps.
 4. Make aluminum-to-galvanized steel connections with tin-plated copper jumpers and mechanical clamps.
 5. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.
- B. Exothermic-Welded Connections: Comply with manufacturer's written instructions. Replace welds that are puffed up or that show convex surfaces indicating improper cleaning. Use exothermic welded connections for the following:
1. Connecting conductors together.
 2. Connecting conductors to ground rods, except at test wells.
 3. Connecting conductors to building steel.
 4. Connecting conductors to plates.
- C. Compression-Type Connections: Use hydraulic compression tools to provide correct circumferential pressure for compression connectors. Use tools and dies recommended by connector manufacturer. Provide embossing die code or other standard method to make a visible indication that a connector has been adequately compressed on grounding conductor.
1. Compression Fittings: Permanent compression-type fittings may be used for the following rather than exothermic connections:
 - a. Connecting conductors together.
 - b. Connecting conductors to building steel.
 - c. Connecting conductors to ground rods, except at test wells.
- D. Mechanical Pressure-Type Connections: Tighten screws and bolts for grounding and bonding connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
1. Mechanical Pressure Fittings: Use bolted mechanical (removable) pressure-type clamps for the following:
 - a. Connecting conductors to ground rods at test wells.
 - b. Connecting conductors to pipes.
- E. Equipment Grounding Conductor Terminations: For No. 8 AWG and larger, use pressure-type grounding lugs. No. 10 AWG and smaller grounding conductors may be terminated with winged pressure-type connectors.
- F. Noncontact Metal Raceway Terminations: If metallic raceways terminate at metal housings without mechanical and electrical connection to housing, terminate each conduit with a grounding bushing. Connect grounding bushings with a bare grounding conductor to grounding bus or terminal in housing. Bond electrically noncontinuous conduits at entrances and exits with grounding bushings and bare grounding conductors, unless otherwise indicated.
- G. Connections at Test Wells: Use compression-type connectors on conductors and make bolted- and clamped-type connections between conductors and ground rods.
- H. Moisture Protection: If insulated grounding conductors are connected to ground rods or grounding buses, insulate entire area of connection and seal against moisture penetration of insulation and cable.

1.3 GROUND RING

- A. Ground the steel framework of the building with a buried electrode at the base of every corner column and at intermediate exterior columns at distances not more than 60 feet apart. Provide a grounding conductor (counterpoise), electrically connected to each ground rod and to each steel column, extending around the perimeter of the building. Protect taps for steel framing connections from physical damage at foundations and transitions to steel columns.
- B. ces.

1.4 UNDERGROUND DISTRIBUTION SYSTEM GROUNDING

- A. Manholes and Handholes: Install a driven ground rod close to wall and set rod depth so 4 inches will extend above finished floor. If necessary, install ground rod before manhole is placed and provide a No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, nonshrink grout.
- B. Connections to Manhole Components: Connect exposed-metal parts, such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 6 AWG minimum, stranded, hard-drawn copper conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits.
- C. Pad-Mounted Transformers and Switches: Install two ground rods and counterpoise encircling the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Use tinned-copper conductor not less than No. 2 AWG for counterpoise and for taps to equipment ground pad. Bury counterpoise not less than 18 inches below grade, or 6 inches below the official frost line, whichever is greater, and 6 inches from the foundation.

1.5 IDENTIFICATION

- F. Provide identification as specified in Division 26 “Low-Voltage Electrical Power Conductors and Cables” and “Identification for Electrical Systems”.

1.6 FIELD QUALITY CONTROL

- G. Testing: Perform the following field quality-control testing:
 - 1. After installing grounding system but before permanent electrical circuitry has been energized, test for compliance with requirements.
 - 2. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, and at ground test wells. Measure ground resistance not less than two full days after the last trace of precipitation, and without the soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance. Perform tests by the fall-of-potential method according to IEEE 81.
 - 3. Provide drawings locating each ground rod and ground rod assembly and other grounding electrodes, identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.
 - 4. Inspect and test in accordance with NETA ATS, except Section 4.
 - 5. Perform inspections and tests listed in NETA ATS, Section 7.13.

6. Perform ground electrode resistance tests under normally dry conditions. Precipitation within the previous 48 hours does not constitute normally dry conditions.
7. Perform point-to-point megohmmeter tests to determine the resistance between the main grounding system and all major electrical equipment frames, system neutral, and/or derived neutral points.
8. Test Values:
 - a. The resistance between the main grounding electrode and earth ground shall be no greater than 10 ohms.
 - b. Equipment Rated 500 kVA and Less: 10 ohms.
 - c. Equipment Rated 500 to 1000 kVA: 5 ohms.
 - d. Equipment Rated More Than 1000 kVA: 3 ohms.
 - e. Substations and Pad-Mounted Switching Equipment: 5 ohms.
 - f. Manhole Grounds: 10 ohms.
9. Minimum system neutral-to-ground insulation resistance: one megohm.
10. Investigate point-to-point resistance values that exceed 0.5 ohms.
 - a. Check for loose connections.
 - b. Check for absent or broken connections.
 - c. Check for poor quality welds.
 - d. Consider other reasons.
11. Investigate and correct deficiencies where measured ground resistances do not comply with specified requirements
12. Excessive Grounding Electrode Resistance: If measured resistance to earth ground value exceeds specified values, add grounding electrodes and additional conductors as required to obtain the specified value.
13. Submit detailed reports indicating inspection and testing results and corrective actions taken.

1.7 GRADING AND PLANTING

- H. Restore surface features, including vegetation, at areas disturbed by Work of this Section. Reestablish original grades, unless otherwise indicated. If sod has been removed, replace it as soon as possible after backfilling is completed. Restore areas disturbed by trenching, storing of dirt, cable laying, and other activities to their original condition. Include application of topsoil, fertilizer, lime, seed, sod, sprig, and mulch. Comply with Division 31 and 32. Maintain restored surfaces. Restore disturbed paving as indicated.

END OF SECTION

SECTION 16072 (260529) - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Hangers and supports for electrical equipment and systems.
 - 2. Construction requirements for concrete bases.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section “Common Work Results for Electrical” for concrete pads for pad-mounted service transformers.

1.3 DEFINITIONS

- A. EMT: Electrical metallic tubing.
- B. IMC: Intermediate metal conduit.
- C. RMC: Rigid metal conduit.

1.4 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design supports for multiple raceways, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.
- C. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
- D. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

1.5 SUBMITTALS

- A. Product Data: For the following:
 - 1. Steel slotted support systems.
 - 2. Nonmetallic slotted support systems.
- B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
 - 1. Trapeze hangers. Include Product Data for components.
 - 2. Steel slotted channel systems. Include Product Data for components.
 - 3. Nonmetallic slotted channel systems. Include Product Data for components.
 - 4. Equipment supports.

- C. Welding certificates.

1.6 QUALITY ASSURANCE

- A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Comply with NFPA 70.

1.7 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
- B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Allied Tube & Conduit.
 - b. Cooper B-Line, Inc.; a division of Cooper Industries.
 - c. ERICO International Corporation.
 - d. GS Metals Corp.
 - e. Thomas & Betts Corporation.
 - f. Unistrut; Tyco International, Ltd.
 - g. Wesanco, Inc.
 - 2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
 - 3. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.
 - 4. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
 - 5. Channel Dimensions: Selected for applicable load criteria.
- B. Nonmetallic Slotted Support Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with 9/16-inch- (14-mm-) diameter holes at a maximum of 8 inches (200 mm) o.c., in at least 1 surface.
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Allied Tube & Conduit.
 - b. Cooper B-Line, Inc.; a division of Cooper Industries.
 - c. Fabco Plastics Wholesale Limited.
 - d. Seasafe, Inc.
 - 2. Fittings and Accessories: Products of channel and angle manufacturer and designed for use with those items.
 - 3. Fitting and Accessory Materials: Same as channels and angles, except metal items may be stainless steel
 - 4. Rated Strength: Selected to suit applicable load criteria.
- C. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

- D. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.
- E. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
- F. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- G. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
 - 1)
 - 2. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
 - 3. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
 - 4. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
 - 5. Toggle Bolts: All-steel springhead type.
 - 6. Hanger Rods: Threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

- A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.
- B. Materials: Comply with requirements in Division 05 Section "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

- A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.
- B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as [required by 70. Minimum rod size shall be 1/4 inch (6 mm) in diameter.
- C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
 - 1. Secure raceways and cables to these supports with two-bolt conduit clamps.
- D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch (38-mm) and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.2 SUPPORT INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this Article.

- B. Raceway Support Methods: In addition to methods described in NECA 1, EMT, IMC, and RMC may be supported by openings through structure members, as permitted in NFPA 70.
- C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb (90 kg).
- D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
 1. To Wood: Fasten with lag screws or through bolts.
 2. To New Concrete: Bolt to concrete inserts.
 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
 4. To Existing Concrete: Expansion anchor fasteners.
 5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inches (100 mm) thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches (100 mm) thick.
 6. To Steel: Welded threaded studs complying with AWS D1.1/D1.1M, with lock washers and nuts.
 7. To Light Steel: Sheet metal screws.
 8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that meet seismic-restraint strength and anchorage requirements.
- E. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

- A. Comply with installation requirements in Division 05 Section "Metal Fabrications" for site-fabricated metal supports.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
- C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE BASES

- A. Construct concrete bases of dimensions indicated but not less than 4 inches (100 mm) larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.
- B. Use 3000-psi (20.7-MPa), 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section "Cast-in-Place Concrete"
- C. Anchor equipment to concrete base.
 1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
 3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
 - 1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).
- B. Touchup: Comply with requirements in Division 09 painting Sections cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

SECTION 16152 (260533) – RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. This Section includes:
 - 1. Raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section “Common Work Results for Electrical” for limited scope general construction materials and methods.
- C. Division 26 Section “Equipment Wiring Systems” for electrical connections to equipment specified under other Sections, Divisions, or furnished by the Owner.
- D. Division 26 Section “Grounding and Bonding”.
- E. Division 26 Section “Hangers and Supports for Electrical Systems”.
- F. Division 26 Section “Under Floor Raceways for Electrical Systems”.
- G. Division 26 Section “Underground Ducts and Raceways for Electrical Systems”.
- H. Division 26 Section "Vibration and Seismic Controls for Electrical Systems" for supports, anchors, concrete bases, seismic restraints and bracing of raceways, boxes, enclosures, and cabinets.
- I. Division 26 Section “Identification for Electrical Systems”.
- J. Division 26 Section "Wiring Devices" for devices installed in boxes, power poles, and multi-outlet assemblies.
- K. Division 26/27 Section “Common Work Results for Communications”.

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”.
- B. Record Drawings: Submit Record Drawings as required by Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Accurately record actual routing of all exterior buried raceway and all interior raceways three inches and larger. Indicate dimensions from fixed structural elements.
- C. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Structural members in path of conduit groups with supports.
 - 2. HVAC items, plumbing items and architectural features in the paths of conduit groups with common supports.

1.4 DEFINITIONS

- A. Terminology used in this specification is as defined below:
 - 1. EMT: Electrical Metallic Tubing
 - 2. FMC: Flexible Metal Conduit
 - 3. GRS: Galvanized Rigid Steel Conduit
 - 4. IMC: Intermediate Metal Conduit
 - 5. LFMC: Liquidtight Flexible Metal Conduit
 - 6. LFNC: Liquidtight Flexible Nonmetallic Conduit
 - 7. RAC: Rigid Aluminum Conduit
 - 8. RMC: Rigid Metal Conduit
 - 9. RNC: Rigid Nonmetallic Conduit

1.5 QUALITY ASSURANCE

- A. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 3 years.
- B. Electrical Components, Devices, and Accessories:
 - 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to AHJ.
 - 2. Marked for intended use.
- C. Comply with NFPA 70.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
- B. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference.

2.2 CONDUITS, SURFACE MOUNTED RACEWAYS AND ACCESSORIES

- A. Metal Conduit And Tubing
 - 1. Manufacturers:
 - a. AFC Cable Systems, Inc.
 - b. Alflex Corporation, a Southwire Company
 - c. Anamet Electrical, Inc.; Anaconda Metal Hose.
 - d. Electri-Flex Co.
 - e. Indalex
 - f. Manhattan/CDT/Cole-Flex
 - g. O-Z/Gedney; Unit of General Signal (Fittings)
 - h. Republic Raceway
 - i. Tyco International; Allied Tube & Conduit Div.
 - j. Western Tube and Conduit Corporation
 - k. Wheatland Tube Co.
 - 2. RMC:
 - a. GRS: Hot-dip galvanized: ANSI C80.1, UL 6.

- b. RAC: ANSI C80.5, UL6A.
- 3. IMC: ANSI C80.6, UL 1242.
- 4. EMT and Fittings: ANSI C80.3, UL 797.
 - a. Fittings: Set-screw or compression\ type.
- 5. FMC: Aluminum: UL 1.
- 6. LFMC: Flexible steel raceway with PVC jacket: UL 360.
 - a. Fittings: NEMA FB 1; compatible with raceway and tubing materials.

B. Nonmetallic Raceway

- 1. Manufacturers:
 - a. AFC Cable Systems, Inc. (Tubing)
 - b. American International.
 - c. Anamet Electrical, Inc.; Anaconda Metal Hose.
 - d. Arnco Corp.
 - e. Cantex Inc.
 - f. Certaineed Corp.; Pipe & Plastics Group.
 - g. Condux International.
 - h. ElecSYS, Inc.
 - i. Electri-Flex Co.
 - j. Lamson & Sessions; Carlon Electrical Products.
 - k. Manhattan/CDT/Cole-Flex.
 - l. Prime Conduit (formerly Carlon)
 - m. RACO; Division of Hubbell, Inc.
 - n. Spiralduct, Inc./AFC Cable Systems, Inc.
 - o. Superflex Ltd.
 - p. Thomas & Betts Corporation.
- 2. RNC: Schedule 40 PVC: NEMA TC 2, UL 651.
 - a. Fittings: match to raceway type and material: NEMA TC 3, NEMA TC 6, UL 651, as applicable.

C. Metal Wireways

- 1. Manufacturers:
 - a. Cooper B-Line
 - b. EPI-Electrical Enclosures
 - c. Hoffman.
 - d. Square D.
- 2. Material and Construction: 14 gauge (minimum) sheet steel, sized and shaped as indicated, NEMA 1.
- 3. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system. Select features, unless otherwise indicated, as required to complete wiring system and to comply with NFPA 70. Where indicated, provide a barrier to divide wireway into compartments.
- 4. Wireway Covers: Screw-cover type.
- 5. Finish: Manufacturer's standard phosphate pre-treatment and baked enamel finish.

D. Nonmetallic Wireways

- 1. Manufacturers:
 - a. Enduro Composite Systems
 - b. Hoffman.
 - c. Lamson & Sessions; Carlon Electrical Products.
- 2. Description: Fiberglass reinforced polyester, extruded and fabricated to size and shape indicated, with no holes or knockouts. Gasketed cover with oil-resistant gasket material and fastened with corrosion resistance captive screws or with snap-on covers and cover splice plates; flanged connections, with stainless-steel screws and oil-resistant gaskets.

3. Description: PVC, extruded and fabricated to size and shape indicated, with snap-on cover and mechanically coupled connections with plastic fasteners.
4. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
5. Select features, unless otherwise indicated, as required to complete wiring system and to comply with NFPA 70.

2.3 BOXES, ENCLOSURES AND CABINETS

A. General

1. Manufacturers:
 - a. Cooper Crouse-Hinds; Div. of Cooper Industries, Inc.
 - b. Emerson/General Signal; Appleton Electric Company.
 - c. Erickson Electrical Equipment Co.
 - d. Hoffman.
 - e. Hubbell, Inc.
 - f. Killark Electric Manufacturing Co.
 - g. O-Z/Gedney; Unit of General Signal.
 - h. RACO; Division of Hubbell, Inc.
 - i. Robroy Industries, Inc.; Enclosure Division.
 - j. Scott Fetzer Co.; Adalet-PLM Division.
 - k. Spring City Electrical Manufacturing Co.
 - l. Thomas & Betts Corporation.
 - m. Walker Systems, Inc.; Wiremold Company (The).
 - n. Woodhead, Daniel Company; Woodhead Industries, Inc. Subsidiary

B. Outlet Boxes

1. Sheet Metal Outlet and Device Boxes: NEMA OS 1; UL514A.
2. Cast-Metal Outlet and Device Boxes: NEMA FB 1, Type FD, with gasketed cover.
3. Nonmetallic Outlet and Device Boxes: NEMA OS 2
4. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified in the following paragraphs. Manufacturers and model numbers listed are used only to represent the characteristics required and are not intended to restrict the use of other Manufacturers listed above and models that meet the specified criteria.
 - a. Boxes for exposed work: deep drawn type with raised covers:
 - 1) Appleton 4S 1/2-DR; 8300 series cover.
 - 2) RACO 190 series; 800 series cover.
 - 3) Steel City 52150 series; RS series cover.
 - b. Concealed and exposed boxes for lighting:
 - 1) Appleton 40-3/4.
 - 2) RACO 160 series.
 - 3) Steel City 54170 series.
 - c. Boxes imbedded in concrete for lighting:
 - 1) Appleton OCR
 - 2) RACO 270 or 280 series.
 - 3) Steel City 54500 series.
 - d. Boxes for flush switches, receptacles, or other general devices:
 - 1) Appleton 4SVB series; 8400 series cover.
 - 2) RACO 198 series; 770 series cover.
 - 3) Steel City CWV series; 52-C-00 series cover.
 - e. Boxes for flush switches, receptacles, or other general devices installed in masonry construction:
 - 1) Appleton MI-250 series or MI-350 series.

- 2) RACO 690 series or 960 series.
- 3) Steel City GW series.
- f. Boxes for telephone, data, telecommunications and audio-video outlets, refer to Division 26 Section "Common Work Results for Communications".
- g. Exposed weatherproof boxes for general devices: cast aluminum with mounting lugs and neoprene gasket:
 - 1) Appleton FDB series.
 - 2) RACO 5300 series.
 - 3) Steel City T100L or LT100L series.
- h. Exposed weatherproof boxes for general devices: cast aluminum with neoprene gasket:
 - 1) Appleton FS series.
 - 2) RACO 5300 series.
 - 3) Steel City T100 or LT100 series.

C. Junction and Pull Boxes

- 1. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
- 2. Cast-Metal Pull and Junction Boxes: NEMA FB 1, cast aluminum with gasketed cover.

D. Floor Boxes

- 1. General:
 - a. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified in the tables below. Manufacturers and model numbers listed are used only to represent the characteristics required and are not intended to restrict the use of other Manufacturers listed above and models that meet the specified criteria.
 - b. Floor boxes used for power: Include a minimum of one normal 20A, 125V NEMA 5-20R duplex receptacle unless noted or scheduled otherwise on the Drawings. Wiring device color: Refer to Division 26 Section "Wiring Devices", or as indicated on the Drawings.
 - c. Floor boxes utilized for telephone, data, or both: Include provisions for mounting telephone/data outlets in accordance with the requirements of the telephone/data systems provider.
 - d. UL514A listed for scrub water exclusion for all floor types.
- 2. Box Type A : For slab on grade: round-faced, watertight, Class 1, fully adjustable cast iron box. For slab above grade: round-faced, concrete-tight, fully adjustable, stamped galvanized steel box. Brass cover plate and brass carpet ring. Provide aluminum cover plate and trim in lieu of brass when directed by Architect. Provide shallow boxes where necessitated by slab depth.

<u>MFR</u>	<u>CAST IRON BOX</u>	<u>STAMPED STEEL BOX</u>	<u>COVER PLATE (POWER)</u>	<u>COVER PLATE (TEL/DATA)</u>	<u>CARPET TRIM</u>
Steel City	602	68D	P60-DS	P60-3/4-2	P60-CP
Walker	887	886	895T	896TCK	895(pwr), 896CK (tel/data)
Hubbell	B2536	B2527	S3925	S2525	S3082

- 3. Box Type B: For slab on grade: single-gang, rectangular, watertight, Class 1, fully adjustable, cast iron box. For slab above grade: single-gang, rectangular, concrete-tight, fully adjustable, stamped galvanized steel box. Brass cover plate and brass carpet ring. Provide aluminum cover plate and trim in lieu of brass when directed by Architect. Provide shallow boxes where necessitated by slab depth.

<u>MFR</u>	<u>CAST IRON BOX</u>	<u>STAMPED STEEL BOX</u>	<u>COVER PLATE (POWER)</u>	<u>COVER PLATE (TEL/DATA)</u>	<u>CARPET TRIM</u>

Steel City	641	N/A	P64-DS	P64-3/4-2	P64-CP
Walker	880CS1	880S1	828R	829CK-3/4	817C, 817T (for tile)
Hubbell	B2436	B2431	S3825	S2425	SB-3083

4. Box Type C: For slab on grade: two-gang, rectangular, watertight, Class 1, fully adjustable, cast iron box with removable partition. For slab above grade: two-gang, rectangular, concrete-tight, fully adjustable, stamped galvanized steel box. Brass cover plate and brass carpet ring. Provide aluminum cover plate and trim in lieu of brass when directed by Architect. Provide shallow boxes where necessitated by slab depth.

<u>MFR</u>	<u>CAST IRON BOX</u>	<u>STAMPED STEEL BOX</u>	<u>COVER PLATE (POWER)</u>	<u>COVER PLATE (TEL/DATA)</u>	<u>CARPET TRIM</u>
Steel City	642	N/A	P64-DS	P64-3/4-2	P64-2G-CP
Walker	880CS2	880S2	828R	829CK-3/4	827C, 827T (for tile)
Hubbell	B4233	B2432	S3825	S2425	SB-3084

5. Box Type D: For slab on grade: three-gang, rectangular, watertight, Class 1, fully adjustable, cast iron box with removable partition. For slab above grade: three-gang, rectangular, concrete-tight, fully adjustable, stamped galvanized steel box. Brass cover plate and brass carpet ring. Provide aluminum cover plate and trim in lieu of brass when directed by Architect. Provide shallow boxes where necessitated by slab depth.

<u>MFR</u>	<u>CAST IRON BOX</u>	<u>STAMPED STEEL BOX</u>	<u>COVER PLATE (POWER)</u>	<u>COVER PLATE (TEL/DATA)</u>	<u>CARPET TRIM</u>
Steel City	643	N/A	P64-DS	P64-3/4-2	P64-3G-CP
Walker	880CS3	880S3	828R	829CK-3/4	837C, 837T (for tile)
Hubbell	B4333	B2433	S3825	S2425	SB-3085

6. For Multi-service Floor Boxes, see Division 26/27 Section “Common Work Results for Communications”.

E. Fire-Rated Poke-Through Outlets – TYPE A Single Service

1. UL listed and UL Fire Classified, flush or pedestal type as indicated on the Drawings, with one- to four-hour fire rating, as required by floor rating and type.
2. Flush type:
 - a. Single-service type: Capable of supporting, at a minimum, a duplex 20A/125V receptacle (or equivalent).
 - b. Furniture-feed type: Single-service type as indicated on the Drawings.
 - c. Cover plate, with individual device covers, and floor flange, UL514A listed for scrub water exclusion.
 - d. Color: As directed by the Architect.
3. Service Pedestal type:
 - a. Single-service type: single-, two-, four-, six-, or eight-gang, with quantities and types of devices as indicated on the Drawings.
 - b. Housing: As directed by the Architect.
4. For additional poke-through types, see Division 26/27 Section “Common Work Results for Communications”.

F. Cabinets and Enclosures

1. General:
 - a. Compliance: NEMA 250; UL 50 and 508A, as applicable.

- b. NEMA Type 1: Code-gauge phosphatized steel with continuously welded seams; manufacturer's standard ANSI 61 gray polyester powder finish inside and out; non-gasketed removable hinged front cover, with flush keyed latch and concealed hinge; collar studs.
- c. [NEMA Type 12: Code-gauge phosphatized steel with continuously welded seams; manufacturer's standard ANSI 61 gray polyester powder finish inside and out; external wall-mounting brackets; rolled flanges on door and door opening; continuous-hinged door, with removable steel pin; oil-resistant continuous gasket; hasp and staple for padlocking; collar studs; captive, plated steel door clamps; interior data pocket.]
- d. NEMA Type 3R: Code-gauge galvanized steel with drip shield top, seam-free front, side, and back; manufacturer's standard ANSI 61 gray polyester powder finish inside and out; non-gasketed continuous-hinged door, with stainless steel pin; captive, plated steel cover screws; hasp and staple for padlocking; collar studs.
- e. [NEMA Type 4X: External wall-mounting brackets; rolled flanges on door and door opening; continuous-hinged door, with removable stainless steel pin; seamless continuous gasket; stainless steel hasp and staple for padlocking; collar studs; captive, stainless steel door clamps on 3 sides of door; interior data pocket:
 - 1) Metal: Code-gauge Type 304 stainless steel with continuously welded seams.
 - 2) Nonmetallic: Fiberglass-reinforced Plastic (FRP) with continuously sealed seams; finished inside with radio-frequency-resistant paint.]
- f. Removable painted steel interior panel mounted on standoffs; metal barriers to separate wiring of different systems and voltages.
- g. Where keyed locks are indicated, provide 2 keys for each enclosure, with all locks keyed alike.
- h. Provide enclosures wider than 36 inches with double doors; removable center posts; internal bracing, supports, or both, as required to maintain their structural integrity; and, accessory feet where required for freestanding equipment.
- i. Provide clamps, grids, slotted wireways, or similar devices to which or by which wiring may be secured. Provide DIN-rail mounted terminal strips for terminating all incoming and outgoing control wiring, and power terminal blocks for incoming/outgoing power wiring.
- j. Provide metal barriers to separate compartments containing control wiring operating at less than 50 volts from power and higher-voltage control wiring.

2.4 FACTORY FINISHES

- A. Finish: For metal wireway and surface raceway, enclosure, or cabinet components, provide manufacturer's standard prime-coat finish ready for field painting.
- B. Finish: For metal wireway and surface raceway, enclosure, or cabinet components, provide manufacturer's standard paint applied to factory-assembled metal wireway and surface raceways, enclosures, and cabinets before shipping.

PART 3 - EXECUTION

3.1 RACEWAYS

- A. General
 - 1. Comply with NECA 1 for installation requirements applicable to products specified in Part 2 except where requirements on drawings or in this article are stricter.
 - 2. Provide sizes and types of raceways as indicated on the Drawings. Sizes are based on THWN insulated copper conductors, except where noted otherwise. Where sizes are not shown on the Drawings or in the Specifications, size raceways in accordance with NFPA 70 requirements for the number, size and type of conductors installed. Minimum raceway size: 1/2 inch (concealed and exposed); 1 inch (underground and under slab).
 - 3. Provide all raceways, fittings, supports, and miscellaneous hardware required for a complete electrical system as described by the Drawings and Specifications.

4. Install a green-insulated, equipment-grounding conductor, which is bonded to the electrical system ground, in all raceways, with the exception of Service Entrance raceways.
5. Install grounding bushings on all conduit terminations and bond to the enclosure, equipment grounding conductor, and electrical system ground.
6. Install raceways concealed in walls or above suspended ceilings in finished areas. When approved by the Architect, raceways may be installed concealed in elevated floor slabs. Do not install raceways horizontally within slabs on grade.
7. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portions of bends are not visible above the finished slab.
8. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.
9. Make bends and offsets so inside diameters are not reduced. Keep legs of bends in the same plane and keep straight legs of offsets parallel, unless otherwise indicated.
10. Install raceways:
 - a. To meet the requirements of the structure and the requirements of all other Work on the Project.
 - b. To clear all openings, depressions, ducts, pipes, reinforcing steel, and so on.
 - c. Within or passing through the concrete structure in such a manner so as not to adversely affect the integrity of the structure. Become familiar with the Architectural and the Structural Drawings and their requirements affecting the raceway installation. If necessary, consult with the Architect.
 - d. Parallel or perpendicular to building lines or column lines.
 - e. When concealed, with a minimum of bends in the shortest practical distance, considering type of building construction and obstructions, unless otherwise indicated.
11. Raceways Embedded in Slabs: Install in middle 1/3 of slab thickness where practical and leave at least 2 inches of concrete cover.
 - a. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement.
 - b. Space raceways laterally to prevent voids in concrete.
 - c. Run conduit larger than 1-inch trade size parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support.
 - d. Change from RNC to coated GRS or IMC before rising above the floor.
12. Where masonry walls are left unfinished, coordinate raceway installations with other trades so that the raceways and boxes are concealed and the wall will have a neat and smooth appearance.
13. Support raceways from structural elements of the building as required by NFPA 70, Division 26 Section "Hangers and Supports for Electrical Systems", and per Division 26 Section "Vibration and Seismic Controls for Electrical Systems" and per Division 23 Section, "Seismic Controls for HVAC Piping and Equipment". Do not support raceways by hangers used for any other systems foreign to the electrical systems; and, do not attach to other foreign systems. Do not lay raceways on top of the ceiling system.
14. Provide support spacing in accordance with NFPA 70 requirements, and at a minimum in accordance with NEMA standards. Support by the following methods:
 - a. Attach single raceway directly to structural steel with beam clamps.
 - b. Attach single raceway directly to concrete with one-hole clamps or clips and anchors. Outdoors and wherever subject to dampness or moisture, offset raceways from the surface by using galvanized clamps and clamp backs, to mitigate moisture entrapment between raceways and surfaces.
 - c. Attach groups of raceway to structural steel with slotted support system attached with beam clamps. Attach raceway to slotted channel with approved raceway clamps.
 - d. Attach groups of raceway to concrete with cast-in-place steel slotted channel fabricated specifically for concrete embedment. Attach raceway to steel slotted channel with approved raceway clamps.
 - e. Hang plumb horizontally suspended single raceway using a threaded rod. Attach threaded rods to concrete with anchors and to structural steel with beam clamps. Attach raceway to threaded rod with approved raceway clamps.

- f. Hang horizontally suspended groups of raceway using steel slotted support system suspended from threaded rods. Attach threaded rods to concrete with anchors and to structural steel with beam clamps. Attach raceway to steel slotted channel with approved raceway clamps.
 - g. Support conductors in vertical raceway in accordance with NFPA 70 requirements.
 - h. Cross-brace suspended raceway to prevent lateral movement during seismic activity.
 - i. Use pre-fabricated non-metallic spacers for parallel runs of underground or under-slab conduits, either direct buried or encased in concrete.
15. Install electrically- and physically-continuous raceways between connections to outlets, boxes, panelboards, cabinets, and other electrical equipment with a minimum possible number of bends and not more than the equivalent of four 90-degree bends between boxes. Make bends smooth and even, without flattening raceway or flaking the finish.
 16. Protect all electrical Work against damage during construction. Repair all Work damaged or moved out of line after rough-in, to meet the Architect's approval, without additional cost to the Owner. Cover or temporarily plug openings in boxes or raceways to keep raceways clean during construction. Clean all raceways prior to pulling conductors or cables.
 17. Align and install raceway terminations true and plumb.
 18. Complete raceway installation before starting conductor installation.
 19. Install a pull cord in each empty raceway that is left empty for installation of wires or cables by other trades or under separate contracts. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull cord.
 20. Install approved expansion/deflection fittings where raceways pass through or over building expansion joints.
 21. Route raceway through roof openings for piping and ductwork or through roof seals approved by the Architect, the roofing contractor, or both. Obtain approval for all roof penetrations and seal types from the Architect, Owner, roofing contractor, or all three as required to maintain new or existing roofing warranties.
 22. Install raceway sealing fittings at suitable, approved, and accessible locations and fill them with UL-listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings at the following points:
 - a. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces or from building exterior to building interior.
 - b. Where otherwise required by NFPA 70.
 23. Stub-up Connections: Extend conduits through concrete floor for connection to freestanding equipment. Install with an adjustable top or coupling threaded inside for plugs set flush with finished floor. Extend conductors to equipment with as indicated; FMC may be used 6 inches above the floor. Install screwdriver-operated, threaded plugs flush with floor for future equipment connections.

B. RMC

1. Use GRS or IMC in the following areas:
 - a. Where indicated.
 - b. Exterior applications where above grade and exposed.
 - c. Below grade when concrete-encased, plastic-coated, or provided with a corrosion resistant approved mastic coating.
 - d. All raceways penetrating slabs on grade (use plastic-coated raceway or provide with a corrosion resistant approved mastic coating). This shall include the 90-degree elbow below grade and the entire vertical transition to above grade.
2. Use RAC in the following areas:
 - a. Indoors above grade.
 - b. Interior wet or damp locations.
 - c. For circuits operating above 60 Hz. Where aluminum raceways are installed for such circuits and pass through concrete, install in nonmetallic sleeve.
3. Do not use RAC:
 - a. Below grade.

- b. Imbedded in concrete or other areas corrosive to RAC.
- C. EMT
 - 1. Use EMT in the following areas:
 - a. Where indicated.
 - b. Interior concealed locations for:
 - 1) Branch and feeder circuits.
 - 2) Low-voltage control, security, and fire alarm circuits
 - 2. Do not use EMT:
 - a. Below grade.
 - b. In exterior applications when exposed.
- D. FMC and LFMC
 - 1. Use FMC or LFMC:
 - a. For the final 24 inches of raceway to all motors, transformers, and other equipment subject to vibration or movement.
 - b. From outlet boxes (attached to building structure) to recessed light fixtures. Install sufficient length to allow for relocating each light fixture within a 5-foot radius of its installed location.
 - 2. Do not use FMC or LFMC:
 - a. For branch circuits, homeruns or feeders.
 - b. <Insert additional locations>
 - 3. Use FMC only in dry locations; use LFMC in damp, wet, corrosive, and outdoor locations.
- E. RNC
 - 1. Solvent-weld RNC fittings and raceway couplings per the manufacturer's instructions and make all connections watertight. Use solvent of the same manufacturer as the raceway.
 - 2. Where installed exposed outdoors or other areas subject to temperature variations, install expansion fittings per Article 352.44 of NFPA 70, to accommodate thermal expansion in straight runs.
 - 3. Use RNC in the following locations:
 - a. Only where specifically indicated, and then only as specified below.
 - b. Underground, single and grouped, in lieu of GRS or IMC, when indicated.
 - 1) Direct buried
 - 2) Concrete-encased (use approved rigid PVC interlocking spacers, selected to provide minimum duct spacing and cover depths indicated while supporting ducts during concreting and backfilling; produced by the same manufacturer as the ducts).
 - 4. Do not use RNC:
 - a. Exposed indoors
 - b. In occupied spaces.
 - c. In return air plenums.
 - d. Where subject to physical damage.
 - e. Where not permitted by codes.
- F. Raceway Fittings: Compatible with raceways and suitable for use and location.
 - 1. RMC and IMC: Use threaded rigid steel conduit fittings, unless otherwise indicated.
 - 2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings and installation tools approved by the manufacturer for use with that material. Patch all nicks and scrapes in PVC coating after installing conduits. Replace all fittings and conduits that have any portion of the coating scraped off to bare metal, at no additional cost to the Owner.
 - 3. Join raceways with fittings designed and approved for that purpose and make joints tight.
 - 4. Use insulating bushings to protect conductors at raceway terminations:
 - a. Where raceways are terminated with locknuts and bushings, align raceways to enter squarely and install locknuts with dished part against box. Use two locknuts, one inside and one outside box.

- b. Where raceways are terminated with threaded hubs, screw raceways or fittings tightly into hub so end bears against wire protection shoulder. Where chase nipples are used, align raceways so coupling is square to box; tighten chase nipple so no threads are exposed.
- G. Telephone and Signal/Data System Raceways, 2-Inch Trade Size and Smaller: In addition to above requirements, install raceways in maximum lengths of 150 feet and with a maximum of two 90-degree bends or equivalent. Separate lengths with pull or junction boxes where necessary to comply with these requirements.
- H. Wireways
 - 1. Use flat head screws, clips and straps to fasten wireways to surfaces. Mount plumb and level.
 - 2. Use suitable insulating bushings and inserts at connections to outlets and corner fittings.
 - 3. Close ends of wireway and unused raceway openings.

3.2 BOXES

A. General

- 1. Verify locations of device boxes prior to rough in.
- 2. Set boxes at elevations to accommodate mounting heights as specified or indicated on the Drawings.
- 3. Electrical boxes are shown on Drawings in approximate locations unless dimensioned. Adjust box locations to accommodate intended purpose.
- 4. Install boxes to preserve fire ratings of walls, floors, and ceilings.
- 5. Install flush wall-mounted boxes without damaging wall insulation or reducing its effectiveness.
- 6. Support boxes independently of raceway.
- 7. Clean the interior of boxes to remove dust, debris, and other material. Clean exposed surfaces and restore finish.
- 8. Adjust flush-mounted boxes to make front edges flush with finished wall material.
- 9. Provide boxes of the depth required for the service, device and the application, and with raised covers set flush with the finished wall surface for boxes concealed in plaster finishes. Select covers with the proper openings for the devices being installed in the boxes. Install boxes flush unless otherwise indicated.
- 10. Install outlet boxes in firewalls complying with UL requirements, with box surface area not exceeding 16 square inches; and, when installed on opposite sides of the wall, separate by a distance of at least 24 inches.

B. Outlet Boxes

- 1. Install all electrical devices, such as plug receptacles, lamp receptacles, light switches, and light fixtures in or on outlet boxes.
- 2. Locations of outlets on Drawings are approximate; and, except where dimensions are shown, determine exact dimensions for locations of outlets from plans, details, sections, or elevations on Drawings, or as directed by Architect. Locate outlets generally from column centers and finish wall lines or to centers or joints of wall or ceiling panels.
- 3. Locate outlet boxes so they are not placed back-to-back in the same wall, and in metal stud walls, so they are separated by at least one stud space, to limit sound transmission from room to room. Install outlet boxes in accessible locations and do not install outlets above ducts or behind furring.
- 4. Install extension and plaster rings as required by NFPA 70.
- 5. Carefully set outlet boxes concealed in non-plastered block walls so as to line up with wall joints. Coordinate the box and raceway installation with the wall construction as required for a flush and neat appearing installation. Outlet box extensions may be used where necessary.
- 6. Do not exceed allowable fill per NFPA 70.
- 7. Where multiple devices are shown grouped together, gang mount with a common cover plate.

C. Junction and Pull Boxes

- 1. Install junction and pull boxes above accessible ceilings and in unfinished areas.
- 2. Provide boxes set flush in painted walls or ceilings with primer coated cover.

3. Where junction and pull boxes are installed above an inaccessible ceiling, locate so as to be easily accessible from a ceiling access panel.
4. Boxes for exterior use shall be:
 - a. PVC with a UV-stabilized PVC cover sealed and gasketed watertight.
 - b. Cast aluminum with a cast aluminum cover sealed and gasketed watertight.
 - c. Cast iron with cast iron cover sealed and gasketed watertight in vehicular traffic areas. Provide box and cover UL listed for use in vehicular traffic areas.
 - d. Install buried boxes so that box covers are flush with grade, unless indicated otherwise.

D. Floor Boxes

1. Use cast or non-metallic floor boxes for installations in slab on grade. Unless otherwise indicated, formed steel boxes are acceptable for slabs above grade.
2. Set metal floor boxes level and flush with finished floor surface.
3. Set non-metallic floor boxes level. Trim after installation to fit flush with finished floor surface.

3.3 CABINETS AND ENCLOSURES

- A. Unless otherwise indicated on the Drawings, provide NEMA 1 construction for indoor, dry locations; NEMA 12 for indoor, damp and dusty locations; NEMA 3R for outdoor locations; NEMA 4X for indoor wet and corrosive locations.
- B. Install flush mounted in the wall in finished spaces, with the top 78 inches above finished floor. The front shall be approximately 3/4-inch larger than the box all around.
- C. Install surface mounted in unfinished spaces, with the top 78 inches above finished floor. The front shall be the same height and width as the box.
- D. Electrically ground all metallic cabinets and enclosures. Where wiring to cabinet or enclosure includes a grounding conductor, provide a grounding lug in the interior of the cabinet or enclosure. Cabinets and enclosures specified in this Section are intended to house miscellaneous electrical components assembled in a custom arrangement, such as contactors and relays.
- E. All components that are specified or indicated for assembly in cabinets and enclosures shall each be individually UL listed and labeled. Arrange wiring so that it can be readily identified. Support wiring no less than every 3 inches. Install gauges, meters, pilot lights and controls on the face of the door.
- F. Do not provide cabinets and enclosures smaller than the sizes indicated. Where sizes and types are not indicated, provide cabinets and enclosures of the size, type and classes appropriate for the use and location per the guidelines of the NEC. Provide all items complete with covers and accessories required for the intended use.

END OF SECTION

SECTION 16135 (260536) – CABLE TRAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Cable trays and accessories for the following types:
 - 1. Steel
 - 2. Aluminum
 - 3. Stainless-steel
 - 4. Fiberglass

1.2 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate the arrangement of cable tray and supports with structural members, ductwork, piping, equipment and other potential conflicts installed under other sections or by others. Coordinate the work with other trades to avoid installation of obstructions within cable tray required clearances.
- B. Coordinate arrangement of cable tray with the dimensions and clearance requirements of the actual products to be installed.
- C. Coordinate the work with placement of supports, anchors, etc. required for mounting.
- D. Notify Contract Administrator of any conflicts with or deviations from the contract documents. Obtain direction before proceeding with work.
- E. Coordination Drawings: Floor plans and sections, drawn to scale. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements. Show the following:
 - 1. Vertical and horizontal offsets and transitions.
 - 2. Clearances for access above and to side of cable trays.
 - 3. Vertical elevation of cable trays above the floor or bottom of ceiling structure.
- F. Cables shall not be installed within cable trays until associated raceway and cable tray system is complete.
- G. SUBMITTALS
- H. Product Data: Include data indicating dimensions, accessories and finishes for each type of cable tray indicated.
 - 1. Fiberglass Cable Tray Systems: Include requirements for strength derating according to ambient temperature.
- I. Shop Drawings: For each type of cable tray.
 - 1. Show fabrication and installation details of cable tray, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.
- J. Coordination Drawings: Floor and reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Dimensioned cable tray routing; including offsets, cable access and clearances. Include fittings for attachment to electrical equipment.
 - 2. Location of structural supports cable tray systems and seismic bracing.

- 3. Location and elevations of structural members, light fixtures, sprinkler piping and heads, HVAC equipment, ducts and diffusers, plumbing piping and access fittings. Include maintenance access clearances.
 - K. Derating Calculations for Fiberglass Cable Tray Systems: Indicate span/load ratings adjusted for applicable service conditions.
 - L. Field quality-control reports.
 - M. Record Drawings: Submit Record Drawings as required by Division 01 and Division 26 Section "General Electrical Requirements":
 - 1. Accurately record actual cable tray routing and locations of supports.
 - N. Operation and Maintenance Data: For cable trays to include in emergency, operation, and maintenance manuals.
- 1.3 QUALITY ASSURANCE
- A. Source Limitations: Obtain cable tray system and associated components and accessories through one source from a single manufacturer.
 - B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
 - C. Comply with NFPA 70.
- 1.4 SEISMIC REQUIREMENTS
- A. Seismic bracing, restraints, and controls for all electrical systems specified herein shall be designed and installed as required by Division 20 Section "Seismic Controls for MEP/F/T Systems".
- 1.5 DELIVERY, STORAGE, AND HANDLING
- A. Store indoors to prevent water or other foreign materials from staining or adhering to cable tray. Unpack and dry wet materials before storage.
 - B. Handle products carefully to avoid damage to finish.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provide new cable tray system consisting of all required components, fittings, supports, accessories, etc. as necessary for a complete system.
- B. Provide products listed, classified, and labeled as suitable for the purpose intended.
- C. Unless otherwise indicated, provide cable tray system to meet span/load ratings in accordance with NEMA VE 1 for metal cable tray systems, or NEMA FG 1 for fiberglass cable tray systems, with safety factor of 1.5 and working load. Account for additional concentrated static loads at supports where required and allowed per NFPA 70.

- D. Unless otherwise indicated, specified widths and loading depths are nominal values according to NEMA VE 1 for metal cable tray systems or NEMA FG 1 for fiberglass cable tray systems with applicable allowable tolerances.

2.2 MANUFACTURERS

- A. [Available] Manufacturers: Subject to compliance with requirements, provide products by one of the following
 1. ABB, Inc.
 2. Cablofil, a brand of Legrand North America, Inc.
 3. Chalfant Manufacturing Company.
 4. Cooper B-Line; Eaton.
 5. Cope; a division of Atkore International.
 6. Enduro Composites
 7. Mono-Systems; Niedax Group
 8. MPHusky.

2.3 MATERIALS AND FINISHES

- A. Cable Trays, Fittings, and Accessories: Steel, complying with NEMA VE 1.
 1. Factory-standard primer, ready for field painting; with cadmium-plated hardware according to ASTM B 766.
- B. Cable Trays, Fittings, and Accessories: Aluminum, complying with NEMA VE 1, Aluminum Association's Alloy 6063-T6 for rails, rungs, and cable trays, and Alloy 5052-H32 or Alloy 6061-T6 for fabricated parts; with chromium-zinc, ASTM F 1136splice-plate fasteners, bolts, and screws.
- C. Cable Trays, Fittings, and Accessories: Stainless steel, Type 304 or 316, complying with NEMA VE 1.
- D. Cable Trays, Fittings, and Accessories: Polyester or vinyl resin fiberglass, complying with NEMA FG 1 and UL 568. Splice-plate fasteners, bolts, and screws shall be fiberglass-encapsulated stainless steel. Design fasteners so that no metal is visible when fully assembled and tightened. Fastener encapsulation shall not be damaged when torqued to manufacturer's recommended value.
 1. Flammability: Fire retardant with NFPA 101, Class A flame spread index when tested in accordance with ASTM E84; self-extinguishing in accordance with ASTM D635.
- E. Sizes and Configurations: Refer to the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.
 1. Center-hanger supports may be used only when specifically indicated.

2.4 CABLE TRAY TYPE

- A. Basket Cable Trays: Wire mesh spacing shall not exceed 2 by 4 inches (50 by 100 mm).
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in 10 foot lengths.
- B. Ventilated Trough Cable Trays:
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in 10 or 20 foot lengths.
 3. Fixed rung spacing shall 4 inches on center.
- C. Ladder Cable Trays:
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in 10 or 20 foot lengths.

3. Rung spacing of 9 inches.
- D. Channel Cable Trays: One-piece construction. Slot spacing shall not exceed 4-1/2 inches o.c.
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in 10 or 20 foot lengths.
- E. Solid-Bottom Cable Trays: One-piece construction. Provide with solid covers.
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in of 10 or 20 foot lengths.
- F. Single Rail Cable Tray: Center rails and rungs with continuous square tube rungs with radius corners. Splice hangers shall be capable of acting as the support points for all-thread rod.
 1. Cable tray width and loading depth shall be as indicated on drawings.
 2. Straight sections shall be supplied in 10 foot lengths.
 3. Rungs shall be spaced every 9 inches.

2.5 CABLE TRAY ACCESSORIES

- A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.
- B. Covers: Louvered type of same materials and finishes as cable tray.
- C. Barrier Strips: Same materials and finishes as cable tray; with supports sufficient to resist cable pulling weight applied during installation.
- D. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.6 SOURCE QUALITY CONTROL

- A. Perform factory design and production tests according to NEMA VE 1 for metal cable tray systems or NEMA FG 1 for fiberglass cable tray systems.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

- A. Verify that conditions are satisfactory for installation prior to starting work.
- B. Install in accordance with manufacturer's instructions.

3.2 CABLE TRAY INSTALLATION

- A. Modifications to Existing Cable Tray Systems: Remove inactive or abandoned cables from existing cable tray system.
- B. Remove burrs and sharp edges from cable trays.
- C. Install cable tray in accordance with NECA 1 and comply with recommendations in NEMA VE 2].
- D. Install as a complete system, including all necessary fasteners, hold-down clips, splice-plate support systems, barrier strips, hinged horizontal and vertical splice plates, elbows, reducers, tees, and crosses.

- E. Arrange cable tray to provide required clearances and maintain cable access.
 - 1. Minimum Clearance Above and Adjacent to Cable Tray: 12 inches.
 - 2. Cable Tray for Telecommunications Cables: Maintain recommended separation from sources of EMI greater than 5 kVA in accordance with NECA/BICSI 568.

- F. Fasten cable tray supports to building structure.
 - 1. Unless otherwise indicated, arrange cable tray to be parallel or perpendicular to building lines.
 - 2. Place supports so that spans do not exceed maximum spans limits set by the manufacturer.
 - 3. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.
 - 4. Support bus assembly to prevent twisting from eccentric loading.
 - 5. Manufacture center-hung support, designed for 60 percent versus 40 percent eccentric loading condition, with a safety factor of 3.
 - 6. Locate and install supports according to NEMA VE 1 for metal cable tray systems or NEMA FG 1 for fiberglass cable tray systems.
 - 7. Install seismic restraints where required in accordance with Division 20 section "Seismic Controls for MEPFT"

- G. Cable Tray Movement Provisions:
 - 1. Provide suitable expansion fittings where cable tray is subject to movement, including but not limited to:
 - a. Where cable tray crosses structural joints intended for expansion.
 - b. Long straight cable tray runs in accordance with NEMA VE 2.
 - c. Use expansion guides in lieu of hold-down clamps where prescribed in NEMA VE 2.
 - d. Set gaps for expansion fittings in accordance with NEMA VE 2.

- H. Make connections to equipment with flanged fittings fastened to cable tray and to equipment. Support cable tray independent of fittings. Do not carry weight of cable tray on equipment enclosure.

- I. Install expansion connectors where cable tray crosses building expansion joint and in cable tray runs that exceed dimensions recommended in to NEMA VE 1 for metal cable tray systems or NEMA FG 1 for fiberglass cable tray systems. Space connectors and set gaps according to applicable standard.

- J. Make changes in direction and elevation using standard fittings.

- K. Make cable tray connections using standard fittings.

- L. Seal penetrations through fire and smoke barriers according to Division 07 Section "Penetration Firestopping."

- M. Sleeves for Future Cables: Install capped sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

- N. Workspace: Install cable trays with enough space to permit access for installing cables.

- O. Install barriers to separate cables of different systems, such as power, communications, and data processing; or of different insulation levels, such as 600, 5,000, and 15,000 Volts.

- P. Provide end closures at unconnected ends of cable tray runs.

- Q. After installation of cable trays is completed, install warning signs in visible locations on or near cable trays.

3.3 CABLE INSTALLATION

- A. Install cables only when cable tray installation has been completed and inspected.
- B. Fasten cables on horizontal runs with cable clamps or cable ties as recommended by NEMA VE 2. Tighten clamps only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.
- C. On vertical runs, fasten cables to tray every 18 inches (457 mm). Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.
- D. Use suitable drop-out fittings or bushings where cables exit cable tray as required to maintain minimum cable bending radius.
- E. Use suitable cable support fittings for long vertical cable tray runs with heavy cables.
- F. Install covers after installation of cable is completed.

3.4 WARNING SIGNS

- A. Legend: "WARNING! NOT TO BE USED AS WALKWAY, LADDER, OR SUPPORT FOR LADDERS OR PERSONNEL."
- B. Materials and fastening are specified in Division 26 Section "Identification for Electrical Systems."

3.5 CONNECTIONS

- A. Ground cable trays according to manufacturer's written instructions and comply with NEMA VE 2 where more stringent.
- B. Install an insulated equipment grounding conductor with cable tray, in addition to those required by NFPA 70. Refer to Division 26 section "Grounding and Bonding for Electrical Systems" for additional requirements.

3.6 FIELD QUALITY CONTROL

- A. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements. Perform the following field quality-control survey:
 - 1. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable tray, vibration, and thermal expansion and contraction conditions, which may cause or have caused damage.
 - 2. Verify that the number, size, and voltage of cables in cable tray do not exceed that permitted by NFPA 70. Verify that communication or data-processing circuits are separated from power circuits by barriers.
 - 3. Verify that there is no intrusion of such items as pipe, hangers, or other equipment that could damage cables.
 - 4. Remove deposits of dust, industrial process materials, trash of any description, and any blockage of tray ventilation.
 - 5. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
 - 6. Check for missing or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
 - 7. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable tray.

B. Report results in writing.

3.7 PROTECTION

A. Protect installed cable trays.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
2. Repair damage to PVC or paint finishes with matching touchup coating recommended by cable tray manufacturer.
3. Install temporary protection for cables in open trays to protect exposed cables from falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials until the risk of damage is over.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 16155 (260543) – UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. This Section includes:
 - 1. Raceways, fittings, boxes, handholes, and manholes for direct buried and concrete-encased electrical distribution.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section "Common Work Results for Electrical” for limited scope general construction materials and methods.
- C. Division 26 Section “Grounding and bonding”
- D. Division 26 Section "Identification for Electrical Systems”

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Product data for the following products:
 - a. Raceways, Raceway fittings, separators, duct-bank materials, manholes, handholes, boxes, solvent cement, warning tape and warning planks.
 - 2. Shop drawings for:
 - a. Detailing fabrication and installation for custom manholes or handholes including duct entry provisions, reinforcing details, frame and cover design, manhole frame support rings, ladder details, grounding details, sump details, joint details, and cable racks, pulling irons, lifting irons.
- B. Record Drawings: Submit Record Drawings as required by Division 01 and Division 26 Section “General Electrical Requirements”:
 - 1. Accurately record actual routing of all exterior buried raceway including coordination with other surrounding utilities and underground structures. Provide scaled plans and sections that Indicate dimensions from finished grade or other fixed structural elements.

1.4 DEFINITIONS

- A. Terminology used in this specification is as defined below:
 - 1. GRS: Galvanized Rigid Steel Conduit
 - 2. RMC: Rigid Metal Conduit
 - 3. RNC: Rigid Nonmetallic Conduit

1.5 QUALITY ASSURANCE

- A. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 3 years.

- B. Electrical Components, Devices, and Accessories:
 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to AHJ.
 2. Marked for intended use.
- C. Comply with NFPA 70 and ANSI C2.
- D. Test and inspect pre-cast concrete utility structures according to ASTM C 1037.
- E. Non-concrete Handhold and Pull-Box Prototype Test: Test prototypes of manholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
 1. Tests of materials shall be performed by a independent testing agency.
 2. Strength tests of complete boxes and covers shall be by either an independent testing agency or the manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
 3. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver ducts to project site with ends capped and store nonmetallic ducts with supports to prevent bending, warping, and deformation.
- B. Store pre-cast and other factory –fabricated underground utility structures at Project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings, if present, are visible.
- C. Lift and support pre-cast concrete units only at designated lifting or supporting points.

1.7 PROJECT CONDITIONS

- A. Interruption of existing electrical service to occupied facilities shall not occur unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated.
 1. Notify Architect no fewer than two days in advance of proposed interruption of electrical service.
 2. Do not proceed with interruption of electrical service without Architects written permission.

1.8 COORDINATION

- A. Coordinate layout and installation of ducts, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field.
- B. Coordinate elevations of ducts and duct-bank entrances into manhole, handholes, and boxes with final locations and profiles of ducts and duct banks as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations from those indicated as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by the Architect.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

B. Where a list is provided, manufacturers are listed alphabetically and not in accordance with any ranking or preference.

2.2 RACEWAYS AND FITTINGS

A. Metal Conduit

1. Manufacturers:
 - a. AFC Cable Systems, Inc.
 - b. Alflex Corporation, a Southwire Company
 - c. Anamet Electrical, Inc.; Anaconda Metal Hose.
 - d. Electri-Flex Co.
 - e. Indalex
 - f. Manhattan/CDT/Cole-Flex
 - g. O-Z/Gedney; Unit of General Signal (Fittings)
 - h. Republic Raceway
 - i. Tyco International; Allied Tube & Conduit Div.
 - j. Wheatland Tube Co.
2. RMC:
 - a. GRS: Hot-dip galvanized: ANSI C80.1, UL 6
3. Plastic-Coated GRS and Fittings: NEMA RN 1, UL-listed. Coating thickness of 0.40 inches (1 mm), minimum.
4. Fittings: NEMA FB 1; compatible with raceway and tubing materials.

B. Nonmetallic Raceway

1. Manufacturers:
 - a. AFC Cable Systems, Inc. (Tubing)
 - b. American International.
 - c. Anamet Electrical, Inc.; Anaconda Metal Hose.
 - d. Arnco Corp.
 - e. Cantex Inc.
 - f. Certaineed Corp.; Pipe & Plastics Group.
 - g. Condux International.
 - h. ElecSYS, Inc.
 - i. Electri-Flex Co.
 - j. Lamson & Sessions; Carlon Electrical Products.
 - k. Manhattan/CDT/Cole-Flex.
 - l. RACO; Division of Hubbell, Inc.
 - m. Spiralduct, Inc./AFC Cable Systems, Inc.
 - n. Superflex Ltd.
 - o. Thomas & Betts Corporation.
2. RNC: Schedule 40 (type EPC-40-PVC) PVC: NEMA TC 2, UL 651.
 - a. a.Fittings: match to raceway type and material: NEMA TC 3, NEMA TC 6, UL 651, as applicable.

C. DUCT ACCESSORIES

1. Duct Separators shall be factory-fabricated rigid interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling.
2. Underground-line warning tape specified in Division 26 Section "Identification for Electrical Systems."

3. Concrete warning planks shall be nominal 12 by 24 by 3 inches in size, manufactured from 6000-psi concrete.
 - a. Color: Red dye added to concrete during batching.
 - b. Labeling: Mark each plank with "ELECTRICAL" in 2-inch high, 3/8-inch deep letters.

2.3 PRE-CAST CONCRETE HANDHOLES AND BOXES

A. General

1. Manufacturers:
 - a. Carder Concrete Products.
 - b. Christy Concrete Products
 - c. Elmhurst-Chicago Stone Co.
 - d. Oldcastle Pre-cast Group
 - e. Riverton Concrete Products; a division of Cretex Companies, Inc.
 - f. Utility Concrete Products, LLC
 - g. Utility Vault Co.
 - h. Wausau Title, Inc.

B. Comply with ASTM C858 for design and manufacturing process.

C. Pre-cast concrete handholes and boxes shall be factory-fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of the handhole or box.

1. Frame and Cover: Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
2. Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
3. Frame and Cover: Weatherproof steel frame, with hinged steel access door assembly with tamper-resistant, captive, cover-securing bolts.
 - a. Cover Hinges: Concealed, with hold-open ratchet assembly.
 - b. Cover Handle: Recessed.
4. Frame and Cover: Weatherproof aluminum frame, with hinged aluminum access door assembly with tamper-resistant, captive, cover-securing bolts.
 - a. Cover Hinges: Concealed, with hold-open ratchet assembly.
 - b. Cover Handle: Recessed.
5. The cover finish shall be a nonskid finish with a minimum coefficient of friction of 0.50.
6. The cover shall have the following legend lettering molded into the cover:
 - a. "C.A.T.V."
 - b. "COMMUNICATIONS"
 - c. "ELECTRICAL"
 - d. "FIBER OPTICS"
 - e. "LIGHTING"
7. Units shall be designed for flush burial and have open bottom, unless otherwise indicated.
8. Extensions and slabs shall be designed to mate with bottom of enclosure and shall be same material as enclosure.
 - a. Extension shall provide increased depth of 12 inches.
 - b. Slab shall be same dimensions as bottom of enclosure, and arranged to provide closure.
9. Windows shall be included as pre-cast openings in walls arranged to match dimensions and elevations of approaching ducts and duct banks plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
 - a. Windows shall be located no less than 6 inches from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.

- b. Window openings shall have cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie into concrete envelopes of duct banks.
 - c. Window openings shall be framed with at least two additional No.4 steel reinforcing bars in concrete around each opening.
10. Duct entrances into handhole walls shall have cast end-bell or duct-terminating fittings in the wall for each entering duct.
- a. Type and size shall match fittings to duct or conduit to be terminated.
 - b. Fittings shall align with elevations of approaching ducts and be located near interior corners of handholes to facilitate racking of cable.
11. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.4 HANDHOLES AND BOXES OTHER THAN PRE-CAST CONCRETE

A. General

1. Description: Comply with SCTE 77.
2. Color of Frame and Cover: Gray where installed in concrete or other paved area; Green where installed in grass area.
3. Configuration: Units shall be designed for flush burial and have open bottom, unless otherwise indicated.
4. Load Ratings:
 - a. Boxes and covers installed in sidewalks and other areas not subject to normal vehicular traffic shall be rated for a design load of 8,000 lbs. minimum.
 - b. Boxes and covers installed in driveways, parking lots, and other off-roadway applications shall be rated for a design load of 15,000 lbs. minimum.
 - c. Boxes and covers installed in roadways and other high vehicular traffic areas shall be rated for a design load of 28,800 lbs.
5. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
6. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
7. Cover Legend: Molded lettering, applicable logo from the following:
 - a. "C.A.T.V"
 - b. "COMMUNICATIONS"
 - c. "ELECTRIC"
 - d. "FIBER OPTICS"
 - e. "LIGHTING"
8. Duct Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
9. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pullin-in irons.

B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel or fiberglass or a combination of the two.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Armorcast Products Company.
 - b. Carson Industries LLC.
 - c. CDR Systems Corporation.
 - d. NewBasis.
 - e. Strongwell

C. Fiberglass Handholes and Boxes with Polymer-Concrete frame and cover: Sheet-molded, fiberglass-reinforced, polyester resin enclosure joined to polymer concrete top ring or frame.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Armorcast Products Company.
 - b. Carson Industries LLC.

- c. Christy Concrete Products.
 - d. Synertech Moulded Products, Inc.; a division of Oldcastle Precast.
 - e.
- D. Fiberglass Handholes and Boxes: Molded of fiberglass-reinforced polyester resin, with covers of polymer concrete.
- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Carson Industries LLC.
 - b. Christy Concrete Products.
 - c. Nordic Fiberglass, Inc.
- E. High-Density Plastic Boxes: Injection molded of high-density polyethylene of copolymer-polypropylene. Cover shall be polymer concrete.
- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Carson Industries LLC.
 - b. Nordic Fiberglass, Inc.
 - c. PenCell Plastics

2.5 PRE-CAST MANHOLES

- A. Pre-cast-concrete manholes shall be furnished in sizes as indicated on the plans and as specified herein. Pre-cast manholes shall be constructed of reinforced concrete, complete with all appurtenances and accessories required.
- 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Carder Concrete Products.
 - b. Christy Concrete Products.
 - c. Elmhurst-Chicago Stone Co.
 - d. Oldcastle Pre-cast Group.
 - e. Riverton Concrete Products; a division of Cretex Companies, Inc.
 - f. Utility concrete Products, LLC.
 - g. Utility Vault Co.
 - h. Wausau Tile, Inc.
- B. Comply with ASTM C858, with structural design loading as specified in Part 3 “Underground enclosure Application” and with interlocking mating sections, complete with accessories, hardware, and features.
- 1. Windows: Pre-cast openings in walls, arranged to match dimensions and elevations of approaching ducts and duct banks plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
 - a. Windows shall be located no less than 6 inches from interior surfaces of walls, floors, or roofs of manholes, but close enough to facilitate racking of cables on walls.
 - b. Window opening shall have cast-in-place, welded wire fabric reinforcement for field cutting and bending to tie into concrete envelopes of duct banks.
 - c. Window openings shall be framed with at least two additional No.4 steel reinforcing bars in concrete around each opening.
 - 2. Duct Entrances in Manhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.
 - a. Type and size shall match fittings to duct or conduit to be terminated.
 - b. Fittings shall align with elevations of approaching ducts and be located near interior corners of manholes to facilitate racking of cable.
- C. Concrete Knockout Panels: 1-1/2 to 32 inches thick, for future conduit entrance and sleeve for ground rod.

- D. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

2.6 CAST-IN-PLACE MANHOLES

- A. Description: underground utility structures, constructed in place, complete with accessories, hardware, and features. Include concrete knockout panels for concrete entrance and sleeve for ground rod.
- B. Materials: Comply with ASTM C858 and with Division 03 Section "Cast-In-Place Concrete."

2.7 UTILITY STRUCTURE ACCESSORIES

- A. Utility structures shall be installed complete including accessories as listed below.
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following
 - a. Bilco Company (The).
 - b. Campbell Foundry Company.
 - c. Carder Concrete Products
 - d. Christy Concrete Products.
 - e. East Jordan Iron Works, Inc.
 - f. Elmhurst-Chicago Stone Co.
 - g. McKinley Iron Works, Inc.
 - h. Neenah Foundry Company.
 - i. NewBasis
 - j. Oldcastle Precast Group
 - k. Osburn Associates, Inc.
 - l. Pennsylvania Insert Corporation.
 - m. Riverton concrete Products; a division of Cretex Companies, Inc.
 - n. Strongwell Corporation; Lenoir City Division.
 - o. Underground Devices, Inc.
 - p. Utility Vault Co.
 - q. Wausau Tile, Inc.
- B. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2 inch diameter eye, and 1 by 4 inch bolt.
 - 1. Working load embedded in 6 inch, 4000-psi concrete is 13,000-lbf maximum tension
- C. Pulling Eyes in Non-concrete Walls: Eyebolt with reinforced fastening, 1-1/4 inch diameter eye, rated 2500-lbf minimum tension.
- D. Pulling-In and Lifting Irons in Concrete Floors: 7/8 inch diameter, hot-dip galvanized, bent rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
 - 1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.
- E. Bolting Inserts for concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of non-corrosive, chemical-resistant, non-conductive thermoplastic material; 1/2-inch ID by 2-3/4 inches deep, flared to 1-1/4 inches minimum at base.
 - 1. Tested Ultimate Pullout Strength: 12,000-lbf minimum.
- F. Expansion Anchors for Installation after Concrete is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2-inch bolt, 5300-lbf rated pullout strength, and minimum 6800-lbf rated shear strength.

- G. Cable Rack Assembly: Steel, hot-rolled galvanized, except insulators.
 - 1. Stanchions: T-section or channel; 2-1/4-inch nominal size; punched with 14 holes on 1-1/2 inch centers for cable-arm attachment.
 - 2. Arms: 1-1/2-inches wide, lengths ranging from 3-inches with 450-lb minimum capacity to 18-inches with 250-lb minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.
 - 3. Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.
- H. Cable Rack Assembly: Nonmetallic. Components fabricated from nonconductive, fiberglass-reinforced polymer.
 - 1. Stanchions: Nominal 36-inches high by 4-inches wide, with minimum of 9 holes for arm attachment.
 - 2. Arms: Arranged for secure, drop-in attachment in horizontal position at any location on cable stanchions, and capable of being locked in position. Arms shall be available in lengths ranging from 3-inches with 450-lb minimum capacity to 20-inches with 250-lb minimum capacity. Top of arm shall be nominally 4-inches wide, and shall have slots along length for cable ties.
- I. Duct-Sealing Compound: Non-hardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 deg F. Capable of withstanding temperature of 300 deg F without slump and adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.
- J. Cover Hooks: Heavy duty, design for lifts 60-lbf and greater] [Light duty, designed for lifts less than 60-lbf]. [Two] <Insert quantity> required.

PART 3 - EXECUTION

3.1 UNDERGROUND DUCT APPLICATION

- A. Ducts for Electrical Cables over 600 V: RNC, NEMA Type EPC-40 PVC, in concrete-encased duct bank, unless otherwise indicated.
- B. Ducts for Electrical Feeders 600volts and Less: RNC, NEMA Type EPC-40 PVC, in concrete-encased duct bank, unless otherwise indicated.
- C. Ducts for Electrical Feeders 600 volts and Less: RNC, NEMA Type EPC-40 PVC, in direct- buried duct bank, unless otherwise indicated.
- D. Ducts for Electrical Branch Circuits: RNC, NEMA Type EPC-40 PVC, indirect-buried duct bank, unless otherwise indicated.
- E. Underground Ducts for Telephone, Communications, or Data Utility Service Cables: RNC, NEMA Type EPC-40 PVC, in concrete-encased or direct-buried duct bank, unless otherwise indicated.
- F. Underground Ducts Crossing Paved Paths Walks, Driveways [and] [Roadways: RNC, NEMA Type EPC-40 PVC, encased in reinforced concrete.

3.2 UNDERGROUND ENCLOSURE INSTALLATION

- A. Handholes and Boxes for 600 volts and Less ,Including Telephone, Communications, and Data Wiring:
 - 1. Units in roadways and Other Deliberate Traffic Paths: Pre-cast concrete. AASHTO HB 17, H-20 structural load rating.
 - 2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Non-deliberate Loading by Heavy Vehicles: Polymer Concrete, SCTE 77, Tier 15 structural load rating.

3. Units in Sidewalk and Similar Applications with a Safety Factor for Non-deliberate loading by Vehicles: Polymer Concrete Units, SCTE 77, Tier 8 structural load rating.
4. Units Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced Polyester resin, structurally tested according to SCTE 77 with 3000-lbf vertical loading.
- 5.

3.3 EARTHWORK

- A. Excavation and Backfilling: Comply with Division 31 Section "Earth Moving" but do not use heavy-duty, hydraulic-operated, compaction equipment.
- B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling and compaction is complete.
- C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Division 32 Sections "Turf and Grasses and "Plants"
- D. Cut and patch existing pavement in the path of underground ducts and utility structures according to Division 01 Section "Cutting and Patching."

3.4 DUCT INSTALLATION

- A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.
- B. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48-inches, both horizontally and vertically, at other locations, unless otherwise indicated.
- C. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in the same plane.
- D. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10-inches o.c. for 5-inch ducts, and vary proportionately for other duct sizes.
 1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell with out reducing duct line slope and without forming a trap in the line.
 2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to manhole or handhole.
 3. Grout end bells into structure walls from both sides to provide watertight entrances.
- E. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least 10 feet outside the building wall without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Division 26 Section "Common Work Results for Electrical."
- F. Sealing: Provide temporary closure at termination of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.
- G. Pulling Cord: Install 100-lbf test nylon cord in ducts, including spares.
- H. Concrete-Encased Ducts: Support ducts on duct separators.
 1. Separator installation: Space separators close enough to prevent sagging and deforming of ducts, with not less than 4 spacers per 20 feet of duct. Secure separators to earth and ducts to prevent

- floating during concreting. Stagger separators approximately 6-inches between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around the ducts or duct group.
2. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
 - a. Start at one end finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to the manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.
 - b. If more than one pour is necessary, terminate each pour in a vertical plane and install ¾-inch reinforcing rod dowels 18-inches into concrete on both sides of joint near corners of envelope.
 3. Pouring Concrete: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct bank application.
 4. Reinforcement: Reinforce concrete-encased duct banks where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
 5. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured with out soil inclusions; otherwise, use forms.
 6. Minimum Space between Ducts: 3-inches between ducts and exterior envelope wall, 2-inches between ducts for like services, and 4-inches between power and signal ducts.
 7. Depth: Install top of duct bank at least 24-inches below finished grade in areas not subject to deliberate traffic, and at least 30-inches below finished grade in deliberate traffic paths of vehicles, unless otherwise indicated.
 8. Stub-Ups: Use manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.
 - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3-inches of concrete.
 - b. Stub-ups to Equipment: For equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60-inches from edge of base. Install insulated grounding bushings on terminations at equipment.
 9. Warning Tape: Bury warning tape approximately 12 inches above all concrete-encased ducts and duct banks. Align tape parallel to and within 3-inches of the centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18-inches. Space additional tapes 12-inches apart, horizontally.

I. Direct-Buried Duct Banks:

1. Support ducts on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
2. Space separators close enough to prevent sagging and deforming of ducts, with not less than 4 spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6-inches between tiers.
3. Excavate trench bottom to provide firm and uniform support for duct bank. Prepare trench bottoms as specified in Division 31 Section "Earth Moving" for pipes less than 6-inches in nominal diameter.
4. Install backfill as specified in Division 31 Section "Earth Moving."
5. After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand-place backfill to 4-inches over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end run and complete backfilling with normal compaction as specified in Division 31 Section "Earth Moving."

6. Install ducts with a minimum of 3-inches between ducts for like services and 6-inches between power and signal ducts.
7. Depth: Install top of duct bank at least 36-inches below finished grade, unless otherwise indicated.
8. Set elevation of bottom of duct bank below the frost line.
9. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.
 - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3-inches of concrete.
 - b. For equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60-inches from edge of base. Install insulated grounding bushings on terminations at equipment.

~~10. Warning Planks: Bury warning planks approximately 12 inches above all direct buried ducts in duct banks placing them 24 inches O.C. Align planks along the width and along the centerline of duct bank. Provide an additional plank for each 12 inch increment of duct bank width over a nominal 48 inches. Space additional planks 12 inches apart, horizontally.~~

3.5 INSTALLATION OF CONCRETE MANHOLES, HANDHOLES, AND BOXES

A. Cast-in-place Manhole Installation:

1. Finish interior surfaces with a smooth-troweled finish.
2. Windows for future duct connections: Form and pour concrete knockout panels 1-1/2 to 2 inches thick, arranged as indicated.
3. Cast-in-place concrete, formwork, and reinforcement are specified in Division 03 Section "Cast-in-Place Concrete."

B. Precast Concrete Handhole and Manhole Installation:

1. Comply with ASTM C891, unless otherwise indicated.
2. Install units level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances.
3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevations:

1. Install handholes with bottom below the frost line, 36 inches below grade.
2. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1-inch above grade.
3. Where indicated, cast handhole cover frame integrally with handhole structure.

D. Drainage: Install drains in bottom of manholes where indicated. Coordinate with drainage provisions indicated.

E. Manhole Access: Circular opening in manhole roof; sized to match cover size.

1. Manholes with Fixed Ladders: Offset access opening from manhole centerlines to align with ladder.
2. Install chimney, constructed of precast concrete collars and rings to support frame and cover and to connect cover with manhole roof opening. Provide moisture-tight masonry joints and waterproof grouting for cast-iron frame to chimney.

F. Waterproofing: Apply waterproofing to exterior surfaces of handholes after concrete has cured at least three days. Waterproofing materials and installation are specified in Division 07 Section "Elastomeric Sheet Waterproofing or Thermoplastic Sheet Waterproofing." After ducts have been connected and grouted, and before backfilling, waterproof joints and connections and touch up abrasions and scars. Waterproof exterior of manhole chimneys after mortar has cured at least three days

- G. Dampproofing: Apply dampproofing to exterior surfaces of handholes after concrete has cured at least three days. Dampproofing materials and installation are specified in Division 07 Section "Bituminous Dampproofing". After ducts have been connected and grouted, and before backfilling, dampproof joints and connections and touch up abrasions and scars. Dampproof exterior of manhole chimneys after mortar has cured at least three days.
- H. Hardware: Install removable hardware, including pulling eye, cable stanchions, cable arms, and insulators, as required for installation and support of cable and conductors and as indicated.
- I. Fixed Manhole Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in manholes.
- J. Field-Installed Bolting Anchors in Manholes and Concrete Handholes: Do not drill deeper than 3-7/8-inches for manholes and 2-inches for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

Warning Sign: Install "Confined Space Hazard" warning sign on the inside surface of each manhole cover.

3.6 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRE-CAST CONCRETE

- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of ducts, and seal joint between box and extension as recommended by the manufacturer.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch (12.5-mm) sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
- C. Elevation: In paved areas and trafficways, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch (25 mm) above finished grade.
- D. Install handholes and boxes with bottom below the frost line, 36 inches below grade.
- E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in the enclosure.
- F. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.
- G. For enclosures installed in asphalt paving and subject to occasional, nondeliberate, heavy-vehicle loading, form and pour a concrete ring encircling, and in contact with, enclosure and with top surface screeded to top of box frame. Bottom of ring shall rest on compacted earth.
 - 1. Concrete: 3000psi, 28-day strength, complying with Division 03 Section "Cast-in-Place Concrete," with a troweled finish.
 - 2. Dimensions: 10-inch wide by 12-inches deep.

3.7 GROUNDING

- A. Ground underground ducts and utility structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."

3.8 INSTALLATION ACCEPTANCE

- A. Prior to final acceptance of the duct bank and associated structures, pull an aluminum or wood test mandrel through the duct to prove joint integrity and to verify ducts have not been deformed. Provide mandrel equal to 80 percent fill of the duct. Test duct bank, manhole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Division 26 Section "Grounding and Bonding for Electrical Systems." Correct any deficiencies and retest as specified above. Clean internal surfaces of manholes (including sumps) and handholes and remove foreign materials.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16701 (260548) - SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL REQUIREMENTS

1.1 SECTION INCLUDES

- A. This section includes general seismic requirements specific other sections of the Division 26 specifications.

1.2 DEFINITIONS

- A. The IBC: International Building Code.
- B. ICC-ES: ICC-Evaluation Service.
- C. OSHPD: Office of Statewide Health Planning and Development for the State of California.

1.3 SUMMARY

- A. Seismic bracing, restraints, and controls for all electrical systems specified herein shall be designed and installed as required by Division 20 Section “Seismic Controls for MEP/F/T Systems”.
- B. The following equipment shall withstand the effects of earthquake motions. The equipment will remain in place without separation of any parts from the device when subjected to the seismic forces specified:
 - 1. Panelboards used in normal power systems
 - 2. Raceways and Boxes used in normal power systems
 - 3. Low-Voltage Transformers used in normal power systems
 - 4. Switchboards used in normal power systems
 - 5. Panelboards used in normal power systems
- C. In addition to the requirements above, the following equipment shall be fully operational after the seismic event:
 - 1. Panelboards used in emergency power systems
 - 2. Raceways and Boxes used in emergency power systems
 - 3. Low-Voltage Transformers used in emergency power systems
 - 4. Switchboards used in emergency power systems
 - 5. Panelboards used in emergency power systems

1.4 SUBMITTALS

- A. Provide submittals as required by Division 20 Section “Seismic Controls for MEP/F/T Systems” for all electrical systems specified herein.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16075 (260553) – IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes the following:
 - 1. Nameplates.
 - 2. Labels for raceways and metal-clad cable.
 - 3. Labels for junction boxes and pull boxes.
 - 4. Labels for wiring devices and lighting control devices.
 - 5. Markers for conductors, and control cables.
 - 6. Tags.
 - 7. Underground-line warning tape.
 - 8. Warning labels and signs.
 - 9. Arc Flash Warning Labels.
 - 10. Instruction signs.
 - 11. Miscellaneous identification products.
 - 12. Painted Identification.

1.2 ADMINISTRATIVE REQUIREMENTS

- A. Where a facility identification standard already exists, that standard shall be continued. Where an identification standard does not exist, color-coding and identification shall be as described herein.
- B. Coordinate identification names, abbreviations, colors, and other features with requirements in the Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual, and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.
- C. Verify final designations for equipment, systems, and components to be identified prior to fabrication of identification products.
- D. Coordinate installation of identifying devices with location of access panels and doors.
- E. Install identifying devices before installing acoustical ceilings and similar concealment.

1.3 SUBMITTALS

- A. Product Data: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements” for each electrical identification product indicated:
 - 1. Identification Schedule: An index of nomenclature of electrical equipment and system components used in identification signs and labels.
 - 2. Samples: For each type of label and sign to illustrate size, colors, lettering style, mounting provisions, and graphic features of identification products.

1.4 QUALITY ASSURANCE

- A. Electrical Equipment, Components, Devices, and Accessories:
 - 1. Listed and labeled as defined in NFPA 70, by an NRTL as defined by OSHA in 29 CFR 1910.7 and that are acceptable to authorities having jurisdiction.
 - 2. Marked for intended use.
- B. Comply with ANSI A13.1 and ANSI C2.

- C. Comply with requirements of NFPA 70.
- D. Comply with 29 CFR 1910.145.

PART 2 - PRODUCTS AND MATERIALS

2.1 GENERAL

- A. Location, text, and method of identification to be used is noted in individual sections. Refer to other sections for additional identification requirements.

2.2 NAMEPLATES

- A. Engraved, Laminated Acrylic or Melamine Label: Non-conductive phenolic with beveled edges. Unless otherwise indicated, provide a single line of text with 1/2-inch- (13-mm-) high letters on 1-1/2-inch- (38-mm-) high label; where two lines of text are required, use labels 2 inches (50 mm) high. For elevated components, increase sizes of labels and letters to those appropriate for viewing from the floor.
 - 1. Punched or drilled for screw mounting.
 - 2. Minimum 1/16 inch (1.6 mm) thick for nameplates with either dimension greater than 4 inches (102 mm) and 1/8 inch (3.2 mm) thick for larger sizes.
- B. Stainless Steel Nameplates: Minimum thickness of 1/32 inch; engraved or laser-etched text.
- C. Aluminum Nameplates: Anodized; minimum thickness of 1/32 inch; engraved or laser-etched text
- D. Colors:
 - 1. Normal systems - white letters on a black background.
 - 2. Emergency systems - white letters on a red background.

2.3 LABELS FOR RACEWAYS AND METAL-CLAD CABLE

- A. Factory Painted Raceways:
 - 1. Metal Raceways: Continuous, rust-inhibiting paint factory applied.
 - 2. Non-Metallic Raceways: Factory dyed or colored PVC sleeve.
- B. Factory Painted Metal-Clad Cable: 2-inch wide, factory painted bands at a maximum of 6-foot on center spacing.
- C. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.
- D. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- E. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inches (50 mm) long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- F. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches (50 mm) wide; compounded for outdoor use.

2.4 LABELS FOR JUNCTION BOXES AND PULL BOXES

- A. Junction box and pull box covers shall be spray painted to identify the voltage and system. Circuit numbers and the panel they originate from shall be listed on the cover using permanent, waterproof, black ink marker.

2.5 LABELS FOR WIRING DEVICES AND LIGHTING CONTROL DEVICES

- A. Self-laminating Computer Printable Labels: Clear over-laminate to protect legend for permanent, clean identification. Self-laminating Polyester material with white print-on area.
- B. Engraved, Laminated Acrylic or Melamine Label: adhesive backed. Minimum letter height shall be 3/16 inch (4.76 mm).
 - 1. Normal systems - white letters on a black background.
 - 2. Emergency systems - white letters on a red background
- C. Engraved cover plates: Provide with white letters. White or ivory cover plates shall have black letters.

2.6 MARKERS FOR CONDUCTOR AND CONTROL CABLES

- A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils (0.08 mm) thick by 1 to 2 inches (25 to 50 mm) wide.
- B. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.
- C. Self-laminating Computer Printable Labels: Clear over-laminate to protect legend for permanent, clean identification. Self-laminating Polyester material with white print-on area.
- D. Aluminum Wraparound Marker Labels: Cut from 0.014-inch- (0.35-mm-) thick aluminum sheet, with stamped, embossed, or scribed legend, and fitted with tabs and matching slots for permanently securing around wire or cable jacket or around groups of conductors.
- E. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch (50 by 50 by 1.3 mm), with stamped legend, punched for use with self-locking nylon tie fastener.

2.7 TAGS

- A. Write-On Tags: Polyester tag, 0.010 inch (0.25 mm) thick, with corrosion-resistant grommet and polyester or nylon tie for attachment to conductor or cable.
 - 1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.

2.8 UNDERGROUND-LINE WARNING TAPE

- A. Materials: Use foil-backed detectable type polyethylene tape suitable for direct burial, unless otherwise indicated.
- B. Foil-backed Detectable Type Tape: 6 inches (152 mm) wide, with minimum thickness of 5 mil, unless otherwise required for proper detection.
- C. Legend: Type of service, continuously repeated over full length of tape.
- D. Color: Tape for Buried Power Lines: Black text on red background.

2.9 WARNING LABELS AND SIGNS

- A. Comply with NFPA 70 and 29 CFR 1910.145. Attachment method shall be acceptable to the manufacturers of the equipment to which the nameplates are being applied and shall not compromise any NRTL listing or labeling criteria.
- B. Self-Adhesive Warning Labels: Factory pre-printed or machine-printed multicolor self-adhesive polyester or self-adhesive vinyl labels; UV, chemical, water, heat, and abrasion resistant; produced using materials recognized to UL 969, configured for display on front cover, door, or other access to equipment, unless otherwise indicated.
 - 1. Use thermal transfer process printing machines and accessories recommended by label manufacturer.
 - 2. Do not use labels designed to be completed using handwritten text.
- C. Baked-Enamel Warning Signs: Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application.
 - 1. 1/4-inch (6.4-mm) grommets in corners for mounting. Nominal size, 7 by 10 inches (180 by 250 mm).
- D. Metal-Backed, Butyrate Warning Signs: Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396-inch (1-mm) galvanized-steel backing; and with colors, legend, and size required for application.
 - 1. 1/4-inch (6.4-mm) grommets in corners for mounting. Nominal size, 10 by 14 inches (250 by 360 mm).
- E. Warning label and sign shall include, but are not limited to, the following legends:
 - 1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
 - 2. Workspace Clearance Warning (208 Volts): "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES (915 MM)."
 - 3. Workspace Clearance Warning (480 Volts): "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 48 INCHES (915 MM)."

2.10 ARC FLASH WARNING LABELS

- A. General: All labels will be based on recommended overcurrent device settings and will be printed after the results of the analysis have been presented and after any system changes, upgrades, or modifications have been incorporated in the system. Refer to Division 26 section "Overcurrent Protective Device Study" for additional requirements.
- B. Materials: Use machine-printed, high adhesion, polyester label; UV, chemical, water, heat, and abrasion resistant, for each work location analyzed.
- C. Machine-Printed Labels: Use thermal transfer process printing machines and accessories recommended by label manufacturer. Labels shall be machine printed, with no field markings. Provide warning labels complying with ANSI Z535.4 to identify arc flash hazards for each work location analyzed by the arc flash and shock risk assessment.
- D. Minimum Size: 3.5 inch by 5 inch (89 mm by 127 mm), unless otherwise noted by Owner.

- E. Legend: Provide custom legend in accordance with NFPA 70E based on equipment-specific data as determined by arc flash and shock risk assessment. The label shall include the following information, at a minimum:
1. Location designation
 2. Nominal voltage
 3. Available fault current
 4. Limited approach boundary
 5. Arc flash boundary
 6. Restricted approach boundary
 7. Hazard risk category
 8. Incident energy
 9. Working distance
 10. Site-specific PPE (personnel protective equipment) requirements.
 11. Date calculations were performed.
 12. Engineering report number, revision number and issue date.

2.11 INSTRUCTION SIGNS

- A. Engraved, Laminated Acrylic or Melamine plastic: Non-conductive phenolic. Unless indicated otherwise, provide with minimum 3/8-inch- (10-mm-) high letters. For elevated components, increase sizes of labels and letters to those appropriate for viewing from the floor.
1. Minimum 1/16 inch (1.6 mm) thick for nameplates with either dimension greater than 4 inches (102 mm) and 1/8 inch (3.2 mm) thick for larger sizes.
 2. Punched or drilled for mechanical fasteners.
 3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.
 4. Normal systems: Engraved legend with white letters on black face.
 5. Essential Systems: Engraved legend with white letters on red face.
- B. Stainless Steel Nameplates: Minimum thickness of 1/32 inch ; engraved or laser-etched text.
- C. Aluminum Nameplates: Anodized; minimum thickness of 1/32 inch; engraved or laser-etched text
- D. Colors:
1. General Information and Operating Instructions – Black letters on white background.
 2. Normal systems - white letters on a black background.
 3. Emergency systems - white letters on a red background.

2.12 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Cable Ties: Fungus-inert, self-extinguishing, 1-piece, self-locking, Type 6/6 nylon cable ties.
1. Minimum Width: 3/16 inch (5 mm).
 2. Tensile Strength: 50 lb (22.6 kg), minimum.
 3. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).
 4. Color: Black, except where used for color-coding.
- B. Fasteners for Nameplates, Labels and Signs
1. Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat lock washers unless otherwise noted.
- C. Floor Marking Tape for Equipment Working Clearance Identification: Self-adhesive vinyl or polyester tape with overlamine, 3 inches wide, with alternating black and white stripes.

2.13 PAINTED IDENTIFICATION

- A. Paint materials and application requirements are specified in Division 09 painting Sections.
1. Exterior Concrete, Stucco, and Masonry (Other Than Concrete Unit Masonry):
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Exterior concrete and masonry primer.
 - 2) Finish Coats: Exterior semi-gloss acrylic enamel.
 2. Exterior Concrete Unit Masonry:
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a block filler.
 - 1) Block Filler: Concrete unit masonry block filler.
 - 2) Finish Coats: Exterior semi-gloss acrylic enamel.
 3. Exterior Ferrous Metal:
 - a. Semi-gloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Exterior ferrous-metal primer.
 - 2) Finish Coats: Exterior semi-gloss alkyd enamel.
 4. Exterior Zinc-Coated Metal (Except Raceways):
 - a. Semi-gloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Exterior zinc-coated metal primer.
 - 2) Finish Coats: Exterior semi-gloss alkyd enamel.
 5. Interior Concrete and Masonry (Other Than Concrete Unit Masonry):
 - a. Semi-gloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Interior concrete and masonry primer.
 - 2) Finish Coats: Interior semi-gloss alkyd enamel.
 6. Interior Concrete Unit Masonry:
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a block filler.
 - 1) Block Filler: Concrete unit masonry block filler.
 - 2) Finish Coats: Interior semi-gloss acrylic enamel.
 7. Interior Gypsum Board:
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Interior gypsum board primer.
 - 2) Finish Coats: Interior semi-gloss acrylic enamel.
 8. Interior Ferrous Metal:
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Interior ferrous-metal primer.
 - 2) Finish Coats: Interior semi-gloss acrylic enamel.
 9. Interior Zinc-Coated Metal (Except Raceways):
 - a. Semi-gloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - 1) Primer: Interior zinc-coated metal primer.
 - 2) Finish Coats: Interior semi-gloss acrylic enamel.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Verify identity of each item before installing identification products.
- B. Do not install adhesive products when ambient temperature is lower than recommended by manufacturer.
- C. Provide identification product listed for the location in which it is to be installed.
- D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.
- E. Painted Identification: Prepare surface and apply paint according to Division 09 painting sections.

3.2 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. For surfaces that require finish work, apply identification devices after completing finish work. Do not install identification products until final surface finishes and painting are complete.
- C. Install self-adhesive labels and markers to achieve maximum adhesion, with no bubbles or wrinkles and edges properly sealed. Replace labels and markers that exhibit bubbles, wrinkles, curling or other signs of improper adhesion.
- D. Location: Install identification products to be plainly visible for examination, adjustment, servicing, and maintenance without interference with operation and maintenance of equipment. Unless otherwise indicated, locate products as follows:
 - 1. Surface-Mounted Equipment: Enclosure front.
 - 2. Flush-Mounted Equipment: Inside of equipment door.
 - 3. Free-Standing Equipment: Enclosure front; also enclosure rear for equipment with rear access.
 - 4. Elevated Equipment: Legible from the floor or working platform.
 - 5. Branch Devices: Adjacent to device.
 - 6. Interior Components: Legible from the point of access.
 - 7. Conduits: Legible from the floor.
 - 8. Boxes: Outside face of cover.
 - 9. Conductors and Cables: Legible from the point of access.
 - 10. Devices: Outside face of cover.
- E. Attach non-adhesive signs and plastic labels with screws and auxiliary hardware appropriate to the location and substrate.
 - 1. Mounting Holes for Mechanical Fasteners: Two, centered on sides for sizes up to 1 inch high; Four, located at corners for larger sizes.
- F. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Identify system voltage with black letters on an orange background. Apply to exterior of door, cover, or other access.
- G. Equipment Nameplates and Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and Operation and Maintenance Manual.
 - 1. Indoor Clean, Dry Locations: Use plastic nameplates, unless noted otherwise.
 - 2. Outdoor Locations: Use plastic nameplates suitable for exterior use.
- H. Install identification products centered, level, and parallel with lines of item being identified.
- I. Mark all handwritten text, where permitted, to be neat and legible.
- J. For refrigeration systems: Neatly bundle circuits and clearly tag and label each circuit with panelboard, branch circuit designation and refrigeration system number at each termination.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16055 (260573) – OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes computer-based studies for the following:
 - 1. Short-circuit analysis.
 - 2. Protective device coordination study.
 - 3. Arc flash and shock risk assessment, including arc flash hazard labels.
- B. Criteria for selection and adjustment of equipment and associated protective devices not specified in this section, as determined by the studies performed.

1.2 ADMINISTRATIVE REQUIREMENTS

- A. The AIC ratings indicated on the Drawings are preliminary and will be finalized based on the results of the short-circuit study. Device ratings for furnished equipment shall be as required by the results of the short-circuit study at no additional cost.
- B. Coordination:
 - 1. Existing Installations: Coordinate with equipment manufacturer(s) to obtain data necessary for completion of studies.
 - 2. Coordinate the work to provide equipment and associated protective devices complying with criteria for selection and adjustment, as determined by studies to be performed.
 - 3. Notify Contract Administrator of any conflicts with or deviations from the contract documents. Obtain direction before proceeding with work.
- C. Pre-Study Meeting: Conduct meeting with Owner to discuss system operating modes and conditions to be considered in studies.
- D. Sequencing:
 - 1. Initial Study:
 - a. Study must be completed and submitted for review prior to final order, assembly or shipping of the electrical distribution system components. Do not order equipment until matching study reports and product submittals have both been evaluated by the Contract Administrator.
 - b. If study has not been approved prior to shipping, assembly or final ordering of the electrical distribution system components, all changes to the equipment necessitated by the results of the study will be provided by the Contractor at no additional cost to the project.
 - 2. Final Study:
 - a. Study must be completed and submitted for review prior to substantial completion. Do not print arc flash labels until final study has been evaluated by the Contract Administrator.
 - b. Verify naming convention for equipment identification prior to creation of final drawings, reports, and arc flash hazard warning labels.
- E. Scheduling:
 - 1. Arrange access to existing facility for data collection with Owner.
 - 2. Where work of this section involves interruption of existing electrical service, arrange service interruption with Owner. Refer to Division 26 section “General Electrical Requirements” for additional requirements.

1.3 SUBMITTALS

- A. Product Data: In addition to submittal requirements specified in other sections, include manufacturer's standard catalog pages and data sheets for equipment and protective devices indicating information relevant to studies.
 - 1. Product data for computer software program to be used for studies.
 - 2. Include characteristic time-current trip curves for protective devices.
 - 3. Include impedance data for busway.
 - 4. Include impedance data for engine generators.
 - 5. Clearly indicate whether proposed short circuit current ratings are fully rated or, where acceptable, series rated systems.
 - 6. Include documentation of listed series ratings upon request.
 - 7. Identify modifications made in accordance with studies to meet the results of the study.
- B. [Electronic files, in an SKM-compatible format, of the time-current characteristic curves for every different overcurrent device used in the reports.]
- C. Product Certificates: For coordination-study and short-circuit-study computer software programs, certifying compliance with IEEE 399.
- D. Qualification Data:
 - 1. Study Preparer Specialist qualifications.
 - 2. Field Testing Agency qualifications.
- E. Arc Flash Hazard Warning Label Samples: One of each type and legend specified.
- F. Other Action Submittals:
 - 1. Initial Study report, stamped or sealed and signed by study preparer, including:
 - a. Cover page including date of study, study methodology, assumptions made and software products used.
 - b. Study input data, including completed computer program input data sheets.
 - c. Short-circuit study report.
 - d. Equipment evaluation report.
 - e. Coordination-study report.
 - f. Settings report.
 - 2. Final Study report, stamped or sealed and signed by study preparer, including:
 - a. Cover page including date of study, study methodology, assumptions made, software products used, and summary of changes between initial and final studies.
 - b. Study input data, including completed computer program input data sheets.
 - c. Short circuit study report.
 - d. Equipment evaluation report.
 - e. Coordination-study report.
 - f. Settings report.
 - g. Arc-Flash Hazard Analysis, including labels.
 - 3. Certification that field adjustable protective devices have been set in accordance with requirements of studies.
- G. Record Drawings: Submit Record Drawings as required by Division 01 and Division 26 Section "General Electrical Requirements":
 - 1. Accurately record on the One-Line Diagram actual ratings and settings for all overcurrent devices, both adjustable and non-adjustable, including all changes made during construction, due to the study, or both.
 - 2. Include computer software files used to prepare studies with file name(s) cross-referenced to specific pieces of equipment and systems.

3. Include copies of previous studies and existing drawings that were obtained during the data collection phase of the study.

1.4 QUALITY ASSURANCE

- A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.
- B. Study Preparer Qualifications: An organization experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
 1. Professional engineer, licensed in the state in which the Project is located, shall be responsible for the study and with a minimum five years experience in the preparation of studies of similar type and complexity using the specified computer software. All elements of the study shall be performed under the direct supervision and control of engineer.
- C. Comply with IEEE 399 for general study procedures.
- D. Comply with IEEE 141, 242 and 551 for short-circuit currents and coordination time intervals.
- E. Comply with IEEE 1584 and NFPA 70E for arc-flash hazard calculations.
- F. Field Testing Agency Qualifications: Independent testing organization specializing in testing, analysis, and maintenance of electrical systems with minimum five years experience; NETA Accredited Company.
 1. Field Supervisor: Certified electrical testing technician; NETA ETT Level III.

PART 2 - PRODUCTS AND MATERIALS

2.1 COMPUTER SOFTWARE DEVELOPERS

- A. Available Computer Software Developers: Subject to compliance with requirements, companies offering computer software programs that may be used in the Work include, but are not limited to, the following:
- B. Computer Software Developers: Subject to compliance with requirements, use the latest commercially available computer software programs utilizing the specified methodologies developed by one of the following:
 1. SKM Systems Analysis, Inc.
- C. Computer Software Developer: Subject to compliance with requirements, use the latest commercially available computer software programs utilizing the specified methodologies developed by <Insert computer software developer's name>.

2.2 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

- A. Comply with IEEE 399.
- B. Analytical features of short-circuit-study computer software program shall include "mandatory," "very desirable," and "desirable" features as listed in IEEE 399, Table 7-4.
- C. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices.

1. Zero-Sequence current.
2. Arcing faults.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.
- B. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices not submitted for approval with coordination study may not be used in study.
- C. Short-circuit study and coordination study to be performed prior to the final submittals for any piece of electrical equipment which has an AIC rating or an over-current protective device so that correct equipment gets ordered for the project conditions.
- D. Arc Flash Study must be performed after conductors and equipment have been installed and after the project's utility company confirms the available fault current. A final short-circuit and coordination study with all device settings shall be submitted with the Arc Flash Study. The goal of the revised settings is to minimize the arc flash hazard while maintaining reasonable coordination and selectivity. For the components of emergency and legally required standby system components, full selectivity must be maintained.

3.2 SYSTEM COMPONENTS TO BE INCLUDED IN STUDIES

- A. Study shall begin with the utility and each alternate power source overcurrent device(s) serving the Project and end at the last branch circuit overcurrent protective device. This includes studies of the complete paths and operating modes on both sides of any transfer switch, contactor or circuit breaker.
- B. Operating modes shall include, where applicable:
 1. Utility as a source.
 2. Generator as a source.
 3. Utility and generator in parallel.
 4. Bus tie breaker open/close positions.
 5. Maintenance settings.
- C. Components include, but are not limited to:
 - 1.
 2. Switchboards
 3. Distribution Panelboards
 4. Panelboards
 5. Air Handling Equipment
 6. Roof Top HVAC equipment
 7. Elevator controllers

3.3 POWER SYSTEM DATA FOR STUDIES

- A. Compile information on project-specific characteristics of actual installed equipment, protective devices, feeders, etc. as necessary to develop single-line diagram of electrical distribution system and associated input data for use in system modeling. Gather and tabulate the following input data to support studies:

1. Product Data for overcurrent protective devices specified in other Division 26 Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Impedance of utility service entrance.
3. Electrical distribution system diagram showing the following:
 - a. Indicate load current that is the basis for sizing continuous ratings of circuits for cables and equipment.
 - b. Protective Devices: Include circuit-breaker and fuse-current ratings and types;
 - c. Protective Relays: Include manufacturer/model, type, settings, current/potential transformer ratio, and associated protective device.
 - d. Transformers: Include primary and secondary voltage ratings, kVA rating, winding configuration, percent impedance, and X/R ratio. kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios.
 - e. Generators: Include manufacturer/model, kilovolt amperes, size, voltage, and source impedance.
 - f. Cables: Indicate conduit material, sizes of conductors, conductor insulation, and length.
 - g. Busways: Include bus material, ampacity and impedance.
 - h. Motors: Include manufacturer/model, type (e.g. induction, synchronous), horsepower rating, voltage rating, full load amps, and locked rotor current or NEMA MG 1 code letter designation.
4. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram:
 - a. Special load considerations, including starting inrush currents and frequent starting and stopping.
 - b. Magnetic inrush current overload capabilities of transformers.
 - c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
 - d. Ratings, types, and settings of utility company's overcurrent protective devices.
 - e. Special overcurrent protective device settings or types stipulated by utility company.
 - f. Protective Devices:
 - 1) Circuit Breakers: Include manufacturer/model, type (e.g. thermal magnetic, electronic trip), frame size, trip rating, voltage rating, interrupting rating, available field-adjustable trip response settings, and features (e.g. zone selective interlocking).
 - 2) Fuses: Include manufacturer/model, type/class (e.g. Class J), size/rating, and speed (e.g. time delay, fast acting).
 - g. Time-current-characteristic curves of devices indicated to be coordinated.
 - h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
 - i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
 - j. Panelboards, switchboards, motor-control center ampacity, and interrupting ratings in amperes rms symmetrical.
5. Existing Installations:
 - a. Provide the services of field testing agency or equipment manufacturer's representative to perform field data collection.
 - b. Collect data on existing electrical distribution system necessary for completion of studies, including field verification of available existing data (e.g. construction documents, previous studies). Include actual settings for field-adjustable devices.

3.4 SHORT-CIRCUIT STUDY

- A. Source Impedance: As an infinite bus on primary side of utility transformer.

- B. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project and use approved computer software program to calculate values. Include studies of system-switching configurations and alternate operation modes that could result in maximum fault conditions.
- C. Calculate momentary and interrupting duties on the basis of maximum available fault current.
- D. Comply with IEEE 241 and IEEE 242 recommendations for fault currents and time intervals.
- E. Calculations to verify interrupting ratings of overcurrent protective devices shall comply with the following:
 - 1. Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.50.
 - 2. Low-Voltage Fuses: IEEE C37.46.
 - 3. Circuit Breakers: IEEE C37.13.
- F. Study Report:
 - 1. Enter calculated X/R ratios and interrupting (5-cycle) fault currents on electrical distribution system diagram of the report.
 - 2. Show interrupting (5-cycle) and time-delayed currents (6 cycles and above) on medium- and high-voltage breakers as needed to set relays and assess the sensitivity of overcurrent relays.
 - 3. List other output values from computer analysis, including momentary (1/2-cycle), interrupting (5-cycle), and 30-cycle fault current values for 3-phase, 2-phase, and phase-to-ground faults.
- G. Equipment Evaluation Report: Prepare a report on the adequacy of overcurrent protective devices and conductors by comparing short-circuit current ratings of these devices with calculated short-circuit current momentary and interrupting duties. Identify locations where the available fault current exceeds the equipment short circuit current rating, along with recommendations.

3.5 COORDINATION STUDY

- A. Perform coordination study and prepare a written report using the results of the short-circuit study and approved computer software program. Comply with IEEE 399.
- B. Comply with NFPA 70 for overcurrent protection of circuit elements and devices.
- C. Comply with IEEE 241 recommendations for fault currents and time intervals.
- D. Analyze alternate scenarios considering known operating modes.
- E. Transformer Primary Overcurrent Protective Devices:
 - 1. Device shall not operate in response to the following:
 - a. Inrush current when first energized.
 - b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
 - c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
 - 2. Device shall protect transformer according to IEEE C57.12.00, for fault currents.
- F. Motors served by voltages more than 600 V shall be protected according to IEEE 620.
- G. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Verify adequacy of phase conductors at maximum three-phase bolted fault currents, equipment grounding conductors, and grounding electrode conductors at maximum ground-fault currents.

- H. Coordination-Study Report: Prepare a written report indicating the following results of coordination study:
1. Tabular Format of Settings Selected for Overcurrent Protective Devices:
 - a. Device tag.
 - b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values.
 - c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.
 - d. Fuse-current rating and type.
 - e. Ground-fault relay-pickup and time-delay settings.
 2. Coordination Curves: Prepared to determine settings of overcurrent protective devices to achieve the level of selective coordination required in the contract documents or by the edition of the National Electrical Code (including any local jurisdiction amendments) the project must comply with. Graphically illustrate that adequate time separation exists between series devices, including power utility company's upstream devices. Show the following specific information:
 - a. For protective Devices:
 - 1) Device tags.
 - 2) Circuit Breakers: Include long time pickup and delay, short time pickup and delay, and instantaneous pickup.
 - 3) Protective Relays: Include current/potential transformer ratios, tap, time dial, and instantaneous pickup.
 - 4) Include ground fault pickup and delay.
 - 5) Include fuse ratings.
 - b. Voltage and current ratio for curves.
 - c. Three-phase and single-phase damage points for each transformer.
 - d. No damage, melting, and clearing curves for fuses.
 - e. Cable damage curves.
 - f. Generator full load current, overload curves, decrement curves and short-circuit withstand points.
 - g. Transformer inrush points.
 - h. Maximum fault current cutoff point.
 - i. Capacitor full load current and damage curves.
 3. Include conclusions and recommendations.
 4. Completed data sheets for setting of overcurrent protective devices.
 5. For emergency, legally required standby and health care essential power systems, such systems must selectively coordinate to the values indicated below unless local amendments to the National Electrical Code require a different value.
 - a. Emergency (NEC article 700) 0.01 seconds
 - b. Legally Required Standby (NEC article 701) 0.01 seconds

3.6 ARC-FLASH HAZARD ANALYSIS

- A. Determine arc-flash incident energy levels and flash protection boundary distances based on the results of the Short-Circuit and Coordination studies in accordance with IEEE 1584. Perform the analysis under worst-case arc-flash conditions for all modes of operation.
- B. In addition to the requirements outlined in IEEE 1584, the study shall include all equipment rated less than 240 Volts fed by transformers less than 125 kVA in the calculations.
 1. Where reasonable, study preparer may assume a maximum clearing time of two seconds in accordance with IEEE 1584, provided that the conditions are such that a worker's egress from an arc flash event would not be inhibited.
 2. For single-phase systems, the calculations may be performed assuming a three-phase system in accordance with IEEE 1584, yielding conservative results.
- C. For equipment with main devices mounted in separate compartmentalized sections, perform calculations on both the line and load side of the main device.
- D. Identify all locations and equipment to be included in the arc-flash hazard analysis:

1. Include a copy of the facility one-line in the report.
2. Identify the possible system operating modes including tie-breaker positions, and parallel generation.
3. Calculate the arcing fault current flowing through each branch for each fault location.
4. Determine the time required to clear the arcing fault current using the protective device settings and associated trip curves.
5. Select the working distances based on system voltage and equipment class.
6. Calculate the incident energy at each fault location at the prescribed working distance.
7. Determine the hazard/risk category (HRC) for the estimated incident energy.
8. Calculate the flash protection boundary at each fault location.
9. Document the assessment in reports and one-line diagrams.
10. Provide labels to be placed on each piece of equipment analyzed. Label shall show the calculated incident energy and hazard/risk category for the calculated incident energy.

E. Results of the arc-flash study shall be summarized in a final report containing the following:

1. Basis, method of hazard assessment, description, purpose, scope, and date of the study.
2. Tabulations of the data used to model the system components and a corresponding one-line diagram.
3. Descriptions of the modes of operation evaluated and identification of the worst case scenario used to evaluate equipment ratings.
4. Tabulations of equipment incident energies, hazard risk categories, and flash protection boundaries. The tabulation shall identify and clearly note equipment that exceeds allowable incident energy ratings.
5. Required arc-flash labeling and placement of labels.
6. Conclusions and recommendations, including recommendations for reducing incident energy at locations where calculated maximum incident energy exceeds 8 calories per sq cm.

3.7 OVERCURRENT PROTECTIVE DEVICE SETTING

- A. Manufacturer's Field Service: Engage a factory-authorized service representative, of electrical distribution equipment being set and adjusted, to set overcurrent protective devices within equipment.
1. After installing overcurrent protective devices and during energizing process of electrical distribution system, perform the following:
 - a. Verify that overcurrent protective devices meet parameters used in studies.
 - b. Adjust devices to values listed in final study results.
 - c. Adjust devices according to recommendations in Chapter 7, "Inspection and Test Procedures," and Tables 100.7 and 100.8 in NETA ATS.

3.8 INSTALLATION

- A. Install arc flash warning labels. Refer to Division 26 section Identification for Electrical Systems for additional requirements.

3.9 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Tests and Inspections:
1. Inspect and test protective devices in accordance with the NETA Acceptance Testing Specification. Certify compliance with test parameters.
- C. Overcurrent protection devices will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports, including a certified report that identifies protective device settings have been adjusted in accordance with the requirements of the study. Include notation of conflicts with or

deviations made from the studies or the contract documents, deficiencies detected, remedial action taken, and observations after remedial action.

3.10 TRAINING

- A. Provide training for Owner's personnel on electrical safety pertaining to arc flash and shock hazards.
- B. Use site-specific arc flash and shock risk assessment report as training reference, supplemented with additional training materials as required.
- C. Provide minimum of eight hours of training performed by a representative of the entity performing the study.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16125 (260923) – LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. This Section includes the following lighting control devices:
 - 1. Line-voltage dimming wall switches.
 - 2. Line-voltage wall switch occupancy sensors.
 - 3. Line-voltage dimming wall switch occupancy sensors.
 - 4. Line-voltage occupancy sensors.
 - 5. Line-voltage photoelectric switches.
 - 6. Stand-Alone Low-voltage occupancy sensors.
 - 7. Stand-Alone Low-voltage photoelectric switches.
 - 8. Stand-Alone Low-voltage switches.
 - 9. Outdoor motion sensors.
 - 10. Time switches.
 - 11. Lighting contactors.
 - 12. Automatic load control relays.
 - 13. Branch circuit transfer switches.
 - 14. Conductors and Cables for Lighting Control Devices.

1.2 DEFINITIONS

- A. Closed loop: Photosensor control algorithm designed for influence by both daylight and electric light in a space or area.
- B. DPDT: Double pole, double throw.
- C. DPST: Double pole, single throw.
- D. Dual-Technology Type: Occupancy sensor detection type that detects occupancy by using a combination of PIR and ultrasonic or acoustic detection technologies.
- E. LED: Light-emitting diode.
- F. Open loop: Photosensor control algorithm designed for influence by daylight entering in a space or area.
- G. PIR Type: Passive infrared. Occupancy sensor detection type that detects occupancy by sensing a combination of infrared heat and movement.
- H. SPST: Single pole, single throw.
- I. Ultrasonic Type: Occupancy sensor detection type that detects occupancy by sensing a change in pattern of reflected ultrasonic energy.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression system, and partition assemblies.

1.4 SUBMITTALS

- A. Product data for the following products:
 - 1. Catalog cut sheets, including major and minor motion coverage patterns sensors, time delay and sensitivity adjustability settings, load restrictions, and performance specification items indicating compliance with this specification for all lighting control devices.
 - 2. Documentation showing compliance with California Energy Commission certification.

- B. Shop Drawings:
 - 1. Occupancy sensors and photoelectric switches
 - a. Show installation details.
 - b. Lighting plan showing location, mounting height, orientation and coverage area of each sensor and coordination with other trades.
 - c. Interconnection diagrams showing field-installed wiring.
 - d. Include diagrams for power, signal, and control wiring.
 - e. For any manufacturer submitted other than that listed as the Basis of Design, provide the following information for Engineer review:
 - 1) Factory-generated occupancy sensor and photoelectric switch layouts on project lighting plans with sensor location, orientation and product type clearly marked on plans. Sensor placement shall be coordinated with project reflected ceiling plan layout, ceiling heights, lights, diffusers, and any other ceiling devices and equipment.
 - 2) List of any deviations to this specification or Basis of Design products.

- C. Field quality-control test reports.

- D. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.
 - 1. Occupancy sensors and photoelectric switches:
 - a. Manufacturer's installation instructions, including instructions for storage, handling, protection, examination, preparation, start-up calibration and installation.
 - b. Product data clearly showing sensor field adjustments, including dip switch setting definitions and location of settings within sensors.
 - c. Manufacturer's maintenance, including operating and adjustment instructions.
 - 2. Timeclocks
 - a. Description of programmed timeclock settings at time of substantial completion.
 - 3. Line-voltage wall box dimming switches
 - a. Provide operating instructions for each type of dimmer.

1.5 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- B. Occupancy sensors and photoelectric switches
 - 1. Products supplied shall be from a single manufacturer that has been continuously involved in the manufacturing of occupancy sensors for a minimum of 5 years.
 - 2. Products shall be manufactured by an ISO 9001 certified manufacturing facility.
 - 3. Manufacturer shall test all equipment prior to shipment.

1.6 WARRANTY

- A. Manufacturers shall provide a five (5) year warranty for sensors and accessories from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL INFORMATION

A. PIR type requirements:

1. Detector Sensitivity: Detect occurrences of 6-inch minimum movement of any portion of a human body that presents a target of not less than 36 sq. in.
2. Sensor shall utilize pulse count processing and digital signature analysis to respond only to those signals caused by human motion.
3. Sensor shall provide high immunity to false triggering from RFI and EMI.
4. Sensor shall have a multiple-segmented fresnel lens in a multiple-tier configuration, with grooves to eliminate dust and residue buildup. Sensor shall be capable of accepting mask inserts to mask specific portions of the lens to prevent false triggering.

B. Ultrasonic type requirements:

1. Detector Sensitivity: Detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.
2. Detection Frequency (Small Area – 500 sq ft and less): Ultrasonic operating frequency shall be crystal controlled at 40 kHz within +/- 0.005% tolerance to assure reliable performance and eliminate sensor cross-talk.
3. Detection Frequency (Medium and Large Areas – greater than 500 sq ft): Ultrasonic operating frequency shall be crystal controlled at 32 kHz within +/- 0.005% tolerance, to assure reliable performance and eliminate sensor cross-talk.
4. Sensors shall be capable of automatically adapting to airflow conditions or filtering frequency spectrum related to air movement.

C. Acoustic type requirements:

1. Detector Sensitivity: Acoustic type technology shall only be used as secondary to PIR in a Dual-Technology Type sensor. Specific sensitivity is based on PIR technology.
2. Sensors shall distinguish noises made by human activity (typing, talking, eating, etc.) and filter out noises made by the environment or building (HVAC, equipment, cars, etc.).
3. Acoustic technology shall enhance reliability and accuracy of PIR sensor.

D. Dual-Technology type requirements:

1. Dual-Technology sensors using ultrasonic technology shall have field-selectable controls on unit to determine if a particular technology or combination of technologies controls the on-off function.
2. Dual-Technology sensors using acoustic technology shall have the PIR technology initially detect motion and a combination of PIR and acoustic technologies shall keep the load on.
3. Sensitivity Adjustment: Separate for each sensing technology.
4. Different LED indicator colors for each sensing technology
5. PIR sensor component shall comply with all requirements listed under PIR type requirements.
6. Ultrasonic sensor component shall comply with all requirements listed under Ultrasonic Type requirements.
7. Acoustic sensor component shall comply with all requirements listed under Acoustic Type requirements.

2.2 LINE-VOLTAGE DIMMING WALL SWITCHES

- #### A. Basis-of-Design Product:
- Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.

- B. Dimmer shall be suitable for dimmed load type of connected light fixture. Load types shall be as indicated on Drawings and confirmed per load type for connected luminaire as indicated in Light Fixture Schedule and approved light fixture and dimmer shop drawings.

2.3 LINE VOLTAGE WALL SWITCH OCCUPANCY SENSORS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for Sensors:
 - 1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. [Complies with California's Title 24 and is certified by the California Energy Commission.] Operating Ambient Conditions: Dry interior conditions, 32 to 120 deg F (0 to 49 deg C), unless indicated elsewhere for specific model and application.
 - 3. Switch Rating: Not less than 800-VA fluorescent at 120 V, 1200-VA fluorescent at 277 V, and 800-W incandescent.
 - 4. Operations: Refer to drawings for Sequence of Operations or other operational instructions. If none appear on drawings, the follow shall apply.
 - a. Occupancy Sensor (auto-on): Upon occupancy of space, loads shall be energized. If occupancy is not detected within the time delay period, loads shall be de-energized.
 - b. Vacancy Sensor (manual-on): Upon occupancy of space, loads are enabled such that manual operation of the switch shall energize loads. If occupancy is not detected within the time delay period, loads shall be de-energized.
 - 5. Operation adjustment: Concealed, field-adjustable for auto-on or manual-on operation.
 - 6. Time Delay adjustment:
 - a. Concealed, field-adjustable.
 - b. Time delay for de-energizing loads shall be adjustable with multiple increments from 30 seconds up to 30 minutes.
 - 7. Adaptive technology: Self-adjusting circuitry detects and memorizes usage patterns of the space and helps eliminate false "off" switching.
 - 8. Mounting: Single-gang wall box switch
 - 9. Finish: Sensor finish shall be as directed by the Architect.
 - 10. Sensor:
 - a. Vandal-resistant lens
 - b. Integral sliding blinders or pre-cut tape strips to block sensor views
 - c. Protrudes no greater than 0.50 inches from wall.
 - d. 180-degree field of view
 - e. Major and minor motion coverage patterns confirmed per Nema WD7 guidelines.
 - f. Detection types: Provide type or types indicated in Lighting Control Device Schedule. Refer to Section 2.1 General Information above for more information.
 - 11. Indicators:
 - a. LED indicator for visual detection of motion
 - b. audible and/or visual alerts for pending shut-off
 - 12. Suitable for switching load types used, including LED, fluorescent, incandescent, magnetic and electronic low voltage and motor load types. UL listed and labeled, zero-cross relay, no minimum load requirement, ground wire.
 - 13. Wall switch shall have no leakage of current to load and integral service switch to permit a maintained off for servicing of lamps for safety purposes
 - 14. Restriction on leakage to grounding conductor.
 - a. For new construction: Dual-technology wall switch sensor shall have not more than 0.5ma leakage of current to ground per UL requirements. Provide and connect a neutral conductor to these devices.

2.4 LINE-VOLTAGE DIMMING WALL SWITCH OCCUPANCY SENSORS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for Sensors:
 - 1. Comply with all requirements listed under Line-Voltage Dimming Wall Switches in this specification and,
 - 2. Comply with all requirements listed under Line-Voltage Wall Switch Occupancy Sensors in this specification.

2.5 LINE-VOLTAGE OCCUPANCY SENSORS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for Sensors: Wall- or ceiling-mounted, solid-state indoor occupancy sensors. Integral relay unit for line voltage sensors.
 - 1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. UL Listed for dry locations and complies with local codes.
 - 3. [Complies with California's Title 24 and is certified by the California Energy Commission.]
 - 4. Operation: Refer to drawings for Sequence of Operations or other operational instructions. If none appear on drawings, the follow shall apply. Upon occupancy of space, loads shall turn on. If occupancy is not detected within the time delay period, loads shall de-energize. Time delay for de-energizing loads shall be adjustable over a minimum range of 1 to 15 minutes with a maximum of 30 minutes.
 - 5. Switch Rating: As indicated in Lighting Control Device Schedule.
 - 6. Detection Coverage: As indicated in Lighting Control Device Schedule on Drawings.
 - 7. Mounting: Suitable for mounting in any position on a standard outlet box.
 - 8. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
 - 9. Indicator: LED, to show when motion is detected during testing and normal operation of the sensor.
 - 10. Bypass Switch: Override the "on" function in case of sensor failure, concealed on unit to prevent tampering.
 - 11. Finish: Sensor finish shall be as directed by the Architect.
 - 12. Operating temperatures: Unless indicated otherwise for specific models, 32 degree F through 104 degree F, and relative humidity of 0%-95%.
 - 13. Field selectable time delay and sensitivity settings or the capability for self-adjusting technologies to optimize time delay and sensitivity settings to respond to occupancy usage patterns. Occupancy usage patterns shall be saved in a non-volatile memory that retains settings in the event of a power outage.
 - 14. Device shall include isolated relay with NO and NC contacts to interface with BMS, HVAC and or other building monitoring systems as indicated on the Drawings
 - 15. Device and related relays shall be compatible with the specific load types controlled.
 - 16. Sensor:
 - a. Coverage pattern: As indicated in Lighting Control Device Schedule, and shall have been confirmed with NEMA WD7 Guide and Robotic test method.
 - b. Detection types: Provide type or types indicated in Lighting Control Device Schedule. Refer to Section 2.1 General Information above for more information.
- C. High-Bay Model:
 - 1. Detection type: PIR type. Refer to Section 2.1 General Information above for more information.

2. Detection Coverage: Selectable by interchangeable PIR lenses, suitable for mounting heights from 12 to 50 feet.

2.6 LINE-VOLTAGE PHOTOELECTRIC SWITCHES

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. [Photoelectric switches shall Comply with California’s Title 24 and be certified by the California Energy Commission.]

2.7 STAND-ALONE LOW-VOLTAGE OCCUPANCY/VACANCY SENSORS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for Sensors: Wall- or ceiling-mounted, solid-state indoor occupancy sensor unit, for use with a separate stand-alone low-voltage power pack containing a line-voltage relay.
 1. Occupancy sensors and all other associated system components shall be provided by the same manufacturer and compatible with each other such that the final installation meets all operational and functional requirements in addition to those listed in this specification.
 2. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. UL Listed for dry locations and complies with local codes.
 4. [Complies with California’s Title 24 and is certified by the California Energy Commission.]
 5. Operations: Refer to drawings for Sequence of Operations or other operational instructions. If none appear on drawings, the follow shall apply.
 - a. Occupancy Sensor (auto-on): Upon occupancy of space, loads shall be energized. If occupancy is not detected within the time delay period, loads shall be de-energized.
 - b. Vacancy Sensor (manual-on): Upon occupancy of space, loads are enabled such that manual operation of a separate, associated switch shall energize loads. If occupancy is not detected within the time delay period, loads shall be de-energized.
 6. Switch Rating: As indicated in Lighting Control Device Schedule.
 7. Detection Coverage: As indicated in Lighting Control Device Schedule on Drawings.
 8. Mounting: Suitable for mounting in any position on a standard outlet box.
 9. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
 10. Indicator: LED, to show when motion is detected during testing and normal operation of the sensor.
 11. Bypass Switch: Override the “on” function in case of sensor failure, concealed on unit to prevent tampering.
 12. Finish: Sensor finish shall be as directed by the Architect.
 13. Operating temperatures of 32 degree F through 104 degree F, and relative humidity of 0%-95%.
 14. Field selectable time delay and sensitivity settings or the capability for self-adjusting technologies to optimize time delay and sensitivity settings to respond to occupancy usage patterns. Occupancy usage patterns shall be saved in a non-volatile memory that retains settings in the event of a power outage.
 15. Sensors:
 - a. Sensor shall be compatible with lighting control system.
 - b. Sensors shall be capable of being combined with additional sensors to achieve adequate coverage.
 - c. Sensor coverage pattern: AS indicated on Lighting Control Device Schedule, and shall have been confirmed with Nema WD7 Guide and Robotic test method.
 - d. Detection types: Provide type or types indicated in Lighting Control Device Schedule. Refer to Section 2.1 General Information above for more information.

- C. High-Bay Model:
 1. Detection type: PIR type. Refer to Section 2.1 General Information above for more information.
- D. Extreme Temperature Model:
 1. Detection type: PIR type. Refer to Section 2.1 General Information above for more information.
 2. Operating Ambient Conditions: Temperatures from minus 40 to plus 125 degree F.

2.8 STAND-ALONE LOW-VOLTAGE PHOTOELECTRIC SWITCHES

- A. General Requirements for switches: Ceiling-mounted, solid-state indoor photoelectric switch, for use with a separate stand-alone low-voltage power pack, containing a line-voltage relay.
 1. Switches and all other associated system components shall be provided by the same manufacturer and compatible with each other such that the final installation meets all operational and functional requirements in addition to those listed in this specification.
 2. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. UL Listed for dry locations and complies with local codes.
 4. [Complies with California's Title 24 and is certified by the California Energy Commission.]
 5. Operations: Refer to drawings for Sequence of Operations or other operational instructions. If none appear on drawings, the follow shall apply. Upon ambient light level measurement reading below setpoint, loads shall be de-energized. Upon ambient light level measurement reading above setpoint, loads shall be energized.
 6. Finish: Sensor finish shall as directed by the Architect
- B. Indoor:
 1. [Photoelectric switches shall be as indicated on the Lighting Control Device Schedule on the Drawings
 2. Description: Solid state, low voltage with contacts rated to operate the connected relay, complying with UL 773A. Sensor shall be powered from the lighting control system or as indicated on the Drawings.
 - a. Light-Level Monitoring Range: 10 to 200 fc (108 to 2152 lx), with an adjustment for turn-on and turn-off levels within that range.
 - b. Time Delay: 30-second minimum, to prevent false operation.
 - c. Mounting: Twist lock complying with IEEE C136.10, with base.
- C. Outdoor:
 1. Description: Solid state, low voltage with contacts rated to operate the connected relay, complying with UL 773A. Sensor shall be powered [from the power pack][from the lighting control system][as indicated on the Drawings].
 - a. Light-Level Monitoring Range: 1.5 to 10 fc (16.14 to 108 lx), with an adjustment for turn-on and turn-off levels within that range.
 - b. Time Delay: 30-second minimum, to prevent false operation.
 - c. Lightning Arrester: Air-gap type.
 - d. Mounting: Twist lock complying with IEEE C136.10, with base.

2.9 STAND-ALONE LOW-VOLTAGE POWER PACKS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for power packs: Box mounted, solid-state indoor power pack/relay unit, for use with a separate stand-alone low-voltage sensor and switches.

1. Power packs and all other associated system components shall be provided by the same manufacturer and compatible with each other such that the final installation meets all operational and functional requirements in addition to those listed in this specification.
2. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
3. UL Listed for dry locations and complies with local codes.
4. [Complies with California's Title 24 and is certified by the California Energy Commission.]
5. Unit shall include isolated relay with NO and NC contacts to interface with BMS, HVAC and or other building monitoring systems as indicated on the Drawings
6. Relay shall be compatible with the specific lighting types controlled.
7. Operations: Refer to drawings for Sequence of Operations or other operational instructions. Unit operates in conjunction with other system components. Refer to operations requirements of associated devices.
8. Switch Rating: As indicated in Lighting Control Device Schedule.
Mounting: Externally mounted through a 1/2-inch (13-mm) knockout in a standard electrical enclosure.
9. Operating temperatures of 32 degree F through 104 degree F, and relative humidity of 0%-95%.

2.10 STAND-ALONE LOW-VOLTAGE SWITCHES

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for switches: Wall-mounted, solid-state indoor manual switch, for use with a separate stand-alone low-voltage power pack, containing a line-voltage relay.
 1. Switches and all other associated system components shall be provided by the same manufacturer and compatible with each other such that the final installation meets all operational and functional requirements in addition to those listed in this specification.
 2. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. UL Listed for dry locations and complies with local codes.
 4. [Complies with California's Title 24 and is certified by the California Energy Commission.]
 5. Operations: Refer to drawings for Sequence of Operations or other operational instructions. If none appear on drawings, the follow shall apply. Manual push of any button shall energize or de-energize loads.
 6. Mounting: Suitable for mounting in any position on a standard outlet box.
 7. Indicator: LED, for each button to indicate when loads are energized and de-energized.
 8. Finish: Sensor finish shall be as directed by the Architect.
 9. Operating temperatures of 32 degree F through 104 degree F, and relative humidity of 0%-95%.

2.11 OUTDOOR MOTION SENSORS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings and complying with all requirements listed.
- B. General Requirements for Sensors: Solid-state outdoor motion sensors.
 1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. [Complies with California's Title 24 and is certified by the California Energy Commission.]
 3. Weatherproof, detection technology as indicated in the Lighting Control Device Schedule on the Drawings.
 4. Detection type: PIR type. Refer to Section 2.1 General Information above for more information.
 5. Detection Coverage: As indicated in Lighting Control Device Schedule on the Drawings.

6. Switch Rating: Line Voltage: Minimum 1000-W incandescent and 500-VA ballast load at 120-V ac; 1000W ballast load at 277-V ac. Voltage as indicated on Drawings and Lighting Control Device Schedule.
7. Ambient-Light Override: Concealed, field-adjustable, light-level sensor from 1 to 20 FC. The switch prevents the lights from turning on when the light level is higher than the set point of the sensor.
8. Concealed, field-adjustable, "off" time-delay selector with multiple increments from 30 seconds up to 15 minutes.
9. Operating Ambient Conditions: Suitable for operation in ambient temperatures ranging from minus 14 to plus 130 deg F, rated as "rain tight" according to UL 773A.
10. Mounting:
 - a. Sensor: Suitable for mounting in any position on a standard outdoor junction box and ½” threaded nipple for use with standard NEMA weatherproof fixture fitting.
 - b. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
11. Bypass Switch: Override the on function in case of sensor failure.

2.12 TIME SWITCHES

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- C. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 1. Area Lighting Research, Inc.; Tyco Electronics.
 2. Intermatic, Inc.
 3. Leviton Mfg. Company Inc.
 4. Lithonia Lighting; Acuity Lighting Group, Inc.
 5. Paragon Electric Co.; Invensys Climate Controls.
 6. Square D; Schneider Electric.
 7. TORK; NSI Industries.
 8. Wattstopper; a Legrand Company.
- D. Electronic Time Switches: Electronic, solid-state programmable units with alphanumeric display; complying with UL 917.
 1. Contact Configuration: SPST.
 2. Contact Rating: 30-A inductive or resistive, 240-V ac, 20-A ballast load, 120/240-V ac.
 3. Program: 2 channels; each channel shall be individually programmable with 40 on-off operations per week and an annual holiday schedule that overrides the weekly operation on holidays.
 4. Program: 8 on-off set points on a 24-hour schedule and an annual holiday schedule that overrides the weekly operation on holidays.
 5. Circuitry: Allow connection of a photoelectric switch relay as substitute for on-off function of a program.
 6. Astronomic Time: All channels.
 7. Battery Backup: For schedules and time clock.
- E. Electronic Time Switches: Electronic, solid-state programmable units with alphanumeric display; complying with UL 917.
 1. Contact Configuration: [SPST] [DPST] [DPDT] <Insert configuration>.
 2. Contact Rating: [30-A inductive or resistive, 240-V ac] [20-A ballast load, 120/240-V ac] <Insert rating>.
 3. Program: 8 on-off set points on a 24-hour schedule[and an annual holiday schedule that overrides the weekly operation on holidays].

4. Circuitry: Allow connection of a photoelectric switch relay as substitute for on-off function of a program[on selected channels].
5. Astronomic Time: [All] [Selected] channels.
6. Battery Backup: For schedules and time clock.

F. [Time switches shall Comply with California's Title 24 and be certified by the California Energy Commission.]

2.13 LIGHTING CONTACTORS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- C. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
 1. ASCO Power Technologies, LP; a division of Emerson Electric Co.
 2. Eaton Electrical Inc.; Cutler-Hammer Products.
 3. GE Industrial Systems; Total Lighting Control.
 4. Hubbell Lighting.
 5. Lithonia Lighting; Acuity Lighting Group, Inc.
 6. Square D; Schneider Electric.
 7. TORK; NSI Industries.
- D. Description: Electrically operated and mechanically held, combination type with non-fused disconnect, complying with NEMA ICS 2 and UL 508.
 1. Current Rating for Switching: Listing or rating consistent with type of load served, including LED tungsten filament, inductive, and high-inrush ballast (ballast with 15 percent or less total harmonic distortion of normal load current).
 2. Fault Current Withstand Rating: Equal to or exceeding the available fault current at the point of installation. Refer to FCA value on drawings, at nearest upstream device.
 3. Enclosure: Provide with enclosure complying with NEMA 250.
 4. Provide with control and pilot devices as indicated on Drawings, matching the NEMA type specified for the enclosure.
- E. BAS Interface: Provide hardware interface to enable the BAS to monitor and control lighting contactors.
 1. Monitoring: On-off status.
 2. Control: On-off operation.

2.14 AUTOMATIC LOAD CONTROL RELAYS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings.
- B. Description: Normally closed, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts; complying with UL 924.
 1. For control of emergency lighting circuits: Loss of normal power shall cause relay to automatically shunt emergency power to lighting circuit regardless of manual or automatic switch position. Emergency lighting circuit shall continue to operate at full power until normal power has been restored.
 2. Coil Rating: 120 or 277 V, as indicated on Drawings.
 3. Mounting: as indicated on the Drawings]. Mount per manufacturer's instructions.

4. [Auxiliary Relay input: Provisions to shunt emergency lighting on upon receiving a signal from an outside system such as security or fire alarm system.]

2.15 BRANCH CIRCUIT TRANSFER SWITCHES

- A. Basis-of-Design Product: Subject to compliance with requirements, provide either the named product or a comparable product by one of the other equivalent manufacturers specified in the Lighting Control Device Schedule on the Drawings.
- B. Description: Normally closed, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts; complying with UL 1008.
 1. For control of emergency lighting circuits: Loss of normal power shall cause relay to automatically shunt emergency power to lighting circuit regardless of manual or automatic switch position. Emergency lighting circuit shall continue to operate at full power until normal power has been restored.
 2. Coil Rating: 120 or 277 V as indicated on Drawings.

2.16 CONDUCTORS AND CABLES FOR LIGHTING CONTROL DEVICES

- A. Comply with requirements in Division 26 Section "Low-Voltage Electrical Power Conductors and Cables.
- B. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG.
- C. Classes 2 and 3 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG.
- D. Class 1 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 14 AWG.
- E. Provide all necessary conductor and cabling required for operation of the controls and control systems specified. This includes power and control wiring required for the controls to operate as described.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. GENERAL
 1. Install devices and associated power packs and wiring in accordance with manufacturer's instructions and applicable codes.
- B. LINE VOLTAGE WALL SWITCHES
 1. Install dimming wall switches to achieve full rating specified on Lighting Control Device Schedule taking into account de-rating for ganging as instructed by the manufacturer.
 2. Provide a separate grounded (neutral) conductor for each circuit controlled by a line voltage switch.
 - a. Do not share neutral conductor on load side of dimmers.
 - b. If neutral termination is not required for the device, cap conductor and tag as "Neutral for future use".
- C. OCCUPANCY/VACANCY SENSORS AND PHOTOELECTRIC SWITCHES
 1. Arrange a pre-installation meeting with manufacturer's factory authorized field representative, at Owner's facility, to verify placement of sensors and installation criteria.
 2. Install and aim sensors in locations to achieve not less than 90 percent coverage of areas indicated. Do not exceed coverage areas specified in manufacturer's literature. The locations and quantities of sensors shown on the drawings are diagrammatic and indicate only the rooms or areas that are to be

provided with sensors. Provide additional sensors as required to properly and completely cover the respective areas.

3. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression systems and partition assemblies.
4. Occupancy sensors with ultrasonic or dual-technology sensing technologies shall be located not closer than 4 feet from the nearest edge of air supply devices or similar obstructions that would adversely affect the sensor performance.
5. Adjust time delay setting of occupancy sensors to de-energize loads after space has been unoccupied for period of time indicated on the Drawings.
6. Install outdoor photoelectric switches with clear view of the northern sky unless noted otherwise on the Drawings.
7. Adjust settings of photoelectric switches to turn on lighting at illumination level indicated on the Drawings.
8. Install devices and auxiliary equipment in compliance with manufacturer's instructions and recommendations.
9. Install relay units where concealed from view and where accessible.
10. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
11. Install switchbox mounted occupancy sensors at same elevation as other lighting control switches.

D. TIME SWITCHES

1. Program timeclock settings as per Sequence of Operations on the Drawings. Confirm final timeclock settings with Owner prior to programming.

E. LIGHTING CONTACTORS

1. Install lighting contactors in locations as indicated on the Drawings.
2. Provide NEMA 1 enclosures for lighting contactors in interior dry locations, NEMA 3R enclosures for lighting contactors in exterior or wet locations[, and NEMA 4X enclosures for lighting contactors in corrosive environments].
3. Mount electrically held lighting contactors with elastomeric isolator pads, to eliminate structure-borne vibration, unless contactors are installed in an enclosure with factory-installed vibration isolators.
4. [Coordinate connection and programming of BAS Interface with controls contractor.]

F. AUTOMATIC LOAD CONTROL RELAYS

1. When used with manual controls, install emergency shunt relay [in separate enclosure adjacent to associated light switch][in accessible ceiling near the control device or wall mounted within electrical room]. Label within enclosure the connected normal and emergency circuits.
2. When used with automatic controls, install where concealed from view in accessible ceiling near the automatic control device or wall mounted within electrical room. Label outlet box cover with connected normal and emergency circuits.

G. BRANCH CIRCUIT TRANSFER SWITCHES

1. Install branch circuit transfer switches where concealed from view in accessible ceiling near the automatic control device or wall mounted within electrical room. Label outlet box cover with connected normal and emergency circuits.

H. WIRING

1. Wiring Method: Comply with Division 26 Section "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size shall be [1/2 inch (13 mm)][<insert size>].
2. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

3. Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.
4. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.2 IDENTIFICATION

- A. General: Provide identification complying with requirements specified in Division 26 Section "Identification for Electrical Systems."
- B. Power and control wiring: Identify using marker tapes.
 1. Identify controlled circuits in lighting contactors.
 2. Identify circuits or luminaries controlled by photoelectric switches and occupancy sensors at each sensor.
- C. Components: Label each component with self-laminating computer printed labels, using a unique designation matching control drawing.
- D. Cover plates: Refer to drawings for labeling requirements of certain cover plates for manual switches, or similar devices, requiring labeling for user information.
- E. Buttons/switches:
 1. Engraved from manufacturer. Refer to drawings for detailed requirements and text for labeling.

3.3 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 1. After installing time switches and sensors, and after electrical circuitry has been energized, adjust and test for compliance with requirements.
 2. Operational Test: Test all occupancy sensors in test mode to confirm sensor coverage and sensitivity of sensor per manufacturer's instructions. Upon completion of tests, set sensor time delay as indicated on Lighting Control Device Schedule. Follow testing and adjustment procedures as written in the manufacturer's installation instructions for each sensor model.
- B. Lighting control devices that fail tests and inspections are defective work. Remove, replace, and retest devices that fail tests.

3.4 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting sensors to suit occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.
- B. Photoelectric switch Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting sensors to suit occupied conditions. Provide up to two visits to Project for this purpose.

3.5 DEMONSTRATION

- A. Coordinate demonstration of products specified in this Section with demonstration requirements for low-voltage, programmable lighting control system specified in Division 26 Section "Lighting Control Systems."

- B. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lighting control devices. Refer to Division 01 Section "Demonstration and Training" and Division 26 Section "Lighting Control Systems" for additional information

END OF SECTION

SECTION 16455 (261200) - MEDIUM VOLTAGE TRANSFORMERS

PART 1 - GENERAL

- A. This Section includes the following types of transformers with medium-voltage primaries:
 - 1. Pad-mounted, liquid-filled transformers.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section "General Electrical Requirements" for general requirements and related documents that apply to this section.
- B. Division 26 Section "Common Work Results for Electrical" for raceways, conductors, cables, and cords.
- C. Division 26 Section "Equipment Wiring Systems" for electrical connections to equipment specified under other sections, Divisions, or furnished by the owner.
- D. Division 26 Section "Medium voltage Cables".
- E. Division 26 Section "Low-voltage Electrical Power Conductors and Cables".
- F. Division 26 Section "Grounding and Bonding For Electrical Systems".
- G. Division 26 Section "Raceway and Boxes for Electrical Systems".
- H. Division 26 Section "Underground Ducts and Raceways for Electrical Systems".
- I. Division 26 Section "Vibration and Seismic Controls for Electrical Systems".
- J. Division 26 Section "Identification for Electrical Systems".
- K. Division 26 Section "Overcurrent Protection Device Coordination Study".
- L. Division 26 Section "Medium-voltage switchgear".
- M. Division 26 Section "Low-voltage Switchgear".
- N. Division 26 Section "Electricity Metering".
- O. Division 26 Section "Fuses".

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 1 and Division 16 Section "General Electrical Requirements".
- B. Product data: Include rated nameplate data, capacities, weights, dimensions, colors, minimum clearances, installed devices and features, location of each field connection, and performance for each type and size of transformer indicated.
 - 1. Medium-voltage Transformers.
- C. Shop drawings for:

1. Diagram power signal and control wiring.
- D. Coordination Drawings: Floor and site plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
1. Underground primary and secondary conduit stub-up location.
 2. Dimensioned concrete base, outline of transformer, and required clearances.
 3. Ground rod and grounding cable locations.
- E. Manufacturer Seismic Qualification Certification: Submit certification that transformer assembly and components will withstand seismic forces defined in Division 16 Section "Electrical Supports and Seismic Restraints." Include the following:
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- F. Qualification Data: For testing agency.
- G. Source quality-control test reports.
- H. Field quality-control test reports.
- I. Follow-up service reports.
- J. Operation and Maintenance Data: For transformer and accessories to include in emergency, operation, and maintenance manuals.
- 1.4 DEFINITIONS
- A. NETA ATS: Acceptance Testing Specification.
- 1.5 QUALITY ASSURANCE
- A. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of transformers and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- D. Comply with IEEE C2.
- E. Comply with ANSI C57.12.10, ANSI C57.12.28, IEEE C57.12.70, and IEEE C57.12.80.
- F. Comply with NFPA 70.
- G. Transformers shall meet the requirements of the most current version of federal law 10 CFR Part 431 "Energy Efficiency Program for Certain Commercial and Industrial Equipment".

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store transformers protected from weather and so condensation will not form on or in units. Provide temporary heating according to manufacturer's written instructions.

1.7 PROJECT CONDITIONS

- A. Service Conditions: IEEE C37.121, usual service conditions except for the following:
 1. Exposure to significant solar radiation.
 2. Altitudes above 3300 feet (1000 m).
 3. Exposure to fumes, vapors, or dust.
 4. Exposure to explosive environments.
 5. Exposure to hot and humid climate or to excessive moisture, including steam, salt spray, and dripping water.
 6. Exposure to seismic shock or to abnormal vibration, shock, or tilting.
 7. Exposure to excessively high or low temperatures.
 8. Unusual transportation or storage conditions.
 9. Unusual grounding-resistance conditions.
 10. Unusual space limitations.

1.8 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- B. Coordinate installation of louvers, doors, spill retention areas, and sumps. Coordinate installation so no piping or conduits are installed in space allocated for medium-voltage transformers except those directly associated with transformers.

1.9 QUALIFICATIONS

- A. Provide products listed and classified by Underwriters Laboratories, Inc (UL) as suitable for the purpose specified and indicated.
- B. Materials shall be manufactured by Companies specializing in the products specified in this section with minimum 3 years documented experience.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Acme Electric Corporation; Power Distribution Products Division.
2. Cooper Industries; Cooper Power Systems Division.
3. Eaton Electrical Inc.; Cutler Hammer Products.
4. Federal Pacific Transformer Company; Division of Electro-Mechanical Corp.
5. GE Electrical Distribution & Control.
6. Hammond Manufacturing; Transformer Group.
7. ABB; Kuhlman Electric Corporation
8. CG Global; Pauwels Transformers,.
9. Pioneer Transformers.
10. Siemens Energy & Automation, Inc.
11. Square D; Schneider Electric.
12. Uptegraff, R. E. Mfg. Co.
13. Virginia Transformer Corp.

2.2 PAD-MOUNTED, THREE-PHASE, LIQUID-FILLED TRANSFORMERS

- A. Description: ANSI C57.12.13, IEEE C57.12.00, pad-mounted, 2-winding transformers. Stainless-steel tank base, cabinet, and sills.
 1. Windings: Aluminum
- B. Insulating Liquid: Mineral oil, complying with ASTM D 3487, Type II, and tested according to ASTM D 117.
- C. Insulating Liquid: Less flammable, edible-seed-oil based, and UL listed as complying with NFPA 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D 92. Liquid shall be biodegradable and nontoxic.
- D. Insulating Liquid: Less flammable, dielectric, and UL listed as complying with NFPA 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D 92. Liquid shall be biodegradable and nontoxic.
- E. Insulating Liquid: Less flammable, silicone-based dielectric, and UL listed as complying with NFPA 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D 92. Liquid shall have low toxicity and be nonhazardous.
- F. Insulation Temperature Rise: 65 deg C when operated at rated kVA output in a 40 deg C ambient temperature. Transformer shall be rated to operate at rated kilovolt ampere in an average ambient temperature of 30 deg C over 24 hours with a maximum ambient temperature of 40 deg C without loss of service life expectancy.
- G. Basic Impulse Level: 95 kV.
- H. Full-Capacity Voltage Taps: Four 2.5 percent taps, 2 above and 2 below rated high voltage; with externally operable tap changer for de-energized use and with position indicator and padlock hasp.
- I. High-Voltage Switch: 200 A or 600 A, make-and-latch rating of 10-kA RMS, symmetrical, arranged for radial feed with 3-phase, 2-position, gang-operated, load-break switch that is oil immersed in transformer tank with hook-stick operating handle in primary compartment.
- J. Primary Fuses: 150-kV fuse assembly with fuses complying with IEEE C37.47.
 1. Current-limiting type in dry-fuse holder wells, mechanically interlocked with liquid-immersed switch in transformer tank to prevent disconnect under load.
 2. Internal liquid-immersed cartridge fuses.
 3. Bay-O-Net liquid-immersed fuses that are externally replaceable without opening transformer tank.

4. Bay-O-Net liquid-immersed fuses in series with liquid-immersed current-limiting fuses. Bay-O-Net fuses shall be externally replaceable without opening transformer tank.
 5. Bay-O-Net liquid-immersed current-limiting fuses that are externally replaceable without opening transformer tank.
- K. Surge Arresters: Distribution class, one for each primary phase; complying with IEEE C62.11 and NEMA LA 1; support from tank wall within high-voltage compartment. Transformers shall have three arresters for radial-feed circuits.
- L. High-Voltage Terminations and Equipment: Live front with externally clamped porcelain bushings and cable connectors suitable for terminating primary cable.
- M. High-Voltage Terminations and Equipment: Dead front with universal-type bushing wells for dead-front bushing-well inserts, complying with IEEE 386 and including the following:
1. Bushing-Well Inserts: One for each high-voltage bushing well.
 2. Surge Arresters: Dead-front, elbow-type, metal-oxide-varistor units.
 3. Parking Stands: One for each high-voltage bushing well.
 4. Portable Insulated Bushings: Arranged for parking insulated, high-voltage, load-break cable terminators; one for each primary feeder conductor terminating at transformer.
- N. Accessories:
1. Drain Valve: 1 inch (25 mm), with sampling device.
 2. Dial-type thermometer.
 3. Liquid-level gage.
 4. Pressure-vacuum gage.
 5. Pressure Relief Device: Self-sealing with an indicator.
 6. Mounting provisions for low-voltage current transformers.
 7. Mounting provisions for low-voltage potential transformers.
 8. Busway terminal connection at low-voltage compartment.
 9. Alarm contacts for gages and thermometer listed above.

2.3 IDENTIFICATION DEVICES

- A. Nameplates: Engraved, laminated-plastic or metal nameplate for each transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 16 Section "Electrical Identification."

2.4 SOURCE QUALITY CONTROL

- A. Factory Tests: Perform design and routine tests according to standards specified for components. Conduct transformer tests according to federal law 10 CFR Part 431 and ANSI C57.12.50.
- B. Factory Tests: Perform the following factory-certified tests on each transformer:
1. Resistance measurements of all windings on rated-voltage connection and on tap extreme connections.
 2. Ratios on rated-voltage connection and on tap extreme connections.
 3. Polarity and phase relation on rated-voltage connection.
 4. No-load loss at rated voltage on rated-voltage connection.
 5. Excitation current at rated voltage on rated-voltage connection.
 6. Impedance and load loss at rated current on rated-voltage connection and on tap extreme connections.
 7. Applied potential.
 8. Induced potential.

9. Temperature Test: If transformer is supplied with auxiliary cooling equipment to provide more than one rating, test at lowest kilovolt-ampere Class OA or Class AA rating and highest kilovolt-ampere Class OA/FA or Class AA/FA rating.
 - a. Temperature test is not required if record of temperature test on an essentially duplicate unit is available.
10. Owner will witness all required factory tests. Notify Architect at least 14 days before date of tests and indicate their approximate duration.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for medium-voltage transformers.
- B. Examine roughing-in of conduits and grounding systems to verify the following:
 1. Wiring entries comply with layout requirements.
 2. Entries are within conduit-entry tolerances specified by manufacturer and no feeders will have to cross section barriers to reach load or line lugs.
- C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
- D. Verify that ground connections are in place and that requirements in Division 16 Section "Grounding and Bonding" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install transformers on concrete bases.
 1. Anchor transformers to concrete bases according to manufacturer's written instructions, seismic codes at Project, and requirements in Division 26 Section "Electrical Supports and Seismic Restraints."
 - a. Construct concrete bases of dimensions indicated, but not less than 4 inches (100 mm) larger in both directions than supported unit and 4 inches (100 mm) high.
 - b. Use 3000-psi (20.7-MPa), 28-day compressive-strength concrete and reinforcement as specified in Division 3 Section "Cast-in-Place Concrete."
 - c. Install dowel rods to connect concrete bases to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around full perimeter of base.
 - d. Install epoxy-coated anchor bolts, for supported equipment, that extend through concrete base and anchor into structural concrete floor.
 - e. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - f. Tack-weld or bolt transformers to channel-iron sills embedded in concrete bases. Install sills level and grout flush with floor or base.
 2. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions, NFPA 70, and the local utility companies.
- B. IDENTIFICATION
 1. Identify field-installed wiring and components and provide warning signs as specified in Division 26 Section "Basic Electrical Materials and Methods."
- C. CONNECTIONS

1. Ground equipment according to Division 16 Section "Grounding and Bonding."
2. Connect wiring according to Division 16 Section "Conductors and Cables."

D. FIELD QUALITY CONTROL

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
2. Testing Agency: Owner will engage a qualified testing and inspecting agency to perform field tests and inspections and prepare test reports.
3. Testing Agency: Engage a qualified testing and inspecting agency to perform the following field tests and inspections and prepare test reports:
4. Perform the following field tests and inspections and prepare test reports:
 - a. After installing transformers but before primary is energized, verify that grounding system at substation is tested at specified value or less.
 - b. After installing transformers and after electrical circuitry has been energized, test for compliance with requirements.
 - c. Perform visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.
 - d. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
5. Remove and replace malfunctioning units and retest as specified above.
6. Test Reports: Prepare written reports to record the following:
 - a. Test procedures used.
 - b. Test results that comply with requirements.
 - c. Test results that do not comply with requirements and corrective actions taken to achieve compliance with requirements.

E. FOLLOW-UP SERVICE

1. Voltage Monitoring and Adjusting: If requested by Owner, perform the following voltage monitoring after Substantial Completion but not more than six months after Final Acceptance:
 - a. During a period of normal load cycles as evaluated by Owner, perform seven days of three-phase voltage recording at secondary terminals of each transformer. Use voltmeters with calibration traceable to National Institute of Science and Technology standards and with a chart speed of not less than 1 inch (25 mm) per hour. Voltage unbalance greater than 1 percent between phases, or deviation of any phase voltage from nominal value by more than plus or minus 5 percent during test period, is unacceptable.
 - b. Corrective Actions: If test results are unacceptable, perform the following corrective actions, as appropriate:
 - c. Adjust transformer taps.
 - d. Prepare written request for voltage adjustment by electric utility.
 - e. Retests: After corrective actions have been performed, repeat monitoring until satisfactory results are obtained.
 - f. Report: Prepare written report covering monitoring and corrective actions performed.
2. Infrared Scanning: Perform as specified in Division 16 Section "Medium-Voltage Switchgear."

3.3 CLEANING

- A. Clean exposed surfaces to remove splatters and restore finish.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16460 (261323) - MEDIUM-VOLTAGE METAL-ENCLOSED SWITCHGEAR

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Switchgear enclosure.
2. Fusible load interrupter switchgear.
3. Load interrupter switchgear with circuit breakers.
4. Circuit breaker switchgear.
5. Power transfer configurations.
6. Instruments.
7. Protective relays.
8. AC control power supply.
9. DC control power supply.
10. Warning labels and signs.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For medium-voltage, metal-enclosed switchgear.

1. Include a tabulation of installed devices with features and ratings.
2. Include dimensioned plans and elevations, showing dimensions, shipping sections, and weights of each assembled section. Elevations must show major components, features, and mimic bus diagram.
3. Include a plan view and cross section of equipment base showing clearances, manufacturer's recommended work space, and locations of penetrations for grounding and conduits. Show location of anchor bolts.
4. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, and location and size of each field connection.
5. Locate accessory and spare equipment storage.
6. Include single-line diagram.
7. Include control power wiring diagrams.
8. Include batteries, battery rack, and equipment base.
9. Include copy of nameplate.
10. Ratings of the assembled switchgear:
 - a. Voltage.
 - b. Continuous current.
 - c. Short-circuit rating.
 - d. Basic Insulation Level.
11. Utility company's metering provisions with indication of approval by utility company.
12. Wiring Diagrams: For each switchgear assembly include the following:
 - a. Power, signal, and control wiring.
 - b. Three-line diagrams of current and future secondary circuits showing device terminal numbers and internal diagrams.
 - c. Schematic control diagrams.

- d. Diagrams showing connections of component devices and equipment.

1.3 INFORMATIONAL SUBMITTALS

- A. Product certificates.
- B. Source quality-control reports.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Manufactured Unit: Metal-enclosed switchgear, designed for application in solidly grounded neutral system.
- B. Switchgear Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by a qualified electrical testing laboratory, and marked for intended location and application.
- C. Comply with IEEE C37.20.3.

2.2 MANUFACTURERS

- A. ABB
- B. Eaton
- C. Siemens
- D. Square D by Schneider Electric

2.3 SWITCHGEAR ENCLOSURE

- A. Outdoor Enclosure: Weatherproof, galvanized steel, designed for installation outdoors. Aisleless, full-height doors, with provisions for padlocking, in front of basic weatherproof equipment. Integral structural-steel base frame with factory-applied asphaltic undercoating.
- B. The enclosure must meet IEEE C37.20.3 Annex A, Category A enclosure requirements.
 - 1. Each vertical section must have the following features:
 - a. Structural design and anchorage adequate to resist loads imposed by 125 mph (200 km/h) wind.
 - b. Space heater operating at one-half or less of rated voltage, sized to prevent condensation, controlled by thermostats to maintain temperature of each section above expected dew point.
 - c. Louvers equipped with insect and rodent screens and filters, and arranged to permit air circulation while excluding rodents and exterior dust.
 - d. Weatherproof ground-fault circuit interrupter duplex receptacle.
 - e. Power for heaters and receptacles must be provided by control power transformer.
 - f. Skid Mounted: Mount each shipping group on an integral base frame as a complete weather-proof unit.
- C. Enclosure Finish:

1. Outdoor Finish: Factory-applied finish in manufacturer's standard color, including under surfaces treated with corrosion-resistant undercoating.

2.4 FUSIBLE LOAD INTERRUPTER SWITCHGEAR

A. Construction:

1. Deadfront, metal-enclosed, fixed-mount, ~~arc-resistant~~, fusible interrupter switchgear assembly of vertical sections.
 - a. Front and rear access switchgear.
 - b. Viewing window to show view of the position of the three poles of the interrupter.
 - c. Mechanical interlock preventing the door from opening when the switch is open and requiring the door to be closed before the switch can be closed.
 - d. Padlocking and tagging the switch in the opened or closed position.
 - e. Switch position indicator.
 - f. Front and rear vertical section covers must have ~~standard full length~~ hinges. The front cover must be a flanged door with latching hardware. The rear cover may be bolted.
2. Bus: Silver-plated copper.
 - a. Ground Bus: Sized to carry the rated short-time withstand current and connected to the metal enclosures of each vertical section.
3. Auxiliary Vertical Sections and Compartments:
 - a. Utility metering compartment that complies with utility company requirements.
 - b. Owner's Metering: Vertical section with a front hinged door for isolated access to meters and associated terminal and fuse blocks for maintenance, calibration or testing while the gear is energized.

- ### B. Surge Arresters: Comply with IEEE C62.11, distribution class; metal-oxide-varistor type, connected in each phase of incoming circuit and ahead of disconnecting device.

C. Switches: Load interrupter type, with fuses. Omit fuses where specifically indicated.

1. Switch Operator: Manual.
2. Switch Construction:
 - a. Grounded, metal shield to cover live components and terminals.
 - b. Supported entirely by interior framework of structure, with copper switchblades and stored-energy operating mechanism.
 - c. Phase barriers, full length of switchblades and fuses for each pole; readily removable and replaceable; designed to allow visual inspection of switch components when barrier is in place.
3. Fuses:
 - a. Installed on a single mounting frame, de-energized when the switch is open.
 - b. Current-Limiting Fuses: Full-range, fast-replaceable, current-limiting type that will operate without explosive noise or expulsion of gas, vapor, or foreign matter from tube.
 - c. Indicator integral with each fuse to show when it has blown.
 - d. Spares: Include three fuses in use and three spare fuses in storage clips in each switch.

D. Accessory Set:

1. Tools and miscellaneous items required for interrupter switchgear test, inspection, maintenance, and operation.
2. Fuse-handling tool recommended by switchgear manufacturer.

E. Capacities and Characteristics:

1. Switchgear Assembly:
 - a. Rated Maximum Voltage and BIL: 15 kV, 95 kV.
 - b. Rated Continuous Current: 1200 A.
 - c. Rated Momentary Withstand Current (600 A and 1200 A Continuous Current Ratings): 40 kA ASYM RMS for 10 cycles.

- d. Rated Short-Time Withstand Current (600 A and 1200 A Continuous Current Ratings): 25 kA SYM RMS for 2 s.
2. Non-Fused Load Interrupter Switch:
 - a. Rated Continuous Current and Load Switching Current: 1200 A.
 - b. Rated Momentary Withstand Current: 40 kA ASYM RMS for 10 cycles.

2.5 FUSED SWITCHES WITH CURRENT LIMITING FUSES:

- A. Fuse Type and Rated Continuous Current: [Insert fuse type], [Insert amperage].
- B. Fuse Interrupting Rating: <Insert value> kA SYM RMS.
- C. Fault Close Current Rating: <Insert value> kA ASYM.

2.6 INSTRUMENTS

- A. Instrument Transformers: Comply with IEEE C57.13.
 1. Potential Transformers: Secondary voltage rating of 120 V and NEMA C 12.11 accuracy class of 0.3 with burdens of W, X, and Y.
 2. Current Transformers: Burden and accuracy class suitable for connected relays, meters, and instruments.
- B. Multifunction Digital Meter and Monitor: Microprocessor-based unit suitable for three- or four-wire systems.
 1. Inputs from sensors or 5 A current-transformer secondaries, and potential terminals rated to 600 V.
 2. Switch-selectable digital display with the following features:
 - a. Phase Currents, Each Phase: Plus or minus 1 percent.
 - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
 - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
 - d. Three-Phase Real Power: Plus or minus 2 percent.
 - e. Three-Phase Reactive Power: Plus or minus 2 percent.
 - f. Power Factor: Plus or minus 2 percent.
 - g. Frequency: Plus or minus 0.5 percent.
 - h. Integrated Demand, with Demand Interval Selectable from 5 to 60 Minutes: Plus or minus 2 percent.
 - i. Accumulated energy, in megawatt hours (megajoules), plus or minus 2 percent; stored values unaffected by power outages for up to 72 hours.
 3. Communications module suitable for remote monitoring of meter quantities and functions. Interface communication and metering requirements in accordance with Section 260913 "Electrical Power Monitoring and Control."
 4. Mounting: Display and control unit that is flush or semiflush mounted in instrument compartment door.

2.7 WARNING LABELS AND SIGNS

- A. Comply with requirements for labels and signs specified in Section "Identification for Electrical Systems."
 1. Warning signs must be baked enamel signs.
 2. Equipment Identification Labels: Laminated acrylic or melamine label.

2.8 SOURCE QUALITY CONTROL

- A. Perform production tests on each circuit breaker housing for this Project, complying with IEEE C37.20.3:

1. Perform mechanical operation tests to ensure proper functioning of shutters, operating mechanism, mechanical interlocks, and interchangeability of removable elements that are designed to be interchangeable.
 2. Verify that control wiring is correct by verifying continuity. Perform electrical operation of relays and devices to ensure they function properly and in the intended sequence.
 3. Perform the control wiring dielectric test at 1500 V for one minute.
- B. Perform production tests, on each circuit breaker supplied for this Project, complying with IEEE C37.20.4.
1. Perform mechanical operation tests to ensure proper functioning of the switch.
 2. Verify the contact gap. Perform terminal-to-terminal resistance test.
 3. Verify that control wiring is correct by verifying continuity. Perform electrical operation of relays and devices to ensure they function properly and in the intended sequence.
 4. Perform the control wiring dielectric test at 1500 V for one minute.

PART 3 - EXECUTION

3.1 INSTALLATION OF SWITCHGEAR

- A. Upon delivery of switchgear and prior to unloading, inspect equipment for damage. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Equipment Mounting:
1. Install switchgear on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 2. Comply with requirements for vibration isolation and seismic control devices specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- C. Switchgear must be installed level and plumb. Switchgear must tilt less than 1.5 degrees while energized.
- D. Maintain minimum clearances and workspace at equipment in accordance with manufacturer's written instructions and NFPA 70.
- E. Comply with NECA 430.

3.2 CONNECTIONS

- A. Ground equipment in accordance with Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Grounding Connections at Exterior Locations:
1. Bond surge arrester and neutrals directly to the switchgear enclosure and then to the grounding electrode system with bare copper conductors, sized as shown.
 2. Keep lead lengths as short as practicable with no kinks or sharp bends.
 3. Fence and equipment connections must not be smaller than No. 4 AWG.
 4. Ground fence at each gate post and corner post and at intervals not exceeding 10 ft. (3 m).
 5. Bond each gate section to the fence post using 1/8 by 1 inch (3 by 25 mm) tinned flexible braided copper strap and clamps.
 6. Make joints in grounding conductors and loops by exothermic weld or compression connector.

- C. Terminate all grounding and bonding conductors on a common equipment grounding terminal on the switchgear enclosure. Install supplemental terminal bars, lugs, and bonding jumpers as required to accommodate the number of conductors for termination.
- D. Complete switchgear grounding and lightning arrester connections prior to making any other electrical connections.
- E. Terminate medium-voltage cables in accordance with Section 260513 "Medium-Voltage Cables."

3.3 SIGNS AND LABELS

- A. Comply with the installation requirements for labels and signs specified in Section 260553 "Identification for Electrical Systems."
- B. Install warning signs as required to comply with OSHA in 29 CFR 1910.269.

3.4 FIELD QUALITY CONTROL

- A. Field tests and inspections must be witnessed by authorities having jurisdiction and/or electric utility, if required.
- B. General Field Testing Requirements:
 - 1. Comply with the provisions of NFPA 70B, "Testing and Test Methods."
 - 2. After installing switchgear and after electrical circuitry has been energized, test for compliance with requirements.
 - 3. Perform each visual and mechanical inspection and electrical test. Certify compliance with test parameters.
- C. Medium-Voltage Switchgear Assembly Field Tests:
 - 1. Visual and Mechanical Inspection:
 - a. Verify that fuse and circuit breaker sizes and types correspond to Drawings and coordination study.
 - b. Verify that current and voltage transformer ratios correspond to Drawings.
 - c. Inspect bolted electrical connections using calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS, Table 100.12. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - d. Confirm correct operation and sequencing of electrical and mechanical interlock systems.
 - e. Attempt closure on locked-open devices. Attempt to open locked-closed devices.
 - f. Make key exchange with devices operated in off-normal positions.
 - g. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
 - h. Inspect insulators for evidence of physical damage or contaminated surfaces.
 - i. Verify correct barrier and shutter installation and operation.
 - j. Exercise active components.
 - k. Inspect mechanical indicating devices for correct operation.
 - l. Verify that filters are in place and vents are clear.
 - m. Perform visual and mechanical inspection of instrument transformers in accordance with Article "Instrument Transformer Field Tests."
 - n. Inspect control power transformers.
 - 1) Inspect for physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.

- 2) Verify that primary and secondary fuse or circuit breaker ratings match drawings.
 - 3) Verify correct functioning of drawout disconnecting and grounding contacts and interlocks.
2. Electrical Tests:
- a. Inspect bolted electrical connections using a low resistance ohmmeter to compare bolted resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - b. Perform dc voltage insulation-resistance tests on each bus section, phase to phase and phase to ground, for one minute. If the temperature of the bus is other than plus or minus 20 deg C, adjust the resulting resistance as provided in NETA ATS, Table 100.11.
 - 1) Insulation-resistance values of bus insulation must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.1. Investigate and correct values of insulation resistance less than manufacturer's recommendations or NETA ATS, Table 100.1.
 - 2) Do not proceed to the dielectric withstand voltage tests until insulation-resistance levels are raised above minimum values.
 - c. Perform a dielectric withstand voltage test on each bus section, each phase to ground with phases not under test grounded, in accordance with manufacturer's published data. If manufacturer has no recommendation for this test, it must be conducted in accordance with NETA ATS, Table 100.2. Apply the test voltage for one minute.
 - 1) If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the test specimen is considered to have passed the test.
 - d. Perform insulation-resistance tests on control wiring with respect to ground. Applied potential must be 500 V(dc) for 300 V rated cable and 1000 V(dc) for 600 V rated cable. Test duration must be one minute. For units with solid-state components or control devices that cannot tolerate the applied voltage, follow the manufacturer's recommendation.
 - 1) Minimum insulation-resistance values of control wiring must not be less than two megohms.
 - e. Control Power Transformers:
 - 1) Perform insulation-resistance tests. Perform measurements from winding to winding and each winding to ground. Insulation-resistance values of winding insulation must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.1. Investigate and correct values of insulation resistance less than manufacturer's recommendations or NETA ATS, Table 100.1.
 - 2) Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to a rated secondary voltage source. Verify correct potential at all devices.
 - 3) Verify correct secondary voltage by energizing the primary winding with system voltage. Measure secondary voltage with the secondary wiring disconnected.
 - 4) Verify correct function of control transfer relays located in the switchgear with multiple control power sources.
 - f. Voltage Transformers:
 - 1) Perform secondary wiring integrity test. Verify correct potential at all devices.
 - 2) Verify secondary voltages by energizing the primary winding with system voltage.
 - g. Perform current-injection tests on the entire current circuit in each section of switchgear.
 - 1) Perform current tests by secondary injection with magnitudes such that a minimum current of 1.0 A flows in the secondary circuit. Verify correct magnitude of current at each device in the circuit.

- h. Perform system function tests in accordance with "System Function Tests" Article.
- i. Verify operation of space heaters.

D. Instrument Transformer Field Tests:

1. Visual and Mechanical Inspection:
 - a. Verify that equipment nameplate data complies with Contract Documents.
 - b. Inspect physical and mechanical condition.
 - c. Verify correct connection of transformers with system requirements.
 - d. Verify that adequate clearances exist between primary and secondary circuit wiring.
 - e. Verify the unit is clean.
 - f. Inspect bolted electrical connections using calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS, Table 100.12. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - g. Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS, Table 100.12.
 - h. Verify that required grounding and shorting connections provide contact.
 - i. Verify correct operation of transformer withdrawal mechanism and grounding operation.
 - j. Verify correct primary and secondary fuse sizes for voltage transformers.
 - k. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
2. Electrical Tests of Current Transformers:
 - a. Inspect bolted electrical connections using a low resistance ohmmeter to compare bolted resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - b. Perform insulation-resistance test of each current transformer and its secondary wiring with respect to ground at 1000 V(dc) for one minute. For units with solid-state components that cannot tolerate the applied voltage, follow manufacturer's written recommendations. Investigate and correct values of insulation resistance less than manufacturer's recommendations or NETA ATS, Table 100.5.
 - c. Perform a polarity test of each current transformer in accordance with IEEE C57.13.1. Polarity results must agree with transformer markings.
 - d. Perform a ratio-verification test using the voltage or current method in accordance with IEEE C57.13.1. Ratio errors must be in accordance with IEEE C57.13.
 - e. Perform an excitation test on transformers used for relaying applications in accordance with IEEE C57.13.1. Excitation results must match the curve supplied by the manufacturer or be in accordance with IEEE C57.13.1.
 - f. Measure current circuit burdens at transformer terminals in accordance with IEEE C57.13.1. Measured burdens must be compared with and must match instrument transformer ratings.
 - g. Perform insulation-resistance tests on the primary winding with the secondary grounded. Test voltages must be in accordance with Table 100.5.
 - h. Perform dielectric withstand tests on the primary winding with the secondary grounded. Test voltages must be in accordance with Table 100.9.
 - i. Perform power-factor or dissipation-factor tests in accordance with test equipment manufacturer's published data.
 - j. Verify that current transformer secondary circuits are grounded and have only one grounding point in accordance with IEEE C57.13.3. That grounding point should be located as specified by the engineer in the project drawings.
3. Electrical Tests of Voltage Transformers:
 - a. Inspect bolted electrical connections using a low resistance ohmmeter to compare bolted resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

- b. Perform insulation-resistance tests winding-to-winding and each winding to ground. Test voltages must be applied for one minute in accordance with Table 100.5. For units with solid-state components that cannot tolerate the applied voltage, follow manufacturer's recommendations. Investigate and correct values of insulation resistance less than manufacturer's recommendations or NETA ATS, Table 100.5.
- c. Perform a polarity test on each transformer to verify the polarity marks or H1- X1 relationship as applicable. Polarity results must agree with transformer markings.
- d. Perform a turns-ratio test on all tap positions. Ratio errors must be in accordance with IEEE C57.13.
- e. Measure voltage circuit burdens at transformer terminals. Measured burdens must be compared with and must match instrument transformer ratings.
- f. Perform power-factor or dissipation-factor tests in accordance with test equipment manufacturer's published data. Power-factor or dissipation-factor values must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use test equipment manufacturer's published data.
- g. Verify that voltage transformer secondary circuits are grounded and have only one grounding point in accordance with IEEE C57.13.3. Test results must indicate that the circuits are grounded at only one point.

E. Ground Resistance Test:

- 1. Visual and Mechanical Inspection:
 - a. Verify ground system complies with the Contract Documents and NFPA 70 Article 250, "Grounding and Bonding."
 - b. Inspect physical and mechanical condition. Grounding system electrical and mechanical connections must be free of corrosion.
 - c. Inspect bolted electrical connections using a calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS, Table 100.12. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - d. Inspect anchorage.
- 2. Electrical Tests:
 - a. Perform fall-of-potential or alternative test in accordance with IEEE 81 on the main grounding electrode or system. The resistance between the main grounding electrode and ground must be no more than 5 ohms.
 - b. Perform point-to-point tests to determine the resistance between the main grounding system and all major electrical equipment frames, system neutral, and derived neutral points. Investigate point-to-point resistance values that exceed 0.5 ohms. Compare equipment nameplate data with Contract Documents.
 - c. Inspect physical and mechanical condition.
 - d. Inspect bolted electrical connections for high resistance using a low-resistance ohmmeter to compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

F. Metering Devices Field Tests:

- 1. Visual and Mechanical Inspection:
 - a. Inspect physical and mechanical condition.
 - b. Inspect bolted electrical connections using calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels must be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS, Table 100.12.
 - c. Inspect cover gasket, cover glass, condition of spiral spring, disk clearance, contacts, and case shorting contacts, as applicable.

- d. Verify the unit is clean.
 - e. Verify freedom of movement, end play, and alignment of rotating disk(s).
2. Electrical Tests:
- a. Inspect bolted electrical connections using a low resistance ohmmeter to compare bolted resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - b. Verify accuracy of meters at all cardinal points. Meter accuracy must be in accordance with manufacturer's published data.
 - c. Calibrate meters in accordance with manufacturer's published data. Calibration results must be within manufacturer's published tolerances.
 - d. Verify all instrument multipliers. Instrument multipliers must be in accordance with system design specifications.
 - e. Verify that current transformer and voltage transformer secondary circuits are intact. Test results must confirm the integrity of the secondary circuits of current and voltage transformers.

G. Medium-Voltage Surge Arrester Field Tests:

1. Visual and Mechanical Inspection:
- a. Verify that equipment nameplate data complies with Contract Documents.
 - b. Inspect physical and mechanical condition.
 - c. Inspect anchorage, alignment, grounding, and clearances.
 - d. Verify the arresters are clean.
 - e. Verify that the ground lead on each device is individually attached to a ground bus or ground electrode.
 - f. Verify that the stroke counter is correctly mounted and electrically connected if applicable. Record the stroke counter reading.
2. Electrical Test:
- a. Perform an insulation-resistance test on each arrester, phase terminal to ground. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.1. Replace units that fail to meet recommended minimum insulation resistance listed in the table.
 - b. Perform a watts-loss test. Evaluate watts-loss values by comparison with similar units and test equipment manufacturer's published data.
 - c. Test grounding connections. Resistance between the arrester ground terminal and the ground system must be less than 0.5 ohm.

H. Microprocessor-Based Protective Relay Field Tests:

1. Visual and Mechanical Inspection:
- a. Record model number, style number, serial number, firmware revision, software revision, and rated control voltage.
 - b. Verify operation of light-emitting diodes, display, and targets.
 - c. Record passwords for each access level.
 - d. Clean the front panel and remove foreign material from the case.
 - e. Check tightness of connections.
 - f. Verify that the frame is grounded in accordance with manufacturer's instructions.
 - g. Set the relay in accordance with results in Section 260573.16 "Coordination Studies" and in Section 260573.19 "Arc-Flash Hazard Analysis."
 - h. Download settings from the relay. Print a copy of the settings for the report and compare the settings to those specified in the coordination study.
2. Electrical Tests:
- a. Perform insulation-resistance tests from each circuit to the grounded frame in accordance with manufacturer's published data.
 - b. Apply voltage or current to analog inputs, and verify correct registration of the relay meter functions.
 - c. Functional Operation: Check functional operation of each element used in the protection

scheme as follows:

- 1) Timing Relay:
 - a) Determine time delay.
 - b) Verify operation of instantaneous contacts.
- 2) Volts/Hertz Relay:
 - a) Determine pickup frequency at rated voltage.
 - b) Determine pickup frequency at a second voltage level.
 - c) Determine time delay.
- 3) Sync Check Relay:
 - a) Determine closing zone at rated voltage.
 - b) Determine maximum voltage differential that permits closing at zero degrees.
 - c) Determine live line, live bus, dead line, and dead bus set points.
 - d) Determine time delay.
 - e) Verify dead bus/live line, dead line/live bus, and dead bus/dead line control functions.
- 4) Undervoltage Relay:
 - a) Determine dropout voltage.
 - b) Determine time delay.
 - c) Determine time delay at a second point on the timing curve for inverse time relays.
- 5) Directional Power Relay:
 - a) Determine minimum pickup at maximum torque angle.
 - b) Determine closing zone.
 - c) Determine maximum torque angle.
 - d) Determine time delay.
 - e) Verify time delay at a second point on the timing curve for inverse time relays.
 - f) Plot the operating characteristic.
- 6) Current Balance Relay:
 - a) Determine pickup of each unit.
 - b) Determine percent slope.
 - c) Determine time delay.
- 7) Negative Sequence Current Relay:
 - a) Determine negative sequence alarm level.
 - b) Determine negative sequence minimum trip level.
 - c) Determine maximum time delay.
 - d) Verify two points on the I-two-squared-t curve.
- 8) Phase Sequence or Phase Balance Voltage Relay:
 - a) Determine positive sequence voltage to close the NO contact.
 - b) Determine positive sequence voltage to open the NC contact (undervoltage trip).
 - c) Verify negative sequence trip.
 - d) Determine time delay to close the NO contact with sudden application of 120 percent of pickup.
 - e) Determine time delay to close the NC contact upon removal of voltage when previously set to rated system voltage.
- 9) Instantaneous Overcurrent Relay:

- a) Determine pickup.
 - b) Determine dropout.
 - c) Determine time delay.
- 10) Time Overcurrent:
- a) Determine minimum pickup.
 - b) Determine time delay at two points on the time current curve.
- 11) Ground Detector Relay:
- a) Determine maximum impedance to ground causing relay pickup.
- 12) Directional Overcurrent Relay:
- a) Determine directional unit minimum pickup at maximum torque angle.
 - b) Determine closing zone.
 - c) Determine maximum torque angle.
 - d) Plot operating characteristics.
 - e) Determine overcurrent unit pickup.
 - f) Determine overcurrent unit time delay at two points on the time current curve.

d. Control Verification:

- 1) Functional Tests:
- a) Check operation of all active digital inputs.
 - b) Check output contacts or silicone-controlled rectifiers (SCRs), preferably by operating the controlled device, such as circuit breaker, auxiliary relay, or alarm.
 - c) Check internal logic functions used in protection scheme.
 - d) Upon completion of testing, reset min/max recorders, communications statistics, fault counters, sequence-of-events recorder, and event records.
- 2) In-Service Monitoring: After the equipment is initially energized, measure magnitude and phase angle of inputs and verify expected values.

I. Nonconforming Work:

- 1. Switchgear will be considered defective if it does not pass tests and inspections.
- 2. Remove and replace defective units and retest.

J. Prepare test and inspection reports. Record as-left set points of adjustable devices.

3.5 SYSTEM FUNCTION TESTS

- A. System function tests must prove the correct interaction of sensing, processing, and action devices. Perform system function tests after field quality control tests have been completed and all components have passed specified tests.
- 1. Develop test parameters and perform tests for the purpose of evaluating performance of integral components and their functioning as a complete unit within design requirements and manufacturer's published data.
 - 2. Verify the correct operation of interlock safety devices for fail-safe functions in addition to design function.
 - 3. Verify the correct operation of sensing devices, alarms, and indicating devices.

END OF SECTION

SECTION 16321 (262413) - SWITCHBOARDS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Service and distribution switchboards 600 V and less.
- B. Surge Protection Devices.
- C. Disconnecting and overcurrent protective devices.
- D. Instrumentation.
- E. Accessory components and features.

1.2 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.3 SUBMITTALS

- A. Product Data: For each type of switchboard, overcurrent protective device, transient voltage suppression device, ground-fault protector, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
- B. Shop Drawings: For each switchboard and related equipment.
 - 1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
 - 2. Detail enclosure types for types other than NEMA 250, Type 1.
 - 3. Detail bus configuration, current, and voltage ratings.
 - 4. Detail short-circuit current rating of switchboards and overcurrent protective devices.
 - 5. Detail utility company's metering provisions with indication of approval by utility company.
 - 6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
- C. Fault-Current Study, Coordination Study, and Overcurrent Protective Device Settings report must be completed and submitted for review prior to final order, assembly or shipping of the electrical distribution system components. If studies have not been approved prior to shipping, assembly or final ordering of the electrical distribution system components, all changes to the equipment necessitated by the results of the study will be provided by the contractor at no additional cost to the project. Refer to specification section "Overcurrent Protective Device Coordination Study"
- D. Field Quality-Control Reports:

1. Test procedures used.
 2. Test results that comply with requirements.
 3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- E. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
1. Routine maintenance requirements for switchboards and all installed components.
 2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 3. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.4 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.
- B. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. Comply with NEMA PB 2.
- F. Comply with NFPA 70.
- G. Comply with UL 891.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.
- B. Handle and prepare switchboards for installation according to NECA 400.
- C. Environmental Limitations:
1. Do not deliver or install switchboards until spaces are enclosed and weather tight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
- D. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.
- E. Remove loose packing and flammable materials from inside switchboards.
- F. Connect temporary electric heating (250 W per section) to prevent condensation.

1.6 FIELD CONDITIONS

- A. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - 1. Ambient Temperature: Not exceeding 104 deg F (40 deg C).
 - 2. Altitude: Not exceeding 6600 feet (2000 m).
- B. Service Conditions: NEMA PB 2, usual service conditions, as follows:
 - 1. Ambient temperatures within limits specified.
 - 2. Altitude not exceeding 6600 feet (2000 m).

1.7 WARRANTY

- A. Warranty Period: Five years from date of Substantial Completion.

1.8 SEISMIC REQUIREMENTS

- A. Seismic bracing, restraints, and controls for all electrical systems specified herein shall be designed and installed as required by Division 26 "Seismic Controls for Electrical Systems" and Division 20 Section "Seismic Controls for MEP/F/T Systems".

PART 2 - PRODUCTS

2.1 SERVICE AND DISTRIBUTION SWITCHBOARDS, 600 VOLTS AND LESS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- B. Basis-of-Design Product: Subject to compliance with requirements, provide comparable products by one of the following, the first listed manufacturer was used as the basis of design:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Siemens Energy & Automation, Inc.
 - 4. Square D; a brand of Schneider Electric.
- C. Front-Connected, Front-Accessible Switchboards:
 - 1. Main Devices: Fixed, individually mounted.
 - 2. Branch Devices: Panel mounted.
 - 3. Sections front and rear aligned.
- D. Nominal System Voltage: As indicated.
- E. Main-Bus Continuous: As indicated.
- F. Indoor Enclosures: Steel, NEMA 250, Type 1.
- G. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
- H. Customer Metering Compartment: A separate customer metering compartment and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks. Include potential transformers

having primary and secondary fuses with disconnecting means and secondary wiring terminated on terminal blocks.

- I. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
- J. Pull Box on Top of Switchboard:
 - 1. Adequate ventilation to maintain temperature in pull box within same limits as switchboard.
 - 2. Set back from front to clear circuit-breaker removal mechanism.
 - 3. Removable covers shall form top, front, and sides. Top covers at rear shall be easily removable for drilling and cutting.
 - 4. Bottom shall be insulating, fire-resistive material with separate holes for cable drops into switchboard.
 - 5. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.
- K. Buses: Three phase, four wire unless otherwise indicated.
 - 1. Phase, and Neutral Buses:
 - a. Material:
 - 1) Tin-plated aluminum.
 - a) Hard-drawn copper, 98 percent conductivity, may be substituted if provided at no additional cost.
 - 2) Hard-drawn copper, 98 percent conductivity.
 - b. Size: Ampacity as indicated on drawings, with uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
 - 1) Neutral bus: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus
 - 2. Ground Bus: Equipped with connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
 - a. Material: Hard-drawn copper, 98 percent conductivity
 - b. Size: Minimum-size required by UL 891
- L. Line-Side Conductor Connectors (Lugs):
 - 1. General: Suitable for use with conductor material and sizes. Connections shall comply with requirements of Division 26 section "Low-Voltage Electrical Power Conductors and Cables".
 - 2. Material: Same as bus material.
 - 3. Capacity rating: Same as associated bus.
 - 4. Type: Provide mechanical type unless otherwise indicated on Drawings, refer to schedules and one-line diagram.
- M. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.
- N. Service Equipment Label: Where used as service entrance equipment, provide NRTL label for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.
- O. Main switchboards used as service entrance equipment shall be provided with infrared windows in quantities and locations to provide line-of-sight viewing of all cable terminations on the line side of the main overcurrent protective device.

2.2 SURGE PROTECTION DEVICES

- A. Provide surge protective devices as required by Division 26 Section "Surge Protective Devices".

- B. Panelboards requiring SPD and the location of the devices shall be as indicated on the Drawings.

2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Arc Flash Mitigation

- 1. Overcurrent devices, 1200 A and larger, shall be provided with an energy-reducing active arc flash mitigation capability. The energy-reducing active arc flash mitigation system shall allow the operator to enable a maintenance mode using a switch which enables a preset accelerated instantaneous override trip to reduce arc flash energy. An LED on the trip unit shall indicate the trip unit is in the maintenance mode.

B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.

- 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time pickup levels.
 - c. Long- and short-time time adjustments.
 - d. Ground-fault pickup level, time delay, and I^2t response.
- 4. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
- 5. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
- 6. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Mechanical or compression style as indicated, suitable for number, size, trip ratings, and conductor material.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
 - f. Communication Capability: Circuit-breaker-mounted communication module with functions and features compatible with power monitoring and control system specified in Division 26 Section "Electrical Power Monitoring and Control."
 - g. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 75 percent of rated voltage.
 - h. Under voltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
 - i. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
 - j. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
- 7. Service-Rated Switches: Labeled for use as service equipment.
- 8. Ground-Fault Relay: Comply with UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.

- a. Configuration: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - b. Internal Memory: Integrates the cumulative value of intermittent arcing ground-fault currents and uses the effect to initiate tripping.
 - c. No-Trip Relay Test: Permits ground-fault simulation test without tripping switch.
 - d. Test Control: Simulates ground fault to test relay and switch (or relay only if "no-trip" mode is selected).
- C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.
 - D. Fuses are specified in Division 26 Section "Fuses."

2.4 INSTRUMENTATION

- A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
 - 1. Potential Transformers: IEEE C57.13; 120 V, 60 Hz, single secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.
 - 2. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
 - 3. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
 - 4. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.
- B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
 - 1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
 - a. Phase Currents, Each Phase: Plus or minus 1 percent.
 - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
 - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
 - d. Megawatts: Plus or minus 2 percent.
 - e. Megavars: Plus or minus 2 percent.
 - f. Power Factor: Plus or minus 2 percent.
 - g. Frequency: Plus or minus 0.5 percent.
 - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
 - 2. Mounting: Display and control unit flush or semi flush mounted in instrument compartment door.

2.5 CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer.
- B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.
- C. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.6 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store switchboards according to NECA 400.
- B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
- C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install switchboards and accessories according to NECA 400.
- C. Equipment Mounting: Install switchboards on concrete base, 4-inch (100-mm) nominal thickness. Comply with requirements for concrete base specified in Division 03 Section "Cast-in-Place Concrete."
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
 - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 4. Install anchor bolts to elevations required for proper attachment to switchboards.
- D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.
- E. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.
- F. Install filler plates in unused spaces of panel-mounted sections.
- G. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.
 - 1. Set field-adjustable switches and circuit-breaker trip ranges.
- H. Install spare-fuse cabinet.
- I. Comply with NECA 1.

3.3 IDENTIFICATION

- A. General: Provide identification complying with requirements specified in Division 26 Section "Identification for Electrical Systems."
- B. Switchboard Nameplates: Label each switchboard with a nameplate.
- C. Device Nameplates: Label each branch circuit device in distribution switchboard with a nameplate.
- D. Warning Labels:
 - 1. Label each switchboard with a warning label in accordance with NFPA70 and NFPA 70E.
- E. Identify field-installed conductors, interconnecting wiring, and components.
- F. Instruction Sign: Provide clear, detailed, written instructions, permanently attached to the electrical gear being served by it for staff reference.
- G. One-Line: Provide a laminated, color-coded, large-format one-line diagram showing the new work is to be provided and installed in the associated electrical room.

3.4 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26 Section "Overcurrent Protective Device Coordination Study."

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NECA 400. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove necessary panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
 - c. Instruments and Equipment:
 - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

D. Switchboard will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 PROTECTION

A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer's written instructions, until switchboard is ready to be energized and placed into service.

3.7 DEMONSTRATION

A. Owner's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories].

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16442 (262416) - PANELBOARDS

PART 1 - GENERAL

1.1 SECTION INCLUDES:

- A. Distribution panelboards.
- B. Lighting and appliance branch-circuit panelboards.
- C. Disconnecting and Overcurrent Protective Devices.
- D. Fused Lighting and Appliance Branch-Circuit Panelboards.
- E. Surge Protection Devices.
- F. Accessory Components and Features.

1.2 DEFINITIONS

- A. SVR: Suppressed voltage rating.
- B. SPD: Surge Protection Device

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.4 SUBMITTALS

- A. Product Data: For each type of panelboard, switching and overcurrent protective device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.
- B. Shop Drawings: For each panelboard and related equipment.
 - 1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
 - 2. Detail enclosure types and details for types other than NEMA 250, Type 1.
 - 3. Detail bus configuration, current, and voltage ratings.
 - 4. Short-circuit current rating of panelboards and overcurrent protective devices.
 - 5. Include evidence of NRTL listing for series rating of installed devices.
 - 6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
 - 7. Include wiring diagrams for power, signal, and control wiring.
 - 8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit electronic files, in an SKM-compatible format.

- C. Fault-Current Study, Coordination Study, and Overcurrent Protective Device Settings report must be completed and submitted for review prior to final order, assembly or shipping of the electrical distribution system components. If studies have not been approved prior to shipping, assembly or final ordering of the electrical distribution system components, all changes to the equipment necessitated by the results of the study will be provided by the contractor at no additional cost to the project. Refer to specification section "Overcurrent Protective Device Coordination Study"
- D. Qualification Data: For qualified testing agency.
- E. Field Quality-Control Reports:
 - 1. Test procedures used.
 - 2. Test results that comply with requirements.
 - 3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- F. Panelboard Schedules: Submit final panelboard directories.
- G. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
 - 1. Routine maintenance requirements for panelboards and all installed components.
 - 2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 - 3. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Member company of NETA or an NRTL.
 - 1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
- B. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NEMA PB 1.
- E. Comply with NFPA 70.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Remove loose packing and flammable materials from inside panelboards; install temporary electric heating (250 W per panelboard) to prevent condensation.
- B. Handle and prepare panelboards for installation according to NEMA PB 1.

1.7 FIELD CONDITIONS

- A. Environmental Limitations:
 - 1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - a. Ambient Temperature: Not exceeding 23 deg F (minus 5 deg C) to plus 104 deg F (plus 40 deg C).
 - b. Altitude: Not exceeding 6600 feet (2000 m).
- B. Service Conditions: NEMA PB 1, usual service conditions, as follows:
 1. Ambient temperatures within limits specified.
 2. Altitude not exceeding 6600 feet (2000 m).
- C. Interruption of Existing Electric Service: Do not interrupt electric service to occupied facilities. Refer to Division 26 Section "General Electrical Requirements" for allowable outages.

1.8 WARRANTY

- | |
|--|
| <p>A. <u>Warranty in accordance with requirements of DIV 01 and section 16050 (26 05 00).</u> Warranty Period: Five years from date of Substantial Completion.</p> |
|--|

1.9 SEISMIC REQUIREMENTS

- A. Seismic bracing, restraints, and controls for all electrical systems specified herein shall be designed and installed as required by Division 26 Section "Seismic Controls for Electrical Systems" and Division 20 Section "Seismic Controls for MEP/F/T Systems".

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.
- B. Enclosures: Flush- or surface-mounted cabinets as noted.
 1. Rated for environmental conditions at installed location.
 - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
 - b. Outdoor Locations: NEMA 250, Type 3R.
 - c. Kitchen and/or Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
 - d. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
 - e. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 5.
 2. Finishes:
 - a. Panels and Trim: Steel and galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
 - b. Back Boxes: Galvanized steel.
 3. Directory Card: Inside panelboard door, mounted in transparent card holder.
- C. Incoming Mains Location: Top and/or bottom as required.
- D. Buses: Three phase, four wire unless otherwise indicated.
 1. Phase, and Neutral Buses:
 - a. Material:
 - 1) Tin-plated aluminum.

- a) Hard-drawn copper, 98 percent conductivity, may be substituted if provided at no additional cost.
 - 2) Hard-drawn copper, 98 percent conductivity.
 - b. Size: Ampacity as indicated on drawings, with uniform capacity for entire length of panelboard's sections.
 - 1) Neutral bus: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus
 - 2. Ground Bus: Equipped with connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
 - a. Material: Hard-drawn copper, 98 percent conductivity
 - b. Size: Minimum-size required by UL 67
 - 3. Split Bus: Vertical buses divided horizontally into individual vertical sections.
- E. Line-Side Conductor Connectors (Lugs):
- 1. General: Suitable for use with conductor material and sizes. Connections shall comply with requirements of Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".
 - 2. Material: Same as bus material.
 - 3. Capacity rating: Same as associated bus.
 - 4. Type: Provide mechanical type unless otherwise indicated on Drawings, refer to schedules and one-line diagram.
- F. Feed-Through Lugs:
- 1. General: Suitable for use with conductor material and sizes. Connections shall comply with requirements of Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".
 - 2. Location: Locate at opposite end of bus from line side lugs or main device.
 - 3. Material: Same as line side conductor connectors.
 - 4. Capacity rating: Same as associated bus.
 - 5. Type: Same as line side conductor connectors.
- G. Subfeed lugs (Double Lugs):
- 1. General: Suitable for use with conductor material and sizes. Connections shall comply with requirements of Division 26 Section "Low-Voltage Electrical Power Conductors and Cables".
 - 2. Location: Locate at same end of bus as incoming lugs or main device.
 - 3. Material: Same as line side conductor connectors.
 - 4. Capacity rating: Same as associated bus.
 - 5. Type: Same as line side conductor connectors.
- H. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
- I. Panelboard Short-Circuit Current Rating – Fully Rated: Fully rated to interrupt symmetrical short-circuit current available at terminals.

2.2 DISTRIBUTION PANELBOARDS

- A. See manufacturers above.
- B. Panelboards: NEMA PB 1, power and feeder distribution type.
- C. Doors: For doors more than 36 inches (914 mm) high, provide two latches, keyed alike.
- D. Mains: As indicated on drawings.

- E. Branch Overcurrent Protective Devices:
 - 1. Connection to bus:
 - a. For Circuit-Breaker Frame Sizes 125 A and Smaller: Bolt-on circuit breakers.
 - b. For Circuit-Breaker Frame Sizes Larger Than 125 A: Bolt-on circuit breakers; plug-in circuit breakers where individual positive-locking device requires mechanical release for removal.
 - 2. Type: Provide types as indicated on drawings and as defined below.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

- A. See manufacturers above.
- B. Panelboards: Circuit breaker type: NEMA PB 1, lighting and appliance branch-circuit type.
- C. Mains: As indicated on drawings.
- D. Branch Overcurrent Protective Devices: Plug-in circuit breakers, replaceable without disturbing adjacent units.
- E. Column-Type Panelboards: Narrow gutter extension, with cover, to overhead junction box equipped with ground and neutral terminal buses.

2.4 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. See manufacturers above.
- B. Arc Flash Mitigation
 - 1. Overcurrent devices, 1200 A and larger, shall be provided with an energy-reducing active arc flash mitigation capability. The energy-reducing active arc flash mitigation system shall allow the operator to enable a maintenance mode using a switch which enables a preset accelerated instantaneous override trip to reduce arc flash energy. An LED on the trip unit shall indicate the trip unit is in the maintenance mode.
- C. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
 - 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 - 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
 - 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time pickup levels.
 - c. Long- and short-time time adjustments.
 - d. Ground-fault pickup level, time delay, and I^2t response.
 - 4. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
 - 5. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
 - 6. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Mechanical type unless otherwise indicated on Drawings, suitable for number, size, trip ratings, and conductor materials.

- c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Ground-Fault Protection: Relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - 1) Mounting: Integral
 - e. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in [on] [off] [on or off] position.
 - f. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.
- A. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.
 - D. Fuses are specified in Division 26 Section "Fuses."

2.5 FUSED LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS (30 TO 400A MAINS)

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Cooper Bussman Quik Spec Coordination Panelboards type QSCP
- B. Bus Bars: Shall be tin-plated copper.
- C. Panelboards: listed to UL 67
 - 1. Provide space behind locking door for a minimum of 6 spaces to store replacement branch circuit fuses.
- D. Mains:
 - 1. Permanently installed lockout means shall be provided.
 - 2. Quick-make, quick-break type.
- E. Branch Overcurrent Protective Devices:
 - 1. Device shall have visible circuit ON/OFF indication with colored and international symbol markings
 - 2. Device shall provide open fuse indication via permanently installed neon or LED indicating light.
 - 3. Fuse and disconnect assembly shall be a finger-safe component with trim installed.
 - 4. No special tools shall be required for fuse removal.
 - 5. Devices shall have bolt-on style bus connectors.
 - 6. Device housing shall be clearly marked with device amperage.
 - 7. Permanently installed lockout means shall be provided on the device for lockout tagout procedures. Permanently installed means for locking device in the ON position shall also be provided.
 - 8. Device shall provide fuse amp rating rejection at the following ampacities to ensure continued circuit protection at the specified circuit rating: 15A, 20A, 30A, 40A, 50A, 60A, 70A, 90A & 100A.
 - 9. Branch circuit overcurrent protection shall be 600Vac UL Listed minimum 300kA IR and CSA Certified minimum 200kA IR finger-safe fuse with Class J* performance characteristics. Cooper Bussmann UL class CF CUBEFuse meets this requirement.

2.6 SURGE PROTECTION DEVICES

- A. Provide surge protective devices as required by Division 26 Section "Surge Protective Devices".
- B. Panelboards requiring SPD and the location of the devices shall be as indicated on the Drawings.

2.7 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

- B. Portable Test Set: For testing functions of solid-state trip devices without removing from panelboard. Include relay and meter test plugs suitable for testing panelboard meters and switchboard class relays.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.
- B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.
- C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install panelboards and accessories according to NEMA PB 1.1.
- B. Wall-Mounted Panelboards: Install panelboards on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For panelboards not at walls, provide freestanding racks complying with Division 26 Section "Hangers and Supports for Electrical Systems."
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.
- D. Mount top of trim 72 inches (1788 mm) above finished floor unless otherwise indicated.
- E. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
- F. Install overcurrent protective devices and controllers not already factory installed.
 - 1. Set field-adjustable, circuit-breaker trip ranges.
- G. Install filler plates in unused spaces.
- H. Stub four 1-inch (27-GRC) empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch (27-GRC) empty conduits into raised floor space or below slab not on grade.
- I. Arrange conductors in gutters into groups and bundle and wrap with wire ties.
- J. Comply with NECA 1.

3.3 IDENTIFICATION

- A. General: Provide identification complying with requirements specified in Division 26 Section "Identification for Electrical Systems."
- B. Panelboard Nameplates: Label each panelboard with a nameplate.

- C. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate.
- D. Warning Labels: Label each panelboard with a warning label in accordance with NFPA 70 and NFPA 70E.
 - 1. Exception: Do not install NFPA 70 working clearance requirements on flush panelboards and similar equipment in finished spaces.
- E. Identify field-installed conductors, interconnecting wiring, and components; complying with Division 26 Section "Identification for Electrical Systems."
- F. Panel Directories
 - 1. Create a directory to indicate installed circuit loads; incorporate Owner's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.
 - 2. Note the date the directory was created/updated.
 - 3. Create directory after loads have been balanced.

3.4 ADJUSTING

- A. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26 Section "Overcurrent Protective Device Coordination Study."

3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- D. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
 - c. Instruments and Equipment:
 - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
- E. Panelboards will be considered defective if they do not pass tests and inspections.

- F. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16140 (262726) - WIRING DEVICES

PART 1 - GENERAL

- A. This Section includes the following:
 - 1. Receptacles: Single, duplex, twist-lock, ground-fault circuit interrupters (GFCI), isolated ground (IG)
 - 2. AC Wall Switches: Single- and double-pole, three- and four-way, maintained and momentary, pilot light and lighted toggle.
 - 3. Device Wall Plates.
 - 4. Emergency Power Off Buttons

1.2 DEFINITIONS

- A. GFCI: Ground-fault circuit interrupter.
- B. IG: Isolated Ground
- C. PIR: Passive Infrared.
- D. RFI: Radio Frequency Interference
- E. SPD: Surge Protective Device
- F. USB: Universal Serial Bus
- G. TR: Tamper Resistant

1.3 SUBMITTALS

- A. General: Submit the following in accordance with Division 01 and Division 26 Section “General Electrical Requirements”.
- B. Product data for the following products:
 - 1. Provide manufacturer’s catalog information specifically marked to indicate which devices are being furnished, and showing dimensions, colors, and configurations for all devices, including, but not limited to: Receptacles, AC wall switches, cover plates, power poles, and multi-outlet assemblies.
- C. Shop drawings for:
 - 1. List of legends and description of materials and process used for pre-marking wall plates.
- D. Field quality-control test reports.
- E. Operations and Maintenance Data:
- F. Warranty: Special warranties specified in this Section.

1.4 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of wiring device and associated cover plate from a single manufacturer and through one source. Where practical and possible, obtain all wiring devices and associated cover plates from a single manufacturer and one source.

- B. Materials shall be manufactured by companies that have been specializing in the products specified in this Section, for a minimum of 10 years.
- C. Electrical Components, Devices, and Accessories:
 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that are acceptable to authorities having jurisdiction.
 2. Marked for intended use.
- D. Comply with NFPA 70.

1.5 COORDINATION

- A. Receptacles for Equipment Furnished by Owner or Under Other Divisions or Contracts: Match plug configurations.

1.6 SPARES

- A. Furnish spare parts described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Wall Plates: One for every 10 of each type (i.e., style, size, and finish) installed, but no fewer than two of each type.

PART 2 - PRODUCTS AND MATERIALS

2.1 GENERAL

- A. Wiring devices are defined as single discrete units of electrical distribution systems, such as convenience receptacles, switches, special purpose receptacles, and similar, which are intended to carry, but not use electrical energy. Install wiring devices as required by the Specifications and where indicated on the Drawings.

2.2 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Receptacles and Switches:
 - a. Cooper Wiring Devices.
 - b. Hubbell Incorporated; Wiring Device-Kellems.
 - c. Leviton Mfg. Company Inc.
 - d. Pass & Seymour/Legrand; Wiring Devices Div.
 2. Emergency Power Off Buttons:
 - a. GE Industrial.
 - b. Square D/Groupe Schneider NA.
 - c. Eaton.
- B. In other Part 2 articles below, where lists of manufacturers and device catalog numbers are included, the following additional requirements apply to product selection:
 1. Additional Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include manufacturers listed in individual articles below, in addition to those listed in Paragraph "Manufacturers" above.

2.3 FINISHES

A. Color:

1. Wiring devices connected to normal power systems: As selected by Architect unless otherwise indicated or required by NFPA 70. Cover plates: The same as the wiring device.
2. Wiring devices connected to emergency power systems: Red Cover plates: The same as the wiring device and engraved with "EMERGENCY POWER" with white filler in the engraving. Engrave the panelboard designation and circuit number serving the emergency device into the cover plate.
3. Isolated-Ground receptacles: Orange with an orange triangle on its face. Cover plates: [The same as the wiring device and engraved with "ISOLATED GROUND" at the top with white filler in the engraving.

B. Manufacturer's model numbers listed are to establish the quality of the wiring devices. Coordinate the proper suffixes in order to provide the correct color as specified above.

2.4 CONVENIENCE RECEPTACLES:

A. The catalog numbers listed below are generally for 20A rated devices. Where 15A rated devices are indicated on the Drawings or required for circuit rating limitations, provide receptacles equivalent to those specified for 20A, but rated for 15A.

B. Duplex convenience receptacles: Heavy Duty Specification grade, NEMA 5-20R, 125V, 20A, grounding type, UL listed and labeled, smooth nylon face, side and back wired, self-grounding.

<u>Manufacturer</u>	<u>Duplex</u>	<u>Single</u>
Cooper	5362	5351
Hubbell	5352A	HBL5361
Leviton	5352	5261
Pass & Seymour	5362	5361

C. Duplex weather resistant convenience receptacles: Heavy Duty Specification grade, NEMA 5-20R, 125V, 20A, grounding type, UL listed and labeled, smooth nylon face, side and back wired, self-grounding.

<u>Manufacturer</u>	<u>Duplex</u>
Cooper	TWR270
Hubbell	5362WR
Leviton	WBR20
Pass & Seymour	WR5862

D. Twist-Locking type receptacles: NEMA L5-20R, 125V, 20A, grounding type, UL listed and labeled, nylon face, side and back wired, self-grounding.

<u>Manufacturer</u>	<u>Single</u>
Cooper	L520R
Hubbell	HBL2310
Leviton	2310
Pass & Seymour	L520-R

- E. Automatically Controlled receptacles: Where indicated on drawings, provide device type from other applicable category, along with marking for controlled receptacles as required by the current version of the NEC. In the case where the NEC is not applicable to the project, the device shall still be provided with this marking. In that case, the NEC is providing the standard for the marking and this specification is requiring it to be marked above and beyond the application of the code.

2.5 GFCI RECEPTACLES

- A. Ground fault circuit interrupter type receptacles: Specification Grade UL listed and labeled complying with UL 943, Class A and NEMA WD-1-1.10, 125V, 20A, trip at 4-6mA within 0.025 second, and feed-thru type with integral heavy duty NEMA 5-20R receptacle arranged to protect receptacles down stream on the same circuit.

<u>Manufacturer</u>	<u>Specification Grade</u>
Cooper	VGf2
Hubbell	GF20LA
Leviton	T7899-H
Pass & Seymour	2095

- B. Ground fault circuit interrupter type weather-resistant receptacles: Specification Grade listed and labeled complying with UL 943, Class A and NEMA WD-1-1.10, 125V, 20A, trip at 4-6mA within 0.025 second, and feed-thru type with integral heavy duty NEMA 5-20R receptacle arranged to protect receptacles down stream on the same circuit.

<u>Manufacturer</u>	<u>Specification Grade</u>
Cooper	WRVGf20
Hubbell	GFTR20
Leviton	W7899
Pass & Seymour	2095TRWR

- C. Ground fault circuit interrupter with Blank Face: Specification Grade UL listed and labeled complying with UL 943, Class A and NEMA WD-1-1.10, 125V, 20A, trip at 4-6mA within 0.025 second, and feed-thru type with integral heavy duty NEMA 5-20R receptacle arranged to protect receptacles down stream on the same circuit.

<u>Manufacturer</u>	<u>Specification Grade</u>
Cooper	VGfD20
Hubbell	GFBF20
Leviton	7595

- D. Ground fault circuit interrupter with Isolated Ground: Specification Grade UL listed and labeled complying with UL 943, Class A and NEMA WD-1-1.10, 125V, 20A, trip at 4-6mA within 0.025 second, and feed-thru type with integral heavy duty NEMA 5-20R receptacle arranged to protect receptacles down stream on the same circuit.

<u>Manufacturer</u>	<u>Specification Grade</u>
Cooper	N/A
Hubbell	N/A
Leviton	2095IGTRW
Pass & Seymour	N/A

2.6 ISOLATED GROUND RECEPTACLES

- A. Isolated ground receptacles: Heavy Duty Specification grade NEMA 5-20R NEMA L5-20R, 125V, 20A, grounding type, UL listed and labeled, nylon face, side and back wired, furnished with a green pigtail connected to the grounding contact, and grounding contacts electrically isolated from the mounting strap.

<u>Manufacturer</u>	<u>[Straight Blade]</u>	<u>[Locking]</u>
Cooper	IG5362	IGL520R
Hubbell	IG5352	IG2310
Leviton	5362-IG	2310-IG
Pass & Seymour	IG5362	N/A

2.7 SWITCHES

- A. The catalog numbers listed below are generally for 20A rated devices. Where 15A rated devices are indicated on the Drawings or required for circuit rating limitations, provide switches equivalent to those specified for 20A, but rated for 15A.
- B. Switches: Heavy Duty Specification grade, rated for 120/277V, 20A, back and side wired, and UL listed and labeled.

<u>Manufacturer</u>	<u>1 Pole</u>	<u>2 Pole</u>	<u>3 Way</u>	<u>4 Way</u>
Cooper	AH1221	AH2221	AH3221	AH4221
Hubbell	1221	1222	1223	1224
Leviton	1221-2	1222-2	1223-2	1224-2

Pass & Seymour CSB20AC1 CSB20AC2 CSB20AC3 CSB20AC4

- C. Key operated light switches: Same as standard light switches except toggle handle shall be operated by a factory provided key.

<u>Manufacturer</u>	<u>1 Pole</u>	<u>2 Pole</u>	<u>3 Way</u>	<u>4 Way</u>
Cooper	221L	2222L	2223L	2224L
Hubbell	HBL1221L	HBL1222L	HBL1223L	HBL1224L
Leviton	1221-2KL	122202KL	1223-2KL	1224-2KL
Pass & Seymour	PS20AC1-L	PS20AC2-L	PS20AC3-L	PS20AC4-L

- D. Switches for use with mechanically-held, electrically-operated lighting contactors: Single pole, double throw, momentary, center off switch, rated for 120/277V, and UL listed and labeled.

<u>Manufacturer</u>	<u>1 Pole</u>
Cooper	1995
Hubbell	HBL1557
Leviton	1257-I
Pass & Seymour	1251

2.8 DUAL VOLTAGE SWITCH RELAY

- A. A normally-open, electrically-held relay that allows a single-pole switch to control loads operating at two different voltages (e.g., 120V and 277V); listed to UL Standard 916; installed in a 2-gang outlet box, with a voltage-separating barrier and plaster ring.

<u>Manufacturer</u>	<u>Model Number</u>
Lighting Controls and Design	GR 2001 DV – X

2.9 COVER PLATES

- A. Damp Location Weatherproof Receptacle Cover Plates: UL-listed Wet Location (cover closed, not in use); die-cast, gasketed (factory-installed) self-closing covers, for horizontal or vertical mounting as indicated:

<u>Manufacturer</u>	<u>Horizontal</u>	<u>Vertical</u>
Cooper	1966	966
Hubbell	RW51020	RW51040
	16140 (262726) - 6	

Leviton	4990	4978
Pass & Seymour	4511	4512

- A. Wet Location Weatherproof Receptacle Cover Plates (Outlet Box Hood): NEMA 3R weather resistant recessed or flush mount, die cast aluminum lockable cover. Configure cover for horizontal mounting of receptacle or as indicated otherwise. Back box must be suitable for conduit connections. Coordinate back box with wall depth.

<u>Manufacturer</u>	<u>Horizontal</u>
Thomas & Betts	CKMU
Eaton	WIUMV-1
Hubbell	WP26MH
Leviton	IUM1H-GY

- B. Damp and Wet Location Weatherproof switch cover plates: Fabricated of cast aluminum or cast zinc, sealed water-tight and UL listed for wet locations.

<u>Manufacturer</u>	<u>1 Gang</u>	<u>2 Gang</u>
Appleton	FSK	--
Raco	5100 Series	--
Steel City	SW Series	--

- C. Other locations: Single and combination types to match corresponding wiring devices and manufacturer of wiring devices specified herein.

1. Plate securing screws: Metal with head color to match finish plate.
2. Material for Finished Spaces: Smooth plastic, minimum 0.10-inch thick. Refer to "Finishes" above for color.
3. Material for Unfinished Spaces and surface mounted wiring devices: Galvanized steel.
4. Masonry walls and oversized wall openings: Jumbo size plates with same material as indicated above.

2.10 EMERGENCY POWER OFF BUTTONS

- A. Push Button Operators: 30MM, watertight/oiltight, heavy duty, 600V maximum ac/dc, 10A continuous, momentary, non-illuminated, shrouded push button operator. Provide with 1 normally open and 1 normally closed contact block.

<u>Manufacturer</u>	<u>Red Button</u>
Schneider	9001KR1RH13

GE Industrial CR104PBG91R3

Eaton 10250T5021

- B. Push/Pull Button Operators: 30MM, watertight/oiltight, heavy duty, 600V maximum ac/dc, 10A continuous, 2 position maintained, non-illuminated, push/pull button operator. Provide with 1 normally open and 1 normally closed contact block.

Manufacturer Red Button

Schneider 9001SKR9RH13

GE Industrial CR104PBM91R5C

Eaton 10250T5B621

- C. Break Glass Operators: 30MM, watertight/oiltight heavy duty, 600V maximum ac/dc, 10A continuous, push button operator that when disk is broken the operator is released to its open position.. Provide with 1 normally closed contact block, surface or recess mounted, NEMA 1, 4, 4X enclosure with integral break glass hammer and chain.

Manufacturer

Schneider 9001K15

Eaton 10250TBG

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install all wiring devices plumb, level, and square with building lines. Wiring device bodies shall extend to the finished surface of the walls, ceiling or floor, as applicable, without projecting beyond them.
- C. Connect wiring devices by wrapping conductors around screw terminals. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
- D. Connect wiring device grounding terminal to branch circuit equipment grounding conductor and bond to metal outlet box. Exception: Do not bond grounding terminals of isolated ground receptacles to the outlet box.
- E. Install devices shown on wood trim, cases or other fixtures symmetrically and, where necessary, set with the long dimensions of the plate horizontal, or ganged in tandem.

- F. Unless dimensioned otherwise, install wiring devices a minimum of 24 inches from the closest edge of any sink.
- G. Install switches with OFF position down.
- H. Install cover plates on all switches, receptacles, and blank outlets.
- I. Locate wiring devices so that the cover plate does not have to be cut to be installed.
- J. Where devices are shown near wall openings, coordinate location if corner guards are to be installed so that cover plates do not require cutting.
- K. Install cover plates after the wall has been finished (painted, wall paper, etc).
- L. Install device boxes in brick or block walls such that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
- M. Provide engraved nameplate on emergency off buttons.
- N. Provide ground fault circuit interruption capability for all 120V receptacles 50A or less and all 208/240V receptacles 100A or less in code required locations. Locations include, but are not limited to: bathrooms, kitchens/food prep areas, exterior locations and within 6' of sinks. Interruption capability can be achieved via a GFCI circuit breaker or a GFCI receptacle.
- O. Provide type and quantity of normally open and/or normally closed contacts for emergency off buttons to meet the sequence of operations shown.
- P. Install wiring devices shown back-to-back on a common wall offset a minimum of 12" horizontally to reduce sound transmission between rooms.

3.2 GENERAL

- A. Outlets are only approximately located on the small scale Drawings. Use great care in the actual location by consulting the various large scale detailed Drawings used by other Division trades, and by securing definite locations from the Architect.
- B. Do not use multi-conductor circuits, with a shared neutral, for any GFCI receptacle circuit. Provide a separate neutral conductor with all GFCI receptacle circuits.
- C. Provide twist-locking type receptacles or other special type receptacles where indicated the Drawings.

3.3 EXAMINATION

- A. Verify existing conditions prior to beginning work.
- B. Verify that outlet boxes are installed at proper height and are flush with the finished surface.
- C. Verify that wall openings are neatly cut and will be completely covered by wall plates.
- D. Verify that floor boxes are adjusted properly and are flush with the finished surface.
- E. Verify that branch circuit wiring installation is completed, tested, and ready for connection to wiring devices.
- F. Verify that openings in access floor are in proper locations.

3.4 PREPARATION

- A. If required, provide extension rings to bring outlet boxes flush with finished surface.
- B. Clean debris from in and around outlet boxes.

3.5 MOUNTING HEIGHTS

- A. Coordinate locations of outlet boxes provided under Division 26 Section "Common Work Results for Electrical".
- B. Unless noted otherwise, install wiring devices at mounting heights indicated in the Electrical Symbols Legend on the construction drawings.
 - 1. Receptacles:
 - a. General:
 - 1) Unless indicated otherwise, install vertically with the ground slot mounted at the top.
 - 2) Where Installed horizontally, install neutral slot mounted at the top.
 - b. Above counters:
 - 1) Mount vertically.
 - c. Mechanical and electrical equipment rooms and janitors closets:
 - 1) Mount horizontally.
 - d. Garages:
 - 1) Wet location: Mount horizontally.
 - 2) Other locations: Mount vertically.
 - e. Weatherproof exterior receptacles:
 - 1) Mount horizontally.
 - f. GFCI receptacles: Same as general receptacles.
 - g. Isolated ground receptacles: Same as general receptacles.
 - h. Concrete Block Walls: Dimensions above may be adjusted slightly, as required to compensate for variable joint dimensions, such that bottom or top of boxes, as applicable, are at block joints.
 - 2. Switches:
 - a. Above counters: Same as for receptacles.
 - b. Concrete Block Walls: Dimension may be adjusted slightly, as required to compensate for variable joint dimensions, such that bottom of boxes are at block joints.
 - c. Walls with wainscoting: 6 inches minimum above wainscoting, but not exceeding 48 inches above finished floor.
 - 3. Telephone/Data Outlet Boxes:
 - a. General: Match mounting height of adjacent wiring device listed above.
 - 4. Emergency Power Off Buttons and Break Glass Operators:
 - a. General: Match requirements of switches listed above.
 - b. Wall-mounted telephone: 40 inches above finished floor.

3.6 IDENTIFICATION

- A. Label all devices fed down stream of GFCI protected receptacles as "GFCI PROTECTED".
- B. Comply with Division 26 Section "Identification for Electrical Systems."
 - a. .
 - b. Adhesive film label, but with letter/number height of 1/4 inch, on face of plate.

3.7 FIELD QUALITY CONTROL

- A. Inspect each wiring device for defects.

- B. Operate each wall switch with circuit energized and verify proper operation.
- C. Verify that each receptacle device is energized. After installing wiring devices and after electrical circuitry has been energized, test for proper polarity, ground continuity, and compliance with requirements.
- D. Test all wiring devices for electrical continuity and proper polarity of connections.
- E. Test each GFCI receptacle device for proper operation.
- F. Correct wiring devices incorrectly installed.
- G. Repair or replace all damaged items or damaged finishes at no expense to the Owner.

3.8 ADJUSTING

- A. Adjust devices and wall plates to be flush and level.

3.9 CLEANING

- A. Clean exposed surfaces to remove splatters and restore finish.

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16150 (262813) - FUSES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
1. Cartridge fuses rated 600-V ac and less for use in:
 - a. Control circuits
 - b. Enclosed switches
 - c. Panelboards
 - d. Switchboards
 - e. Enclosed controllers
 - f. Motor-control centers.
 2. Plug fuses rated 125-V ac and less for use in plug-fuse-type:
 - a. Enclosed switches
 - b. Fuseholders
 - c. Panelboards.
 3. Plug-fuse adapters for use in Edison-base, plug-fuse sockets.
 4. Spare-fuse cabinets.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material, dimensions, descriptions of individual components, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:
1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.
 - a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
 - b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.
 2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
 3. Current-limitation curves for fuses with current-limiting characteristics.
 4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse. Submit on translucent log-log graph paper if available.
 5. Coordination charts and tables and related data.
 6. Fuse sizes for elevator feeders and elevator disconnect switches.
- B. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
1. All items requested under "Product Data".

1.3 QUALITY ASSURANCE

- A. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.
- D. Comply with NFPA 70.
- E. Comply with UL 248-11 for plug fuses.

1.4 PROJECT CONDITIONS

- A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F (5 deg C) or more than 100 deg F (38 deg C) apply manufacturer's ambient temperature adjustment factors to fuse ratings.

1.5 COORDINATION

- A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

1.6 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: Equal to 10percent of quantity installed for each size and type, but no fewer than two of each size and type.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following]:
 - 1. Cooper Bussmann, Inc.
 - 2. Edison Fuse, Inc.
 - 3. Mersen Electrical Power
 - 4. Littelfuse, Inc.

2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.

2.3 PLUG FUSES

- A. Characteristics: UL 248-11, nonrenewable plug fuses; 125-V ac.

2.4 PLUG-FUSE ADAPTERS

- A. Characteristics: Adapters for using Type S, rejection-base plug fuses in Edison-base fuseholders or sockets; ampere ratings matching fuse ratings; irremovable once installed.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- C. Install plug-fuse adapters in Edison-base fuseholders and sockets. Ensure that adapters are irremovable once installed.
- D. Install spare-fuse cabinet(s).

3.2 EXAMINATION

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 FUSE APPLICATIONS

- A. Cartridge Fuses:
 - 1. Service Entrance:
 - a. Greater than 600A:
 - 1) Class L, time delay
 - b. 600A or less:
 - 1) Class RK1, time delay
 - 2. Feeders:
 - a. Greater than 600A:
 - 1) Class L, time delay
 - b. 600A or less:
 - 1) Class RK1, time delay
 - 3. Motor Branch Circuits:
 - a. Class RK1 time delay
 - 4. Other Branch Circuits:
 - a. Class RK1, time delay
 - 5. Control Circuits:
 - a. Class CC fast acting

END OF SECTION

PAGE INTENTIONALLY LEFT BLANK

SECTION 16410 (262816) - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Fusible switches.
 - 2. Nonfusible switches.
 - 3. Shunt trip switches.
 - 4. Molded-case circuit breakers (MCCBs).
 - 5. Enclosures.

1.2 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, double throw.

1.3 PERFORMANCE REQUIREMENTS

1.4 SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
 - 1. Enclosure types and details for types other than NEMA 250, Type 1.
 - 2. Current and voltage ratings.
 - 3. Short-circuit current ratings (interrupting and withstand, as appropriate).
 - 4. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
- B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Wiring Diagrams: For power, signal, and control wiring.
- C. Qualification Data: For qualified testing agency.
- D. Field quality-control reports.
 - 1. Test procedures used.
 - 2. Test results that comply with requirements.
 - 3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- E. Manufacturer's field service report.
- F. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
 - 1. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.

1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.
- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NFPA 70.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - 1. Ambient Temperature: Not less than minus 22 deg F (minus 30 deg C) and not exceeding 104 deg F (40 deg C).
 - 2. Altitude: Not exceeding 6600 feet (2010 m).

1.7 COORDINATION

- A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.8 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: Equal to 10percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 2. Fuse Pullers: Two for each size and type.

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Siemens Energy & Automation, Inc.
 - 4. Square D; a brand of Schneider Electric.
- B. Type GD, General Duty, Single Throw, 240-V ac, 800 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with cartridge fuse interiors to accommodate specified fuses, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

- D. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
 5. Hookstick Handle: Allows use of a hookstick to operate the handle.
 6. Lugs: Mechanical type, suitable for number, size, and conductor material.
 7. Service-Rated Switches: Labeled for use as service equipment.

2.2 NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.
- B. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- C. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 4. Hookstick Handle: Allows use of a hookstick to operate the handle.
 5. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.3 SHUNT TRIP SWITCHES

1. Manufacturers: Subject to compliance with requirements, Cooper Bussmann, Inc.
 2. Ferraz Shawmut, Inc.
 3. Littelfuse, Inc.
- B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with 200-kA interrupting and short-circuit current rating when fitted with Class J fuses.
- C. Switches: Three-pole, horsepower rated, with integral shunt trip mechanism and Class J fuse block; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.
- D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, > with a control power transformer enough capacity to operate shunt trip, connected pilot, and indicating and control devices.
- E. Accessories:
1. Oiltight key switch for key-to-test function.
 2. Oiltight green ON pilot light.
 3. Isolated neutral lug; 100 percent rating.
 4. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.

5. Form C alarm contacts that change state when switch is tripped.
6. Three-pole, double-throw, fire-safety and alarm relay; 120-V ac or 24-V dc coil voltage.
7. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.

2.4 MOLDED-CASE CIRCUIT BREAKERS

- A. Manufacturers: Subject to compliance with requirements:
 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.
- B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.
- C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- D. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- E. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
 1. Instantaneous trip.
 2. Long- and short-time pickup levels.
 3. Long- and short-time time adjustments.
 4. Ground-fault pickup level, time delay, and I^2t response.
- F. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
- G. Ground-Fault, Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).
- H. Features and Accessories:
 1. Standard frame sizes, trip ratings, and number of poles.
 2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.
 3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting
 4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered] type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
 5. Communication Capability: Circuit-breaker-mounted module with functions and features compatible with power monitoring and control system, specified in Division 26 Section "Electrical Power Monitoring and Control."
 6. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
 7. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
 8. Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
 9. Alarm Switch: One NO contact that operates only when circuit breaker has tripped.

10. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
11. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
12. Electrical Operator: Provide remote control for on, off, and reset operations.
13. Accessory Control Power Voltage: Integrally mounted, self-powered 120-V ac

2.5 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
 2. Outdoor Locations: NEMA 250, Type 3R.
 3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4
 4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- B. Comply with mounting and anchoring requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Install fuses in fusible devices.
- E. Comply with NECA 1.

3.3 IDENTIFICATION

- A. Comply with requirements in Division 26 Section "Identification for Electrical Systems."
 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.4 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.
 - c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
 4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections..
- C. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
- 3.5 ADJUSTING
- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

END OF SECTION

SECTION 16241 (263600) – TRANSFER SWITCHES

PART 1 - GENERAL REQUIREMENTS

1.1 SUMMARY

- A. This section includes transfer switches rated 600 V and less, including the following:
 - 1. Automatic transfer switches.
 - 2. Remote annunciation systems.
 - 3. Remote annunciation and control systems.
- B. This section does not include the following:
 - 1. Double throw (manual type) switches. Refer to Section 262816 for this equipment.
 - 2. Medium Voltage Automatic Transfer Switches. Refer to Section(s) 261300 or section 262313 for this equipment.

1.2 RELATED SECTIONS INCLUDING THE FOLLOWING:

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Related Sections include the following:
 - 1. Division 21 Section "Electric-Drive, Centrifugal Fire Pumps" for automatic transfer switches for fire pumps.
 - 2. Division 21 Section "Electric-Drive, Vertical-Turbine Fire Pumps" for automatic transfer switches for fire pumps.

1.3 SUBMITTALS REQUIRED FOR REVIEW

- A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.
 - 1. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.
 - 2. Schematic diagrams.
 - 3. Wiring diagrams.
- C. Manufacturer Seismic Qualification Certification: Submit certification that transfer switches accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- D. Qualification Data: For manufacturer] [and] [testing agency].
- E. Factory test reports.
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
 - 1. Features and operating sequences, both automatic and manual.
 - 2. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

1.4 DEFINITIONS

- A. Closed Transition (Make-Before-Break): In a switching device, a configuration in which the new connection path is established before the previous contacts are opened. This prevents the switched path from ever seeing an open circuit.
- B. Open Transition (Break-Before-Make): A switch that is configured to break (open) the first set of contacts before engaging (closing) the new contacts. This prevents the momentary connection of the old and new circuit paths together.
- C. Withstand duration: The withstand rating value is the level of fault current that must be withstood for a specified length of time, i.e., 42000 amps at 3 cycles.
- D. Level 1 Equipment: Level 1 is the more stringent NFPA emergency life safety requirement and is imposed when failure of the emergency system, including the transfer equipment could result in loss of human life or serious injury.
- E. Level 2 Equipment: Level 2 is the less stringent NFPA emergency life safety requirement and is imposed when failure of the emergency system including the transfer equipment is less critical to human life safety.

1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Maintain a service center capable of providing training, parts, and emergency maintenance repairs within a response period of less than eight hours from time of notification.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with NEMA ICS 1.
- D. Comply with NFPA 70.
- E. Comply with NFPA 99.
- F. Comply with NFPA 110.
- G. Comply with UL 1008 unless requirements of these Specifications are stricter.
- H. Installed equipment must be UL listed and bear the UL label.

1.6 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of the Transfer Switch that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Damage from transient voltage surges.
- B. Warranty Period: Cost to repair or replace any parts for two years from date of Substantial Completion.
- C. Extended Warranty Period: Cost of replacement parts (materials only, f.o.b. the nearest shipping point to Project site), for eight years, that failed in service due to transient voltage surges.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Contactor Transfer Switches:
 - a.
 - b. Emerson; ASCO Power Technologies, LP.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

- A. Indicated Voltage and Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated. Voltage ratings shall be consistent with applications from 115 volts AC to 600 volts and single or three phase as required by the application. Current ratings and the number of poles shall be as indicated on the plans.
- B. Tested Fault-Current Closing and Withstand Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
 - 1. Where transfer switch includes internal fault-current protection, rating of switch and trip unit combination shall exceed indicated fault-current value at installation location.
 - 2. Where the transfer switch internal fault-current protection can not exceed the indicated fault-current values, an enclosed fused switch with current limiting fuses shall be installed ahead of the transfer switch.
- C. Controls: Solid State control having repetitive accuracy of all settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C. All internal controls components shall be accessible from the equipment front.
- D. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.
- E. Electrical Operation: Accomplish by a non-fused, momentarily energized solenoid or electric-motor-operated mechanism, mechanically and electrically interlocked in both directions.

- F. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
 - 1. Limitation: Switches using molded-case switches or circuit breakers or insulated-case circuit-breaker components are not acceptable.
 - 2. Switch Action: Double throw; mechanically held in both directions.
 - 3. Contacts: Silver composition or silver alloy for load-current switching. Conventional automatic transfer-switch units, rated 225 A and higher, shall have separate arcing contacts.
- G. [Neutral Switching. Where four-pole switches are indicated, provide overlapping neutral contacts.
- H. Neutral Terminal: Solid and fully rated bus bar, unless otherwise indicated.
- I. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, either by color-code or by numbered or lettered wire and cable tape markers at terminations. All factory wiring shall be accessible from the equipment front. Color-coding and wire and cable tape markers are specified in Division 26 Section "Identification for Electrical Systems."
 - 1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
 - 2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated. Power terminals shall be rated for 90 degree C and copper or aluminum cable.
 - 3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
- J. Enclosures: General-purpose NEMA 250, Type [1] [3R] [12], complying with NEMA ICS 6 and UL 508, unless otherwise indicated.
- K. Bus and Wiring: All Bus and cable /control wire shall be copper.
- L. Cable Entry: Cable entry shall be from the top and bottom.
- M. Service Entrance Rating: Where indicated on the plans, the Automatic transfer switch shall be UL rated for use as service entrance equipment.

2.3 AUTOMATIC TRANSFER SWITCHES

- A. Comply with Level 1 equipment according to NFPA 110.
- B. Switching Arrangement: Double-throw type, incapable of pauses or intermediate position stops during normal functioning, unless otherwise indicated.
- C. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.
- D. Manual Switch Operation: Unloaded. Control circuit automatically disconnects from electrical operator during manual operation.
- E. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval is adjustable from 1 to 30 seconds.
- F. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.

- G. In-Phase Monitor: Factory-wired, internal relay controls transfer so it occurs only when the two sources are synchronized in phase. Relay compares phase relationship and frequency difference between normal and emergency sources and initiates transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer is initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
- H. Automatic Transfer-Switch Features:
1. Undervoltage Sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage is adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
 2. Adjustable Time Delay: For override of normal-source voltage sensing to delay transfer and engine start signals. Adjustable from zero to six seconds, and factory set for one second.
 3. Frequency: Monitor the frequency of the incoming normal power circuit. For the normal source, initiate transfer if the frequency varies more than 5% from the rated nominal value. For the emergency source, inhibit transfer if the normal source circuit frequency varies more than 5% from the rated nominal value.
 4. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
 5. Time Delay for Retransfer to Normal Source: Adjustable from 0 to 30 minutes, and factory set for 10 minutes to automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.
 6. Test Switch: Simulate normal-source failure.
 7. Switch-Position Pilot Lights: Indicate source to which load is connected.
 8. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and emergency-source sensing circuits.
 - a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
 - b. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."
 9. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.
 10. Transfer Override Switch: Overrides automatic retransfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.
 11. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
 12. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.
 13. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods are adjustable from 10 to 30 minutes. Factory settings are for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
 - a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
 - b. Push-button programming control with digital display of settings.
 - c. Integral battery operation of time switch when normal control power is not available.

2.4 SOURCE QUALITY CONTROL

- A. Factory test and inspect components, assembled switches, and associated equipment. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- B. Floor-Mounting Switch: Anchor to floor by bolting.
 - 1. Concrete Bases: 4 inches (100 mm) high, reinforced, with chamfered edges. Extend base no more than 4 inches (100 mm) in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems."
- C. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.
- D. Identify components according to Division 26 Section "Identification for Electrical Systems."
- E. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

- A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.
- B. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."
- C. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.3 FACTORY TESTS:

- A. The Automatic Transfer Switch and Bypass Isolation Switch shall be factory tested to verify compliance with these specifications and ensure proper operation

3.4 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to perform tests and inspections and prepare test reports.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.
- C. Perform tests and inspections and prepare test reports.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installation, including connections, and to assist in testing.
 - 2. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.

3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
4. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
 - a. Check for electrical continuity of circuits and for short circuits.
 - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
 - c. Verify that manual transfer warnings are properly placed.
 - d. Perform manual transfer operation.
5. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
 - a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
 - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
 - c. Verify time-delay settings.
 - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
 - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
 - f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for 1 pole deviating by more than 50 percent from other poles.
 - g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.
6. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.
 - a. Verify grounding connections and locations and ratings of sensors.

D. Testing Agency's Tests and Inspections:

1. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
3. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
 - a. Check for electrical continuity of circuits and for short circuits.
 - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
 - c. Verify that manual transfer warnings are properly placed.
 - d. Perform manual transfer operation.
4. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
 - a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
 - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
 - c. Verify time-delay settings.
 - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
 - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
 - f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for 1 pole deviating by more than 50 percent from other poles.
 - g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.
5. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.
 - a. Verify grounding connections and locations and ratings of sensors.

E. Coordinate tests with tests of generator and run them concurrently.

- F. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.
- G. Remove and replace malfunctioning units and retest as specified above.
- H. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
 - 1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
 - 2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
 - 3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment as specified below. Refer to Division 01 Section "Demonstration and Training."
- B. Coordinate this training with that for generator equipment.

END OF SECTION

SECTION 16450 (262200) - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1500 kVA:
 - 1. Distribution transformers.

1.2 SUBMITTALS

- A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, technical certification sheets and performance for each type and size of transformer indicated.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Wiring Diagrams: Power, signal, and control wiring.
 - 2. Transformer ratings including:
 - a. kVA
 - b. Primary and secondary voltage
 - c. Taps
 - d. Basic impulse level (BIL) for equipment over 600 volts
 - e. Design impedance
 - f. Insulation class and temperature rise
 - g. Sound level.
- C. Manufacturer Seismic Qualification Certification: Submit certification that transformers, accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. The following minimum mounting and installation guidelines shall be met, unless specifically modified by the above referenced standards.
 - a. The Contractor shall provide equipment anchorage details, coordinated with the equipment mounting provision, prepared and stamped by a licensed civil engineer in the state. Mounting recommendations shall be provided by the manufacturer based upon approved shake table tests used to verify the seismic design of the equipment.
 - b. The equipment manufacturer shall certify that the equipment can withstand, that is, function following the seismic event, including both vertical and lateral required response spectra as specified in above codes.
 - c. The equipment manufacturer shall document the requirements necessary for proper seismic mounting of the equipment. Seismic qualification shall be considered achieved when the capability of the equipment, meets or exceeds the specified response spectra.
 - 4. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- D. Qualification Data: For testing agency.
- E. Source quality-control test reports.
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.3 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
 - 1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- B. Source Limitations: Obtain each transformer type through one source from a single manufacturer.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."
- E. Transformers shall meet the requirements of the most current version of federal law 10 CFR Part 431 "Energy Efficiency Program for Certain Commercial and Industrial Equipment".
- F. All transformers shall be UL listed and bear the UL label.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.5 COORDINATION

- A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
- B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Products.
 - 2. ACME Electric Corporation; Power Distribution Products Division
 - 3. General Electric Company.
 - 4. Siemens Energy & Automation, Inc.

5. Hammond Company
6. Sola/Hevi-Duty
7. Square D; Schneider Electric.

2.2 GENERAL TRANSFORMER REQUIREMENTS

- A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
- B. Cores: One leg per phase. Cores shall be constructed of high grade, non-aging silicon steel. The core and coil assembly shall be impregnated with non-hydroscopic, thermosetting varnish and cured to reduce hot spots and seal out moisture. The completed core and coil shall be bolted to the base of the enclosure but isolated by means of rubber, vibration-absorbing mounts. There shall be no metal-to-metal contact between the core and coil and the enclosure. The core of the transformer shall be visibly grounded to the enclosure by means of a flexible grounding conductor or strap sized in accordance with UL and NEC requirements. The neutral shall be brought to a stud to facilitate the required external grounding of the secondary
- C. Coils: Continuous windings without splices except for taps.
 1. Internal Coil Connections: Brazed or pressure type.
 2. Coil Material: Aluminum.
- D. Connections to transformers shall be by flexible metal conduit and using flexible couplings.
- E. Transformers shall be designed for continuous operation at rated kVA, for 24 hours a day, 365 days a year operation, with normal life expectancy as defined in ANSI C57.96.
- F. Wiring/Terminations:
 1. Recommended external cable shall be rated 90 degrees C (sized at 75 degrees C ampacity) for encapsulated and 75 degrees C for ventilated designs.
 2. Connectors should be selected on the basis of the type and cable size used to wire the specific transformer.
 3. Lug kits shall be provided by the Manufacturer of the transformer.

2.3 DISTRIBUTION TRANSFORMERS

- A. Comply with NEMA ST 20, and list and label as complying with UL 1561.
- B. Provide transformers that are constructed to withstand seismic forces specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- C. Enclosures: Unless otherwise specified, transformer enclosures shall be ventilated and be fabricated of heavy gauge, sheet steel construction. Enclosures shall have a baked polyester powder coat finish-gray in color and suitable for interior or exterior applications. Enclosures shall be constructed so that there are no exposed live parts. Enclosures shall have a removable front cover to allow access to internal parts and wiring terminations
 1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.
 2. Transformer locations:
 - a. Dry locations:
 - 1) Ventilated
 - 2) NEMA 250, Type 2.
 - b. Damp or wet:
 - 1) Ventilated. Provide weather shields over ventilation openings.
 - 2) NEMA 250, Type 3R.
 - c. Corrosive locations:
 - 1) Totally enclosed, non-ventilated
 - 2) NEMA 250, Type 4X, stainless steel

3. The maximum temperature of the enclosure shall not exceed 90 degrees C.
 4. The maximum temperature of the top of the enclosure shall not exceed 50°C rise above a 40°C ambient.
- D. Transformer Enclosure Finish: Comply with NEMA 250.
1. Finish Color: Gray.
- E. Taps for Three-phase Transformers smaller than 24 kVA and all single phase transformers: Two 5 percent taps below rated voltage.
- F. Taps for Transformers 25 kVA through 500 kVA: Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.
- G. Taps for Transformers 501 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.
- H. Insulation Class for transformers less than 15 kVA: 185 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.
- I. Insulation Class for transformers 15 kVA and larger: 220 deg C, UL-component-recognized insulation system with a maximum of 150 deg C rise above 40 deg C ambient temperature
- J. Energy Efficiency for Transformers Rated 15 kVA and Larger:
1. Complying with the requirements of the most current version of federal law 10 CFR Part 431 "Energy Efficiency Program for Certain Commercial and Industrial Equipment" efficiency levels.
 2. Tested in accordance with federal law 10 CFR Part 431.
- K. Mounting Methods.
1. Transformers 75 KVA and larger shall be floor mounted unless indicated otherwise. Transformers 45 KVA and smaller may be wall mounted where wall construction is suitable for the load. Floor mounted transformers shall be securely bolted to a 4 inch house keeping pad with vibration isolation pads. Wall mounted or suspended transformers shall have a means of isolating vibration from the support.
 2. Transformers up through 1000 KVA shall be mounted on elastomeric vibration isolation pads. Pad shall be constructed of neoprene, rubber, glass fiber, or a combination thereof. Pads shall be "ribbed" or "waffled" in texture. Pads shall be selected for smallest durometer (hardness), preferably less than 50. Deflection of pad shall be .25" static minimum. Stack pads until the desired deflection is achieved.
 3. Wall Mounting: Manufacturer's standard brackets.
 4. Suspended Mounting: See transformer mounting detail on plans.
- L. Low-Sound-Level Requirements: Maximum sound levels (NEMA ST 20), when factory tested according to IEEE C57.12.91, as follows:
1. 9 kVA and Less: 40 dBA
 2. 30 to 50 kVA: 45 dBA
 3. 51 to 150 kVA: 50 dBA
 4. 151 to 300 kVA: 55 dBA
 5. 301 to 500 kVA: 60 dBA
 6. 501 to 700 kVA: 62 dBA
 7. 701 to 1000 kVA: 64 dBA
 8. 1001 to 1500 kVA: 65 dBA

2.4 IDENTIFICATION DEVICES

- A. Nameplates: Engraved, laminated-plastic or metal nameplate for each transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26 Section "Identification for Electrical Systems."

2.5 SOURCE QUALITY CONTROL

- A. Test and inspect transformers according to ANSI C57.12.01 and IEEE C57.12.91.
- B. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project.

2.6 FACTORY TESTING

- A. The following standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with the latest version of ANSI and NEMA standards.
 - 1. Ratio tests at the rated voltage connection and at all tap connections
 - 2. Polarity and phase relation tests on the rated voltage connection
 - 3. Applied potential tests
 - 4. Induced potential test
 - 5. No-load and excitation current at rated voltage on the rated voltage connection

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.
- B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.
- C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
- D. Verify that ground connections are in place and requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.
 - 1. Brace wall-mounting transformers as specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions, seismic codes applicable to Project, and requirements in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."
- C. Use flexible conduit under the provisions of Division 26 Section "Raceways and Boxes for Electrical Systems" for connections to transformer case. Minimum flexible conduit length shall be two (2) feet.

- D. Mount transformers on vibration isolating pads suitable for isolating the transformer noise from the building structure.

3.3 CONNECTIONS

- A. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."
- B. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
- C. Remove and replace units that do not pass tests or inspections and retest as specified above.
- D. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.
 - 1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
 - 2. Perform 2 follow-up infrared scans of transformers, one at 4 months and the other at 11 months after Substantial Completion.
 - 3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.
- E. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

- A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.
- B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.
- C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

- A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 16251 (264113) - LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes requirements for UL 96A Master Labeled lightning protection system consisting of air terminals on roofs, roof mounted mechanical equipment, stacks, bonding of structure and miscellaneous metal objects; Grounding electrodes; and interconnecting conductors.
- B. System Design: Contractor shall perform all calculations and develop all plan and detail drawings required, in conjunction with these specifications, for installation of a complete and fully functional lightning protection system.
- C. All “Out buildings” in future phase shall be included.

1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
 - 1. Division 26 Section “General Electrical Requirements”.
 - 2. Division 26 Section “Common Work Results for Electrical”.
 - 3. Division 26 section “Grounding and Bonding for Electrical Systems”.
 - 4. Division 26 Section “Raceway and Boxes for Electrical Systems”.
 - 5. Division 26 Section “Surge Protective Devices”.
- B. Applicable Codes and Standards
 - 1. NFPA 70 – National Electrical Code
 - 2. UL 96 – Lightning Protection Components
 - 3. UL 96A – Installation requirements for Lightning Protection Systems
 - 4. NFPA 780 – Lightning Protection Systems
 - 5. LPI 175 – Standard of Practice for the Design – Installation – Inspection of Lightning Protection Systems

1.3 DEFINITIONS

- A. The following definitions apply to terms used in this section:
 - 1. Air Terminal: A strike termination device that is a receptor for attachment of flashes to the lightning protection system and is UL listed for that purpose.
 - 2. Bonding: An electrical connection between an electrically conductive object and a component of a lightning protection system that is intended to significantly reduce potential differences created by lightning currents.
 - 3. Class I Materials: Lightning conductors, air terminals, ground terminals, and associated fittings required by NFPA 780 for protection of structures not exceeding 75 feet (23 meters) in height.
 - 4. Class II Materials: Lightning conductors, air terminals, ground terminals, and associated fittings required by NFPA 780 for the protection of structures exceeding 75 feet (23 meters) in height.
 - 5. Bonding conductor: A conductor intended to be used for equalization between grounded metal bodies and a lightning protection system.
 - 6. Main conductor: A conductor intended to be used to carry lightning currents between strike termination devices (air terminals) and ground terminals.
 - 7. UL: Underwriters Laboratories, Inc.
 - 8. LPI: Lightning Protection Institute

1.4 SUBMITTALS

- A. Product Data: Submit product data showing dimensions and materials of each component including listing in accordance with UL 96A.
- B. Shop Drawings: For air terminals and mounting accessories.
 - 1. Layout of the lightning protection system showing layout of air terminals grounding electrodes, and bonding connections, along with details of the components to be used in the installation.
 - 2. Include indications for use of raceway, conductor sizes, roof and/or floor penetrations, data on how concealment requirements will be met, and calculations required by NFPA 780 for bonding of grounded and isolated metal bodies.
 - 3. Layout and installation drawings shall be fully coordinated with other trades. Failure of the lightning protection contractor to perform this coordination shall not relieve said contractor from properly completing the work.
- C. Qualification Data: For qualified manufacturer. Include data on listing or certification by UL.
 - 1. Manufacturer: A company specializing in lightning protection equipment with minimum 3 years documented experience and membership in good standing with the Lightning Protection Institute.
- D. Certification, signed by Contractor, that roof adhesive is approved by manufacturer of roofing material.
- E. Field quality-control reports.
- F. Comply with recommendations in NFPA 780, Annex D, "Inspection and Maintenance of Lightning Protection Systems," for maintenance of the lightning protection system.
- G. Other Informational Submittals: Plans showing dimensioned as-built locations of grounding features, including the following:
 - 1. Ground rods.
 - 2. Ground loop conductor.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications:
 - 1. Certified by UL, trained and approved for installation of units required for this Project.
 - 2. The contractor shall be recognized as being regularly engaged in the design and installation of lightning protection systems with a minimum of 3years documented experience.
 - 3. Include documentation of certification and experience with all submitted bids.
- B. System Certificate:
 - 1. UL Master Label.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 780, "Definitions" Article.

1.6 COORDINATION

- A. Coordinate installation of lightning protection with installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies requiring bonding to lightning protection components, and building finishes.
- B. Coordinate installation of air terminals attached to roof systems with roofing manufacturer and Installer.
- C. Flashings of through-roof assemblies shall comply with roofing manufacturers' specifications.

PART 2 - PRODUCTS

2.1 LIGHTNING PROTECTION SYSTEM COMPONENTS

- A. All materials used in the installation shall be new and shall comply in weight, size, and composition with UL 96 and NFPA 780. Materials shall be labeled or listed by UL for use on lightning protection systems.
- B. Roof-Mounted Air Terminals: NFPA 780, Class II, aluminum or copper unless otherwise indicated.
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. East Coast Lightning Equipment Inc.
 - b. ERICO International Corporation.
 - c. Harger.
 - d. Heary Bros. Lightning Protection Co. Inc.
 - e. Independent Protection Co.
 - f. Preferred Lightning Protection.
 - g. Robbins Lightning, Inc.
 - h. Thompson Lightning Protection, Inc.
 - 2. Air Terminals More than 24 Inches (600 mm) Long: With brace attached to the terminal at not less than half the height of the terminal.
 - 3. Single-Membrane, Roof-Mounted Air Terminals: Designed specifically for single-membrane roof system materials. Comply with requirements in Division 07 roofing Sections.
- C. Main and Bonding Conductors: Copper and Class II.
- D. Ground Loop Conductor: The same size and type as the main conductor except tinned.
- E. Ground Rods: Copper-clad 3/4 inch (19 mm) in diameter by 10 feet (3 m) long.

2.2 SURGE PROTECTIVE DEVICES

- A. Surge Protective Devices SPD's required to meet UL 96A for UL Master Labeling shall be as specified in Division 26 Section "Surge Protective Devices".

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install lightning protection components and systems according to UL 96A and NFPA 780.
- B. Install conductors with two direct paths from air terminals to ground connections. Avoid sharp bends. Follow the manufacturer's written installation instructions.
- C. Conceal the following conductors:
 - 1. System conductors.
 - 2. Down conductors.
 - 3. Interior conductors.
 - 4. Conductors within normal view of exterior locations at grade within 200 feet (60 m) of building.
- D. Cable Connections: Use crimped or bolted connections for all conductor splices and connections between conductors and other components. Use exothermic-welded connections in underground portions of the system.

- E. Cable Connections: Use exothermic-welded connections for all conductor splices and connections between conductors and other components.
 - 1. Exception: In single-ply membrane roofing, exothermic-welded connections may be used only below the roof level.
- F. Air Terminals on Single-Ply Membrane Roofing: Comply with roofing membrane and adhesive manufacturer's written instructions.
- G. Air Terminals on Mechanical Equipment: Air terminals on mechanical equipment shall be mounted such that maintenance operations can be performed without relocation of the air terminal or interconnecting conductors.
- H. Bond extremities of vertical metal bodies exceeding 60 feet (18 m) in length to lightning protection components.
- I. Bond lightning protection components with intermediate-level interconnection loop conductors to grounded metal bodies of building at 60-foot (18-m) intervals.

3.2 CORROSION PROTECTION

- A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.
- B. Use conductors with protective coatings where conditions cause deterioration or corrosion of conductors.

3.3 FIELD QUALITY CONTROL

- A. Notify Architect at least 48 hours in advance of inspection before concealing lightning protection components.
- B. UL Inspection: Meet requirements to obtain a UL Master Label for system.

END OF SECTION

SECTION 16264 (264313) – SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Section includes Surge Protection for:
 - 1. Surge Protection Devices Internally Mounted In Switchboards
 - 2. Panelboard Suppressors Internally Mounted In Panelboards
- B. Section includes field-mounted SURGE Protective Devices (SPD's) for low-voltage (120 to 600 V) power distribution and control equipment. Device type ratings shall be:
 - 1. Type 1 - Service Entrances
 - 2. Type 2 - Service entrances or distribution switchboards or panelboards
- C. Refer to Definitions below for clarification of type selection.

1.2 DEFINITIONS

- A. ATS: Acceptance Testing Specifications.
- B. VPR: Voltage Protection Rating. The average of measured limiting voltage before and after Nominal Discharge Testing (In,) rounded up to one of UL's VPR categories (Table 63.1 of ANSI/UL 1449 Third Edition) such as 330 volt, 400 volt, 500 volt, etc. VPR is posted on each device UL label.
- C. In or In or Inominal: Nominal Discharge Current. Peak value of surge current, selected by the manufacturer, through the SPD having current wave shape of 8/20 microseconds where the SPD remains functional after 15 surges. In is posted on the device UL label.
- D. SPD: Surge Protective Device. Previously Transient Voltage Surge Suppressor (TVSS), a broad class of protective devices, installed parallel with the distribution panel or service disconnect, meant to protect downstream electrical distribution equipment from the effects of high voltage surges on the line.
- E. MCOV: Maximum Continuous Operating Voltage. The maximum continuous operating voltage rating of a Metal Oxide Varistor (MOV) that can be applied without the MOV being damaged and/or destroyed by thermal runaway. MCOV is posted on the device UL label.
- F. SCCR: Short Circuit Current Rating. The maximum current rating the SPD can sustain without being damaged and/or destroyed. SCCR is posted on the device UL label.
- G. SPD Type:
 - 1. TYPE 1: Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service equipment overcurrent device, as well as the load side, including watt-hour meter socket enclosures and intended to be installed without an external overcurrent protective device. Type 1 devices are required for Master Certification of Lightning Protection System installations under UL 96A.
 - 2. TYPE 2: Permanently connected SPDs intended for installation on the load side of the service equipment overcurrent device, including SPDs located at the branch circuit panel.
 - 3. TYPE 3: Point-of-utilization SPDs, installed at a minimum conductor length of 10 meters (30 feet) from the electrical service panel to the point of utilization, e.g., cord-connected, direct plug-in, receptacle type and SPDs installed at the utilization equipment being protected. The distance (10 meters or 30 feet) is exclusive of conductors provided with or used to attach SPD's.
 - 4. TYPE 4: Component SPDs, including discrete components as well as component assemblies for installation on panelboards or control panels.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate SPD devices with Division 26 Section "Electrical Power Monitoring and Control."

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated. Include model number, SPD type, system voltage, phases, modes of protection, voltage Protection rating (VPR), and Nominal Discharge Current (I_n), and accessories required.
- B. Product Certificates: For SPD devices, from manufacturer.
- C. Field quality-control reports.
- D. Operation and Maintenance Data: For SPD devices to include in emergency, operation, and maintenance manuals.
- E. Warranties: Sample of special warranties.

1.5 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled by UL or other Nationally Recognized Testing Laboratory (NRTL) as defined in NFPA 70, by a testing agency, and marked for intended location and application.
- B. Comply with IEEE C62.41.2 and test devices according to IEEE C62.45.
- C. Comply with NEMA LS 1.
- D. Comply with UL 1283 and ANSI/ UL 1449 Third Edition.
- E. Comply with NFPA 70.
- F. The SPD shall be compliant with the restrictions of the Hazardous Substances (RoHS) Directive 2002/95/EC.

1.6 PROJECT CONDITIONS

- A. Interruption of Existing Electrical Service: Refer to Division 26, Section "General Electrical Requirements".
- B. Service Conditions: Rate SPD devices for continuous operation under the following conditions unless otherwise indicated:
 - 1. Maximum Continuous Operating Voltage: Not less than 115 percent of nominal system operating voltage.
 - 2. Operating Temperature: 30 to 120 deg F (0 to 50 deg C).
 - 3. Humidity: 0 to 85 percent, noncondensing.
 - 4. Altitude: Less than 20,000 feet (6090 m) above sea level.

1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SERVICE ENTRANCE SUPPRESSORS (INTERNALLY AND EXTERNALLY MOUNTED SPD'S AT SERVICE ENTRANCE GEAR)

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB USA.
 2. AC Data Solutions.
 3. Advanced Protection Technologies Inc. (APT).
 4. Atlantic Scientific.
 5. Current Technology Inc.; Danaher Power Solutions.
 6. Danaher Power Solutions; United Power Products.
 7. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 8. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 9. Intermatic, Inc.
 10. LEA International.
 11. Leviton Mfg. Company Inc.
 12. Liebert Corporation; a division of Emerson Network Power.
 13. Northern Technologies, Inc.; a division of Emerson Network Power.
 14. Siemens Energy & Automation, Inc.
 15. Square D; a brand of Schneider Electric.
 16. Surge Suppression Incorporated.
- B. Surge Protection Devices:
1. Comply with UL 1449 Third Edition.
 2. Modular design (with field-replaceable modules) Non-modular design.
 3. Fuses, rated at 200-kA interrupting capacity.
 4. Fabrication using bolted compression lugs for internal wiring.
 5. Redundant suppression circuits.
 6. Redundant replaceable modules.
 7. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
 8. LED indicator lights for power and protection status.
 9. Audible alarm, with silencing switch, to indicate when protection has failed.
 10. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
 11. Four-digit transient-event counter set to totalize transient surges.
- C. Peak Single-Impulse Surge Current Rating, per phase:
1. 200kA per mode/400kA
- D. Nominal Discharge current (I_n): The SPD shall be tested to meet UL 1449 Third Edition Nominal Discharge Current requirements. All modes of protection shall be tested including any required overcurrent protection.
1. Type 1 SPD's shall be tested and labeled at 10kA 20kA per mode.
 2. Type 2 SPD's shall be tested and labeled at 3kA 5kA 10kA 20kA per mode.
- E. Protective Impulse: The SPD shall be tested by application of 15 repetitive impulses of 3000 amps and 6000 volts having an 8x20 microsecond wave shape
- F. Protection modes and UL 1449-Third Edition VPR for grounded wye circuits 3-phase, 4-wire circuits shall be as follows:

	480Y/277 V	208Y/120 V	600Y/347 V
Line to Neutral	1200	700	1500
Line to Ground	1200	700	1500
Neutral to Ground	1200	700	1500

2.2 PANELBOARD SUPPRESSORS (INTERNALLY MOUNTED SPD'S AT PANELBOARD LOCATION)

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB USA.
 2. AC Data Solutions.
 3. Advanced Protection Technologies Inc. (APT).
 4. Atlantic Scientific.
 5. Current Technology Inc.; Danaher Power Solutions.
 6. Danaher Power Solutions; United Power Products.
 7. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 8. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 9. Intermatic, Inc.
 10. LEA International.
 11. Leviton Mfg. Company Inc.
 12. Liebert Corporation; a division of Emerson Network Power.
 13. Northern Technologies, Inc.; a division of Emerson Network Power.
 14. Siemens Energy & Automation, Inc.
 15. Square D; a brand of Schneider Electric.
 16. Surge Suppression Incorporated.
- B. Surge Protection Devices:
1. Comply with UL 1449 Third Edition.
 2. Modular design (with field-replaceable modules) Non-modular design.
 3. Short-circuit current rating complying with UL 1449 Third Edition, and matching or exceeding the panelboard short-circuit rating and redundant suppression circuits; with individually fused metal-oxide varistors.
 4. Fuses, rated at 200-kA interrupting capacity.
 5. Fabrication using bolted compression lugs for internal wiring.
 6. Integral disconnect switch.
 7. Redundant suppression circuits.
 8. Redundant replaceable modules.
 9. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
 10. LED indicator lights for power and protection status.
 11. Audible alarm, with silencing switch, to indicate when protection has failed.
 12. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
 13. Four Six-digit transient-event counter set to totalize transient surges.
- C. Peak Single-Impulse Surge Current Rating per phase:
1. 100kA per mode/200kA
- D. Nominal Discharge current (I_n): The SPD shall be tested to meet UL 1449 Third Edition Nominal Discharge Current requirements. All modes of protection shall be tested including any required overcurrent protection.
1. Type 1 SPD's shall be tested and labeled at 10kA 20kA per mode.

2. Type 2 SPD's shall be tested and labeled at 10kA 20kA per mode.

E. Protection modes and UL 1449 Third Edition VPR for grounded wye circuits, 3-phase, 4-wire circuits shall be as follows:

	480Y/277 V	208Y/120 V	600Y/347 V
Line to Neutral	1200	700	1500
Line to Ground	1200	700	1500
Neutral to Ground	1200	700	1500

2.3 ENCLOSURES

A. All SPD Units shall be fully enclosed unless otherwise noted. Provide enclosures suitable for the locations indicated and as described below:

1. Indoor Enclosures:

- a. NEMA 250 Type 1 constructed of a polymer or steel material
- b. NEMA 250 Type 12 constructed of a polymer or steel material with a gasket to exclude dust.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install SPD devices at service entrance on load side, with ground lead bonded to service entrance ground.
- B. Install SPD devices for panelboards and auxiliary panels with conductors or buses between suppressor and points of attachment as short and straight as possible. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground.
 1. Provide multiple, 30 60 100-A circuit breaker as a dedicated disconnecting means for SPD unless otherwise indicated.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS, "Surge Arresters, Low-Voltage Surge Protection Devices" Section. Certify compliance with test parameters.
2. After installing SPD devices but before electrical circuitry has been energized, test for compliance with requirements.
3. Complete startup checks according to manufacturer's written instructions.

B. SPD device will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.3 STARTUP SERVICE

A. Do not energize or connect any equipment to their sources until SPD devices are installed and connected.

- B. Do not perform insulation resistance tests of the distribution wiring equipment with the SPD installed. Disconnect before conducting insulation resistance tests, and reconnect immediately after the testing is over.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to maintain SPD devices.

END OF SECTION

SECTION 16511 (265100) – INTERIOR LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

- A. Included in the work of this section are labor, material, and appurtenances required to complete the work of this Section as specified herein, including, but not limited to:
 - 1. Interior light fixtures, lamps, LEDs, reflectors, lenses or faceplates, ballasts, transformers, drivers and power supplies (includes exterior light fixtures normally installed on exterior surfaces of buildings).
 - 2. Emergency lighting units.
 - 3. Exit signs.
 - 4. Light fixture supports.
 - 5. Coordination.
 - 6. Quality assurances.
 - 7. Specific requirements.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section “General Electrical Requirements” for general requirements and related documents that apply to this Section.
- B. Division 26 Section “Common Work Results for Electrical” for raceways, conductors, cables, and cords.
- C. Division 26 Section "Exterior Lighting” for exterior light fixtures, except those normally mounted on exterior surfaces of buildings.
- D. Division 26 Section "Lighting Control Devices" for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
- E. Division 26 Section "Wiring Devices" for manual wall-box dimmers.

1.3 SUBMITTALS

- A. General:
 - 1. Only those light fixtures and manufacturers per each fixture type designated and listed in the Light Fixture Schedule or on the Drawings, and approved in accordance with paragraph 1.4-SUBSTITUTIONS of this Section, or both, will be accepted. Where the Light Fixture Schedule indicates an allowance to be made for a specific light fixture, the price is a contractor price and monies shall be allotted for freight, installation, and lamping (if designated). Alternate manufacturers presented at bid shall be disqualified.
 - 2. Submit all light fixtures, specified for use on this Project, in a single submittal package of portfolios, so that all light fixtures can be reviewed at one time.
 - 3. Prepare portfolios from manufacturer's standard specification sheets, and include the fixture tag indicated on the Light Fixture Schedule to identify each light fixture. Do not combine more than one light fixture type on a single sheet.
 - 4. Fixture or other materials shall not be shipped, stored, or installed into the work without approval of shop drawings.
 - 5. Modifications to fixtures shall be in accordance with Architect’s comments.
- B. Product Data: For each type of light fixture, collated and bound in sets, and arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:
 - 1. Summary page with the following for each light fixture type

- a. The number, type and wattage of the light fixture lamps or LEDs (including, but not limited to, assemblies, arrays, bars or modules).
 - b. Light fixture ballast, driver or auxiliary device manufacturer, number and type.
 2. Fixture cut sheets with name of manufacturer and options to be provided marked, including, but not limited to, voltage, lensing, and finish/color.
 - a. Descriptive information providing physical characteristics of light fixture, including, but not limited to, materials, dimensions, fixture efficacy and/or efficiency, and verification of indicated parameters.
 - b. For LED fixtures, include also L70 lifetime and wattage of luminaire including driver/power supply losses.
 - 1) Include MacAdam ellipse step information for:
 - a) All interior light fixtures
 - b) Exterior luminaires installed on exterior building surfaces specified with 80 CRI or greater.
 3. Light fixture mounting details, including non-standard outlet boxes.
 4. Construction of light fixture housing and door (if applicable).
 5. Ballast cut sheet with options marked, providing physical description of ballast including, but not limited to, voltage, lamp, ballast factor, power factor, amperage and wattage.
 6. Power supply, transformer, and/or driver cut sheet with options marked, providing physical description of auxiliary device including, but not limited to, voltage, power factor, amperage, wattage, and maximum remote distance charts between device and light fixture.
 7. Light fixture finish and color (if applicable).
 8. Lamp cut sheet with options marked, providing physical description of lamps, including, but not limited to, voltage, wattage, efficacy, CCT, CRI, lumens, and life expectancy.
 - a. For LED lamps, include also number of MacAdam ellipse steps and L70 lifetime.
 9. Photometric data, in IESNA format, including LM-79 for LED luminaires, based on laboratory tests of each light fixture type, outfitted with lamps, ballasts, and accessories identical to those indicated for the light fixture as applied in this Project.
 - a. For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by the manufacturer.
 10. Emergency ballast cut sheet: Descriptive cut sheets providing physical description of emergency ballasts for use in normal light fixtures, including, but not limited to, complete battery information, lumens, and method for testing per NFPA 101.
- C. Shop Drawings: Show details of non-standard or custom light fixtures. Indicate dimensions, finish color, including, but not limited to, custom color, weights, methods of field assembly, components, features, accessories, and modifications. Scaled documents shall be provided for custom fixtures.
- D. Submittal Schedule
 1. Within 30 days of Division 26 contractor award, shop drawings covering all light fixtures within this section shall be forwarded to architect to begin approval process. Any shop drawings submitted after the required time frame will require the contractor to submit only the 1st named manufacturer and associated specification data listed on the fixture schedule as the only approved manufacturer. No substitutions will be allowed after the specified time frame.
 2. Within 15 days of “approved” and “approved as noted” shop drawings, contractor shall forward to Architect a guaranteed ship date for each specified fixture.
 3. Within 15 days after contractor’s receipt of “reject and resubmit” or “not approved” shop drawings, contractor shall provide Architect with resubmitted shop drawings for only those fixtures deemed unacceptable.
 4. Contractor is responsible to call to the attention of the Architect any submittals that have not been returned to him in a timely manner that may affect delivery of fixtures or as otherwise affecting Section 1.4.D of this specification.
- E. Control Wiring

- F. Coordination Drawings: Refer to architectural reflected ceiling plans or details for exact location of light fixtures; engineering documents shall not be referenced for exact fixture positions. Contractor shall check and verify dimensions and details on drawings before proceeding with the work. If any question arises about the true meaning of drawings, refer the matter to the Architect, whose decision is final. In no case proceed with work with any uncertainty. Architectural documents shall show and coordinate with assistance from installers of items involved:
1. Light fixtures.
 2. Suspended ceiling components.
 3. Structural members to which suspension systems for light fixtures will be attached.
 4. Other items in finished ceiling including the following:
 5. Air outlets and inlets.
 6. Speakers.
 7. Sprinklers.
 8. Smoke and fire detectors.
 9. Occupancy sensors.
 10. Access panels.
 11. Perimeter moldings.
- G. Product Certificates: For each type of ballast for bi-level and dimmer-controlled fixtures, signed by product manufacturer.
- H. Qualification Data: For agencies providing photometric data for light fixtures.
- I. Field quality-control test reports.
- J. Operation and Maintenance Data: For lighting equipment and fixtures to include in operation and maintenance manuals.
- K. Warranties: Special warranties specified in this Section.

1.4 SUBSTITUTIONS

- A. Refer to Division 26 Section "General Electrical Requirements".
- B. Prior to the Bid Date, substitutions will not be considered unless the Architect/Engineer have received written request for approval at least ten calendar days prior to the date for receipt of Bids. Include in each such request the Light Fixture Schedule designation, name of the material or equipment for which it is to be substituted and complete Product Data for the proposed substitute, as defined in SUBMITTALS above, and all other information necessary for an evaluation. Provide interior point-by-point photometric calculations, under both normal and emergency lighting conditions, as applicable, if required by the Engineer. Submit a \$100.00 review fee to the Engineer with each such point-by-point calculation for use of electronic base files. The fee will be returned if the substitution is added to the specification.
- C. During the Bid
1. Any proprietary, sole-sourced light fixture listed in the fixture schedule shall be unit priced only. Unit prices shall be clearly identified on the bid form.
 2. Representative agents shall be allowed to offer mini-lot pricing (MLP). MLP shall be defined as:
 - a. Agents can group only specified fixtures they represent, and
 - b. Only represent in the region where the specification originated, and
 - c. Exclude all fixtures outside their represented lines from the MLP, and
 - d. Sole-sourced (proprietary) light fixtures shall not be included in the MLP.
 3. Packaging of light fixtures will not be considered nor approved. Packaging is defined as: distributor(s) providing a single price for a light fixture package made up of specified and non-specified light fixtures. Any submittal package containing non-specified light fixtures or inclusion of lighting control systems will be immediately rejected in its entirety.

- D. After the Bid Date, proposals to substitute light fixtures for those shown on the Drawings or specified herein, will only be considered as a deduct. Submit proposed substitutions separately, in Submittal form, with a list of proposed substitutions together with a deduct price for each substitution. Proposed substitutions will then be reviewed by the Architect/Engineer.
- E. During the construction period, no substitutions shall be considered if product delay is due to contractor's failure to order products in a timely manner after presentation of fixture schedules and specifications. Additional costs associated with air freight or special factory runs to meet schedule due to contractor's error shall be at the expense of contractor.
- F. The Architect/Engineer has the final authority as to whether the light fixture is an acceptable replacement to the specified item. The proposed substitution may also be rejected for aesthetic reasons if felt necessary or desirable. In the event the proposed substitutions herein described are rejected, provide the specified item(s).

1.5 DEFINITIONS

- A. BF: Ballast factor.
- B. CCT: Correlated color temperature
- C. CFL: Compact Fluorescent
- D. CRI: Color-rendering index.
- E. CU: Coefficient of utilization.
- F. EISA: Energy Independence and Security Act of 2007.
- G. HID: High-intensity discharge.
- H. L70: minimum 70% maintained initial-rated lumens at average rated life for LEDs
- I. LED: Light Emitting Diode
- J. LED Lamp: Replaceable LED light source with an integral driver within envelope of lamp. Lamp/Base types may include MR16/bi-pin, PAR/medium base, etc.
- K. LED Module: Light source that contains LEDs, and may include additional components such as lenses, reflectors, or refractors, however do not include drivers.
- L. LER: Light fixture (Luminaire) efficiency rating.
- M. Light Fixture: Complete light fixture, including ballast housing if provided.
- N. RCR: Room cavity ratio.

1.6 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories:
 1. Listed and labeled as defined in NFPA 70, Article 100, by an NRTL as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
 2. Marked for intended use.
- B. Comply with NFPA 70.

- C. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
- D. Regulatory Agencies: Provide fixtures conforming to nationally- or internationally-recognized accredited testing agencies, such as U.S., ETL, ARL, or others in acceptance with local code enforcement policy.
- E. Electrical Components and Devices: Provide only fixtures that comply with National Electric Code (NEC), and in particular to Section 410. All ceiling recessed fixtures, whether indicated in a catalog number or not, shall be equipped with an integral thermal protection device.

1.7 COORDINATION

- A. Unless otherwise noted, perform all electrical Work required for the proper installation and operation of equipment, furnishings, devices and systems specified in other Divisions of these Specifications, furnished under other contracts, and/or furnished by the Owner for installation under this Contract.
- B. Coordinate layout and installation of light fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including, but not limited to, HVAC equipment, fire-suppression system, and partition assemblies. Contractor shall arrange his installation in proper relation to other work so that there shall be no interference, damage or delay to other trades' work
- C. Give ample notice of any special openings or rough-in work required for placing electrical/lighting work so as to avoid cutting or removal of completed work.
- D. Where work of this Section is to be flush or concealed, install it so it does not project beyond finished lines of walls, ceilings or floor surface.
- E. Verify all ceiling systems and coordinate light fixture type and accessories prior to ordering light fixtures. Coordinate and cooperate with ceiling installer in regards to the location and installation of light fixtures.

1.8 WARRANTY

- A. General Guarantee: For a period of one year after Owner's initial acceptance and establishment of the beginning date of the guarantee period, and at no cost to the Owner, Contractor shall promptly furnish and install replacements for any fixtures or components deemed by the Owner as defective in workmanship under normal operating conditions, excluding lamp replacement as noted in Section 1.10.A.1. Contractor shall repair installed equipment on the job site to Owner's satisfaction. For any time during said guarantee period that fixtures are not fully functional due to defects in material or workmanship, Contractor shall provide or pay for suitable temporary light fixtures, and shall remove said temporary fixtures upon installation of replacement elements. Contractor shall furthermore guarantee replacement fixtures for a period of one year following replacement.
- B. Contractor shall not be held responsible for damage of fixtures or equipment components occurring after the beginning of the guarantee period due to acts of vandalism, acts of war, or acts of God.
- C. LED Warranties: Shall be free from defects in materials and workmanship for the period indicated from date of factory shipment.
 - 1. LED Luminaires, including LED modules, arrays and drivers: Five years.
 - 2. LED Lamps: Three years.

1.9 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Additional light fixtures and accessories as scheduled on the Drawings.
- B. Where light fixtures are specified with tamper proof hardware, provide the Owner with three tools for each different type of hardware.
- 1.10 SPARES
- A. Furnish spare materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Lamps: 10 for every 100 of each type and rating installed. Furnish at least one of each type.
 2. Plastic Diffusers and Lenses: 1 for every 100 of each type and rating installed. Furnish at least one of each type.
 3. Battery and Charger Data: One for each emergency lighting unit.
 4. Ballasts and/or Drivers: 2 for every 100 of each type and rating installed. Furnish at least one of each type.
 5. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

PART 2 - PRODUCTS AND MATERIALS

2.1 MANUFACTURERS

- A. In Light Fixture Schedule where titles below are column or row headings that introduce lists, the following requirements apply to product selection:
1. Basis-of-Design Product: The design for each light fixture is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified that meets or exceeds performance characteristics of the named product.
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified. No substitutions shall be allowed as per Section 1.4.

2.2 LIGHT FIXTURES AND COMPONENTS, GENERAL REQUIREMENTS

- A. Provide light fixtures as shown on the drawings and/or specified. This shall include all lamps, material and labor to securely hang light fixtures, clean them and make them completely ready for use. Provide all hangers, supports, and miscellaneous hardware required to install light fixtures. Provide additional tie wires connected to structure to conform to applicable seismic requirements where required.
- B. Light fixture models scheduled on the Drawings are to show the manufacturer, grade and style of light fixtures required. Regardless of the manufacturer's catalog number suffixes indicated, provide all options and features as described in the Light Fixture Schedule.
- C. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures. Manufacturer of recessed fixtures shall provide mounting brackets suitable for connection to ceiling system structure. Modifications to standard mounting brackets shall be coordinated with contractor and delivered with fixture so that no delays to product delivery shall be allowed.
- D. Incandescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5A. Minimum gauge of sheet steel to be 18 gauge.
- E. Fluorescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5 and NEMA LE 5A as applicable. Minimum gauge of sheet steel to be 22 gauge.
- F. HID Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5B.

- G. Metal Parts: Free of burrs and sharp corners and edges.
- H. Sheet Metal Components: Steel, unless otherwise indicated. Form and support to prevent warping and sagging.
- I. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- J. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:
 - 1. White Surfaces: 85 percent.
 - 2. Specular Surfaces: 83 percent.
 - 3. Diffusing Specular Surfaces: 75 percent.
 - 4. Laminated Silver Metallized Film: 90 percent.
- K. Plastic Diffusers, Covers, and Globes:
 - 1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 - a. Lens Thickness: At least 0.125 inch minimum unless different thickness is indicated.
 - b. UV stabilized.
 - 2. Glass: Annealed crystal glass, unless otherwise indicated.
- L. Where located within structural concrete, light fixture housing and any other luminaire components in direct contact with concrete shall be effectively coated and/or covered to prevent chemical reactions with the concrete in accordance with the American Concrete Institute Code.
- M. Fixture Finishes:
 - 1. Apply fixture finishes after fabrication in a manner that assures a durable wear-resistant surfacing. Give exposed metal surfaces (brass, bronze, aluminum and others) and finished castings, except chromium-plated or stainless steel parts, an even coat of high-grade meth/acrylate lacquer or transparent epoxy.
 - 2. For corrosive or salt water environments, manufacturer shall provide fixtures with low copper/zinc cast aluminum (AB-47100 aluminum with less than 0.6% copper – classified for corrosive areas) housings to prevent salts from “pitting” aluminum housing. Manufacturer shall provide, in addition to or in lieu of, AB-47100 aluminum, ion added or pre-anodized polyester powder cast finish for “marine grade” applications. Manufacturer shall otherwise provide all stainless steel housing in conjunction with stainless steel hardware.
 - 3. Recessed downlights in corrosive or salt water interior environments shall be equipped with a “natatorium” finish comprised of a zinc-chromated and phosphated process, then powder-coated on the exterior of the housing.
- N. Reflectors:
 - 1. Provide aluminum reflectors or reflecting cones for downlight style fixtures comprised of #12 aluminum reflector sheet, 0.57 inch (15 gauge) or heavier and free of tool-making indentations, including spinning lines caused by assembly techniques. All reflectors shall be of first-quality, anodized finish :Alzak” with specular or semi-specular finish and color as selected. Provide specular reflectors with no apparent brightness above 45 degrees from Nadir and semi-specular, diffuse reflectors with no apparent brightness above 75 degrees from Nadir.
- O. Mounting hardware and trims:
 - 1. Coordinate as need to suit ceiling conditions.
 - 2. Light fixtures near or in contact with insulation shall comply with code.

3. Maintain a 3” minimum working clearance between non-IC rated light fixture housings and insulation on all adjacent ductwork, piping, walls and ceilings.
- P. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps, LEDs, ballasts and/or drivers. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
1. Label shall include the following lamp, LEDs, ballast and/or driver characteristics:
 - a. "USE ONLY" and include specific lamp or LED type.
 - b. Lamp diameter code (T-4, T-5, T-8, T-12, etc.), tube configuration (twin, quad, triple, etc.), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.
 - c. Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires. Indicate maximum allowed wattage.
 - d. LED type, wattage, beam angle (if applicable) for LED luminaires. Indicate maximum allowed wattage.
 - e. Start type (preheat, rapid start, instant start, etc.) for fluorescent and compact fluorescent luminaires.
 - f. ANSI ballast type (M98, M57, etc.) for HID luminaires.
 - g. CCT and CRI for all luminaires.

2.3 EXIT SIGNS

- A. Description: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Signs:
1. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.
 2. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.
 - a. Battery: Sealed, maintenance-free, nickel-cadmium type.
 - b. Charger: Fully automatic, solid-state type with sealed transfer relay.
 - c. Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
 - d. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - e. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - f. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 - g. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.
 3. Master/Remote Sign Configurations:
 - a. Master Unit: Comply with requirements above for self-powered exit signs, and provide additional capacity in LED power supply, ballast and battery for power connection to remote unit.
 - b. Remote Unit: Comply with requirements above for self-powered exit signs, except omit power supply, battery and test features. Arrange to receive full power requirements from master unit. Connect for testing concurrently with master unit as a unified system.

2.4 EMERGENCY LIGHTING UNITS

- A. Description: Self-contained units complying with UL 924.
1. Battery: Sealed, maintenance-free, lead-acid type.

2. Charger: Fully automatic, solid-state type with sealed transfer relay.
3. Operation: Relay automatically turns lamp on when power supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
4. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
5. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
6. Wire Guard: Heavy-chrome-plated wire guard protects lamp heads or fixtures.
7. Integral Time-Delay Relay: Holds unit on for fixed interval of 15 minutes when power is restored after an outage.
8. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
9. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.

2.5 DRIVERS FOR LED LUMINAIRES

- A. Description: Designed for type and quantity of LED diodes of light fixture. Drivers shall tolerate sustained open circuit and short circuit output conditions without damage. Driver shall be designed for full light output unless dimmer or bi-level control is indicated:
 1. Sound Rating: A.
 2. Total Harmonic Distortion Rating: Less than 20 percent. Shall comply with ANSI C82.77.
 3. Transient Voltage Protection: IEEE C62.41, Category A or better.
 4. Power Factor: 0.90 or higher at full load.
 5. Interference: Comply with 47 CFR, Chapter 1, Part 15, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
 6. Driver shall operate with maximum sustained variations of +/-10% input voltage and frequency with no damage to driver.
 7. Driver output shall be regulated to maximum +/- 5% published load range or requirements of downstream LED fixture.
 8. LED Current Crest Factor: 1.5 or less.
 9. LED drivers shall not over-drive LEDs at a current or voltage above LED rated values in order to increase LED lumen output.
 10. Meets EN610000 for input harmonics.
 11. ROHS Compliant.
- B. Dimming Drivers:
 1. Dimming Range: Visually flicker-free, strobe-free, continuous dimming of source as follows, unless specifically noted otherwise in the Light Fixture Schedule whichever is more stringent:
 - a. Luminaires: 100 to 10 percent of rated lumens.
 - b. Lamps: 100 to 20 percent of rated lumens.
 2. 0-10V dimming drivers: Compliant with IEC 60929 standard for 4-wire dimming.
 3. Compatibility: Certified by manufacturer for use with specific dimming control system and LED indicated.
 4. Control: Coordinate to ensure that the dimming driver, power supply, controller, dimming module, and/or wallbox dimmer and connecting wiring are compatible.

2.6 LED LAMPS AND LUMINAIRES

- A. Comply with ANSI C78.377 for white light LED color range. Unless noted otherwise in the Light Fixture Schedule, LED color quality characteristics shall be 80 CRI minimum and 3000K CCT.
- B. LED binning specification tolerance to be within 3 MacAdam ellipses of rated values or as indicated in the Light Fixture Schedule, whichever is more stringent. All LEDs used for same fixture type throughout the project to originate from same production bin.
- C. Unless indicated otherwise in the Light Fixture Schedule, minimum 70% maintained initial-rated lumens at average rated life of as follows:
 - 1. LED lamps: 20,000 hours
 - 2. LED luminaires: 50,000 hours
- D. ROHS compliant
- E. Manufacturer of LED chips will be evaluated based on the manufacturer's product literature and data. At a minimum, LED fixtures or lamps will incorporate Bridgelux, Cree, Nichia, Osram or Xicato LEDs; additional manufacturers may be considered however the Architect or Engineer has the authority to reject other manufacturers for technical or aesthetic reasons if felt necessary or desirable.

2.7 AUXILIARY DEVICES FOR LOW VOLTAGE AND LED FIXTURES

- A. Provide remote power supplies, drivers and/or transformers for light fixtures as required for a complete and operational system. Where equipment is not indicated as plenum rated, provide an additional enclosure for the device(s) suitable for the installed environment.

2.8 LIGHT FIXTURE SUPPORT COMPONENTS

- A. Comply with Sections "260548 Seismic Controls for Electrical" and "260529 - Hangers and Supports for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
- C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
- D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage.
- E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gauge.
- F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
- G. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

2.9 RETROFIT KITS FOR FLUORESCENT LIGHT FIXTURES

- A. Comply with UL 1598 listing requirements.
 - 1. Reflector Kit: UL 1598, Type I. Suitable for two- to four-lamp, surface-mounted or recessed light fixtures by improving reflectivity of fixture surfaces.
 - 2. Ballast and Lamp Change Kit: UL 1598, Type II. Suitable for changing existing ballast, lamps, and sockets.

2.10 TRANSFORMERS FOR LOW VOLTAGE FIXTURES

- A. Provide transformers to low voltage lamps which are suitable for the electrical characteristics of the supply circuits to which they are to be connected. For remote electronic or magnetic transformers, contractor shall remote transformers so as to reduce voltage drop. For 25 amp low-voltage linear systems, contractor shall not daisy-chain 25A loaded runs together. Contractor shall provide home-run from end of run to remote transformer.

2.11 COLD CATHODE TUBING

- A. Surface or recessed cold cathode shall be installed at locations indicated on drawings to form a continuous line of light, without noticeable breaks at tube ends. Recommended porcelain socket ends and support elements shall be illustrated on shop drawing submittal. Tube colors shall be selected by Architect, lighting designer, or interior designer, based on manufacturer's standard palette of colors and shall be indicated on Fixture Schedule. Contractor shall not order cold cathode tubes without written confirmation of said color by Architect or Owner based on sample, mockup, or other verification means. Failure of contractor to obtain written approval of color shall hold contractor solely responsible for financial obligations to provide approved color.
- B. Lamps shall be made from 1-inch diameter glass. Lamps showing end darkening, stains, discolorations, spiraling or sputtering shall be rejected. Manufacturer shall comply with NEC regulations regarding lighting service over or under 1000 volts. For said systems requiring under 1000V, manufacturer shall supply only 200MA ballasted cold cathode system.
- C. Bidding cold cathode manufacturers shall be U.L. IFAY 48 listed and shall have an approved IFAY 48 number given by U.S. prior to bidding. WZBL installers of cold cathode shall be disqualified. Failure to comply with specifications for U.L. IFAY manufacturers shall deny payment to WZBL manufacturer and contractor. Contractor shall be financially and legally responsible for providing an IFAY 40 system.
- D. Shop drawings shall be submitted for approval. These drawings shall include scale plans and details showing the method of installation of ballasts or transformers, intermediate feeds and connections. A copy of this approved shop drawing shall be submitted to the Owner for his use in lamp replacement and maintenance.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify conditions of equipment and installation prior to beginning work.
- B. Verify that equipment is ready for connecting, wiring, and energizing.

3.2 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Light Fixtures: All work shall be executed to present a neat appearance. Set level, plumb, and square with ceilings and walls. Install lamps in each fixture.
- C. Temporary Lighting: If it is necessary, and approved by Architect, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, install new lamps, and reinstall.
- D. Support for Light Fixtures in or on Grid-Type Suspended Ceilings: Use grid as a support element.

1. Install ceiling support system rods or wires, independent of the ceiling suspension devices, for each fixture. Locate not more than 6 inches from light fixture corners.
 2. Support Clips: Fasten to light fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
 3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.
 4. Install at least one independent support rod or wire from structure to a tab on light fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.
- E. Suspended Light Fixture Support:
1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
 2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
 3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end. Provide suitable connectors or collars to connect adjoining units to appear as a continuous unit.
 4. Decorative pendant mounted light fixtures
 - a. Provide cord and/or stem lengths to match elevations above finished floor as indicated on architectural elevations. If architectural elevations do not indicate suspension heights, coordinate with Architect to determine final suspension heights. Regardless, contractor shall not field cut pendants or order rigid stems without elevation approval from Architect. Pendant suspensions on electrical documents are for reference only.
 - 1) Cord-mounted: Manufacturers shall supply luminaires with flexible, field cutting cords. Contractor shall field cut cords as required.
 - 2) Field-cutable, rigid-stem mounted: Manufacturers shall supply luminaires with field cutting rigid stems. Contractor shall field cut stems as required.
 - 3) Factory-cut rigid stem mounted: Contractor shall provide rigid stem dimensions to the manufacturer as required.
 - b. Junction boxes used to feed light fixtures shall be covered by manufacturer supplied canopy plates.
- F. Installation within non-standard ceilings, including, but not limited to, wood and metal ceilings.
1. For recessed downlight light fixtures, specification is based on standard throats to accommodate ceiling thicknesses of 3/4" or less. If non-standard ceiling (such as wood, thickened gypboard ceilings and metal plank type) require throats greater than 3/4", modifications to manufacturer's standard 3/4" throat shall be determined by Architect and Contractor prior to shop drawing submission.
 2. For light fixtures recessed into metal ceilings, rigidly support light fixture to ensure that trim fits flush with ceiling plane.
- G. Manufacturer shall supply contractor with a complete list of component elements to comply with design intent for either 20-amp (flexible low voltage track systems or line voltage track) or 50-amp bus bar track systems. Contractor shall install track systems based on design requirements outlined herein or Light Fixture Schedule.
- H. Connect wiring according to Section "260519 - Low-Voltage Electrical Power Conductors and Cables."
- I. Through wiring of recessed light fixtures, in suspended ceilings, is not permitted. Connect each light fixture by a whip to a junction box. The whip shall be of sufficient length to allow the light fixture to be relocated within a 6-foot radius.
- J. Wall Mounted Light fixtures
1. Unless otherwise noted, conceal all raceways and back boxes for wall mounted light fixtures. Coordinate all wall-mounted light fixtures with interior elevations. Where specific elevations or dimensions are not indicated, verify the correct location with Architect prior to installation. Contractor shall supply structure to support weight of fixture.

- K. Contractor shall construct light coves according to architectural details. Contractor shall ensure, unless otherwise directed, that top of fixture lamp is flush with top of cove lip. Contractor shall provide blocking as needed under fixture to ensure stated requirement.
- L. Auxiliary Devices for low voltage and LED Fixtures
 1. Install device within maximum remote distances and with wiring sized per manufacturer's recommendations.
 2. In public areas or other areas where remote device visibility is undesirable, install device where concealed from view, well ventilated and accessible. Provide access panels as required.
 3. Provide label on device indicating fixture type and location/room served along with panelboard circuit number.
 4. Properly support remote lighting devices, including transformers, power supplies, and drivers, per Code and manufacturer's recommendations.

3.3 MULTI-LEVEL SWITCHING

- A. For multi-level (step-dimming) drivers or ballasts, provide number of switch conductors required to the device for operation of all light levels intended.
- B. The lighting design for this project has included multi-level (inboard/outboard) switching. Where indicated, 3-lamp light fixtures shall have the center lamp switched from the switch nearest the door and the outer 2 lamps switched from the other switch.
- C. Where indicated, 4-lamp light fixtures shall have the outer 2 lamps switched from one switch and the center 2 lamps shall be switched from the other switch.

3.4 DIMMING

- A. For dimmable light fixtures, provide both control and power wiring between light fixture and control device and between light fixtures. Quantity of low voltage and line voltage wiring and wire type shall be per manufacturer's recommendations. At a minimum, provide the following based on control type at either 120V or 277V, unless recommended otherwise by the manufacturer:
 1. 0-10V – two low voltage conductors and two line voltage conductors plus ground
 2. 2-Wire dimming – two line voltage conductors plus ground
 3. 3-Wire dimming – three line voltage conductors (1 for control and two for power) plus ground
 4. DALI – two low voltage conductors and two line voltage conductors plus ground
 5. Proprietary digitally addressable – as required per the manufacturer
 6. DMX – two line voltage conductors plus ground and DMX cabling
- B. Coordinate light fixture and control device dimming types for compatibility.

3.5 COORDINATION

- A. Light fixtures shown on the Electrical Drawings represent general arrangements only. Refer to Architectural Drawings for exact locations.
- B. Coordinate the installation and location of light fixtures with other work and all other trades before installation to avoid conflicts. Coordinate light fixture locations in mechanical rooms with final installed piping and ductwork layouts.
- C. Verify all ceiling systems and coordinate light fixture type and accessories prior to ordering light fixtures. Coordinate and cooperate with ceiling installer in regards to the location and installation of light fixtures.
- D. Coordinate final light fixture locations in walk-in coolers and freezers with refrigeration coils and other trades.

- E. Wall-Mounted Light fixtures
 - 1. Coordinate all wall-mounted light fixtures with the architectural features of the building. Where specific elevations or dimensions are not indicated, verify the correct location with the Architect prior to beginning any work.

3.6 ADJUSTING

- A. Contractor shall adjust all light fixture sockets to match the lamp specified and aim all adjustable light fixtures as directed by the Architect.
- B. Where required, focusing shall be done during hours of darkness. Upon notification by contractor that all fixtures are correct as per shop drawings and functioning, that specified lamps have been verified, lighting designer or Architect shall coordinate with contractor as to a mutually agreed upon time to complete focusing. Failure of contractor to notify Architect during substantial completion will result in failure to comply with specifications.

3.7 FIELD QUALITY CONTROL

- A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.
- B. Clean light fixtures of dirt and debris upon completion of the installation. Protect installed light fixtures from damage during the remainder of the construction period.
- C. Upon completion of the installation of light fixtures, and after building circuits have been energized, energize lighting branch circuits to demonstrate capability and compliance with the requirements. Where possible, correct malfunctioning units at the site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.
- D. At the time of final acceptance of this project by the Owner, ensure that all lamps are in working order and all light fixtures are fully lamped.
- E. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.8 STARTUP SERVICE

- A. Burn-in all lamps that require specific aging period to operate properly, prior to occupancy by Owner. Burn-in fluorescent and compact fluorescent lamps intended to be dimmed, for at least 100 hours at full voltage.

3.9 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.
 - 1. Adjust aimable luminaires in the presence of Architect.

END OF SECTION

SECTION 16521 (265600) - EXTERIOR AREA LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following lighting equipment:
 - 1. Exterior LED light fixtures with LED modules and drivers.
 - 2. Light-fixture-mounted photoelectric relays.
 - 3. Poles and accessories.

1.2 RELATED SECTIONS INCLUDE THE FOLLOWING:

- A. Division 26 Section "General Electrical Requirements" for general requirements and related documents that apply to this Section.
- B. Division 26 Section "Common Work Results for Electrical" for raceways, conductors, cables, and cords.
- C. Division 26 Section "Grounding and Bonding for Electrical Systems"
- D. Division 26 Section "Raceway and Boxes for Electrical Systems.
- E. Division 26 Section "Underground Ducts and Raceways for Electrical Systems"
- F. Division 26 Section "Identification for Electrical Systems"
- G. Division 26 Section "Lighting Control Devices" for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
- H. Division 26 Section "Lighting Controls" for manual or programmable control systems with low-voltage control wiring or data communication circuits.
- I. Division 26 Section "Wiring Devices" for devices installed in poles.
- J. Division 26 Section "Fuses"
- K. Division 26 Section "Enclosed Switches and Circuit Breakers"
- L. Division 26 Section "Lightning Protection for Structures"
- M. Division 26 Section "Interior Lighting" for exterior luminaires normally mounted on exterior surfaces of buildings.

1.3 SUBMITTALS

- A. General:
 - 1. Only those light fixtures and manufacturers per each fixture type designated and listed in the Light Fixture Schedule or on the Drawings, and approved in accordance with paragraph 1.4-SUBSTITUTIONS of this Section, or both, will be accepted. Where the Light Fixture Schedule indicates an allowance to be made for a specific light fixture, the price is a contractor price and

- monies shall be allotted for freight, installation, and lamping (if designated). Alternate manufacturers presented at bid shall be disqualified.
2. Submit all light fixtures, specified for use on this Project, in a single submittal package of portfolios, so that all light fixtures can be reviewed at one time.
- B. Prepare portfolios from manufacturer's standard specification sheets, and include the number indicated on the Light Fixture Schedule to identify each light fixture. Do not combine more than one light fixture type on a single sheet.
1. Fixture or other materials shall not be shipped, stored, or installed into the work without approval of shop drawings.
 2. Modifications to fixtures shall be in accordance with Architect's comments.
- C. Product Data: For each light fixture, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, finishes, and the following:
1. Summary page with the following for each light fixture type
 - a. The number, type and wattage of the light fixture lamps or LEDs (including, but not limited to, assemblies, arrays, bars or modules).
 - b. Light fixture ballast, driver or auxiliary device manufacturer, number and type.
 2. Fixture cut sheets with name of manufacturer and options to be provided marked, including, but not limited to, voltage, lensing, and finish/color.
 - a. Descriptive information providing physical characteristics of light fixture, including, but not limited to, materials, dimensions, effective projected area, fixture efficacy and/or efficiency, and verification of indicated parameters.
 - b. For LED fixtures, include also L70 lifetime and wattage of luminaire including driver/power supply losses.
 - 1) Include MacAdam ellipse step information for luminaires specified with 80 CRI or greater.
 3. Light fixture mounting details, including, but not limited to, non-standard outlet boxes.
 4. Construction of light fixture housing and door (if applicable).
 5. Ballast cut sheet with options marked, providing physical description of ballast including, but not limited to, voltage, lamp, ballast factor, power factor, amperage and wattage.
 - a. For dimming ballasts, also include dimming type technology and dimming range/limits.
 6. Power supply, transformer, and/or driver cut sheet with options marked, providing physical description of auxiliary device including, but not limited to, voltage, power factor, amperage, wattage, and maximum remote distance charts between device and light fixture.
 - a. For dimming LED, also include dimming type technology and dimming range/limits.
 7. Lamp cut sheet with options marked, providing physical description of lamps, including, but not limited to, voltage, wattage, efficacy, CCT, CRI, lumens, and life expectancy.
 - a. For LED lamps, include also number of MacAdam ellipse steps and L70 lifetime.
 8. Details of attaching light fixtures and accessories.
 9. Details of installation and construction.
 10. Photometric data, in IESNA format, including LM-79 for LED luminaires, based on laboratory tests of each light fixture type, outfitted with lamps, ballasts, and accessories identical to those indicated for the light fixture as applied in this Project.
 - a. Photometric data shall be certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
 11. For pole-mounted LED area lighting fixtures, IES-TM-21 LED luminaire lifetime and lumen maintenance projections.
 12. Emergency ballast cut sheet: Descriptive cut sheets providing physical description of emergency ballasts for use in normal light fixtures, including, but not limited to, complete battery information, lumens, and method for testing per NFPA 101.
 13. Photoelectric relays.
 14. Materials, dimensions, and finishes of poles.

15. Means of attaching light fixtures to supports, and indication that attachment is suitable for components involved.
16. Anchor bolts for poles.
17. Manufactured pole foundations.

D. Delegated-Design Submittals for Pole-Mounted Area Lighting: Submit the following documents, signed and sealed by a qualified professional engineer:

1. Structural analysis data and calculations used for pole selection and foundations.
 - a. Manufacturer Seismic Qualification Certification: Submit certification that lighting components and their mounting and anchorage provisions are designed to remain in place with out separation of any parts when subject to seismic forces defined in Division 26 Section "Vibration and Seismic and Seismic Controls for Electrical Systems" Include the following:
 - 2) Basis for Certification: Indicate whether withstand certifications are based on actual test of assembled components or calculation.
 - 3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
 - b. Manufacturer Wind-Load Strength Certification: Submit certification that selected total support system, including poles and equipment anchorage devices, complies with AASHTO LTS-4 or as required by the local authority having jurisdiction, whichever is more stringent, for location of project.
2. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
3. Design calculations for the following:
 - a. Design calculations for determination of poured-in-place concrete foundation size and reinforcement
4. Shop Drawings:Submittal Schedule
 - a. Within 30 days from Division 26 Contractor award, shop drawings covering all light fixtures within this section shall be forwarded to architect to begin approval process. Any shop drawings submitted after the required time frame will require the contractor to submit only the 1st named manufacturer and associated specification data listed on the fixture schedule as the only approved manufacturer. No substitutions will be allowed after the specified time frame.
 - b. Within 15 days of "approved" and "approved as noted" shop drawings, Contractor shall forward to Architect a guaranteed ship date for each specified fixture.
 - c. Within 15 days after Contractor's receipt of "reject and resubmit" or "not approved" shop drawings, Contractor shall provide Architect with resubmitted shop drawings for only those fixtures deemed unacceptable.
 - d. Contractor is responsible to call to the attention of the Architect any submittals that have not been returned to him in a timely manner that may affect delivery of fixtures or as otherwise affecting Section 1.4.D of this specification.
5. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
6. Wiring Diagrams: Power and control wiring.

E. Qualification Data: For Installer.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For light fixtures to include in operation and maintenance manuals.

H. Warranty: Special warranties specified in this Section.

1.4 SUBSTITUTIONS

A. Refer to Division 26 Section "General Electrical Requirements".

- B. Prior to the Bid Date, substitutions will not be considered unless the Architect/Engineer have received written request for approval at least ten calendar days prior to the date for receipt of Bids. Include in each such request the Light Fixture Schedule designation, name of the material or equipment for which it is to be substituted and a complete description of the proposed substitute including cut sheets, photometric data, and all other information necessary for an evaluation. Provide interior point-by-point calculations if required by the Engineer. Submit a \$100.00 review fee to the Engineer with each such point-by-point calculation for use of electronic base files. The fee will be returned if the substitution is added to the specification.
- C. During the Bid
 - 1. Any proprietary, sole-sourced light fixture listed in the fixture schedule shall be unit priced only. Unit prices shall be clearly identified on the bid form.
 - 2. Representative agents shall be allowed to offer mini-lot pricing (MLP). MLP shall be defined as:
 - a. Agents can group only specified fixtures they represent, and
 - b. Only represent in the region where the specification originated, and
 - c. Exclude all fixtures outside their represented lines from the MLP, and
 - d. Sole-sourced (proprietary) light fixtures shall not be included in the MLP.
 - 3. Packaging of light fixtures will not be considered nor approved. Packaging is defined as: distributor(s) providing a single price for a light fixture package made up of specified and non-specified light fixtures. Any submittal package containing non-specified light fixtures or inclusion of lighting control systems will be immediately rejected in its entirety.
- D. After the Bid Date, proposals to substitute light fixtures for those shown on the Drawings or specified herein, will only be considered as a deduct. Submit proposed substitutions separately, in Submittal form, with a list of proposed substitutions together with a deduct price for each substitution. Proposed substitutions will then be reviewed by the Architect/Engineer.
- E. The Architect/Engineer have the final authority as to whether the light fixture is an acceptable replacement to the specified item. The proposed substitution may also be rejected for aesthetic reasons if felt necessary or desirable. In the event the proposed substitutions herein described are rejected, provide the specified item(s).

1.5 DEFINITIONS

- A. BF: Ballast factor.
- B. CCT: Correlated color temperature
- C. CRI: Color-rendering index.
- D. CU: Coefficient of utilization.
- E. EISA: Energy Independence and Security Act of 2007.
- F. HID: High-intensity discharge.
- G. L70: minimum 70% maintained initial-rated lumens at average rated life for LEDs
- H. LED: Light Emitting Diode
- I. LED Lamp: Replaceable LED light source with an integral driver within envelope of lamp. Lamp/Base types may include MR16/bi-pin, PAR/medium base, etc.
- J. LED Module: Light source that contains LEDs, and may include additional components such as lenses, reflectors, or refractors, however do not include drivers.

- K. LER: Light fixture efficacy rating.
- L. Light fixture: Complete light fixture, including ballast housing if provided.
- M. LLD: Lamp Lumen Depreciation.
- N. LLF: Light Loss Factor.
- O. Luminaire: Complete lighting fixture, including ballast housing if provided.
- P. Pole: Light fixture support structure, including tower used for large area illumination.
- Q. Standard: Same definition as "Pole" above.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this project.
- B. Light Fixture Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with IEEE C2, "National Electrical Safety Code."
- E. Comply with NFPA 70.

1.7 COORDINATION

- A. Unless otherwise noted, perform all electrical Work required for the proper installation and operation of equipment, furnishings, devices and systems specified in other Divisions of these Specifications, furnished under other contracts, and/or furnished by the Owner for installation under this Contract.
- B. Coordinate layout and installation of light fixtures, poles, foundations, and underground raceway system with other above- and below-grade site construction and utilities. Notify Architect/Engineer of conflicts before proceeding with the Work.

1.8 WARRANTY

- A. General Guarantee: For a period of one year after Owner's initial acceptance and establishment of the beginning date of the guarantee period, and at no cost to the Owner, Contractor shall promptly furnish and install replacements for any fixtures or components deemed by the Owner as defective in workmanship under normal operating conditions, excluding lamp replacement as noted in Section 1.12.A.1. Contractor shall repair installed equipment on the job site to Owner's satisfaction. For any time during said guarantee period that fixtures are not fully functional due to defects in material or workmanship, Contractor shall provide or pay for suitable temporary light fixtures, and shall remove said temporary fixtures upon installation of replacement elements. Contractor shall furthermore guarantee replacement fixtures for a period of one year following replacement.
- B. Contractor shall not be held responsible for damage of fixtures or equipment components occurring after the beginning of the guarantee period due to acts of vandalism, acts of war, or acts of God.

- C. LED Warranties: Shall be free from defects in materials and workmanship for the period indicated from date of factory shipment.
 - 1. LED Luminaires, including LED modules, arrays and drivers: Five years.
 - 2. LED Lamps: Three years.

- D. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.
 - 1. Warranty Period for Light fixtures: Free from defects in materials and workmanship (excluding fuses and lamps) for a period of 5 years from date of Substantial Completion.
 - 2. Warranty Period for Lamps: Replace lamps and fuses that fail within 6 months from date of Substantial Completion; furnish replacement lamps and fuses that fail within the second 6 months from date of Substantial Completion.
 - 3. Warranty Period for Poles: Repair or replace light poles and standards that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less than 5 years from date of Substantial Completion.
 - 4. Alignment Warranty: Accuracy of alignment of light fixtures shall remain within specified illuminance uniformity ratios for a period of 5 years from date of successful completion of acceptance tests. Realign fixtures that become misaligned during the warranty period. Replace alignment products that fail within the warranty period. Retest distribution to verify proper realignment.
 - 5. Warranty for Pole-Mounted LED Area Lights: Light fixture (including LEDs and drivers) and pole will be free of defects in material and workmanship for a period of ten years from date of product purchase.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Package aluminum poles for shipping according to ASTM B 660.
- B. Store poles on decay-resistant-treated skids at least 12 inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.
- C. Retain factory-applied pole wrappings on metal poles until right before pole installation.
- D. Handle all poles with web fabric straps.

1.10 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Additional light fixtures, poles, and accessories as scheduled on the Drawings.
- B. Where light fixtures are specified with tamper proof hardware, provide the Owner with three tools for each different type of hardware.

1.11 SPARES

- A. Furnish spare materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Lamps: 10 for every 100 of each type and rating installed. Furnish at least one of each type.
 - 2. Glass and Plastic Lenses, Covers, and Other Optical Parts: 5 for every 100 of each type and rating installed. Furnish at least one of each type.

3. Ballasts and/or Drivers: 2 for every 100 of each type and rating installed. Furnish at least one of each type.
4. Globes and Guards: 2 for every 20 of each type and rating installed. Furnish at least one of each type.
5. Fuses: 10 for every 100 of each type and rating installed.

PART 2 - PRODUCTS AND MATERIALS (PROVIDED BY OTHERS)

2.1 MANUFACTURERS

- A. In Light Fixture Schedule (on the drawings) where titles below are column or row headings that introduce lists, the following requirements apply to product selection:
 1. Basis-of-Design Product: The design for each light fixture is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified that meets or exceeds performance characteristics of the named product.
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 LIGHT FIXTURES, GENERAL REQUIREMENTS

- A. Light fixtures shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.
- B. Comply with IES RP-8 for parameters of lateral light distribution patterns indicated for light fixtures.
- C. Comply with IES BUG ratings where indicated on the Light Fixture Schedule.
- D. Metal Parts: Free of burrs and sharp corners and edges.
- E. Sheet Metal Components: Corrosion-resistant aluminum, unless otherwise indicated. Form and support to prevent warping and sagging.
- F. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed light fixtures.
- G. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- H. Exposed Hardware Material: Stainless steel for latches, fasteners, and hinges.
- I. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- J. Light Shields: Metal baffles or louvers, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
- K. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:
 1. White Surfaces: 85 percent.
 2. Specular Surfaces: 83 percent.
 3. Diffusing Specular Surfaces: 75 percent.

- L. Gaskets for Lenses and Refractors: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in light fixture doors.
- M. Where located within structural concrete, light fixture housing and any other luminaire components in direct contact with concrete shall be effectively coated and/or covered to prevent chemical reactions with the concrete in accordance with the American Concrete Institute Code.
- N. Light Fixture Finish: Manufacturer's standard paint applied to factory-assembled and -tested light fixture before shipping. Where indicated, match finish process and color of pole or support materials.
- O. Factory-Applied Finish for Aluminum Light Fixtures: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
 - 2. Class I, Color Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 611.
 - a. Color: As indicated on the Light Fixture Schedule.
- P. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps, LEDs, ballasts and/or drivers. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
 - 1. Label shall include the following lamp, LEDs, ballast and/or driver characteristics:
 - a. "USES ONLY" and include specific lamp or LED type.
 - b. Lamp diameter code (T-4, T-5, T-8), tube configuration (twin, quad, triple), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.
 - c. Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.
 - d. LED type, wattage, beam angle (if applicable) for LED luminaires. Include maximum allowed wattage.
 - e. Start type (preheat, rapid start, instant start) for fluorescent and compact fluorescent luminaires.
 - f. ANSI ballast type (M98, M57, etc.) for HID luminaires.
 - g. For LED luminaires, includes CCT and CRI.

2.3 LAMPS GENERAL

- A. Unless specific manufacturers and lamp types are called for in the Light Fixture Schedule, all lamps provided for this project shall be by the same manufacturer. Lamps shall be manufactured by:
 - 1. Eiko
 - 2. General Electric
 - 3. Osram/Sylvania
 - 4. Philips
 - 5. Soraa
 - 6. Venture
- B. All lamps shall be new and shall be delivered to the project in manufacturer's original sealed package.
- C. Substitutions of specific lamp manufacturer as addressed in Fixture Schedule shall not be allowed. Costs associated with re-lamping due to non-compliance with specification, for both labor and material costs, shall be the sole responsibility of the contractor. For those fixtures with lamp included in fixture, contractor shall coordinate with manufacturer to ensure only approved lamp(s) is (are) installed. Lamp manufacturers indicated on Fixture Schedule are for reference. Where required, contractor shall coordinate with Owner regarding national purchasing agreement of specific lamp manufacturers. Purchasing of lamps, whether

through competitive bidding of listed manufacturers or proprietary supply, shall be at the discretion of the Owner.

2.4 DRIVERS FOR LED LUMINAIRES

- A. Description: Designed for type and quantity of LED diodes of light fixture. Drivers shall tolerate sustained open circuit and short circuit output conditions without damage. Driver shall be designed for full light output unless dimmer or bi-level control is indicated:
1. Sound Rating: A.
 2. Total Harmonic Distortion Rating: Less than 20 percent. Shall comply with ANSI C82.77.
 3. Transient Voltage Protection: IEEE C62.41, Category A or better.
 4. Power Factor: 0.90 or higher at full load.
 5. Interference: Comply with 47 CFR, Chapter 1, Part 15, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
 6. Driver shall operate with maximum sustained variations of +/- 10% input voltage and frequency with no damage to driver.
 7. Driver output shall be regulated to +/- 5% published load range.
 8. LED Current Crest Factor: 1.5 or less.
 9. LED drivers shall not over-drive LEDs at a current or voltage above LED rated values in order to increase LED lumen output.
 10. Meets EN610000 for input harmonics.
 11. ROHS Compliant.
 12. Suitable for use in outdoor light fixtures.
 13. Dimming Drivers
 - a. Dimming Range: Visually flicker-free, strobe-free, continuous dimming of source as follows, unless specifically noted otherwise in the Light Fixture Schedule whichever is more stringent:
 - 4) Luminaires: 100 to 10 percent of rated lumens.
 - 5) LED Lamps: 100 to 20 percent of rated lumens.
 - b. 0-10V dimming drivers: Compliant with IEC 60929 standard for 4-wire dimming.
 - c. Compatibility: Certified by the manufacturer for use with specific dimming control system and LED indicated.
 - d. Control: Coordinate to ensure that the dimming driver, power supply, controller, dimming module, and/or wallbox dimmer and connecting wiring are compatible.

2.5 LED LAMPS AND LUMINAIRES

- A. Comply with ANSI C78.377 for white light LED color range. Unless noted otherwise in the Light Fixture Schedule, LED color quality characteristics shall be 70 CRI minimum and 4000K CCT. All LEDs used for same fixture type throughout the project to originate from same production bin.
- B. LED binning specification tolerance to be within 3 MacAdam ellipses of rated values for color as indicated in the Light Fixture Schedule.
- C. Unless indicated otherwise in the Light Fixture Schedule, minimum 70% of maintained initial-rated lumens at the average rated life as follows:
1. LED outdoor pole mounted area lights: 100,000 hours
 2. LED lamps: 20,000 hours
 3. Other LED luminaires: 50,000 hours
- D. ROHS compliant
- E. Manufacturer of LED chips will be evaluated based on the manufacturer's product literature and data. At a minimum, LED fixtures or lamps will incorporate Bridgelux, Nichia, Cree, Xicato or Osram LEDs;

additional manufacturers may be considered however the Architect or Engineer has the authority to reject other manufacturers for technical or aesthetic reasons if felt necessary or desirable.

2.6 AUXILIARY DEVICES FOR LOW VOLTAGE AND LED FIXTURES

- A. Provide remote power supplies, drivers and/or transformers for light fixtures as required for a complete and operational system.

2.7 LIGHT FIXTURE-MOUNTED PHOTOELECTRIC RELAYS

- A. Comply with UL 773 or UL 773A.
- B. Contact Relays: Factory mounted, single throw, designed to fail in the on position, and factory set to turn light unit on at 1.5 to 3 fc and off at 4.5 to 10 fc with 15-second minimum time delay.
 - 1. Relay with locking-type receptacle shall comply with NEMA C136.10.
 - 2. Adjustable window slide for adjusting on-off set points.

2.8 POLES AND SUPPORT COMPONENTS, GENERAL REQUIREMENTS

- A. Structural Characteristics: Comply with AASHTO LTS-4.
 - 1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed indicated in Part 1 "Structural Analysis Criteria for Pole Selection" Article.
 - 2. Strength Analysis: For each pole, multiply the actual equivalent projected area of light fixtures and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.
- B. Light Fixture Attachment Provisions: Comply with light fixture manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts, unless otherwise indicated.
- C. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
 - 1. Materials: Shall not cause galvanic action at contact points.
 - 2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication, complying with ASTM A 123/A 123M or ASTM A 153/A 153M unless stainless-steel items are indicated.
 - 3. Anchor-Bolt Template: Plywood or steel.
- D. Concrete Pole Foundations: Cast in place, 3000-psi (28-day minimum compressive strength, with anchor bolts to match pole-base flange. Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete."

2.9 STEEL POLES

- A. Poles: Comply with ASTM A 500, Grade B, carbon steel with a minimum yield of 46,000 psig; 1-piece construction up to 40 feet in height with access handhole in pole wall.
 - 1. Shape: As indicated in the Light Fixture Schedule.
 - 2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.
- B. Pole-Top Tenons: Fabricated to support light fixture or light fixtures and brackets indicated, and securely fastened to pole top.
- C. Steps: Fixed steel, with nonslip treads, positioned for 15-inch vertical spacing, alternating on opposite sides of pole; first step at elevation 10 feet above finished grade.

- D. Grounding and Bonding Lugs: Welded 1/2-inch threaded lug, complying with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.
- E. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported cable times a 5.0 safety factor.
- F. Platform for Lamp and Ballast Servicing: Factory fabricated of steel with finish matching that of pole.
- G. Galvanized Finish: After fabrication, hot-dip galvanize complying with ASTM A 123/A 123M.
- H. Factory-Painted Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - 1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or SSPC-SP 8, "Pickling."
 - 2. Interior Surfaces of Pole: One coat of bituminous paint, or otherwise treat for equal corrosion protection.
 - 3. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
 - a. Color: As indicated by manufacturer's designations

2.10 POLE ACCESSORIES

- A. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify conditions of equipment and installation prior to beginning work.
- B. Verify that equipment is ready for connecting, wiring, and energizing.

3.2 LIGHT FIXTURE INSTALLATION

- A. Install lamps in each light fixture.
- B. Fasten light fixture to indicated structural supports.
- C. Adjust light fixtures that require field adjustment or aiming.
- D. Baffles and Louvers for Spill Light Correction: Install on lighting fixtures with fasteners provided by the manufacturer. Install and adjust to correct out-of-limit spill-light and glare measurements.
- E. Auxiliary devices for low voltage and LED fixtures installation
 - 1. Install device within maximum remote distances and with wiring sized per manufacturer's recommendations.
 - 2. In public areas or other areas where remote device visibility is undesirable, install device where concealed from view, well-ventilated and accessible. Provide access panels as required.
 - 3. Provide label on device indicating fixture type and location/room served along with panelboard circuit number.

4. Properly support remote lighting devices, including, but not limited to, transformers, power supplies, and drivers, per Code and manufacturer's recommendations.
5. Provide enclosures suitable for installation environment as required.

3.3 MULTI-LEVEL SWITCHING

- A. For multi-level (step-dimming) drivers or ballasts, provide number of switch conductors required to the device for operation of all light levels intended.

3.4 DIMMING

- A. For dimmable light fixtures, provide both control and power wiring between light fixture and control device and between light fixtures. Quantity of low voltage and line voltage wiring and wire type shall be per manufacturer's recommendations. At a minimum, provide the following based on control type at either 120V or 277V, unless recommended otherwise by the manufacturer:
 1. 0-10V – two low voltage conductors and two line voltage conductors plus ground
 2. 2-Wire dimming – two line voltage conductors plus ground
 3. 3-Wire dimming – three line voltage conductors (1 for control and two for power) plus ground
 4. DALI – two low voltage conductors and two line voltage conductors plus ground
 5. Proprietary digitally addressable – as required per the manufacturer
 6. DMX – two line voltage conductors plus ground and DMX cabling
- B. Coordinate light fixture and control device dimming types for compatibility.

3.5 POLE INSTALLATION

- A. Align pole foundations and poles for optimum directional alignment of light fixtures and their mounting provisions on the pole. Install poles and other structural units level, plumb, and square.
- B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features, unless otherwise indicated on Drawings:
 1. Fire Hydrants and Storm Drainage Piping: 60 inches.
 2. Water, Gas, Electric, Communication, and Sewer Lines: 10 feet.
 3. Trees: 15 feet.
- C. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Division 03 Section "Cast-in-Place Concrete."
- D. Foundation-Mounted Poles: Mount pole with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.
 1. Use anchor bolts and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
 2. Grout void between pole base and foundation. Use nonshrink or expanding concrete grout firmly packed to fill space. Grout materials, installation, and finishing requirements are specified in Division 05 Section "Metal Fabrications".
 3. Install base covers, unless otherwise indicated.
 4. Use a short piece of 1/2-inch- diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.
- E. Raise and set poles using web fabric slings (not chain or cable).

3.6 CORROSION PREVENTION

- A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
- B. Steel Conduits: Comply with Division 26 Section "Raceways and Boxes for Electrical Systems", including use of coated conduits in concrete foundations.

3.7 GROUNDING

- A. Ground metal poles and support structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."
 - 1. Install grounding electrode for each pole, unless otherwise indicated.
 - 2. Install grounding conductor pigtail in the base for connecting light fixture to grounding system.
- B. Ground nonmetallic poles and support structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."
 - 1. Install grounding electrode for each pole.
 - 2. Install grounding conductor and conductor protector.
 - 3. Ground metallic components of pole accessories and foundations.

3.8 FIELD QUALITY CONTROL

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Adjust all light fixture sockets to match the lamp specified and aim all adjustable light fixtures as directed by the Architect.
- C. Upon completion of the installation of light fixtures, and after building circuits have been energized, apply electrical energy to demonstrate capability and compliance with the requirements. Where possible, correct malfunctioning units at the site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.
- D. Clean light fixtures of dirt and debris upon completion of the installation. Protect installed light fixtures from damage during the remainder of the construction period.
- E. At the time of Substantial Completion, aim all adjustable fixtures, such as flood and spot lights, per the Architect's direction. Provide all necessary equipment to support this effort, such as scaffolds and lifts, as required.
- F. At the time of Final Acceptance of this Project by the Owner, all lamps shall be in working order and all light fixtures shall be fully lamped.
- G. Illumination Observations: Verify normal operation of lighting units after installing light fixtures and energizing circuits with normal power source.

3.9 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain light fixtures. Refer to Division 01 Section "Demonstration and Training."

TABLE OF CONTENTS

DIVISION 28 - FIRE ALARM SPECIFICATION

13980 (284600) FIRE DETECTION AND ALARM

END OF DIVISION 28

PAGE INTENTIONALLY LEFT BLANK

SECTION 13980 (284600) FIRE DETECTION AND ALARM

NEW SPEC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Related Sections: The following sections contain requirements that relate to this Section:
 - 1. Division 7 Section "Penetration Firestopping" for material and methods for firestopping systems.
 - 2. Division 26 Section "Common Work Results for Electrical," for materials and methods for coordination, sleeves and common installation requirements.

1.2 DESCRIPTION OF WORK

- A. This Section requires the Contractor to furnish all materials required to install the fire alarm system. The Contractor shall be responsible for installing, testing, and start-up of a complete functioning fire alarm system, and each element thereof, as specified or indicated on the Drawings or reasonably inferred, including every article, device or accessory (whether or not specifically called for by item) necessary to facilitate each system's function as indicated by the design and the equipment specified. Elements of the work include materials, labor, supervision, supplies, equipment, transportation and utilities.
- B. Division 28 of the Specifications and Drawings numbered with prefixes FA generally describe these systems, but the scope of the Fire Alarm work includes all such work indicated in the Contract Documents: Instructions to Bidders; Proposal Form; General Conditions; Supplementary General Conditions; Architectural, Structural, Fire Suppression, Mechanical, Plumbing, Fire Alarm and Electrical Drawings and Specifications; and Addenda.
- C. The Drawings have been prepared diagrammatically and are intended to convey the scope of work, indicating the general location and arrangement of the major equipment, devices, appliances, etc. without showing all the exact details as to elevations, circuits, routing, and other installation requirements. Use the Drawings as a guide when laying out the system and verify that materials and equipment will fit into the designated spaces, and which, when installed per manufacturers' requirements, will ensure a complete, coordinated, satisfactory and properly operating system.
- D. The scope of work in this section includes:
 - 1. Fire alarm control unit(s)
 - 2. Manual fire alarm pull stations
 - 3. System smoke detectors
 - 4. Aspirating smoke detection (ASD) systems
 - 5. Heat detectors
 - 6. Notification appliances
 - 7. Sprinkler system waterflow and valve tamper alarms
 - 8. Elevator recall
 - 9. Air handling unit shutdown
 - 10. Battery stand-by power
 - 11. Multi-channel one-way voice notification system
 - 12. Fire pump status monitoring
 - 13. Digital alarm communicator transmitter (DACT)

1.3 QUALITY ASSURANCE

- A. All work under this division shall be executed in a thorough professional manner by competent and experienced workmen licensed to perform the Work specified.
- B. All work shall be installed in strict conformance with manufacturer's requirements and recommendations. Equipment and materials shall be installed in a neat and professional manner and shall be aligned, leveled, and adjusted for satisfactory operation.
- C. Material and equipment shall be new, shall be of the best quality and design, shall be current model of the manufacturer, shall be free from defects and imperfections and shall have markings or a nameplate identifying the manufacturer and providing sufficient reference to establish quality, size and capacity. Material and equipment of the same type shall be made by the same manufacturer whenever practicable.
- D. Installation of devices shall be performed or supervised by a National Institute for Certification of Engineering Technologies (NICET) Level III or higher Fire Alarm Technician. Submit copies of the certification for employees through shop drawing submittals.

1.4 APPLICABLE CODES AND STANDARDS

- A. Execute Work in accordance with the National Fire Protection Association Standards and all Local, State, and National codes, ordinances and regulations in force governing the particular class of Work involved. Obtain timely inspections by the constituted authorities. Upon final completion of the Work obtain and deliver to the Owner executed final certificates of acceptance from the Authority Having Jurisdiction.
- B. Any conflict between these Specifications and accompanying Drawings and the applicable Local, State and Federal codes, ordinances and regulations shall be reported to the Architect in sufficient time, prior to the opening of Bids, to prepare the Supplementary Drawings and Specification Addenda required to resolve the conflict.
- C. The governing codes are minimum requirements. Where these Drawings and Specifications exceed the code requirements, these Drawings and Specification shall prevail.
- D. All material, manufacturing methods, handling, dimensions, method or installation and test procedure shall conform to but not be limited to the following industry standards and codes.
 - 1. NFPA 70, "National Electrical Code", 2017 Edition.
 - 3. NFPA 72, "National Fire Alarm and Signaling Code", 2016 Edition.
 - 4. NFPA 20, "Standard for the Installation of Stationary Pumps for Fire Protection", 2016 Edition.
 - 5. Underwriters Laboratories, "Fire Protection Equipment Directory", Latest Edition.
 - 6. FM Global, "Approval Guide", Latest Edition.
 - 7. California Building Code (CBC) 2019 Edition with local amendments.
 - 8. California Fire Code (CFC) 2019 Edition with local amendments.
- E. Contractor shall comply with rules and regulations of public utilities and municipal departments affected by connections of services.

1.5 DEFINITIONS

- A. General:
 - 1. Furnish: The term "furnish" is used to mean "supply and deliver to the project site, ready for unloading, unpacking, assembly, installation and similar operations."
 - 2. Install: The term "install" is used to describe operations at the project site including the actual "unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations."

3. Provide: The term "provide" means "to furnish and install, complete and ready for the intended use."
 4. Furnished by Owner or Furnished by Others: The item will be furnished by the Owner or Others. It is to be installed and connected under the requirements of this Division, complete and ready for operation, including items incidental to the Work, including services necessary for proper installation and operation. The installation shall be included under the guarantee required by this Division.
 5. NRTL: Nationally Recognized Testing Laboratory, as defined and listed by OSHA in 29 CFR 1910.7 (e.g., UL, ETL, CSA, etc.), and acceptable to the AHJ over this project. Nationally Recognized Testing Laboratories and standards listed are used only to represent the characteristics required and are not intended to restrict the use of other listed Manufacturers and models that meet the specified criteria.
 6. FACP: Fire Alarm Control Panel.
 7. NICET: National Institute for Certification in Engineering Technologies.
 8. ASD: Aspirating Smoke Detection.
- B. The terms "approved equal", "equivalent", or "equal" are used synonymously and shall mean "accepted by or acceptable to the Engineer as equivalent to the item or manufacturer specified". The term "approved" shall mean labeled, listed, or both, by an NRTL, and acceptable to the AHJ over this project.

1.6 COORDINATION

- A. The Contractor shall visit the site and ascertain the conditions to be encountered while installing the Work under this Division, verify all dimensions and locations before purchasing equipment or commencing work, and make due provision for same in the bid. Failure to comply with this requirement shall not be considered justification for omission, alteration, incorrect or faulty installation of Work under this Division or for additional compensation for Work covered by this Division.
- B. The Contractor shall refer to Drawings of the other disciplines and to relevant equipment drawings and shop drawings to determine the extent of clear spaces. The Contractor shall make offsets required to clear equipment, beams and other structural members; and to facilitate concealing piping in the manner anticipated in the design.
- C. The Contractor shall maintain a foreman on the jobsite at all times to coordinate their work with other contractors and subcontractors so that various components of the Fire Alarm systems will be installed at the proper time, will fit the available space, and will allow proper service access to the equipment. Carry on the work in such a manner that the work of the other contractors and trades will not be handicapped, hindered, or delayed at any time.
- D. Work of this Division shall progress according to the "Construction Schedule" as established by the Prime Contractor and their subcontractors and as approved by the Architect. Cooperate in establishing these schedules and perform the Work under this Division, in a timely manner in conformance with the construction schedule so as to ensure successful achievement of schedule dates.
- E. Where coordination and interfacing with other systems or equipment is required, it shall be the responsibility of the fire alarm system installer (contractor) to either provide the relays, contacts, power supplies and other necessary hardware or see to it that such hardware is provided with the other systems or equipment.
- F. The contractor shall coordinate work in this section with all related trades. Work and/or equipment provided in other sections and related to the fire alarm system shall include, but not be limited to:
 1. Sprinkler waterflow and valve tamper switches shall be provided by the fire sprinkler installer, but wired and connected by the fire alarm installer.

2. Duct smoke detectors shall be furnished, wired and connected by the fire alarm system installer. The HVAC installer shall furnish necessary duct opening to install the duct smoke detector's housing.
 3. Air handling fan control circuits and contacts to be furnished by the HVAC control equipment.
 4. Conduit shall be by Division 26 "Common Work Results for Electrical".
- G. System shall be complete and operational with power and control wiring provided to meet the design intent shown on the drawings and specified within the specification sections.

1.7 MEASUREMENTS AND LAYOUTS

- A. The drawings are schematic in nature, but show the various components of the systems approximately to scale and attempt to indicate how they are to be integrated with other parts of the building. Figured dimensions shall be taken in preference to scale dimensions. Determine exact locations by job measurements, by checking the requirements of other trades, and by reviewing the Contract Documents. The Contractor will be held responsible for errors which could have been avoided by proper checking and inspection.

1.8 SUBMITTALS

- A. Refer to Division 1 and General Conditions for submittal requirements, in addition to requirements specified herein. Submittals not complying fully with the submittal requirements will be rejected.
- B. Contractor shall prepare installation drawings (working shop drawings) based upon this design. Requests for deviations from the approved design shall be submitted in writing to the Engineer of Record for approval.
- C. Shop drawings shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations. Drawings that are not legible, or that do not contain sufficient detail to verify compliance with applicable codes and standards, will be rejected without further review.
- D. Submittals and shop drawings shall not contain HEI's firm name or logo, nor shall it contain the HEI's engineers' seal and signature. They shall not be copies of HEI's work product. If the contractor desires to use elements of such product, the license agreement for transfer of information at the end of this section must be used.
- E. Submit Shop Drawings as early as required to support the project schedule. Allow for one week Engineer review time plus mailing time plus a duplication of this time for resubmittal if required. Submit Shop Drawings as soon as possible before construction starts.
- F. Before submitting Shop Drawings and material lists, the Contractor shall verify that the equipment submitted is mutually compatible and suitable for the intended use. Contractor shall verify that the equipment will fit the available space and allow ample room for maintenance. If the size of equipment furnished makes necessary any change in location, or configuration, submit a shop drawing showing the proposed layout.
- G. Refer to Division 1 for acceptance of electronic submittals for this project. For electronic submittals, Contractor shall submit the documents in accordance with the procedures specified in Division 1. Contractor shall notify the Architect and Engineer that the shop drawings have been posted. If electronic submittal procedures are not defined in Division 1, Contractor shall include the website, user name and password information needed to access the submittals. For submittals sent by e-mail, Contractor shall copy the Architect and Engineer's designated representatives. Contractor shall allow the Engineer review time as specified above in the construction schedule. Contractor shall submit only the documents required to purchase the materials and/or equipment in the electronic submittal and shall clearly indicate the materials,

performance criteria and accessories being proposed. General product catalog data not specifically noted to be part of the specified product will be rejected and returned without review.

- H. The Engineer's checking and subsequent acceptance of such submittals shall not relieve the Contractor from responsibility for deviations from Drawings or Specifications unless the Contractor has, in writing, called the Engineer's and Architect's attention to such deviations at the time of submission, and secured written acceptance; nor shall it relieve the Contractor from responsibility for errors in dimensions, details, sizes of members, or quantities; or for omissions of components or fittings; or for not coordinating items with actual building conditions and adjacent work.
- I. Product Data: Provide a bill of materials and product cutsheets showing material specifications, electrical characteristics and connection requirements. Highlight or indicate specific product options and accessories as applicable to the project.
- J. Shop Drawings:
 - 1. Comply with recommendations and requirements in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - 2. Shop drawings shall be prepared by a NICET Level III or higher certified technician. Submit copies of the certification for the designer with submittal.
 - 3. The fire alarm system equipment vendor shall provide shop drawings showing fire alarm floor plans and a full building riser diagram. Fire alarm floor plans and riser diagram shall show fire alarm control panel, annunciator, all fire alarm initiating devices and notification appliances. Show typical wiring diagrams of control panel/s, annunciator and each device and wiring connections required. Show all interfaces to other systems, such as temperature control systems, and security systems.
 - 4. The fire alarm floor plans and riser diagram shall show wiring to all fire alarm devices/appliances, indicating wire sizes and quantities as well as conduit/raceway sizes and locations of end-of-line (EOL) resistors. The fire alarm floor plans and riser diagram shall clearly show the routing of all fire alarm system wiring, including all horizontal routing and vertical routing (in chases).
 - 5. Routing of all fire alarm wiring shall comply with the "Survivability" requirements of NFPA 72.
 - 6. Provide a Sequence of Operations Matrix that explains how the submitted fire alarm system functions.
 - 7. Include voltage drop calculations for notification-appliance circuits.
 - 8. Include battery-size calculations.
 - 9. Shop drawing scale shall match the Engineer's drawings where possible.
 - 10. Shop drawings shall be produced using computer-aided design. Hand drawn documents will not be reviewed or approved.
- K. Indicate within the submittal all applicable UL listings and all applicable approvals or certifications.
- L. Qualification Data: Submit copies of the certification for the Installer.
- M. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of products.

1.9 ELECTRONIC DRAWING FILES

- A. In preparation of shop or record drawings, Contractor may, at their option, obtain electronic drawing files in AutoCAD or DXF format from the Engineer for a shipping and handling fee of \$200 for a drawing set up to 12 sheets and \$15 per sheet for each additional sheet. Contact the Architect for Architect's written authorization. Contractor shall complete and send the form attached at the end of this section along with a check made payable to Henderson Engineers, Inc. Contractor shall indicate the desired shipping method and drawing format on the attached form. In addition to payment, Architect's written authorization and Engineer's release agreement form must be received before electronic drawing files will be sent.

1.10 SUBSTITUTIONS

- A. Refer to Division 1 and General Conditions for Substitutions.
- B. Materials, products and equipment described in the Bidding Documents establish a standard of required function, dimension, appearance and quality to be met by the proposed substitution.
- C. No substitution will be considered prior to receipt of Bids unless written request for approval to bid has been received by the Engineer at least ten calendar days prior to the date for receipt of Bids. Each such request shall include the name of the material or equipment for which it is to be substituted and a complete description of the proposed substitute including drawings, cuts, performance and test data and other information necessary for an evaluation. A statement setting forth changes in other materials, equipment or other Work that incorporation of the substitute would require shall be included. The burden of proof of the merit of the proposed substitute is upon the proposer. The Engineer's decision of approval or disapproval to bid of a proposed substitution shall be final.
- D. If the proposed substitution is approved prior to receipt of Bids, such approval will be stated in an Addendum. Bidders shall not rely upon approvals made in any other manner. Verbal approval will not be given.
- E. No substitutions will be considered after the Contract is awarded unless specifically provided in the Contract Documents.

1.11 OPERATION AND MAINTENANCE DATA

- A. Refer to Division 1 and General Conditions for Operational and Maintenance Manuals.
- B. Instruct the Owner's permanent personnel in the proper operation of, startup and shutdown procedures and maintenance of the equipment and components of the systems installed under this Division.
- C. The O&M Manuals shall be provided in labeled 3-ring binder with cover, binding label, tabbed fly sheets and plastic insert folders for Record Drawings. Include the following sections with the appropriate information for each section:
 - 1. Typewritten Index.
 - 2. Qualifications. Provide designer and installer qualification.
 - 3. Bill of Materials. Provide complete nomenclature, model number and vendor information for all parts.
 - 4. Operating Instructions. Complete instructions detailing operation and maintenance of all equipment installed.
 - 5. Product Data: Provide product cutsheets for all equipment utilized and installed.
 - 6. Riser diagram.
 - 7. Device addresses.
 - 8. Record copy of site-specific software.
 - 9. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:
 - a. Equipment tested.
 - b. Frequency of testing of installed components.
 - c. Frequency of inspection of installed components.
 - d. Requirements and recommendations related to results of maintenance.
 - e. Manufacturer's user training manuals.
 - 10. Manufacturer's required maintenance related to system warranty requirements.
 - 11. Abbreviated operating instructions for mounting at fire alarm control unit and each annunciator unit.
 - 12. Guarantee. Copy of all guarantees and warranties issued.
 - 13. Contact list with minimum three service representative phone numbers.

1.12 RECORD DRAWINGS

- A. A set of prints shall be kept on the jobsite during construction for the purpose of noting changes to location of all fire alarm equipment, devices, appliances and circuits as finally installed. During the course of construction, the Contractor shall indicate on these drawings, changes made from the Contract Drawings. Particular attention shall be made to those items which need to be located for servicing.
- B. The record drawings shall show actual locations of initiating devices, notification appliances, and end-of-line devices. Show the approximate location, size and type of all wiring and routing of wiring. Drawings should also include one-line riser diagrams showing all devices.
- C. The Contractor shall sign-off on the Record Drawings as being an accurate representation of the completed installation.
- D. Refer to Division 1 and General Conditions for Record Drawings
- E. At the completion of the project, the Contractor shall obtain at their expense, reproducible copies of the drawings and incorporate changes noted on the jobsite work prints onto these sheets. These changes shall be done by a skilled drafter. Each sheet shall be marked "Record Drawing", with date. The drawings and associated system calculations shall be delivered to the Architect.

1.13 SPARE PARTS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Provide 10% of the total or a minimum of one (1) manual pull station.
 - 2. Provide 10% of the total or a minimum of two (2) of each type of automatic smoke detector.
 - 3. Provide 5% of the total or a minimum of one (1) of each type of automatic heat detector.
 - 4. Provide 5% of the total or a minimum of one (1) of each type of ASD detector.
 - 5. Provide 5% of the total or a minimum of two (2) of each strobe type and candela rating.
 - 6. Provide 5% of the total or a minimum of two (2) of each horn/speaker type. Combination horn/speaker/strobe units matching the units installed are acceptable.
 - 7. Keys and Tools: One extra set for access to locked or tamper proofed components.

1.14 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the products indicated in this section with minimum three years documented experience.
- B. Installer: Company specializing in installing the products indicated in this section with minimum three years documented experience. Shall be bondable and licensed Contractor and employ full-time factory-trained and certified installers and technicians. Installers shall provide with the fire alarm submittal proof of factory training for each installer.
- C. Final checkout and verification: Shall be conducted by a technician certified by the National Institute for Certification in Engineering Technologies (NICET) registered as level III or higher in the fire protection technology certification program. Provide certification information with fire alarm submittal.
- D. The equipment manufacturer's service department shall be fully stocked in standard parts and components and engaged in the maintenance of fire alarm systems. On-the-premises service shall be available within 4 hours of notification, 7 days a week, 24 hours a day.

1.15 GUARANTEES AND WARRANTIES

- A. Refer to Division 1 and General Conditions for Guarantees and Warranties.

- B. Furnish service and maintenance of fire alarm system including wiring and raceways for one year from date of substantial completion.
- C. All components, system software, parts and assemblies shall be guaranteed against defects in materials and workmanship for the one-year period stated above, unless specific items are noted to carry a longer warranty in the Construction Documents or manufacturer's standard warranty.
- D. Labor (including travel expenses) to trouble-shoot, repair, reprogram, or replace components shall be furnished by this contractor at no charge during the warranty period.
- E. All corrective software modifications made during warranty periods shall be updated on all user documentation and on user and manufacturer archived software.

1.16 PROJECT CONDITIONS

- A. Conditions Affecting Work In Existing Buildings: The following project conditions apply:
 1. The Drawings describe the general nature of remodeling to the existing building. However, the Contractor shall visit the Site prior to submitting a bid to determine the nature and extent of work involved.
 2. Work in the existing building shall be scheduled with the Owner.
 3. Certain demolition work must be performed prior to the remodeling. The Fire Alarm Contractor shall perform the demolition which involves fire alarm system equipment and materials.
 4. Fire Alarm Contractor shall remove articles which are not required for the new work. Unless otherwise indicated, each item removed by the Contractor during this demolition shall be removed from the premises and disposed of in accordance with applicable federal, state and local regulations.
 5. Fire Alarm Contractor shall relocate and reconnect fire alarm equipment that must be relocated in order to accomplish the remodeling shown in the Drawings or indicated in the Specifications. General Contractor shall install finish material.
 6. Obtain permission from the Architect for channeling of floors or walls not specifically noted on the Drawings.
 7. Protect adjacent materials indicated to remain. Install and maintain dust and noise barriers to keep dirt, dust, and noise from being transmitted to adjacent areas. Remove protection and barriers after demolition operations are complete.
 8. Locate, identify, and protect Fire alarm services passing through demolition area and serving other areas outside the demolition limits. Maintain services to areas outside demolition limits. When services must be interrupted, install temporary services for affected areas.
- B. Use of Devices during Construction: Protect devices during construction unless devices are placed in service to protect the facility during construction.

PART 2 - PRODUCTS AND MATERIALS

2.1 SYSTEM DESCRIPTION

- A. Noncoded, UL-listed, networked addressable system, with multiplexed signal transmission and voice/strobe evacuation.
- B. All components provided shall be listed for use with the selected system.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- D. Source Limitations for Fire alarm System and Components: Components shall be compatible with, and operate as an extension of, existing system. Provide system manufacturer's certification that all components provided have been tested, and will operate, as a system.

2.2 MANUFACTURER

- A. Subject to compliance with requirements, provide products manufactured by the following manufacturer as indicated on the Drawings:
 - 1. Edwards

2.3 SYSTEMS OPERATIONAL DESCRIPTION

- A. Fire alarm signal initiation shall be by one or more of the following devices and systems:
 - 1. Manual pull stations.
 - 2. Heat detectors.
 - 3. Smoke detectors.
 - 4. Aspirating smoke detection system.
 - 5. Automatic sprinkler system water flow.
- B. Fire alarm signal shall initiate the following actions:
 - 1. Identify alarm and specific initiating device at fire alarm control unit(s) and remote annunciators (if provided).
 - a. A pulsing alarm tone shall occur within the control panel until acknowledged.
 - b. The alarm LED shall flash on the control panel and remote annunciator panel until the alarm has been acknowledged at the control panel/remote annunciator panel. Once acknowledged, this same LED shall latch on and the custom label for the address in alarm shall be displayed on the alphanumeric LCD readout. A subsequent alarm received from another address after acknowledged shall flash the alarm LED on the control panel showing the new alarm information.
 - 2. Transmit an alarm signal to the alarm supervising station.
 - 3. The audible and visible alarm signal shall operate until it is manually silenced or acknowledged.
 - 4. Record events in the system memory.
 - 5. Unlock electric door locks in designated egress paths.
 - 6. Release fire and smoke doors held open by magnetic door holders.
 - 7. Activate voice/alarm communication system.
 - 8. All fan-powered air-handling equipment shall shutdown and remain down until the fire alarm control panel is reset.
 - 9. Close smoke dampers in air ducts of designated air-conditioning duct systems.
 - 10. Shutdown audio system/background music.
- C. Supervisory signal initiation shall be by one or more of the following devices and actions:
 - 1. Valve supervisory switch.
 - 2. Duct-smoke detectors
 - 3. High- or low-air-pressure switch of a dry-pipe or pre-action sprinkler system.
 - 4. Alert and Action signals of aspirating detection system.
 - 5. Fire pump running.
 - 6. Fire pump loss of power.
 - 7. Fire pump power phase reversal.
 - 8. Independent fire detection and suppression systems.
 - 9. User disabling of zones or individual devices.
 - 10. Loss of communication with any panel on the network.
- D. System Supervisory Signal Actions:

1. Identify specific device causing supervisory signal fire alarm control unit and remote annunciators (if provided).
 - a. Visible and audible supervisory alarm indicated by address at fire alarm control panel.
 - b. Manual acknowledge function at fire alarm control panel and remote annunciator panel silences audible supervisory alarm; visible alarm is displayed until device is returned to its normal position/supervisory condition is cleared.
2. Record events in the system memory.
3. After a time delay of 90 seconds transmit a supervisory signal to the alarm supervising station.
4. Duct-mounted smoke detectors shall shutdown their respective unit upon detection of smoke and remain down until manually reset.
5. Individual fan-powered air distribution equipment less than 2,000 cfm that is not provided with duct detection shall shutdown when the respective air handling unit is shutdown.

E. System trouble signal initiation shall be by one or more of the following devices and actions:

1. Open circuits, shorts, and grounds in designated circuits.
2. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
3. Loss of communication with any addressable sensor, input module, relay, control module, remote annunciator, printer interface, or Ethernet module.
4. Loss of primary power at fire alarm control unit.
5. Ground or a single break in internal circuits of fire alarm control unit.
6. Abnormal ac voltage at fire alarm control unit.
7. Break in standby battery circuitry.
8. Failure of battery charging.
9. Abnormal position of any switch at fire alarm control unit or annunciator.
10. Voice signal amplifier failure.

F. System Trouble Signal Actions:

1. Identify specific device causing trouble signal fire alarm control unit and remote annunciators (if provided).
 - a. Visible and audible trouble alarm indicated by address at fire alarm control panel.
 - b. Manual acknowledge function at fire alarm control panel and remote annunciator panel silences audible trouble alarm; visible alarm is displayed until device is returned to its normal position/trouble condition is cleared.
2. Record events in the system memory.
3. After a time delay of 90 seconds, transmit a trouble signal to the alarm supervising station.
4. Transmit system status to building management system.
5. Display system status on graphic annunciator.

2.4 FIRE ALARM SYSTEM CONTROL PANEL

A. General Requirements for Fire Alarm Control Panel:

1. Edwards EST4 addressable multi-zone fire alarm system
 - a. System software and programs shall be held in nonvolatile flash, electrically erasable, programmable, read-only memory, retaining the information through failure of primary and secondary power supplies.
 - b. Provide fiber connection between the FACP and FACU/Transponder panels.
 - c. The FACP shall be listed for connection to a central-station signaling system service.
 - d. The FACP shall be provided with surge protection.
 - e. Install in a flush mounted enclosure.
 - f. The fire alarm system control unit shall be UL listed for releasing service.
 - g. Additional FACP/FACU components detailed in drawings, contractor to provide all necessary components for intended function.

- B. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire alarm control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
 - 1. Annunciator and Display: Liquid-crystal type, 80 characters, minimum.
 - 2. Keypad: Arranged to permit entry and execution of programming, display, and control commands.

- C. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory signals and digital alarm communicator transmitters shall be powered by 24-V dc source.
 - 1. The location of the dedicated branch circuit disconnecting means shall be permanently identified at the control unit.
 - 2. The circuit disconnecting means shall have a red marking and be provided with a breaker lock or other approved method to avoid accidental operation.
 - 3. Alarm current draw of entire fire alarm system shall not exceed 80 percent of the power-supply module rating.

- D. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.
 - 1. Batteries: Sealed lead acid.
 - 2. The secondary power system shall operate system in standby mode for 4 hours followed by alarm mode for 15 minutes.

- E. System Supervision: Automatically detects and reports open circuits, shorts, and grounds of wiring for initiating device, signaling line, and notification appliance circuits. Alarm, supervisory and trouble signals shall be monitored by the supervising station over a Digital Alarm Communicator Transmitter (DACT), or other approved method.

- F. Fire Pump Control and Status: Provide supervised START (no STOP control shall be installed) controls and visible alarm status indication at the Fire Command Center and at the Remote Annunciator for the fire pump in accordance with NFPA 20. Coordinate with the fire pump controller supplier and provide the necessary conduit and wiring for the control and status indication. Refer to Division 21.

- G. Elevator Recall and Shutdown: Provide output signals to the elevator controller(s) using addressable relays to initiate elevator recall and shutdown functions per ASME A17.1. Provide equipment, output signals and logic as required by code and by the elevator system supplier and installer.
 - 1. Elevator recall shall be initiated by any one of the following alarm-initiating devices:
 - a. Elevator lobby detector(s).
 - b. Smoke detector in elevator machine room.
 - c. Smoke detector(s) in elevator hoistway.
 - d. Heat detector(s) in elevator pit.
 - 2. Elevator controller shall be programmed to move the cars to the alternate recall floor if lobby detectors located on the designated recall floors are activated.
 - 3. Elevator shutdown shall be initiated by any one of the following alarm-initiating devices:
 - a. Heat detector in elevator machine room.
 - b. Heat detector(s) at top of elevator hoistway.

2.5 EMERGENCY VOICE/ALARM COMMUNICATIONS SYSTEMS (EVACS):

- A. The system shall incorporate one-way emergency voice communication via specified speakers. A central audible module shall provide for the necessary alarm message/tone generation, main and remote microphone connections and mixers/pre-amplifier circuits. Continuous supervision shall be provided along with specific information as to the type of failure (main microphone trouble, tone trouble, etc.)

1. Indicate number of alarm channels for automatic, simultaneous transmission of different announcements to different zones or for manual transmission of announcements by use of the central-control microphone. Amplifiers shall comply with UL 1711.
 - a. Allow the application of, and evacuation signal to, indicated number of zones and, at the same time, allow voice paging to the other zones selectively or in any combination.
 - b. Programmable tone and message sequence selection.
 - c. Standard digitally recorded messages for "Evacuation" and "All Clear."
 - d. Generate tones to be sequenced with audio messages of type recommended by NFPA 72 and that are compatible with tone patterns of notification appliance circuits of fire alarm control unit.
2. Hand held push to talk, noise canceling microphone in recessed protective panel mounted enclosure; 5 feet coiled cable; and LED to indicate the microphone push to talk has been pressed.
3. Audible power amplifiers shall be self filtered; contain 24 volt power supply, transformer and amplifier monitor circuits; Amplifier shall operate all system speakers plus twenty-five (25) percent spare capacity.
4. Digitized voice messages are required to notify building occupants during alarm conditions. Message player shall not rely on tape or mechanical means of transmitting the voice message. A standard evacuation message shall be provided; however, the system shall be capable of transmitting a custom message of up to five (5) minutes long.
5. Alarm sequence shall consist of a temporal (3) alarm tone for a maximum of 15 seconds followed by an automatic pre-selected message. At the end of the message the tone shall resume. This sequence shall continue until the fire alarm control panel has been silenced. Manual voice paging shall be available via panel switches to page individual floors or groups of floors. Each floor shall be an individual audible zone and have a corresponding audible switch.

2.6 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter (DACT) shall be acceptable to the central station and shall comply with UL 864.
- B. The installing contractor shall select the appropriate DACT equipment based on the available communication methods.
- C. Coordinate with General Contractor to ensure proper connections are provided for communication to and from the DACT. Two (2) separate communication methods are required and shall not be subject to a common failure within the scope of work identified within these contract documents. Unless noted otherwise, the installing contractor shall utilize two (2) of the following communication methods:
 1. Building 10/100 Base network (LAN), DSL modem, or cable modem.
 2. Bosch 465 Cellular Communicator.
 - a. The transmitter shall automatically detect and choose the best network in the area based on signal strength and immediately self-adjust for operation as necessary.
 3. Other alternative method complying with the performance requirements of NFPA 72 for 'Communication Methods for Supervising Station Alarm Systems that is acceptable to the Authority Having Jurisdiction and the Engineer of Record. Approval of any alternative methods must be obtained from the Engineer of Record via an RFI prior to submitting bids for the scope of work.
- D. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire alarm control unit and automatically transmit across the primary communication method. If service on the primary communication method is interrupted for longer than 45 seconds, the transmitter shall initiate a local trouble signal and transmit a signal indicating loss of primary communication to the supervising station over the secondary communication method. Transmitter shall automatically report communication restoration to the supervising station. If service is lost on both communication methods, transmitter shall initiate a local trouble signal.
- E. Digital data transmission shall include the following:

1. Address of the alarm initiating device.
2. Address of the supervisory signal.
3. Address of the trouble signal.
4. Loss of ac supply.
5. Loss of power.
6. Low battery.
7. Abnormal test signal.
8. Communication bus failure.

F. Secondary Power: Integral rechargeable battery and automatic charger.

G. Self-Test: Conducted automatically every 24 hours with report transmitted to supervising station.

2.7 FIRE ALARM SYSTEM CONTROL UNIT(S)/TRANSPONDERS

A. Description: Alphanumeric display and LED indicating lights shall match those of fire alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

1. Mounting: Flush
2. Provide remote microphone and emergency/voice alarm system controls.
3. Additional details/components provided in drawing set.

2.8 INITIATING DEVICES

A. Manual Fire Alarm Boxes: Edwards Addressable Signature Series SIGA-278

1. Double action mechanism requiring two actions to initiate an alarm, pull lever type; with integral addressable module arranged to communicate manual station status (normal, alarm, or trouble) to fire alarm control unit.
2. Station Reset: Key or wrench operated switch.
3. Indoor Protective Shield: Factory fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm. Lifting the cover actuates an integral battery-powered audible horn intended to discourage false-alarm operation.

B. System Smoke Detectors: Edwards Addressable Signature Series SIGA-OSD w/ SIGA-SB4 base.

1. Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base.
2. Device shall have an integral visual-indicating light, LED type, indicating detector has operated and power-on status.
3. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
4. Photoelectric detectors shall have sensitivity between 0.5 and 3.5 percent/foot smoke obscuration.

C. Duct Smoke Detectors: Edwards Addressable Signature Series SIGA-SD

1. Provide for variations in duct air velocity between 100 and 4,000 feet per minute.
2. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied. Provide an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet.
3. Self-Restoring: Detectors shall not require resetting or readjustment after actuation to restore them to normal operation.
4. Relay Fan Shutdown: Fully programmable relay rated to interrupt fan motor control circuit.
5. Provide remote alarm LEDs and remote test stations as shown on the plans.
6. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC system ducts.

- D. Heat Detectors: Edwards Addressable Signature Series SIGA-HRD w/ SIGA-SB4 base.
 - 1. Detector shall have twist lock base interchangeable with smoke detectors bases and be equipped with an integral addressable module arranged to communicate detector status (normal, alarm, or trouble) to fire alarm control unit.
 - 2. Combination Type: Actuated by either a fixed temperature of 135 deg F (57 deg C) or a rate of rise that exceeds 15 deg F (8 deg C) per minute unless otherwise indicated.
 - 3. Fixed-Temperature Type: Actuated by temperature that exceeds a fixed temperature of 135 deg F (88 deg C).

2.9 NOTIFICATION APPLIANCES

- A. General Requirements for Notification Appliances: Connected to notification appliance signal circuits, zoned as indicated, equipped for mounting as indicated, and with screw terminals for system connections.
 - 1. Combination Devices: Factory integrated audible and visible devices in a single mounting assembly, equipped for mounting as indicated, and with screw terminals for system connections. Minimum audible level and strobe intensity shall meet all requirements for separate appliances.
 - 2. Provide strobe synchronization as required per NFPA 72.
 - 3. Wall mounted notification appliances shall be manufacturer standard red finish unless noted otherwise on drawings.
 - 4. Ceiling mounted notification appliances shall be manufacturer standard white finish unless noted otherwise on drawings.
- B. Exterior Alarm Bells: Electric vibrating, 10-inch bell with operating mechanism behind dome and weatherproof bell kit. Sound Rating: 90 dB at 10 feet.
- C. Alarm Horns: Comply with UL 464. Electric vibrating polarized type, 24-V dc; with provision for housing the operating mechanism behind a grille. Horns shall produce a sound-pressure level of 90 dBA, measured 10 feet (3 m) from the horn, using the coded signal prescribed in UL 464 test protocol.
- D. Alarm Speakers: Comply with UL 1480. High quality tone and voice reproduction; capacitor connected for connection to supervised notification appliance circuit; semi-flush mounting; four inch cone; high impact, flame retardant PC/ABS thermoplastic; 25 or 70 VRMS; multi-tapped output power rated ¼ to 2 watts and produce 79 to 88 dB at 10 feet.
- E. Special Application Speakers (Warehouse):
 - 1. Edwards TCPA-10 70v loudspeakers
- F. Visible Alarm Notification Appliances (Strobes): Xenon strobe lights complying with UL 1971, unfiltered or clear filtered white light, with candela ratings as indicated on drawings. Strobes shall meet all requirements of the Americans with Disabilities Act.

2.10 AUXILIARY DEVICES

- A. Waterflow Alarm Switches: Shall be provided by the Fire Sprinkler Installer and shall be wired complete and ready for use by the Fire Alarm System Installer. Switch shall have an adjustable delay to minimize false alarms due to fluctuations in water pressure.
- B. Valve (Tamper) Switches: Shall be provided by the Fire Sprinkler Installer and shall be wired complete and ready for use by the Fire Alarm System Installer.
- C. Monitor Module: Addressable microelectronic module providing a system address for alarm initiating devices for wired applications with normally open contacts. Include address setting means on the module.
- D. Control/Relay Module: Provide intelligent control relay modules. The Control Relay Module shall provide one form "C" dry relay contact rated at 2 amps @ 24 VDC to control external appliances or equipment

shutdown. The control relay shall be rated for pilot duty and releasing systems. The position of the relay contact shall be confirmed by the system firmware.

- E. Fire Department Key Box: Shall be by Knox Company or as otherwise specified by the authority having jurisdiction. Provide internal switch(es), as required by the Authority Having Jurisdiction, to indicate supervisory condition(s) at the fire alarm control and annunciator panels.

2.11 DEVICE GUARDS

- A. Description: Welded wire mesh of size and shape for smoke detectors, notification appliances, or other device requiring protection as indicated on the plans.
 - 1. Factory fabricated and furnished by device manufacturer.
 - 2. Finish: Factory finished to match the color of the protected appliance or device.

2.12 FIRE ALARM WIRE AND CABLE

- A. Fire Alarm Power Branch Circuits: Building wire as specified in Division 26.
- B. Fire alarm Wire and Cable: NRTL listed and labeled as complying with NFPA 70 (NEC) Article 760. All wiring, including wiring to existing modified devices and appliances shall be new.
- C. Signaling Line, Initiating Device and Notification Appliance Circuits: Power limited fire protective signaling cable, solid copper conductor, 300 volts insulation, suitable for temperature, conditions and location installed. Minimum wire size for initiating device circuits, control circuits and notification appliance circuits shall be determined by calculations and manufacturer's requirements or recommendations. Wire and cable shall be twisted and shielded if recommended by the system manufacturer.
- D. The type of cable chosen should be based on fire alarm system requirements, specification requirements and applicable code requirements. Consideration should also be given to the length of cable runs and potential interference.
- E. Initiating, notification, and control circuits shall be sized based on 20% additional power consuming devices.
- F. Conduit and Boxes: Comply with requirements in Division 26 Section "Raceway and Boxes for Electrical Systems.
- G. Circuit Integrity Cable: Twisted shielded pair, NFPA 70, Article 760, Classification CI, for power-limited fire alarm signal service Type FPL. NRTL listed and labeled as complying with UL 1424 and UL 2196 for a 2-hour rating.
- H. Multiconductor Armored Cable: NFPA 70, Type MC, copper conductors, Type TFN/THHN conductor insulation, copper drain wire, copper armor with outer jacket and red identifier stripe, NRTL listed for fire alarm and cable tray installation, plenum rated.
- I. Initiating-Device, Notification-Appliance, and Signaling-Line Circuits: Provide circuitry, which meets the performance requirements during abnormal conditions, based upon the class of the circuitry selected.
 - 1. Initiating Device Circuits: Class B.
 - a. Pathway Survivability: Level 1.
 - 2. Notification Appliance Circuits: Class B.
 - b. Pathway Survivability: Level 1.
 - 3. Signaling Line Circuits: Class B.
 - c. Pathway Survivability: Level 1.

4. Any circuits interconnecting fire alarm control panels between separate buildings shall be provided with surge protection.

2.13 ACCESS TO EQUIPMENT

- A. All detectors, modules, equipment, etc. shall be located so as to provide easy access for operation, service inspection and maintenance.
- B. Access Doors:
 1. Provide access doors for all concealed equipment, except where above lay-in ceilings.
 2. Access doors shall be adequately sized for the devices served with a minimum size of 18" x 18", furnished by the respective Contractor or Subcontractor and installed by the General Contractor.
 3. Access doors must be of the proper materials for type of construction where installed.
 4. The exact location of all access doors shall be verified with the Architect prior to installation.
 5. Steel Access Doors and Frames: Factory-fabricated and assembled units, complete with attachment devices and fasteners ready for installation. Joints and seams shall be continuously welded steel, with welds ground smooth and flush with adjacent surfaces.
 6. Frames: 16-gauge steel, with a 1-inch-wide exposed perimeter flange for units installed in unit masonry, pre-cast, or cast-in-place concrete, ceramic tile, or wood paneling.
 - a. For installation in masonry, concrete, ceramic tile, or wood paneling: 1 inch-wide-exposed perimeter flange and adjustable metal masonry anchors.
 - b. For gypsum wallboard or plaster: perforated flanges with wallboard bead.
 7. Flush Panel Doors: 14-gauge sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees; factory-applied prime paint.
 - a. Fire-Rated Units: Insulated flush panel doors, with continuous piano hinge and self-closing mechanism.
 8. Locking Devices: Flush, screwdriver-operated cam locks.
 9. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the work include, but are not limited to, the following:
 - a. Arrow United Industries.
 - b. Bar-Co., Inc.
 - c. J.L Industries.
 - d. Karp Associates, Inc.
 - e. Milcor Div. Inryco, Inc.
 - f. Nystrom Building Products
 - g. Wade
 - h. Zurn

PART 3 - EXECUTION

3.1 GENERAL

- A. The Contractor shall install, program and test all new equipment identified in this contract in accordance with the applicable codes, standards, and manufacturer's instructions.
- B. The installation supervisor shall be on the job site during the entire installation. The installation supervisor shall maintain marked up copies of the drawings at the job site showing as-built conditions. These drawings shall be updated daily and available for Owner review.
- C. The Contractor shall provide all required conduit and all associated hardware, and shall install (pull), connect, and test all cable for a complete fire alarm system. All wiring shall be installed in accordance with the guidelines of these specifications and documents as well as the NFPA codes and standards listed in these specifications.

3.2 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
 - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 EQUIPMENT INSTALLATION

- A. Comply with NFPA 72 and requirements of authorities having jurisdiction for installation and testing of fire alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."
 - 1. Devices placed in service before all other trades have completed cleanup shall be replaced.
 - 2. Devices installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.
- B. Connecting to Existing Equipment: Verify that existing fire alarm system is operational before making changes or connections.
 - 1. Connect new equipment to existing control panel.
 - 2. Expand, modify, and supplement existing control/monitoring equipment as necessary to extend existing functions to the new points. New components shall be capable of merging with existing configuration without degrading the performance of either system.
- C. Install wall-mounted equipment, with tops of cabinets not more than 72 inches above the finished floor.
- D. Manual Fire alarm Boxes: Provide manual fire alarm boxes as shown on drawings. Mount manual fire alarm box on a background of a contrasting color. The operable part of manual fire alarm box shall be at 48 inches above floor level unless noted otherwise.
- E. Smoke and Heat Detectors: Provide detectors as shown on drawings.
 - 1. Comply with the "Smoke-Sensing Fire Detectors" section in the "Initiating Devices" chapter in NFPA 72, for smoke detector spacing.
 - 2. Comply with the "Heat-Sensing Fire Detectors" section in the "Initiating Devices" chapter in NFPA 72, for heat detector spacing.
 - 3. HVAC: Locate detectors not closer than 36 inches from air-supply diffuser or return-air opening.
 - 4. Lighting Fixtures: Locate detectors not closer than 12 inches from any part of a lighting fixture and not directly above pendant mounted or indirect lighting.
 - 5. Install a cover on each smoke detector that is not placed in service during construction. Cover shall remain in place except during system testing. Remove cover prior to system turnover.
 - 6. Install ceiling mounted detectors in areas with exposed structure tight to underside of floor/roof deck unless noted otherwise on drawings.
- F. Duct Smoke Detectors: Comply with NFPA 72. Install sampling tubes so they extend the full width of the duct. Tubes more than 36 inches long shall be supported at both ends.
 - 1. Do not install smoke detector in duct smoke detector housing during construction. Install detector only during system testing and prior to system turnover.
 - 2. Provide duct detection and shutdown for fan powered air distribution equipment exceeding 2,000 cfm.

3. Provide equipment and connections to shutdown fan powered air distribution equipment with a capacity less than 2,000 cfm that are part of an air distribution system with a capacity greater than 2,000 cfm.
- G. Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location. Do not install smoke detectors in unsprinklered elevator shafts.
- H. Remote Status and Alarm Indicators: Install in a visible location near each smoke detector, sprinkler water-flow switch, or valve-tamper switch that is not readily visible from normal viewing position.
- I. Install ceiling mounted visible and audible/visible notification appliances in areas with exposed structure to bottom of floor/roof structure or at 30 ft AFF, whichever is lower unless noted otherwise on drawings.
- J. Install ceiling mounted visible and audible/visible notification appliances in areas with finished ceilings flush with bottom of ceiling or at 30 ft AFF, whichever is lower unless noted otherwise on drawings.
- K. Install wall mounted visible and audible/visible notification appliances with visible element (strobe) between 80 inches and 96 inches above finished floor unless noted otherwise on drawings.
- L. All notification appliance speakers shall be tapped at ½ watt unless noted otherwise on drawings. In rooms less than 100 sq ft, speakers are permitted to be tapped at ¼ watt.

3.4 PATHWAYS

- A. Pathways above suspended ceilings and in nonaccessible locations may be routed exposed where permitted by NFPA 70 & 72.
 1. Exposed pathways located less than 96 inches above the floor shall be installed in conduit.
- B. Pathways shall be installed in conduit.
- C. All detection and control circuits associated with smoke control systems shall be fully enclosed within continuous raceways.
- D. Minimum allowable conduit size shall be ¾ inch. The conduit shall be sized so that conduit fill does not exceed 75% of NFPA 70 maximum fill requirements. Cables in vertical risers shall not exceed 50% of NFPA 70 maximum fill requirements. Conduit installation shall be as required by the Contractor's layout and as described in these specifications. All conduit field routing shall be acceptable to the Owner. Routing not acceptable shall be rerouted and replaced without expense to the Owner.
- E. All wire, cable, conduit and raceways shall be concealed in walls, ceiling spaces, electrical shafts or closets in finished areas except as specifically noted otherwise. Conduit and raceways may be exposed in unfinished areas or where specifically approved by the Owner.
- F. Except as otherwise specified or indicated on the drawings, all conduit shall be installed parallel or perpendicular to dominant surfaces with right angle turns made of symmetrical bends or fittings. Except where prevented by the location of other work, a single conduit or a conduit group shall be centered on structural members.
- G. Conduit shall be located at least six inches from hot water or steam pipes, and from other hot surfaces. Conduit shall not block access to any existing equipment or fixtures.
- H. Mount end-of-line device in box with last device or separate box adjacent to last device in circuit for conventional hardwired class B initiating and notification appliance circuits.

- I. Conduit shall be securely fastened to all boxes and cabinets. Threads on metallic conduit shall project through the wall of the box to allow the bushing to butt against the end of the conduit. The locknuts both inside and outside shall then be tightened sufficiently to bond the conduit securely to the box. Conduit shall enter cabinets from the bottom and sides only.

3.5 CONNECTIONS

- A. All wiring shall be terminated at devices or panels using terminal connectors for screw type terminals. All terminal connectors for conductors shall be pre-insulated ring type or pre-insulated spade type. Pre-insulated terminal connectors shall include a vinyl sleeve, color coded to indicate conductor size. Pre-insulated terminal connectors shall include a metallic support sleeve bonded to the vinyl-insulating sleeve and designed to grip the conductor insulation.
- B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 36 inches (910 mm) from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.
 - 1. Alarm initiating connection to smoke control system (smoke management) at firefighters' smoke control system panel.
 - 2. Alarm initiating connection to stairwell and/or elevator shaft pressurization systems.
 - 3. Smoke dampers in air ducts of designated HVAC systems.
 - 4. Provide equipment and connections to shutdown fan powered air distribution equipment with an individual capacity less than or equal to 2,000 cfm that are part of an air distribution system with a design capacity greater than 2,000 cfm.
 - 5. Electronically locked doors and access gates.
 - 6. Alarm initiating connection to elevator recall system and components.
 - 7. Alarm initiating connection to activate emergency lighting control.
 - 8. Connection to disable sound systems upon alarm activation.
 - 9. Supervisory connections at valve supervisory switches.
 - 10. Supervisory connections at low-air pressure switch of each dry-pipe sprinkler system.
 - 11. Supervisory connections at elevator shunt-trip breaker.
 - 12. Data communication circuits for connection to building management system.
 - 13. Supervisory connections at fire pump power failure including a dead-phase or phase-reversal condition.
 - 14. Supervisory connections at fire pump engine control panel.
 - 15. ASD Components. Including but not limited to; command, display and detector modules.

3.6 INSTALLATION OF ACCESS DOORS

- A. Set frames accurately in position and securely attached to supports, with face panels plumb and level in relation to adjacent finish surfaces.
- B. Adjust hardware and panels after installation for proper operation.

3.7 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. All conduits and junction boxes shall be labeled as specified in Division 26 (red).
- C. The location of end-of-line resistors shall be identified with a label indicating "EOL."
- D. Provide label at each initiating device indicating the device address. Label shall be visible from the floor below or immediately adjacent to the device.

3.8 GROUNDING

- A. Ground fire alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire alarm control unit.
- B. Ground shielded cables at the control panel location only. Insulate shield at device location.

3.9 FIELD QUALITY CONTROL

- A. Systems shall be checked and tested in accordance with the instructions provided by the manufacturer to insure that the system functions as required and is free of grounds, opens, and shorts. Each device shall be tested.
 - 1. Smoke detectors shall be tested with products of combustion.
- B. Upon completion of the system installation and before the Date of Final Acceptance, a factory-trained technician shall perform all necessary tests and adjustments and shall then file a Letter of Certification and a Certificate of Completion (NFPA 72) with the Owner indicating that the system functions and conforms to the Fire Alarm System Specifications.
- C. Upon completion of the system installation, a factory-trained technician shall perform all necessary tests and adjustments in the presence of the Owner's designated personnel. Test in accordance with NFPA 72 and requirements of the authority having jurisdiction. Perform the following tests at a minimum:
 - 1. Visual Inspection: Conduct visual inspection prior to testing. Inspection shall be based on completed record Drawings and system documentation that is required by the "Completion Documents, Preparation" table in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - 2. System Testing: Comply with the "Test Methods" table in the "Testing" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 - a. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
 - b. Test visible appliances for the public operating mode according to manufacturer's written instructions.
- D. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
- E. Fire alarm system will be considered defective if it does not pass tests and inspections.
- F. Include services of factory trained and certified technician to supervise installation, adjustments, final connections, and system testing as performed by the fire alarm contractor's factory-trained technicians.

3.10 DEMONSTRATION

- A. The equipment supplier's factory trained technician shall train the Owner's personnel in the proper use and maintenance of the system. Training sessions shall be conducted as needed, for a total of up to eight (8) hours.
- B. Demonstrate normal and abnormal modes of operation, and required responses to each.
- C. Video tape the training sessions in format as agreed to with the Owner. Provide three copies of each session to the Owner and obtain written receipt from the Owner.

SPECIFICATION FOR RAMMED AGGREGATE PIER® FOUNDATION SYSTEMS

PART 1: GENERAL REQUIREMENTS

1.01 Description

Work shall consist of designing, furnishing and installing Rammed Aggregate Pier foundations to the lines and grades designated on the project foundation plan and as specified herein. The aggregate piers shall be constructed by either augering a cavity or driving a hollow mandrel to the design depth and vertically ramming lifts of aggregate using the specially designed tamper head and high-energy impact densification equipment to create the compacted aggregate pier. The Rammed Aggregate Pier elements shall be in a columnar-type configuration and shall be used to produce an intermediate foundation system for support of foundation loads.

1.02 Work Included

- A. Provision of all equipment, material, labor, and supervision to design and install Rammed Aggregate Pier elements. Design shall rely on subsurface information presented in the project geotechnical report. Layout of Rammed Aggregate Pier elements, spoil removal (as required), footing excavations, and subgrade preparation following aggregate pier installation is not included.
- B. The Rammed Aggregate Pier design and installation shall adhere to all methods and standards described in this Specification.
- C. Drawings and General Provisions of the Contract, including General and Supplemental Conditions, and Division 1 Specifications, apply to the work in this specification.

1.03 Approved Installers

- A. The Rammed Aggregate Pier Installer (the Installer) shall be approved by the Owner's Engineer prior to bid opening. Without exception, no alternate installer will be accepted unless approved by the Owner's Engineer at least two (2) weeks prior to bid opening.
- B. Installers of Rammed Aggregate Pier foundation systems shall have a minimum of 5 years of experience with the installation of Rammed Aggregate Pier systems and shall have completed at least 50 projects.
- C. Installers licensed by the Geopier Foundation Company, Inc. (www.geopier.com) will be accepted as approved installer.
- D. Without exception, no alternate installer will be accepted unless approved by Owner's Engineer and Geopier Foundation Company, Inc.
- E. Installers currently approved for these works are:

Western Ground Improvement, Irvine, CA
Foundation Service Corp., Hudson, IA
GeoConstructors, Inc., Leesburg, VA
Geopier-Northwest, Inc., Bellevue, WA
Helical Drilling, Inc. Braintree, MA
Peterson Contractors, Inc., Reinbeck, IA
Amcon Limited, Nova Scotia, Canada
GeoSolv Design/Build, Inc., Ontario, Canada
Rapid Impact Piers, Ltd., British Columbia, Canada

1.04 Reference Standards

- A. Design
 - 1. “Control of Settlement and Uplift of Structures Using Short Aggregate Piers,” by Evert C. Lawton (Assoc. Prof., Dept. of Civil Eng., Univ. of Utah), Nathaniel S. Fox (President, Geopier Foundation Co., Inc.), and Richard L. Handy (Distinguished Prof. Emeritus, Iowa State Univ., Dept. of Civil Eng.), reprinted from *IN-SITU DEEP SOIL IMPROVEMENT, Proceedings of sessions sponsored by the Geotechnical Engineering Division/ASCE in conjunction with the ASCE National Convention held October 9-13, 1994, Atlanta, Georgia.*
 - 2. “Settlement of Structures Supported on Marginal or Inadequate Soils Stiffened with Short Aggregate Piers,” by Evert C. Lawton and Nathaniel S. Fox. *Geotechnical Special Publication No. 40: Vertical and Horizontal Deformations of Foundations and Embankments*, ASCE, 2, 962-974.
 - 3. “Behavior of Geopier®-Supported Foundation Systems during Seismic Events,” by Kord Wissmann, Evert C. Lawton, and Tom Farrell. Geopier Foundation Company, Inc. Blacksburg, VA ©1999.
- B. Modulus Testing
 - 1. ASTM D 1143 - Pile Load Test Procedures
 - 2. ASTM D 1194 - Spread Footing Load Test
- C. Materials and Inspection
 - 1. ASTM D 1241 - Aggregate Quality
 - 2. ASTM D 422 - Gradation of Soils
- D. Where specifications and reference documents conflict, the Rammed Aggregate Pier Designer shall make the final determination of the applicable document.

1.05 Certifications and Submittals

- A. Design Calculations - The Installer shall submit detailed design calculations and construction drawings prepared by the Rammed Aggregate Pier Designer (the Designer) for review and approval by the Owner or Owner’s Engineer. All plans shall be sealed by a Professional Engineer in the State in which the project is constructed.
- B. Professional Liability Insurance - The Rammed Aggregate Pier Designer shall have Errors and Omissions design insurance for the work. The insurance policy should provide a minimum coverage of \$3 million per occurrence.
- C. Modulus Test Reports – A modulus test(s) is performed on a non-production Rammed Aggregate Pier element as required by the Rammed Aggregate Pier Designer to verify the design assumptions. The Installer shall furnish the General Contractor a description of the installation equipment, installation records, complete test data, analysis of the test data and verification of the design parameter values based on the modulus test results. The report shall be prepared under direction of a Registered Professional Engineer.
- D. Daily Rammed Aggregate Pier Progress Reports – The Installer shall furnish a complete and accurate record of Rammed Aggregate Pier installation to the General Contractor. The record shall indicate the pier location, length, volume of aggregate used or number of lifts, densification

forces during installation, and final elevations or depths of the base and top of piers. The record shall also indicate the type and size of the installation equipment used, and the type of aggregate used. The Installer shall immediately report any unusual conditions encountered during installation to the General Contractor, to the Designer and to the Testing Agency.

PART 2: MATERIALS

2.01 Aggregate

- A. Aggregate used by the Rammed Aggregate Pier Installer for pier construction shall be pre-approved by the Designer and shall demonstrate suitable performance during modulus testing. Typical aggregate consists of Type 1 Grade B in accordance with ASTM D-1241-68, No. 57 stone, recycled concrete or other graded aggregate approved by the Designer.
- B. Potable water or other suitable source shall be used to increase aggregate moisture content where required. The General Contractor shall provide such water to the Installer.

PART 3: DESIGN REQUIREMENTS

3.01 Rammed Aggregate Pier Design

- A. The design of the Rammed Aggregate Pier system shall be based on the service load bearing pressure and the allowable total and differential settlement criteria of all footings indicated by the design team for support by the Rammed Aggregate Pier system. The Rammed Aggregate Pier system shall be designed in accordance with generally-accepted engineering practice and the methods described in Section 1 of these Specifications. The design life of the structure shall be 50 years.
- B. The design shall meet the following criteria.

Maximum Allowable Bearing Pressure for Footings supported by Rammed Aggregate Pier Reinforced Soils	Up to 10,000 psf
Estimated Total Long-Term Settlement for Footings:	≤ 1-inch
Estimated Long-Term Differential Settlement of Adjacent Footings:	≤ ½-inch
- C. The Rammed Aggregate Pier elements shall be designed using a Rammed Aggregate Pier stiffness modulus to be verified by the results of the modulus test described in Section 5.02 of these specifications.

3.02 Design Submittal

The Installer shall submit detailed design calculations, construction drawings, and shop drawings, (the Design Submittal), for approval at least 3 week(s) prior to the beginning of construction. A detailed explanation of the design parameters for settlement calculations shall be included in the Design Submittal. Additionally, the quality control test program for Aggregate Pier system, meeting these design requirements, shall be submitted. All computer-generated calculations and drawings shall be prepared and sealed by a Professional Engineer, licensed in the State or Province where the piers are to be built. Submittals will be submitted electronically only unless otherwise required by specific submittal instructions.

PART 4: EXECUTION

4.01 Approved Installation Procedures

The following sections provide general criteria for the construction of the Rammed Aggregate Pier elements. Unless otherwise approved by the Designer, the installation method used for Rammed Aggregate Pier construction shall be that as used in the construction of the successful modulus test.

- A. Augered Rammed Aggregate Pier systems –
 - 1. Augered Rammed Aggregate Pier system shall be pre-augered using mechanical drilling or excavation equipment.
 - 2. If cave-ins exceeding 10% of the lift volume occur during excavation such that the sidewalls of the hole are deemed to be unstable, steel casing shall be used to stabilize the cavity or a displacement Rammed Aggregate Pier system may be used.
 - 3. Aggregate shall be placed in the augered cavity in lift thicknesses as determined by the Rammed Aggregate Pier Designer.
 - 4. A specially-designed beveled tamper and high-energy impact densification apparatus shall be employed to densify lifts of aggregate during installation. The apparatus shall apply direct **downward** impact energy to each lift of aggregate. Compaction equipment that induces horizontal vibratory energy (such as Vibroflot equipment) is not permitted.

- B. Displacement Rammed Aggregate Pier systems –
 - 1. Displacement Rammed Aggregate Pier systems shall be constructed by advancing a specially designed mandrel with a minimum 15 ton static force augmented by dynamic vertical ramming energy to the full design depth. The hollow-shaft mandrel, filled with aggregate, is incrementally raised, permitting the aggregate to be released into the cavity, and then lowered by vertically advancing and/or ramming to densify the aggregate and force it laterally into the adjacent soil. The cycle of raising and lowering the mandrel is repeated to the top of pier elevation. The cycle distance shall be determined by the Rammed Aggregate Pier designer.
 - 2. Special high-energy impact densification apparatus shall be employed to vertically densify the Rammed Aggregate Pier elements during installation of each constructed lift of aggregate.
 - 3. Densification shall be performed using a mandrel/tamper. The mandrel/tamper foot is required to adequately increase the lateral earth pressure in the matrix soil during installation. Compaction equipment that induces horizontal vibratory energy (such as Vibroflot equipment) is not permitted.
 - 4. Downward crowd pressure shall be applied to the mandrel during installation.

4.02 Plan Location and Elevation of Rammed Aggregate Pier Elements

The as-built center of each pier shall be within 6 inches of the locations indicated on the plans. Piers installed outside of the above tolerances and deemed not acceptable shall be rebuilt at no additional expense to the Owner.

4.03 Rejected Rammed Aggregate Pier Elements

Rammed Aggregate Pier elements installed beyond the maximum allowable tolerances shall be abandoned and replaced with new piers, unless the Designer approves the condition or provides other remedial measures. All material and labor required to replace rejected piers shall be provided at no additional cost to the Owner, unless the cause of rejection is due to an obstruction or mislocation.

PART 5: QUALITY CONTROL

5.01 Control Technician

The Installer shall have a full-time, on-site Control Technician to verify and report all installation procedures. The Installer shall immediately report any unusual conditions encountered during installation to the Rammed Aggregate Pier Designer, the General Contractor, and to the Testing Agency.

5.02 Rammed Aggregate Pier Modulus Test

As required by the RAP designer, a Rammed Aggregate Pier Modulus Test(s) will be performed at locations agreed upon by the Rammed Aggregate Pier Designer and the Testing Agency to verify or modify Rammed Aggregate Pier designs. Modulus Test Procedures shall utilize appropriate portions of ASTM D 1143 and ASTM D 1194, as outlined in the Rammed Aggregate Pier design submittal.

5.03 Bottom Stabilization Testing (BSTs) / Crowd Stabilization Testing (CSTs)

Bottom stabilization testing (BSTs) or Crowd stabilization testing (CSTs) shall be performed by the Control Technician during the installation of the modulus test pier. Additional testing as required by the Rammed Aggregate Pier Designer shall be performed on selected production Rammed Aggregate Pier elements to compare results with the modulus test pier.

PART 6: QUALITY ASSURANCE

6.01 Independent Engineering Testing Agency (Owner's Quality Assurance)

The Rammed Aggregate Pier Installer shall provide full-time Quality Control monitoring of Rammed Aggregate Pier construction activities. The Owner or General Contractor is responsible for retaining an independent engineering testing firm to provide Quality Assurance services.

6.02 Responsibilities of Independent Engineering Testing Agency

- A. The Testing Agency shall monitor the modulus test pier installation and testing. The Installer shall provide and install all dial indicators and other measuring devices.
- B. The Testing Agency shall monitor the installation of Rammed Aggregate Pier elements to verify that the production installation practices are similar to those used during the installation of the modulus test elements.
- C. The Testing Agency shall report any discrepancies to the Installer and General Contractor immediately.
- D. The Testing Agency shall observe the excavation, compaction and placement of the foundations as described in Section 7.05. Dynamic Cone Penetration testing may be performed to evaluate the footing bottom condition as determined by the Testing Agency.

PART 7: RESPONSIBILITIES OF THE GENERAL CONTRACTOR

7.01 Site Preparation and Protection

- A. The General Contractor shall locate and protect underground and aboveground utilities and other structures from damage during installation of the Rammed Aggregate Pier elements.
- B. Site grades for Rammed Aggregate Pier installation shall be within 1 foot of the top of footing elevation or finished grade elevation to minimize Rammed Aggregate Pier installation depths. Ground elevations and bottom of footing elevations shall be provided to the Rammed Aggregate Pier Installer in sufficient detail to estimate installation depth elevations to within 3 inches.
- C. The General Contractor will provide site access to the Installer, after earthwork in the area has been completed. A working surface shall be established and maintained by the General Contractor to provide wet weather protection of the subgrade and to provide access for efficient operation of the Rammed Aggregate Pier installation.
- D. Prior to, during and following Rammed Aggregate Pier installation, the General Contractor shall provide positive drainage to protect the site from wet weather and surface ponding of water.
- E. If spoils are generated by Rammed Aggregate Pier installation, spoil removal from the Rammed Aggregate Pier work area in a timely manner to prevent interruption of Rammed Aggregate Pier installation is required.

7.02 Rammed Aggregate Pier Layout

The location of Rammed Aggregate Pier-supported foundations for this project, including layout of individual Rammed Aggregate Pier elements, shall be marked in the field using survey stakes or similar means at locations shown on the drawings.

7.03 Contractor's / Owner's Independent Testing Agency (Owner's Quality Assurance)

General Contractor is responsible for acquiring an Independent Testing Agency (Quality Assurance) as required. Testing Agency roles are as described in Part 6 of this specification. The Aggregate Pier Installer will provide Quality Control services as described in Part 5 of this specification.

7.04 Excavations of Obstructions

- A. Should any obstruction be encountered during Rammed Aggregate Pier installation, the General Contractor shall be responsible for promptly removing such obstruction, or the pier shall be relocated or abandoned. Obstructions include, but are not limited to, boulders, timbers, concrete, bricks, utility lines, etc., which shall prevent placing the piers to the required depth, or shall cause the pier to drift from the required location.
- B. Dense natural rock or weathered rock layers shall not be deemed obstructions, and piers may be terminated short of design lengths on such materials.

7.05 Utility Excavations

The General Contractor shall coordinate all excavations made subsequent to Rammed Aggregate Pier installations so that excavations do not encroach on the piers as shown in the Rammed Aggregate Pier construction drawings. Protection of completed Rammed Aggregate Pier elements is the responsibility of the General Contractor. In the event that utility excavations are required in close proximity to the installed Rammed Aggregate Pier elements, the General Contractor shall contact the Rammed Aggregate Pier Designer immediately to develop construction solutions to minimize impacts on the installed Aggregate Pier elements.

7.06 Footing Bottoms

- A. Excavation and surface compaction of all footings shall be the responsibility of the General Contractor.

- B. Foundation excavations to expose the tops of Rammed Aggregate Pier elements shall be made in a workman-like manner, and shall be protected until concrete placement, with procedures and equipment best suited to (1) avoid exposure to water, (2) prevent softening of the matrix soil between and around the Rammed Aggregate Pier elements before pouring structural concrete, and (3) achieve direct and firm contact between the dense, undisturbed Rammed Aggregate Pier elements and the concrete footing.
- C. All excavations for footing bottoms supported by Rammed Aggregate Pier foundations shall be prepared in the following manner by the General Contractor. Recommended procedures for achieving these goals are to:
 - 1. Limit over-excavation below the bottom of the footing to 3-inches (including disturbance from the teeth of the excavation equipment).
 - 2. Compaction of surface soil and top of Rammed Aggregate Pier elements shall be prepared using a motorized impact compactor (“Wacker Packer,” “Jumping Jack,” or similar). Sled-type tamping devices shall only be used in granular soils and when approved by the designer. Loose or soft surficial soil over the entire footing bottom shall be recompacted or removed, respectively. The surface of the aggregate pier shall be recompacted prior to completing footing bottom preparation.
 - 3. Place footing concrete immediately after footing excavation is made and approved, preferably the same day as the excavation. Footing concrete must be placed on the same day if the footing is bearing on moisture-sensitive soils. If same day placement of footing concrete is not possible, open excavations shall be protected from surface water accumulation. A lean concrete mud-mat may be used to accomplish this. Other methods must be pre-approved by the Designer.
- D. The following criteria shall apply, and a written inspection report sealed by the project Testing Agency shall be furnished to the Installer to confirm:
 - 1. That water (which may soften the unconfined matrix soil between and around the Rammed Aggregate Pier elements, and may have detrimental effects on the supporting capability of the Rammed Aggregate Pier reinforced subgrade) has not been allowed to pond in the footing excavation at any time.
 - 2. That all Rammed Aggregate Pier elements designed for each footing have been exposed in the footing excavation.
 - 3. That immediately before footing construction, the tops of Rammed Aggregate Pier elements exposed in each footing excavation have been inspected and recompacted as necessary with mechanical compaction equipment.
 - 4. That no excavations or drilled shafts (elevator, etc) have been made after installation of Aggregate Pier elements within the excavation limits described in the Rammed Aggregate Pier construction drawings, without the written approval of the Installer or Designer.
- E. Failure to provide the above inspection and certification by the Testing Agency, which is beyond the responsibility of the Rammed Aggregate Pier Installer, may void any written or implied warranty on the performance of the Rammed Aggregate Pier system.

PART 8: PAYMENT

8.01 Method of Measurement

- A. Measurement of the aggregate piers is on a lump sum basis.
- B. Payment shall cover design, supply and installation of the aggregate pier foundation system. Excavation of unsuitable materials, delays, re-engineering, and remobilization as documented and approved by the Owner or Owner’s Engineer, shall be paid for under separate pay items.

8.02 Basis of Payment

- A. The accepted quantities of piers will be paid per approval, in-place aggregate-pier. Payment will be made under:

<u>Pay Item:</u>	<u>Pay Unit:</u>
Preparation of plans and specifications and installation of rammed aggregate pier elements	\$____ Lump Sum

- B. Unit prices shall be provided to account for:

Additional Installed Piers (w/o remobilization)	\$____ Each
Add for Casing Holes	\$____/Linear Foot
Additional Mobilizations	\$____ Each
Additional Modulus or Uplift Load Tests	\$____ Each

SECTION 02300 (31 2000) – EARTHWORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Excavation, filling, and backfilling for structures, pavement, and outparcels.
2. Trenching and backfilling for utilities.
3. Dewatering.
4. Boring under crossings.

B. Related Requirements:

1. Section 02318 - Rock Excavation.
2. Section 02340 - Soil Stabilization.
3. Section 02370 - Erosion Control and Sedimentation. Temporary and permanent erosion control.
4. Section 02375 - Stone Protection. Rip-rap stone for slope protection.
5. Section 02900 - Planting
6. Division 3 - Subbase requirements for granular subbase below building slabs.
7. Appendix B – Testing, Inspection, and Observation by Owner.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. ASTM International (ASTM)

1. ASTM C136 - Particle Size Analysis of Soil.
2. ASTM D1557 - Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 Kn.m/m³)).
3. ASTM D2487 - Classification of Soils for Engineering Purposes (Unified Soil Classification System).
4. ASTM D2488 - Description and Identification of Soils (Visual-Manual Procedures).
5. ASTM D4318 - Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
6. ASTM D4829 – Standard Test Method for Expansion of Soils.
7. ASTM D5778 – Standard Test Method for Performing Electronic Friction Cone and Piezocone Penetration Testing of Soils.
8. ASTM D6938 – In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

C. State of California Department of Transportation (CALTRANS):

1. 2018 Standard Specifications

D. City of Stockton

1. City of Stockton Standard Specifications, latest edition

E. National Fire Protection Association (NFPA)

1. NFPA 70 - National Electrical Code.

F. American Water Works Association (AWWA)

1. AWWA C200 - Standard for Steel Water Pipe - 6 In. (150 mm) and Larger.
2. AWWA C206 - Field Welding Of Steel Water Pipe.

1.3 DEFINITIONS

- A. Satisfactory Materials: ASTM D2487 soil classification groups GW, GP, GM, SW, SP, SM, ML, CL, [CH,] [MH,] [SC,][GC,] or a combination of these group symbols.
 - 1. Fill material shall further conform to the plasticity index and liquid limits (PI and LL) specified in Paragraph FILLING hereinafter.
 - 2. Satisfactory materials shall be free of rock or gravel larger than allowed for fill or backfill material as specified hereinafter or as shown on the drawings.
 - 3. Satisfactory materials shall contain no debris, waste, frozen materials, vegetation, and other deleterious matter.
 - 4. Unless specifically stated otherwise in "Foundation Subsurface Preparation" on the Drawings, the following table stipulates maximum allowable values for plasticity index (PI) and liquid limit (LL) of satisfactory materials to be used as fill in specified areas:

<u>Location</u>	<u>PI</u>	<u>LL</u>
Building area (below upper four feet)	10	30
Building area (upper four feet)	10	30
Areas outside the building pad including outparcels	10	30

- B. Unsatisfactory Materials: Materials which do not comply with the requirements for satisfactory materials are unsatisfactory.
 - 1. Unsatisfactory materials also include man-made fills; trash; refuse; backfills from previous construction; and material classified as satisfactory materials which contains root and other organic matter or frozen material. The CTL shall be notified of any contaminated materials.
 - 2. Unsatisfactory materials also include satisfactory materials not maintained within optimum and 3 percent above optimum moisture content at time of compaction.
- C. Rock: Rock shall be as defined in Section 02318.

1.4 SUBMITTALS

- A. Submit 30-pound sample of each type of off-site fill material that is to be used at the site in airtight containers to the independent testing laboratory or submit gradation and certification of aggregate material that is to be used at the site to the independent testing laboratory for review.
- B. Submit name of each material supplier and specific type and source of each material. Change in source throughout project requires approval of Owner.
- C. Submit Dewatering Plans upon request by Owner.
- D. Shop drawings or details pertaining to excavating and filling are not required unless otherwise shown on the Drawings or if contrary procedures to Construction Documents are proposed.
- E. Shop drawings or details pertaining to site utilities are not required unless required by regulatory authorities or unless uses of materials, methods, equipment, or procedures that are contrary to The Drawings or Specifications are proposed. Do not perform work until Owner has accepted required shop drawings.
- F. Contact utility companies and determine if additional easements will be required to complete project. Provide written confirmation of the status of all easements to Owner at time of Preconstruction Conference or no later than 90 days prior to project possession date.

PART 2 - PRODUCTS

2.1 SOIL AND ROCK MATERIALS

02300-2

- A. Fill and Backfill. Satisfactory materials excavated from the site. The following supersedes Caltrans Section 19-3.03I in total: CDF will be accepted in lieu of the standard backfill specifications. It shall be mandatory in all situations where the prevention of subsequent settlement after placement of backfill is required and in trenches eight (8) inches wide or less.
- B. Imported Fill Material: Satisfactory material provided from offsite borrow areas when sufficient satisfactory materials are not available from required excavations.
- C. Trench Backfill: ASTM D2321 unless otherwise specified or shown on the drawings.
- D. Building Subbase Material: Subbase for building and appurtenances slabs on ground is specified in Section 03300 or 03312 as applicable.
- E. Bedding: Aggregate Type as indicated on the plans or naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D2940; except with 100 percent passing a 1-inch sieve and not more than 8 percent passing a No.200 sieve.
- F. Drainage Fill: Washed, narrowly graded mixture of crushed stone, or crushed or uncrushed gravel; ASTM D448; coarse-aggregate grading Size 57; with 100 percent passing a 1-1/2- inch sieve and 0 to 5 percent passing a No.8 sieve.
- G. Filter Material: Narrowly graded mixture of natural or crushed gravel, or crushed stone and natural sand; ASTM D448; coarse-aggregate grading Size 67; with 100 percent passing a 1-inch sieve and 0 to 5 percent passing a No.4 sieve.
- H. Topsoil: Topsoil shall consist of stripping material excavated from the site. Topsoil shall consist of organic surficial. Topsoil shall be as further defined in Section 02900 – Planting.

2.2 APPURTENANT MATERIALS

- A. Stabilization fabrics and geogrids: As specified in Section 02340.
- B. Filter and drainage fabrics: As specified in Section 02340.
- C. Steel Casing Pipe: Comply with AWWA C200 minimum grade B, size, and wall thickness as indicated on The Drawings.
- D. Trench Utility Locator Tape: Heavy duty 6" wide underground warning tape. Tape shall be made from polyethylene material, 3.5 mils thick, with a minimum tensile strength of 1,750 psi. Place the tape at one-half the minimum depth of cover for the utility line or a maximum of 3 feet, whichever is the less, but never above the top of subgrade. Color of tape shall be determined by as follows:
 - 1. Natural Gas or Propane – Yellow.
 - 2. Electric – Red.
 - 3. Telephone – Orange.
 - 4. Water – Blue.
 - 5. Sanitary Sewer – Green.

2.3 EQUIPMENT

- A. Transport off-site materials to project using well-maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

2.4 SOURCE QUALITY CONTROL

- A. Laboratory testing of materials proposed for use in the project shall be by the Wal-Mart Construction Testing Laboratory at no cost to Contractor. The Contractor shall provide samples of material obtained off-site.

02300-3

- B. Perform California Bearing Ratio (CBR) tests in outparcels and areas to receive pavement for each type of material that is imported from off-site. CBR value shall be equal to or above pavement design subgrade CBR value indicated on Construction Drawings.
- C. Following tests shall be performed on each type of on-site or imported soil material used as compacted fill:
 - 1. Moisture and Density Relationship: ASTM D1557.
 - 2. Mechanical Analysis: AASHTO T88 or ASTM D422.
 - 3. Plasticity Index: ASTM D4318.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Identify required lines, levels, contours, datum, elevations, and grades necessary for construction as shown on the drawings.
- B. Notify utility companies to remove or relocate public utilities that are in conflict with proposed improvements.
- C. Protect plant life, lawns, fences, existing structures, sidewalks, paving, and curbs, unless otherwise noted on the drawings from excavating equipment and vehicular traffic.
- D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.
- E. Remove from site, material encountered in grading operations that is unsatisfactory material or undesirable for backfilling, subgrade, or foundation purposes. Dispose of in manner satisfactory to Owner and local governing agencies. Backfill areas with layers of satisfactory material and compact as specified herein.
- F. Prior to placing fill in low areas, such as previously existing creeks, ponds, or lakes, perform following procedures:
 - 1. Drain water out by gravity with ditch having flow line lower than lowest elevation in low area. If drainage cannot be performed by gravity ditch, use adequate pump to obtain the same results.
 - 2. After drainage of low area is complete, remove muck, mud, debris, and other unsatisfactory material by using acceptable equipment and methods that will keep natural soils underlying low area dry and undisturbed.
 - 3. All muck, mud, and other materials removed from low areas shall be dried on-site by spreading in thin layers for observation. Material shall be inspected and, if found to be satisfactory for use as fill material, shall be incorporated into lowest elevation of site filling operation, but not under building subgrade or within 5'-0" of perimeter of building subgrade, paving or outparcel subgrade. If, after observation, material is found to be unsatisfactory, it shall be removed from site.
- G. Locate and identify utilities that have previously been installed and protect from damage.
- H. Locate and identify existing utilities that are to remain and protect from damage.
- I. Maintain in operating condition existing utilities, previously installed utilities, and drainage systems encountered in utility installation. Repair surface or subsurface improvements shown on the Drawings.
- J. Verify location, size, elevation, and other pertinent data required making connections to existing utilities and drainage systems as indicated on the Drawings.
- K. Over excavate and properly prepare areas of subgrade that are not capable of supporting proposed systems. Stabilize these areas by using acceptable geotextile fabrics or aggregate material placed and compacted as specified in Section 02340.

3.2 DEWATERING

A. General:

1. Dewatering activities shall conform to applicable provisions in 02370.
2. Provide dewatering systems as required for excavations.
3. Design and provide dewatering system using accepted and professional methods consistent with current industry practice to eliminate water entering the excavation under hydrostatic head from the bottom or sides. Design system to prevent differential hydrostatic head, which would result in floating out soil particles in a manner, termed as a "quick" or "boiling" condition. System shall not be dependent solely upon sumps or pumping water from within the excavation where differential head would result in a quick condition, which would continue to worsen the integrity of the excavation's stability.
4. Provide dewatering system of sufficient size and capacity to prevent ground and surface water flow into the excavation and to allow Work to be installed in a dry condition.
5. Control, by acceptable means, all water regardless of source. Contractor shall be responsible for disposal of the water.
6. Control groundwater in a manner that preserves strength of foundation soils, does not cause instability or raveling of excavation slopes, and does not result in damage to existing structures. Where necessary, lower water level in advance of excavation utilizing wells, wellpoints, jet educators, or similar positive methods. The water level as measured by piezometers shall be maintained a minimum of 3 feet below prevailing excavation level.
7. Commence dewatering prior to any appearance of water in excavation and continue until Work is complete to the extent that no damage results from hydrostatic pressure, flotation, or other causes.
8. Open pumping with sumps and ditches will be allowed provided it does not result in boils, loss of fines, softening of the ground, or instability of slopes.
9. Install wells or wellpoints, if required, with suitable screens and filters so that continuous pumping of fines does not occur. Arrange discharge to facilitate collection of samples by the Owner. During normal pumping and upon development of wells, levels of fine sand or silt in the discharge water shall not exceed 5 ppm. Install sand tester on discharge of each pump during testing to verify that levels are not exceeded.
10. Control grading around excavations to prevent surface water from flowing into excavation areas.
11. No additional payment will be made for any supplemental measures to control seepage, groundwater, or artesian head.

B. Design:

1. Designate and obtain the services of a qualified dewatering specialist to provide dewatering plan as may be necessary to complete the Work.
2. Contractor shall be responsible for the accuracy of the drawings, design data, and operational records required.
3. Contractor shall be responsible for the design, installation, operation, maintenance, and any failure of any component of the system.

C. Damages:

1. Contractor shall be responsible for and shall repair any damage to work in place, other contractor's equipment, utilities, residences, highways, roads, railroads, private and municipal well systems, adjacent structures, natural resources, habitat, existing wells, and the excavation. Contractor responsibility shall also include, damage to the bottom due to heave and including but not limited to, removal and pumping out of the excavated area that may result from Contractor's negligence, inadequate or improper design and operation of the dewatering system, and any mechanical or electrical failure of the dewatering system.
2. Remove subgrade materials rendered unsatisfactory by excessive wetting and replace with approved backfill material at no additional cost to the Owner.

D. Maintaining Excavation in Dewatering Condition:

1. Dewatering shall be a continuous operation. Interruptions due to power outages or any other reason will not be permitted.
2. Continuously maintain excavation in a dry condition with positive dewatering methods during preparation of subgrade, installation of pipe, and construction of structures until the critical period of construction or backfill is completed to prevent damage of subgrade support, piping, structure, side slopes, or adjacent facilities from flotation or other hydrostatic pressure imbalance.
3. Provide standby equipment on site, installed, wired, and available for immediate operation if required to maintain dewatering on a continuous basis in the event any part of the system becomes inadequate or fails.

If dewatering requirements are not satisfied due to inadequacy or failure of dewatering system, perform such work as may be required to restore damaged structures and foundation soils at no additional cost to Owner.

4. System maintenance shall include but not be limited to 24-hour supervision by personnel skilled in the operation, maintenance, and replacement of system components and any other work required to maintain excavation in dewatered condition.

E. System Removal: Upon completion of the work, remove dewatering equipment from the site, including related temporary electrical service.

F. Wells shall be removed or cut off a minimum of 3 feet below final ground surface, capped, and abandoned in accordance with regulations by agencies having jurisdiction.

3.3 TOPSOIL EXCAVATION

A. Cut heavy growths of grass from areas before stripping and remove cuttings with remainder of cleared vegetative material.

B. Strip topsoil from areas that are to be filled, excavated, landscaped, or re-graded to such depth that it prevents intermingling with underlying subsoil or questionable material.

C. Stockpile topsoil in storage piles in areas shown on The Drawings or where directed by Owner. Construct storage piles to freely drain surface water. Cover storage piles as required to prevent windblown dust. Dispose of unsuitable topsoil as specified for waste material, unless otherwise specified by Owner. Remove excess topsoil from site unless specifically noted otherwise on the Drawings.

3.4 GENERAL EXCAVATION

A. Classification of Excavation: The Contractor shall assure himself by site investigation or other necessary means that he is familiar with the type, quantity, quality, and character of excavation work to be performed. Excavation shall be considered unclassified excavation, except as indicated in the Contract Documents.

B. When performing grading operations during periods of wet weather, provide adequate dewatering, drainage and ground water management to control moisture of soils.

C. Shore, brace, and drain excavations as necessary to maintain excavation as safe, secure, and free of water at all times.

D. Excavate building areas to line and grade as shown on the Drawings being careful not to over excavate beyond elevations needed for building subgrades.

E. Place satisfactory excavated material into project fill areas.

F. Unsatisfactory excavated material shall be disposed of in manner and location that is acceptable to Owner and local governing agencies.

G. Perform excavation using capable, well-maintained equipment and methods acceptable to Owner and local governing agencies.

3.5 ROCK EXCAVATION

A. Rock excavation is specified in Section 02318.

3.6 TRENCHING EXCAVATION FOR UTILITIES

A. Contact local utility companies before excavation begins. Dig trench at proper width and depth for laying pipe, conduit, or cable. Cut trench banks vertical, if possible, and remove stones from bottom of trench as necessary to

avoid point-bearing. Over-excavate wet or unstable soil, if encountered, from trench bottom as necessary to provide suitable base for continuous and uniform bedding. Replace over-excavation with satisfactory material and dispose of unsatisfactory material.

- B. Trench excavation sidewalls shall be sloped, shored, sheeted, braced, or otherwise supported by means of sufficient strength to protect workmen in accordance with applicable rules and regulations established for construction by the Department of Labor, Occupational Safety and Health Administration (OSHA), and by local ordinances. Lateral travel distance to exit ladder or steps shall not be greater than 25 feet in trenches 4 feet or deeper.
- C. Perform trench excavation as indicated on the Drawings for specified depths. During excavation, stockpile materials suitable for backfilling in orderly manner far enough from bank of trench to avoid overloading, slides, or cave-ins.
- D. Remove excavated materials not required or not satisfactory as backfill or embankments and waste off-site or at on-site locations approved by the Owner and in accordance with governing regulations. Dispose of structures discovered during excavation as specified in Section 02220.
- E. Prevent surface water from flowing into trenches or other excavations by temporary grading or other methods, as required. Remove accumulated water in trenches and other excavations as specified.
- F. Open cut excavation with trenching machine or backhoe. Where machines other than ladder or wheel-type trenching machines are used, do not use clods for backfill.
- G. Accurately grade trench bottom to provide uniform bearing and support for each section of pipe on bedding material at every point along entire length except where necessary to excavate for bell holes, proper sealing of pipe joints, or other required connections. Dig bell holes and depressions for joints after trench bottom has been graded. Dig no deeper, longer, or wider than needed to make joint connection properly.
- H. Trench width below top of pipe shall not be less than 12 inches nor more than 18 inches wider than outside surface of pipe or conduit that is to be installed to designated elevations and grades. Other trench width for pipe, conduit, or cable shall be least practical width that will allow for proper compaction of trench backfill.
- I. Trench depth requirements measured from finished grade or paved surface shall meet the following requirements or applicable codes and ordinances, whichever is more stringent:
 - 1. Water Mains: 30 inches to top of pipe barrel or 6 inches below frost line, established by local building official, whichever is deeper.
 - 2. Sanitary Sewer: Elevations and grades as indicated on the drawings and as specified in Section 02535.
 - 3. Storm Sewer: Elevations and grades as indicated on the Drawings.
 - 4. Electrical Conduits: 24 inches minimum to top of conduit or as required by NEC 300-5, NEC 710-36 codes, or local utility company requirements, whichever is deeper.
 - 5. TV Conduits: 18 inches minimum to top of conduit or as required by local utility company, whichever is deeper.
 - 6. Telephone Conduits: 18 inches minimum to top of conduit, or as required by local utility company, whichever is deeper.
 - 7. Gas Mains and Service: 30 inches minimum to top of pipe, or as required by local utility company, whichever is deeper.

3.7 SUBGRADE PREPARATION

- A. Scarification and Compaction: The exposed subgrade soil should be scarified, moisture conditioned, and compacted. The depth of scarification of subgrade soils and moisture conditioning of the subgrade is highly dependent upon the time of year of construction and the site conditions that exist immediately prior to construction. If construction occurs during the winter or spring, when the subgrade soils are typically already in a moist condition, scarification and compaction may only be 8 inches. If construction occurs during the summer or fall when the subgrade soils have been allowed to dry out deeper, the depth of scarification and moisture conditioning may be as much as 18 inches or more. The geotechnical engineer should be present to observe the

exposed subgrade and specify the depth of scarification and moisture conditioning required subsequent to grading cuts and prior to placing fill.

Areas exposed by excavation or stripping and on which subgrade preparations are to be performed shall be scarified, moisture conditioned and compacted to at least 95% Maximum Dry Density as obtained by the Standard Proctor Method (ASTM 1557), moisture conditioned within optimum and 3% above the optimum moisture content.

- B. Proofrolling: Subgrades shall be proofrolled to detect areas of insufficient compaction and soft pocket, or areas of excess yielding. Proofrolling shall be accomplished by making minimum of two complete passes with fully-loaded tandem-axle dump truck with a minimum weight of 20 tons, or approved equal, in each of two perpendicular directions. Limit vehicle speed to three mph. Areas of failure such as soft spots, unsatisfactory soils, and areas of excessive pumping or rutting shall be excavated and re-compacted as specified herein. Continual failure areas shall be stabilized in accordance with Section 02340 at no additional cost to Owner. Subgrade exposed longer than 48 hours or on which precipitation has occurred shall be re-proofrolled. Document proofrolling procedure, specific locations, deficiencies, and corrective measures for review by Owner or Owner's CTL upon request.

3.8 FILLING

- A. Fill areas to contours and elevations shown on the Drawings with materials deemed satisfactory.
- B. Place fills in continuous lifts specified herein.
- C. Fill within proposed building subgrade, paving subgrade, and outparcel subgrades shall not contain rock or stone greater than 6 inches in any dimension.
- D. Unless otherwise specified for rock fill, rock or stone less than 6-inches in largest dimension may be used in fill below structures, paving, outparcels, and graded areas, up to 24 inches below surface of proposed subgrade or finish grade of graded areas when mixed with satisfactory material. Rock or stone less than 2 inches in largest dimension may be used in fill within the upper 24 inches of proposed subgrade or finish grade of graded areas when mixed with satisfactory material.
- E. Fill materials used in preparation of subgrade shall be placed in lifts or layers not to exceed 10 inches loose measure and compacted as specified hereinafter.
- F. Material imported from off-site shall have CBR or LBR value equal to or above pavement design subgrade CBR or LBR value indicated on The Drawings.
- G. Building area subgrade pad shall be that portion of site directly beneath and 5 feet beyond building and appurtenances, including limits of future building expansion areas as shown on the Drawings.
- H. Prepare building area subgrade pad in strict accordance with "Foundation Subsurface Preparation" as shown on the Drawings. The Foundation Subsurface Preparation provisions shall take precedence over the provisions of this section whenever duplication or conflict occurs.

3.9 ROCK FILL

- A. Rock fill shall include on-site excavated material classified as rock excavation as specified in Section 02318. Rock fill may be utilized in fill up to 48 inches below top of subgrade or finish grade of graded areas outside the proposed building, paving, and outparcel areas. Rock fill shall consist of rock having a maximum dimension not greater than 12 inches in any dimension. Rock fill shall be placed in successive horizontal layers of loose material having a thickness of approximately the maximum size of the larger rock in the lift, but not greater than 12 inches. Each layer of material shall be spread uniformly, completely saturated, and compacted. Shot rock shall not be dumped into place, but shall be distributed in horizontal lifts by blading and dozing in such a manner as to ensure proper placement into final position in the embankment. Voids shall be filled with finer material including shot rock fines and limited soil fines during the spreading operation. Successive layers shall not be placed until all

02300-8

voids of the current lift are filled and the lift is compacted. Each successive layer of material shall adequately bond to the material on which it is placed. Compaction shall be accomplished with vibratory compactors, heavy rubber-tired rollers, or steel-wheeled rollers. Compaction shall be by uniform passes of compaction equipment in sufficient number of passes, but not less than two passes, such that no further consolidation is evident.

3.10 PIPE BEDDING

- A. Excavate trenches for pipe or conduit to 4 inches below bottom of pipe and to the width as specified herein. Place 4 inches of bedding material, compact in bottom of trench, and shape to conform to lower portion of pipe barrel.
- B. Place geotextile fabric as specified on the Drawings and in accordance with Section 02340.

3.11 TRENCH BACKFILLING

- A. Materials used for trench backfill shall comply with requirements as specified herein.
- B. Backfill and compact in accordance with fill and compaction requirements in ASTM D2321 unless otherwise shown on the drawings.
- C. Do not backfill trenches until required tests are performed and utility systems comply with and are accepted by applicable governing authorities.
- D. Backfill trenches to contours and elevations shown on the Drawings.
- E. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

3.12 BORINGS AND CASINGS UNDER ROADS, HIGHWAYS, AND RAILROAD CROSSINGS

- A. When indicated by the Drawings, street, road, highway, or railroad crossings for utility mains installed by jacking and boring method shall be in accordance with area specifications and governing authorities.
- B. Excavation of approach pits and trenches within right-of-way of street, road, highway, or railroad shall be of sufficient distance from paving or railroad tracks to permit traffic to pass without interference. Tamp backfill for approach pits and trenches within right-of-way in layers not greater than 6-inches thick for entire length and depth of trench or pit. Compact backfill to 95 percent of maximum density in accordance with ASTM D1557 obtained at optimum moisture as determined by AASHTO T180. Mechanical tampers may be used after cover of 6 inches has been obtained over top of barrel of pipe.
- C. Accomplish boring operation using commercial type boring rig. Bore hole to proper alignment and grade. Bore hole shall be within 2 inches of same diameter as largest outside joint diameter of pipe installed. Install pipe in hole immediately after bore has been made and in no instance shall hole be left unattended while open.
- D. In event subsurface operations result in failure or damage to pavement or railroad tracks within 1 year of construction, make necessary repairs to pavement or railroad tracks. If paving cracks on either side of pipe line or is otherwise disturbed or broken due to construction operations, repair or replace disturbed or broken area.
- E. Clean, prime, and line interior and exterior of casing pipe with two coats of asphalt coating in accordance with and governing authorities.
- F. Butt weld steel casing. Welds shall be full penetration single butt-welds in accordance with AWWA C206.
- G. Install casing and utility pipe with end seals, vent pipe, and other special equipment in accordance with area specifications and governing authorities.

3.13 COMPACTION

- A. Compact as follows:

02300-9

<u>Location</u>	Percent of Maximum Laboratory Density <u>ASTM D1557</u>
Subgrade & Fill below Structures, Pavement and Outparcels	95
Subgrade & Fill in All other Areas	92

- B. Maintain moisture content between optimum and 3% above the optimum moisture content of fill materials to attain required compaction density.
- C. Exercise proper caution when compacting immediately over top of pipes or conduits. Water jetting or flooding is not permitted as method of compaction.
- D. Corrective Measures for Non-Complying Compaction: Remove and recompact deficient areas until proper compaction is obtained. Continual failure areas shall be stabilized in accordance with Section 02340 at no additional cost to Owner.

3.14 MAINTENANCE OF SUBGRADE

- A. Verify finished subgrades to ensure proper elevation and conditions for construction above subgrade.
- B. Protect subgrade from excessive wheel loading during construction, including concrete trucks, dump trucks, and other construction equipment.
- C. Remove areas of finished subgrade found to have insufficient compaction density to depth necessary and replace in manner that will comply with compaction requirements by use of material with CBR or LBR equal to or better than that specified on the drawings. Surface of subgrade after compaction shall be firm, uniform, smooth, stable, and true to grade and cross-section.
- D. Construct temporary ditches and perform such grading as necessary to maintain positive drainage away from subgrade at all times.

3.15 BORROW AND SPOIL SITES

- A. Comply with NPDES and local erosion control permitting requirements for any and all on-site and off-site, disturbed spoil and borrow areas. Upon completion of spoil or borrow operations, clean up spoil or borrow areas in a neat and reasonable manner to the satisfaction of Owner or off-site property owner, if applicable.

3.16 FINISH GRADING

- A. Check grading of building subgrades by string line from grade stakes (blue tops) set at not more than 50-foot centers. Allowable tolerance shall be plus or minus 0.10 feet from plan grade. Provide engineering and field staking as necessary for verification of lines, grades, and elevations.
- B. Grade areas where finish grade elevations or contours are indicated on the Drawings, other than paved areas, outparcels, and buildings, including excavated areas, filled and transition areas, and landscaped areas. Graded areas shall be uniform and smooth, free from rock, debris, or irregular surface changes. Ground surfaces shall vary uniformly between indicated elevations. Grade finished ditches to allow for proper drainage without ponding and in manner that will minimize erosion potential. For topsoil, sodding, and seeding requirements refer to Section 02900.
- C. Correct settled and eroded areas within 1 year after date of completion at no additional expense to Owner. Bring grades to proper elevation.

3.17 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Except for specified mandatory testing, field quality control testing and inspection shall be at the discretion of the Contractor

as necessary to assure compliance with Contract requirements. Owner T&I specified below shall not be considered a substitute for the Contractor's responsibility to perform similar routine, necessary, and customary testing and inspection of the methods and frequency suitable for the type of work involved.

3.18 OWNER TESTING AND INSPECTION (T&I) AND OBSERVATION

- A. The Owner will perform testing and inspection (T & I) as specified in Appendix B (Section 02300).
- B. Civil Engineering Consultant Observation: The Owner's Civil Engineering Consultant (CEC) will perform special observations as specified in Appendix B (Section 01456).

END OF SECTION

SECTION 02318 (31 2316) - ROCK EXCAVATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Removal including, drilling, blasting, and protection of rock excavation.

B. Related Requirements:

1. Section 02230 – Site Clearing. Clearing of trees, brush, and vegetation prior to excavation.
2. Section 02300 – Earthwork: Excavation, filling, and compaction of earth materials and rock fill.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. National Fire Protection Association (NFPA)

1. NFPA495 - Code for Manufacturing, Transportation, Storage, And Use of Explosive Material

C. United States Department of Interior, Bureau of Mines

1. Seismic Effects of Blasting

D. Occupational Safety & Health Administration (OSHA)

1. 29CFR1910.109 - Explosives and Blasting Agents

E. State of California Department of Transportation (CALTRANS)

1. 2018 Standard Specifications

F. City of Stockton Standard Specifications

1.3 DEFINITIONS

- A. Rock Excavation: Removal of igneous, metamorphic, or sedimentary rock or stone, boulders over two cubic yards in volume in open areas and one cubic yard in volume in trenches; and masonry, concrete, or solid frozen soil that cannot be removed by rippers or other mechanical methods and, therefore, requires drilling and blasting.
 1. The excavation and disposal of all "Rock Excavation" that is indicated by the Soils Report shall be considered unclassified excavation and shall be included with site work grading as part of the lump sum base bid.
 2. If "Rock Excavation" is required that is not indicated by the Soils Report, the Wal-Mart Construction Manager shall be notified prior to such rock excavation, and he must then visit the site and verify the necessity for excess "Rock Excavation," determine an estimated quantity and provide the Contractor written approval to proceed. In the event the estimated quantity is exceeded, the Wal-Mart Construction Manager shall again be notified to establish a revised estimated quantity and authorize the Contractor to proceed. Payment for the authorized work shall be by a Change Order to the Contract.
- B. Trenches: Excavations having vertical sides whose depths exceed its width, made for storm water drainage, sanitary sewer, water, and gas pipes, electric, communications, and steam conduits, and related uses.

1.4 SUBMITTALS

- A. Submit Blasting Plan prior to any blasting and Monitoring Reports to the Owner and Governing Agencies for review.

02318-1

1.5 REGULATORY REQUIREMENTS

- A. Conform to requirements of NFPA495, Bureau of Mines Seismic Effects of Blasting, and OSHA 29CFR1910.109 as applicable.
- B. Comply with all applicable laws, rules, ordinances and regulations of the Federal, State and local regulatory authorities and insurers that govern the licensing, transportation, storage, handling, use, and disposition of explosives.
- C. Prior to rock excavation, obtain and pay for all powder and blasting permits and licenses from regulatory agencies.
- D. If blasting is required or undertaken, the responsible Subcontractor shall be licensed in the State and shall possess a current blasting license issued by the appropriate regulatory authority and be permitted for the transportation of explosives if required.
- E. In case of conflict between regulations or between regulations and Specifications, the Contractor shall comply with the strictest applicable codes, regulations or Specifications.

1.6 SITE CONDITIONS

- A. Environmental Requirements: Determine environmental effects associated with proposed work and safeguard those concerns as regulated by law and local governing agencies by reasonable and practical methods.
- B. Existing Conditions: The Contractor shall be responsible for any and all damage and/or injury from the use of explosives. The Contractor shall save and hold harmless the Owner, Architect and Engineer from any and all claims from the use of explosives. Removal of materials of any nature by blasting shall be done in such a manner and at such times as to avoid damage affecting integrity of existing construction and damage to new or existing dwellings, structures and water wells in or adjacent to the area of the work. It shall be the Contractor's responsibility to determine the method of operation to ensure desired results and integrity of completed work. All damage caused by the Contractor's blasting operations shall be repaired to the full satisfaction of the Owner at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Explosives, detonator/delay device, and blast mat materials shall be type recommended by explosive supplier and shall comply with requirements specified herein.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Verify site conditions and note subsurface conditions affecting work of this section.
- B. Identify required lines, levels, and elevations that will determine extent of proposed removals.

3.2 ROCK EXCAVATION

- A. Cut rock to form level bearing at bottom of footing and trench excavations. Remove shaled layers to provide sound and unshattered base for footings or foundations. Contractor shall consider reuse of excavated materials on site in accordance with Section 02300. If material cannot be utilized on site, dispose of material offsite.
- B. If placed in embankments, perform rock excavation in manner that will produce material of such size as in accordance with Section 02300. Remove rock to allow for construction and/or installation of the site and building improvements as indicated on Construction Drawings. Remove loose or shattered rock, overhanging ledges and boulders which might dislodge.

02318-2

- C. Use lean concrete or suitable materials as directed by registered geotechnical engineer to replace rock overblast or over excavation in building and expansion area to facilitate placement of utilities and foundations systems.

3.3 ROCK BLASTING

A. General

1. The drilling and blasting methods and programs shall be those necessary to accomplish any and all rock excavation required for completion of the improvements shown on the Construction Drawings in accordance with the procedures specified herein. Do not use explosives as a primary means of transporting material outside the excavated prism.
2. Blasting work shall be performed only with necessary permits from all regulatory authorities and after completion of the preblast survey. Blasting work shall take place only after persons in the vicinity have been notified and have reached positions of safety. Take appropriate precautions to prevent all persons from entering the blasting area. Use methods and programs that will prevent damage to, but not limited to, adjacent dwellings, structures, public domain, natural resources, habitat, existing wells and landscape features and that will minimize the scattering of rock, stumps or other debris. All affected roadways shall be inspected, cleared, and opened to traffic within 1 hour of completed blasting or as required by governing authorities.
 3. Complete all blasting with experienced powdermen licensed to use explosives in the State.
4. Conduct blasting at such hours (between ___ a.m. to ___ p.m.) so as not to disrupt surrounding residences and businesses, and in accordance with Federal, state and local regulations and/or ordinances with regard to noise.
5. Take all precautions necessary to warn and/or protect any individuals exposed to his operations prior to any blasting. Blasting mats or other approved flyrock protection shall be employed as necessary to protect areas adjacent to blasting.
6. Develop and maintain records covering pertinent data on the location, depth and area of the blast, the diameter, spacing, depth, overdepth, pattern, amount, distribution and powder factor for the explosives used per hole and per blast; the sequence and pattern delays, and description and purpose of special methods. Provide a copy of the records to the Owner upon the Owner's request. Receipt and acceptance by the Owner of blasting data will not relieve the Contractor of responsibility to produce satisfactory results as set forth in these specifications. Drilling and blasting shall be done only to the depth, amount and at such locations, with explosives of such quantity, distribution, and density that will not produce unsafe or damage rock surfaces or damage rock beyond the prescribed excavation limits. The Contractor shall be responsible for the cost of removal of overblast and also for the cost of placement and compaction of suitable replacement fill where overblast removal is required or occurs.
7. When a drilling and blasting program results in damage to the excavation or unacceptable peak particle velocity or frequency values as specified herein, the Contractor will be required to devise and employ revised methods that will prevent such damage or unacceptable ground motions at no cost to the Owner. The revisions may include special methods such as presplit and zone blasting, shallow lifts, reduction in size of individual blasts, small diameter blast holes, closely spaced blast holes, reduction of explosives, greater distribution of explosives by use of decking and primacord or variation in density of explosives and chemical or mechanical splitting of the rock.

B. Explosives

1. Take special precautions for proper use of explosives to prevent harm to human life and damage to surface structures, utility lines, or other subsurface structures.
2. Store, handle, and employ explosives in accordance with Federal, state and local regulations, or, in the absence of such, in accordance with the provisions of the NFPA and OSHA.

C. Blasting Vibration And Limit Criteria

1. The amount of vibration, frequency and overpressure generated by blasting shall not exceed regulatory statutes or directives established by State, local or other authorities. In no case shall the maximum Peak Particle Velocity (PPV) exceed the limits indicated on Figure B-1, Appendix B, of the United States Bureau of Mines Report of Investigations, RI 8507, 1980 or latest edition.
2. The peak airblast overpressure measured at the location of the nearest occupied, aboveground structure (considering wind direction) shall not exceed 0.014 psi.

D. Preblast Survey

1. General:

- a. Conduct a preblast survey prior to initiating blasting work. Preblast survey shall be performed by a registered Professional Engineer or specialized consultant licensed in the State of the work covered under this contract and specialized in conducting preblast surveys.
- b. The preconstruction/preblast survey shall consist of documenting conditions of all existing dwellings and structures located within a minimum of 500 feet of the limits of all work requiring rock blasting prior to commencement of blasting or further if required by Federal, state or local regulations.
- c. The purpose of the preblast survey is to determine the conditions of existing dwellings, structures and water supply wells and document any pre-existing defects and other physical factors that could reasonably be affected by the blasting. Structures such as dams, ponds, pipelines, cables and transmission lines, cisterns, structures of historical significance, and/or structures with unusually costly or vulnerable contents shall be included. The preblast survey shall also note the nature and sensitivity of livestock that may be affected by the blasting.

2. Examination of and Preparation for Survey:

- a. The Contractor shall contact the property owners (or their legal representative) of properties within a minimum of 500 feet of the limits of all blasting work in order to obtain permission to conduct a survey of their property. If the property owner does not grant the Contractor permission to conduct the survey, the Contractor shall contact the property owner a second time by registered mail/return receipt requested. The second request for permission to conduct the survey shall include a description of the survey to be performed and the purpose of the survey. At least 72 hours prior to start of blasting work, notify the appropriate local regulatory authority of any property owners who refuse access for the preconstruction survey.
- b. Notify the property owners at least 48 hours prior to conducting the preblast survey. After completion of the survey, two copies of the preblast report shall be submitted to the appropriate local regulatory authority for their reference if required. Additionally, one copy shall be kept on file at the location of the project and one copy provided to the Owner upon request.

3. Method:

- a. The preblast survey shall include a detailed examination of the interior and exterior of structures located within a minimum of 500 feet of the limits of blasting work. Color photographs, videotapes, and written descriptions shall be taken as required to document the condition of areas within the limits of the survey area. Particular note shall be made of evident structural faults or deficiencies, or recent repairs.
- b. The preblast survey shall also include an assessment of water supply wells located within a minimum 500 feet of the limits of all blasting work. This assessment shall include the following items:
 - 1) Information regarding the date of construction of the well, depth, method of construction, yield, water quality and any other existing available data will be requested from each well owner and/or the installer, provided the installer is known.
 - 2) A short duration pump test shall be performed on each well utilizing the existing pump that services each well. The pump shall be activated, the volume of water measured and the drawdown in the well measured for a 1-hour or less period until approximate steady state conditions are achieved. The data obtained from these measurements shall be used to estimate the approximate yield of each well.
 - 3) Upon completion of the above-described short duration pump test, obtain a groundwater sample from the well and submit to a State certified water quality laboratory. Laboratory shall analyze sample for iron, manganese, total dissolved solids, turbidity and total coliform.

4. Survey Report:

- a. The Contractor shall prepare a written report summarizing the results of the preblast survey. The final written report shall be signed and sealed by the Contractor's qualified inspector. The report shall contain the following:
 - 1) Location and description of each property
 - 2) Descriptions of the conditions of the on-site elements
 - 3) Summary of the visual inspection
 - 4) Color photographs, sketches, and videotape with vocal summary
 - 5) All data developed from the water supply well assessment
- b. Provide videotapes to include supplemental information, as required. Pictorial documentation shall be of professional quality and shall be provided with a scale, where practicable. Clearly label picto-

02318-4

rial documentation with an identification number, name of the project and the Engineer or qualified person conducting the survey, name of the property owner, date the picture or video tape was taken, and sufficient information to determine the location of the area in question.

- c. The Contractor's inspector shall immediately report in writing to the Contractor any findings that, in his opinion, indicate that any structure or well will be adversely affected by the required construction and blasting.
- d. If, during the course of construction and blasting, the Contractor is requested by an adjacent property owner to view alleged damage to property, the Contractor shall give written notice to the Owner prior to the Contractor's visit to the adjacent owner's property.

E. Blast Monitoring:

- 1. Contractor shall perform seismic blast monitoring in accordance with State and local regulations.
- 2. Contractor shall provide monitoring of blasting vibrations and over-pressures to allow evaluation of compliance with the specified vibration/over-pressures to criteria. As a minimum, the Contractor will monitor each blast as follows:
 - a. Monitor vibrations at the exterior walls of all structures within 500 feet of each blast location.
 - b. If no structures are located within 500 feet of the blast location, monitor vibrations at three equally spaced radial points located a minimum of 500 feet from the blast locations.
 - c. Monitor over-pressures for all structures within a minimum 500 feet of the blast.
- 3. If requested by the Owner, report vibration/overpressure-monitoring results to the Owner within two hours of blasting. Monitoring performed by the Contractor does not relieve the Contractor of responsibility for control of vibration and overpressure during blasting operations.

3.4 ROCK CUT FACE EXCAVATION

- A. The slope of the soil above the top of any permanently exposed rock cut face shall be no steeper than 3(H):1(V) unless otherwise noted on the Construction Drawings. Slope of the rock face shall meet the requirements below.

TYPE OF ROCK	SLOPE (Horizontal to Vertical)
Solid limestone or sandstone	_____
Interbedded limestone, sandstone or shale	_____
Layered shale (no hard rock)	_____

- B. Benches of at least ten feet in width at a maximum of twenty feet in elevation intervals or as noted on the Construction Drawings. The benches shall serve to provide rock traps and divert water from the rock face.

3.5 ROCK TRAP

- A. Locate rock traps at the base of permanently exposed rock slopes and construct as indicated in the Construction Documents or Blasting Plan.

3.6 OVEREXCAVATION AND BACKFILL

- A. Over excavation which is required to remove unsuitable natural undisturbed bedrock weakened by weathering or other cause not inflicted by the Contractor shall be immediately reported to the Owner and performed as directed by the Owner, and the theoretical lines and grades will be adjusted accordingly. Material outside the excavation limits which are disturbed due to the fault or negligence of the Contractor or due to his failure to exercise sound construction practices, shall be either replaced by the Contractor with suitable materials (earth or concrete), or bolted, or both as directed, at no cost to the Owner.

END OF SECTION

SECTION 02340 (31 3200) - SOIL STABILIZATION

PART 1 GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Excavation, treatment, and backfilling of subgrade for lime, cement, fly ash, or bridge lift stabilization.
 - 2. Geotextile fabric and geogrid for stabilization of subgrade.
- B. Related Requirements:
 - 1. Section 01351 – Regulatory Compliance:
 - a. Disposal and removal of construction and universal waste.
 - b. Work practice control methods for airborne respirable dust.
 - 2. Section 02300 – Earthwork
 - 3. Appendix B – Testing, Inspection, and Observation by Owner.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.
- B. ASTM International (ASTM):
 - 1. ASTM C150 - Portland Cement.
 - 2. ASTM C618 - Fly Ash and Raw or Calcined Natural Pozzolan for use as a Mineral Admixture in Portland Cement Concrete.
 - 3. ASTM C977 - Quicklime and Hydrated Lime for Soil Stabilization.
- C. American Association of State Highway and Transportation Officials (AASHTO):
 - 1. AASHTO M216 - Lime for Soil Stabilization.
- D. National Lime Association (NLA):
 - 1. NLA Bulletin 326 - Lime Stabilization Construction Manual.
- E. State of California Department of Transportation (CALTRANS):
 - 1. 2018 Standard Specifications
- F. Occupational Safety and Health Administration (OSHA):
 - 1. OSHA 01926.1153 Respirable Crystalline Silica.

1.3 ENVIRONMENTAL REQUIREMENTS

- A. Do not install mixed materials in wind in excess of 10 mph or when temperature is below 40 degrees Fahrenheit.
- B. Minimize dust emissions or provide equipment that suppresses dust.
- C. Dispose of construction waste in accordance with the requirements of Section 01351 Regulatory Compliance Supplement.

1.4 SUBMITTALS

- A. Submit 30-pound sample of each material to be used at the site in airtight containers to the Construction Testing Laboratory (CTL) or submit gradation and certification of material that is to be used to the CTL for review.

- B. Submit name of each materials supplier and specific type and source of each material. Obtain approval of Owner prior to change in source.
- C. Submit mix designs, materials mix ratio, and laboratory test data to the Civil Engineering Consultant of Record 4 weeks prior to beginning stabilization activities. Certify materials and mix ratios will achieve the specified requirements as indicated in the Construction Documents or as specified by state and local agencies for soil stabilization if not stated in the Construction Documents.
- D. Submit approved mix designs, materials mix ratio, and laboratory test data to the CTL prior to commencing stabilization activities.

PART 2 PRODUCTS

1.5 MANUFACTURERS

- A. Provide products from one of the following manufacturers as specified in the Materials paragraph below:
 1. TenCate Geosynthetics North America (Mirafi), Pendergrass, GA., (706) 693-2226, www.tencate.com
 2. Hanes Geo Components (WEBTEC), Winston Salem, NC. (336) 747-1600, www.hanesgeo.com
 3. Tensar International Corp., Atlanta, GA. (888) 828-5126, www.tensarcorp.com
 4. Thrace-LINQ Inc., Summerville, SC (843) 873-5800, www.thracelinq.com
 5. DuPont (Tytar). Summerville, SC (843) 832-6860, www.typargeo.com
 6. Synteen Technical Fabrics, Lancaster, SC (800) 796-8336, www.synteen.com

1.6 MATERIALS

- A. Soil Treatment Materials:
 1. Hydrated Lime: ASTM C977 or AASHTO M216.
 2. Portland Cement: ASTM C150, Type I.
 3. Fly Ash: ASTM C618.
- B. Aggregate:
 1. Coarse Aggregate: Crushed carbonate, crushed gravel, crushed air-cooled slag, granulated slag, a mixture of crushed and granulated slag, or other types of suitable material meeting the following gradation requirements:

Sieve Size	Percent Passing
2 inches	100
1 inch	70-100
3/4 inch	50-90
No. 4	30-60
No. 30	7-30
No. 200	0-5

2. Fine Aggregate: Sand – Natural river or bank sand; washed; free of silt, clay, loam, friable or soluble materials, and organic matter meeting the following gradation requirements:
- 3.

Sieve Size	Percent Passing
No. 4	90-100
No. 50	7-40
No. 200	0-5

- C. Subsoil: Existing to be reused.
- D. Bridge Lift Material: Surge stone, granular fill, or shot rock fill.

1.7 ACCESSORIES

- A. Curing Seal: Asphalt Emulsion Primer.

- B. Geotextile Fabric for Stabilization: Provide one of the following:
 1. Mirafi HP 370 or HP 570, by TenCate.
 2. SF40 or SF65, by DuPont.
 3. GTF-200 or 300, by Thrace-LINQ.
 4. TerraTex HD, by Hanes.

- C. Geogrid for Stabilization: Provide one of the following:
 1. Biaxial Geogrid Type 1 (formerly BX 1100), by Tensar.
 2. Biaxial Geogrid Type 2 (formerly BX 1200), by Tensar.
 3. Mirafi BXG 11, by TenCate.
 4. Mirafi BXG 12, by TenCate.
 5. SF 11, by Synteen.
 6. SF 12, by Synteen.

PART 3 EXECUTION

1.8 PREPARATION

- A. Obtain approval of mix design before proceeding with placement.

- B. Start stabilization only when weather and soil conditions are favorable for successful application of proposed material.

- C. Proofroll subgrade to identify areas in need of stabilization.

1.9 EQUIPMENT

- A. Perform operations using suitable, well maintained equipment capable of excavating subsoil, mixing and placing materials, wetting, consolidating, and compacting of material.

1.10 EXCAVATION

- A. Excavate subsoil to depth sufficient to accommodate soil stabilization.

- B. Remove lumped subsoil, boulders, and rock that interfere with achieving uniform subsoil conditions.

- C. Do not excavate within normal 45 degree bearing splay of any foundation.

- D. Notify Construction Manager of unexpected subsurface conditions. Discontinue affected work in area until notified to resume work.

- E. Correct areas over-excavated in accordance with Section 02300.

- F. Remove excess excavated material from site.

1.11 GEOTEXTILE FABRIC AND/OR GEOGRID

- A. Place geotextile fabric and/or geogrid over subsoil surface, lap edges and ends in accordance with manufacturer's recommendations in those areas that are shown on Construction Drawings or in those areas that need additional stabilization prior to placement of base course. Bridge lift sections may require the use of geotextile fabric and/or geogrid for stabilization prior to placement of fill.

- B. Place geotextile fabric and/or geogrid in accordance with manufacturer's recommendations.

1.12 SOIL TREATMENT AND BACKFILLING

- A. Lime Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with hydrated lime in accordance with state highway department specifications.
- B. Cement Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with Portland cement in accordance with state highway department specifications.
- C. Fly Ash Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with fly ash in accordance with state highway department specifications.
- D. Bridge Lifts: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade by application of a bridge lift. Bridging over existing soils shall be acceptable only when approved in writing by the Owner. Place geotextile fabric or geogrid over existing soils to be bridged. The geotextile fabric or geogrid selected shall be appropriate for the bridge lift material being placed. Place bridge lift over geotextile fabric or geogrid. Surge stone and shot rock will be approved by the Owner's representative on a submittal basis. The Owner and the Owner's representative shall have sole discretion as to the acceptability of all submittals.
- E. Backfill and compaction of treated subsoil shall be in accordance with Sections 02300.
- F. Maintain optimum moisture of mixed materials to attain required stabilization and compaction.
- G. Finish subgrade surface in accordance with Section 02300.
- H. Remove surplus mix materials from site.

1.13 CURING

- A. Immediately following compaction of mix, seal top surface with curing seal.
- B. Do not permit traffic for 72 hours after sealing top surface.

1.14 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Field quality control testing and inspection shall be at the discretion of the Contractor (except for specified mandatory testing listed below) as necessary to assure compliance with Contract requirements. Owner T&I shall not be considered a substitute for the Contractor's responsibility to perform similar routine, necessary, required, and customary testing and inspection of the methods and frequency suitable for the type of work involved.

1.15 OWNER TESTING AND INSPECTION (T&I) AND OBSERVATION

- A. The Owner will perform testing and inspection (T & I) as specified in Appendix B (Section 02340).
- B. Civil Engineering Consultant Observation: The Owner's Civil Engineering Consultant (CEC) will perform special observations as specified in Appendix B (Section 01456).

END OF SECTION

SECTION 02375 (31 3700) – STONE PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Rip-rap, bedding, and filter fabric for stone slope protection.
- B. Related Requirements:
 - 1. Section 02300 – Earthwork: Geotextile fabric

1.2 REFERENCES

- A. State of California Department of Transportation (CALTRANS):
 - 1. 2018 Standard Specifications
- B. City of Stockton Standard Specifications

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Rip-Rap: Stone for rip-rap shall consist of field stone or rough unhewn quarry stone as nearly uniform in section as is practical. Stones shall be dense, resistant to action of air and water, and suitable for purpose intended. Unless otherwise specified, stones shall weigh between 50 and 150 pounds each, and at least 60 percent of stones shall weigh more than 100 pounds each.
- B. Bedding Stone: Quarried and crushed angular limestone, 6-inches in depth, and with the following gradation:

Sieve Designation	% By Weight Passing Square Mesh Sieves
3"	100
No. 4	20-65
No. 200	0-10

- C. Filter Fabric: Geotextile fabric shall be as specified in Section 02340 and as detailed on Construction Drawings.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Start stabilization only when weather and soil conditions are favorable for successful application of proposed material.
- B. Notify Construction Manager of unexpected subsurface conditions. Discontinue affected work in area until notified to resume work.
- C. Dress slopes and other areas to be protected to line and grade shown on Construction Drawings prior to placing of rip-rap. Undercut areas to receive rip-rap to elevation equal to final elevation less average diameter of stones before placing rip-rap.
- D. Correct areas over-excavated in accordance with Section 02300.

- E. Remove excess excavated material from site.

3.2 PLACEMENT

- A. Place rip-rap in areas where indicated on Construction Drawings.
- B. Install filter fabric and bedding stone prior to placement of rip-rap if so indicated on Construction Drawings.
- C. Place stones so that greater portion of weight is carried by earth and not by adjacent stones. Place stones in single layer with close joints. Upright areas of stone shall make angle of approximately 90 degrees with embankment slope. Place courses from bottom of embankment upward, with larger stones being placed in lower courses. Fill open joints with spalls. Embed stones in embankment as necessary to present uniform top surface such that variation between tops of adjacent stones shall not exceed 3 inches.

3.3 GEOTEXTILE FABRIC AND/OR GEOGRID

- A. Place geotextile fabric over subsoil surface, lap edges and ends in accordance with manufacturer's recommendations and as shown on the Drawings.

END OF SECTION

SECTION 02715 (32 1100) - BASE COURSE

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Aggregate base for asphaltic concrete including sand/shell base and hot-mix sand asphalt base.
- B. Related Requirements:
 - 1. Section 02300 – Earthwork: Excavation, Backfill, and Compaction for Pavement subgrade.
 - 2. Appendix B – Testing and inspection by Owner.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.
- B. ASTM International (ASTM):
 - 1. ASTM D698 – Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbs/ft³ (600 kN-m/m³)).
 - 2. ASTM D1557 – Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbs/ft³ (2,700 kN-m/m³)).
- C. Asphalt Institute.
- D. State of California Department of Transportation (CALTRANS):
 - 1. 2018 Standard Specifications
- E. City of Stockton Standard Specifications, latest edition

1.3 QUALITY ASSURANCE

- A. A Construction Testing Laboratory (CTL) selected and paid for by the Owner, will be retained to perform construction testing on site at no cost to the Contractor. Contractor shall perform testing and inspections and be responsible for costs incurred, as necessary, to assure moisture content and gradation of materials imported to the site meet the specifications

1.4 SUBMITTALS

- A. Submit materials certificate to the Owner's Civil Engineering Consultant and the Owner's Construction Testing Laboratory, signed by materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein or on the Construction Drawings.
- B. Submit certification of base course materials and placement as specified in Parts 2 and 3 hereinafter.

1.5 WEATHER LIMITATIONS

- A. Do not place aggregate when base surface temperature is less than 40 degrees F, nor when air temperature is below 45 degrees F. Do not place aggregate when surface is wet or frozen. Do not place aggregate when weather conditions are unfavorable otherwise.
- B.

PART 2 - PRODUCTS

02715-1

2.1 BASE COURSE MATERIAL

- A. Aggregate Base Course: Aggregate base course shall consist of a well graded, durable aggregate uniformly moistened and mechanically stabilized by compaction. Base course may consist of a granular base (crushed slag, stone, or gravel, etc), sand/shell base material, or a hot-mix sand asphalt base.
- B. Base course shall be as shown on the drawings, or when not shown, shall be as specified herein.
- C. Aggregate base material requirements from State or other local highway agency specifications may be used for aggregate base course for roads, streets, or similar use pavements if the following conditions are met:
 - 1. Percentage of material by weight passing the No. 200 sieve will not exceed 10.
 - 2. Portion of the material passing the No. 40 sieve must have a liquid limit not greater than 25 and a plasticity index not greater than 5.
- D. Aggregate shall consist of clean, sound, durable particles of crushed stone, crushed slag, crushed gravel, angular sand, or other approved material. Aggregate shall be free of lumps of clay, organic matter, and other objectionable materials or coatings. The portion retained on the No. 4 sieve shall be known as coarse aggregate; that portion passing the No. 4 sieve shall be known as fine aggregate.
 - 1. Coarse aggregates shall be angular particles of uniform density.
 - 2. Fine aggregates shall be angular particles of uniform density. Fine aggregate shall consist of screenings, angular sand, crushed recycled concrete fines, or other finely divided mineral matter processed or naturally combined with the coarse aggregate.
- E. Gradation: The specified gradation requirements shall apply to the completed base course. The aggregates shall have a maximum size of 2 inches and shall be continuously well graded within the following limits:

GRADATION OF AGGREGATES
 Percentage by Weight Passing Square-Mesh Sieve

Sieve Designation	No. 1	No. 2	No. 3
2 inch	100	----	----
1-1/2 inch	70-100	100	----
1 inch	45-80	60-100	100
1/2 inch	30-60	30-65	40-70
No. 4	20-50	20-50	20-50
No. 10	15-40	15-40	15-40
No. 40	5-25	5-25	5-25
No. 200	0-10	0-10	0-10

NOTE: Particles having diameters less than 0.0008 inch shall not be in excess of 3 percent by weight of the total sample tested.

- F. Hot-mix Sand Asphalt Bases: Asphalt Institute Type VI, VII, or VIII Mixes for Hot-mix Sand Asphalt Bases. Hot-Mix base shall be used only under asphaltic concrete surfaces.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Contractor shall verify to the Owner in writing that the subgrade has been inspected, tested, and gradients and elevations are correct, dry, and properly prepared in accordance with Section 02300.

3.2 CONSTRUCTION

- A. Perform base course construction in accordance with the applicable State standard specifications or as shown or specified.

02715-2

- B. Perform base course construction in a manner that will drain the surface properly and prevent runoff from adjacent areas from draining onto base course construction.
- C. Compact base material to not less than 98 percent of optimum density as determined by ASTM D698 or 95 percent of optimum density, as determined by ASTM D1557 unless otherwise indicated on the Drawings.
- D. Construct to thickness indicated on Construction Drawings. The minimum base thickness as shown on drawings shall be achieved throughout all pavement areas.
 - 1. Granular Base: Apply in lifts or layers not exceeding 8-inches, measured loose.
 - 2. Sand/Shell Base: Apply in lifts or layers not exceeding 4-inches, measured loose.
 - 3. Hot-mix Sand Asphalt Bases: Apply in lifts or layers not exceeding 3-inches, measured loose.

3.3 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Field quality control testing and inspection shall be at the discretion of the Contractor (except for specified mandatory testing listed below) as necessary to assure compliance with Contract requirements. Owner T&I shall not be considered a substitute for the Contractor's responsibility to perform similar routine, necessary, and customary testing and inspection of the methods and frequency suitable for the type of work involved.
- B. Mandatory Testing and Inspection:
 - 1. Measure base course tolerances no more than 25 ft. on center with a rod and level or stringline.
 - 2. Certify in writing to the Owner that base course placement is in accordance with Contract Document requirements prior to subsequent work thereon.

6.1 OWNER TESTING AND INSPECTION (T&I) AND OBSERVATION

- A. The Owner will perform testing and inspection (T & I) as specified in Appendix B (Section 02715).
- B. Engineering Consultant Observation: The Owner's Civil Engineering Consultant (CEC) will perform special observations as specified in Appendix B (Section 01456).

END OF SECTION

SECTION 02740 (32 1216) - ASPHALT CONCRETE PAVING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Asphalt concrete binder and surface course.
- B. Related Requirements:
 - 1. Section 01351 – Regulatory Compliance:
 - a. Disposal and removal of hazardous construction and demolition waste.
 - b. Work practice control methods for airborne respirable dust
 - 2. Section 02300 - Earthwork.
 - 3. Section 02715 - Base Course.
 - 4. Section 02765 - Pavement Markings: Including removal of pavement markings.
 - 5. Section 02770 - Curbs and Sidewalks.
 - 6. Appendix B – Testing, Inspection, and Observation by Owner.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

 2. IS 128 - HMA Pavement Mix Type Selection Guide

- A. Occupational Safety and Health Administration (OSHA):
1. OSHA 01926.1153 Respirable Crystalline Silica.

1.3 QUALITY ASSURANCE

- A. Pre-installation Meeting: Convene a pre-installation meeting at the site at least two weeks prior to commencing work of this Section. Require attendance of parties directly affecting work of this Section, including, but not limited to, the Owner's representative, CTL's representative and inspector, Contractor, paving sub-contractor and job foreman.
1. Contact Wal-Mart Construction Manager three weeks prior to pre-installation conference to confirm schedule.
 2. Record discussions of meeting and decisions and agreements (or disagreements) reached, and furnish copy of record to each party attending. Review foreseeable methods and procedures related to paving work, including the following:
 - a. Review preparation and installation procedures and coordinating and scheduling required with related work.
 - b. Review proposed sources of paving materials, including capabilities and location of plant that will manufacture hot-mix asphalt.
 - c. Tour, inspect and discuss condition of subgrade, drainage structures, and other preparatory work.
 - d. Review requirements for protecting paving work, including restriction of traffic during installation period and for remainder of construction period.
 - e. Review and finalize construction schedule and verify availability of materials, installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - f. Review paving requirements (drawings, specifications and other contract documents).
 - g. Review required submittals, both completed and yet to be completed.
 - h. Review required inspections, testing procedures.
 - i. Review weather and forecasted weather conditions, and procedures for coping with unfavorable conditions.
 - j. Review safety precautions relating to placement of paving.

1.4 SUBMITTALS

- A. Submit mix designs to the Civil Engineering Consultant of Record at least 30 days prior to beginning asphalt paving operations. Mix designs over one year old will not be accepted by Owner. Mix design submittal shall follow the format as recommended by Asphalt Institutes Manual MS-2 and include the following:
1. Type and Name of mix.
 2. Gradation Analysis.
 3. Optimum asphalt content.
 4. Grade of asphalt binder.
 5. Volumetric properties.
 6. References to local State Highway Department Specification for each material when applicable.
 7. CALTRANS Mix Design Requirements from Section 30-4.01 of the Standard Specifications
 8. Certification Letter from Testing Laboratory verifying the quality Reclaimed Asphalt Pavement.
- B. Submit approved mix designs and laboratory test results to CTL signed by the materials producer and Contractor certifying materials and mix ratios conform to the requirements specified herein.
- C. Submit certification of asphalt placement as specified in Field Quality Control.

1.5 ENVIRONMENTAL REQUIREMENTS

- A. Minimize dust emissions or provide equipment that suppresses dust.

1.6 PROJECT CONDITIONS

- A. Weather Limitations:
 - 1. Apply tack coat when ambient or base surface temperature is above 40 F, and when temperature has been above 35 F for 12 hours immediately prior to application. Do not apply when base is wet, contains excess moisture, during rain, or when frozen.
 - 2. Construct asphalt concrete paving when ambient temperature is above 40 F.
- B. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Aggregate: Use locally available materials and gradations that meet local State Highway Department Specifications and exhibit satisfactory records of previous installations. All aggregate requirements, including those for quality, shall meet those in AASHTO M323 for the specified traffic level.
- B. Asphalt Binder: Asphalt binder shall be a performance-graded (PG) binder, meeting the requirements of M 320, which is appropriate for the climate and traffic-loading conditions at the site of the paving project and in compliance with the local State Highway Department Specifications for that location, or as specified by the contract documents.
 - 1. Design reliability shall be 85% for the high- and low-temperature performance.
 - 2. The minimum required PG binder shall be that which satisfies the required design reliability using the pavement temperature data determined.
 - 3. The high-temperature grade shall be increased by one grade equivalent to accommodate low traffic speeds.
- C. Tack Coat: Emulsified asphalt; AASHTO M140 or AASHTO M208, SS-1h, CSS-1, or CSS-1h, may be diluted with up to 1 part water to 1 part asphalt.
- D. Mineral Filler: Rock or slag dust, hydraulic cement, or other inert material complying with AASHTO M17, if recommended by local State Highway Department Specifications.
- E. Reclaimed Asphalt Pavement (RAP): RAP may be used in accordance with Section 39-2.02B(5) of the CALTRANS Standard Specifications. The mix design shall contain the percentage of RAP that is to be used in the production. Higher proportions of RAP may be used upon approval with evidence showing specified quality of mix is retained. Production procedures using RAP material shall conform to NAPA IS 123. Additional RAP provisions shall be as follows:
 - 1. Material-handling machinery shall not drive on the RAP stockpiles.
 - 2. RAP maximum top size aggregate introduced into the mix shall be 1-1/2 inches.
 - 3. Dust (fines) in the RAP, when added to the virgin aggregate, shall not exceed the requirements of the virgin mix design.
 - 4. Moisture content shall be monitored to assure that the material can be thoroughly dried as it is processed.
 - 5. Stockpiles shall be left uncovered or stored under the roof of an open-sided building.
 - 6. Material handling front-end loader operators shall be experienced in handling RAP materials.
 - 7. RAP shall be loaded in the cold feed bins in small consistent quantities without causing the material to compact in the bin.
 - 8. RAP shall not be held in the bin for extended periods of time, especially on hot, humid days.
 - 9. During production, RAP material shall not be allowed to contact open flame.

2.2 AGGREGATE SIZE REQUIREMENTS - SUPERPAVE MIX

- A. Nominal Maximum Size The combined aggregate shall have a nominal maximum aggregate size of 4.75 to 19.0

02740-3

mm for surface courses and no larger than 25 mm for subsurface courses in accordance with Table 3 of AASHTO M323. Selection of the appropriate nominal maximum aggregate size mixture shall be in accordance with NAPA IS 128.

- B. Gradation Classification The combined aggregate gradation shall be classified as coarse-graded when it passes below the Primary Control Sieve (PCS) control point as defined in Table 4 of AASHTO M323. All other gradations shall be classified as fine-graded.

2.3 ASPHALT-AGGREGATE MIXTURE

- A. Hot-Mix Asphalt meeting City of Stockton Standard Specifications Section 39.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that the prepared base material has been inspected, tested, and gradients and elevations are correct, dry, and properly prepared in accordance with Section 02715.

3.2 PREPARATION

- A. Proof roll prepared base material surface to check for unstable areas in accordance with Section 02300 including documentation and re-proof rolling as required. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.
- B. Establish and maintain required lines and elevations.
- C. Cover the surfaces of curbs, gutters, manholes and other structures on which the asphalt concrete mixture will be placed, with a thin, uniform coat of liquid asphalt. Where the asphalt concrete mixture will be placed against the vertical face of an existing pavement, clean the vertical face to remove foreign substances and apply a coating of liquid asphalt at a rate of approximately 0.25 gallons per square yard.
- D. Density Control Strips.
 1. Prior to beginning placement of asphalt, construct asphalt concrete density control strips.
 2. Source and type of material, material requirements, and laydown and compaction equipment used for compaction shall be the same as that to be used in the project.
 3. The subgrade or pavement layer upon which the control strip is constructed shall tested prior to construction of the control strip.
 4. The control strip shall be a minimum of 250 linear feet long and one paver width wide.
 5. Rolling the control strip shall continue until no appreciable increase in density is obtained by additional coverages.
 6. Upon completion of rolling, the Contractor shall use a nuclear testing device to establish the mean density of the control strip. The mean density will be based on 10 tests taken at randomly selected sites within the control strip area. The nuclear gauge will be calibrated with the average of 3 cores taken from the same area. The average of the cores shall meet the specified density requirements. The calibration factor between the average nuclear density and average core density shall be applied to the Contractor's nuclear gauge for Contractor's density monitoring.
- E. Equipment:
 1. Equipment necessary for the paving of asphalt concrete shall be on the project prior to beginning paving operations.
 2. Maintain equipment in satisfactory operating condition and correct breakdowns in manner that will not delay or be detrimental to the schedule of paving operations.

3.3 APPLICATION

- A. Tack Coat:

02740-4

1. Apply to contact surfaces of previously constructed asphalt concrete base courses or Portland cement concrete and surfaces abutting or projecting into asphalt concrete or into asphalt concrete pavement.
2. Apply tack coat to asphalt concrete base course or sand asphalt base course. Apply emulsified asphalt tack coat between each lift or layer of full depth asphalt concrete and sand asphalt bases and on surface of bases where asphalt concrete paving will be constructed.
3. Apply at rate which produces a residual of asphalt cement between 0.04 and 0.06 gal per sq. yd of surface.
4. Allow drying until at proper condition to receive paving.

3.4 ASPHALT CONCRETE PLACEMENT

- A. Place asphalt concrete mixture on completed, compacted underlying surface, spread, and strike off. Spread mixture at the minimum ambient temperature that will allow the required density to be achieved.
- B. Whenever possible, spread pavement by finishing machine; however, inaccessible or irregular areas may be placed by hand methods. Spread hot mixture uniformly to required depth with hot shovels and rakes. After spreading, carefully smooth hot mixture to remove segregated course aggregate and rake marks. Rakes and lutes used for hand spreading shall be type designed for use on asphalt mixtures. Do not dump loads faster that they can be properly spread. Workers shall not stand on loose mixture while spreading.
- C. Placement and routing of hauling and placing equipment shall be conducted in a manner to avoid tire tracking of bituminous material onto existing paved surfaces.
- D. Paving Machine Placement: Apply successive lifts of asphalt concrete in transverse directions except when placing within small areas, parallel lifts may be placed when considered more practical. Joints of successive parallel lifts shall be offset a minimum of 2 feet. Place surface course parallel to flow of traffic. Place asphalt paving in typical strips not less than 10'-0" wide. Asphalt concrete pavement, including base and surface course, shall be placed in two or more lifts as indicated on drawings. Pavement thicknesses shall be thickness shown on the drawings for each course but not less than 1-1/2 inch nor more than 3 inches for each lift.

3.5 ROLLING AND COMPACTION

- A. After being spread, mixture shall be compacted by rolling as soon as it will bear the weight of rollers without undue displacement. Number, weight, types of rollers, and sequences of rolling operations shall be such that the required density and surface are consistently attained while the mixture is in workable condition.
- B. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.
- C. Breakdown Rolling: Perform breakdown or initial rolling immediately following rolling of joints and outside edge. Check surface after breakdown rolling and repair displaced areas by loosening and filling with hot material.
- D. Intermediate Rolling: Follow breakdown rolling as soon as possible while mixture is hot. Continue second rolling until mixture has been thoroughly compacted as follows:
 1. Minimum Average Density: 93 percent of theoretical maximum density according to AASHTO T209 or ASTM D2041, with no individual test less than 91 percent nor greater than 97 percent.
- E. Finish Rolling: Perform finish rolling while mixture is still warm enough for removal of roller marks. Continue rolling until roller marks are eliminated and course has attained maximum density.
- F. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut out such areas and fill with fresh, hot asphalt concrete. Compact by rolling to maximum surface density and smoothness.
- G. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked. Any masked or marred finish surfaces shall be repaired or smoothed.
- H. Compaction at Unsupported Edges of Pavements: Start the first roller pass 12-15 inches from the unsupported edge. Allow the uncompacted asphalt to act as a dike to hold the mat in place. The final pass over the uncompacted dike

should not slough off if the roller is supported on the compacted mat.

3.6 JOINTS

- A. General: Place each asphalt paving layer as continuous as possible to keep the number of joints to a minimum. Create joints between old and new pavement, between successive days work, and where the mixture has become cold (less than 140 degrees F). Make these joints in such a manner as to create a continuous bond between the old and new pavement construction courses.
- B. Construction joints shall have same texture, density, and smoothness as other sections of asphalt concrete course.
- C. Transverse Joints: If placing of material is discontinued or if material in place becomes cold, make a joint running perpendicular to the direction traveled by the paver. Before placement continues, trim the edge of the previously placed pavement to a straight line perpendicular to the paver and cut back to expose an even vertical surface for the full thickness of the course. When placement continues, position the paver on the transverse joint so that sufficient hot mixture will be spread in order to create a joint after rolling that conforms to the required smoothness. If the temperature of the previously placed pavement material drops below 140 degrees F before paving is resumed, give the exposed vertical face a thin coat of liquid asphalt just before paving is continued.
- D. Longitudinal Joints: Coat longitudinal joints that are not completed before the previously laid mixture has cooled to a temperature below 140 degrees F, with liquid asphalt just before paving is continued.

3.7 FIELD QUALITY CONTROL

- A. Responsibilities: Unless otherwise specified, the quality control tests and inspections specified below will be conducted by the Owner's Construction Testing Laboratory (CTL) at no cost to the Contractor in accordance with Section 01458. Field testing, frequency, and methods may vary as determined by and between the Owner and CTL. The Contractor shall perform additional testing or inspection as considered necessary by the Contractor for assurance of quality control including use of a nuclear density gauge to establish rolling patterns and monitor in-place density.
- B. Core Sampling and Testing: Asphalt surface and base courses shall be randomly cored at minimum rate of 5 cores per day's placement per mix type, but not less than 5 cores in light duty areas and 5 cores in heavy-duty areas shall be obtained. Asphalt concrete pavement samples shall be tested for conformance with density and thickness requirements. Cores shall be cut from minimal loading areas representative of project.
- C. Coring holes shall be immediately filled by the Contractor with full depth, hot-mix asphalt concrete or non-shrink grout tinted to match the surrounding pavement.
- D. Surface Smoothness Test: In areas of obvious depressions or bumps, suspect areas of each lift shall be checked with a 10'-0" straightedge both parallel with, and at right angles to, centerline of the paved area. The variation of the surface between two contact points shall not exceed 1/4-inch.
- E. Thickness Test: The Contractor shall measure pavement thickness behind the paver at the beginning of and during pavement placing operations to assure proper thickness. The CTL will measure thickness of each core sample taken. At each core location, the thickness of the course shall meet or exceed the thickness shown. If the thickness of a lower course of asphalt is less than the thickness shown, it shall be identified as a deviation and recorded. The Contractor shall either remove and replace the deficient pavement or increase the thickness of the upper course so that the total thickness of the pavement meets or exceeds the design thickness, provided that the specified compaction of the lower lift is achieved. If the Contractor elects to increase the thickness of the upper course, three additional cores shall be taken in the area after the upper course is laid to verify that the total thickness is achieved.
- F. Field density test for in-place materials:
 - 1. Density tests shall be conducted on each core sample taken in accordance with ASTM D1188 or D2726 (AASHTO T166, T275, T331) as applicable.
 - 2. In-place density tests by nuclear method in accordance with ASTM D2950 shall also be taken by the Contractor as necessary to assure the specified density is obtained. Nuclear density shall be correlated with ASTM D1188 or D2726 or AASHTO T166, T275, T331 as applicable.

3. Density tests on courses to be overlaid by subsequent courses shall be performed within 48 hours prior to placement of next lift. If inclement weather occurs after testing, retest prior to placement of next lift.
- G. Volumetric Properties: Obtain test samples from the truck at the asphalt plant. Mixture samples shall be taken at least 2 times for every 8 hour day.
1. Superpave Mix: Compact into specimens in accordance with AASHTO T312. Test each specimen for determination of relative density, VMA, VFA, and dust-to-binder ratio.
 2. Marshall Mix: Compact into specimens using compactive blows equal to mix design per side with the Marshall hammer as described in AASHTO T245. Temperature shall be equal to temperature at paving machine with reheating. Test each specimen for determination of laboratory air voids, Marshall stability, and flow.
- H. Check surface areas as necessary to identify ponding areas. Remove and replace unacceptable paving as directed by Owner.
- I. Asphalt Content and Aggregate Gradation: Asphalt content extraction and gradation of extracted aggregate testing shall be performed in accordance with AASHTO T 308 or AASHTO T164 and ASTM D5444 respectively and local State Highway Department Specifications requirements. At least two asphalt content and two gradation tests shall be taken for each 2000 tons or each day pavement is placed.
- J. Areas of deficient paving, including compaction, smoothness, thickness, and asphalt mixture, shall be delineated, removed, and replaced in compliance with specifications requirements. Alternative remedial or corrective measures for repair of deficient paving may be allowed provided a plan of corrective action is submitted in the form of a Request For Information (RFI) and the plan is approved by the CEC.
- K. The Contractor shall certify in writing that asphalt placement is in accordance with specification requirements.

END OF SECTION

Rev 10: (10/21/14) Revised Field QC par wording in Part 3. (WM/Urhahn) Updated BASF product names per vendor rebranding. (RHA/Waite) Clarified editor's note for Owner CTL to include responsibility for DOT requirements. (WM/Richards)

Rev 11: (04/24/15) Modified for T&I consolidation in Appendix B. (CI 128496)

Rev 12: (06/12/15) Clarified and added editor notes to reference CEC responsibility for special observations and coordinating with Appendix B. (WM/Richards)

Rev 13: (09/20/15) Revised Appendix B title to include "Observation." (WM/Urhahn) Revised sitework Appendix B title to "App B for CEC Edits." (WM/Richards)

Rev 14: (05/01/16) Added light pole bases to summary. Updated concrete mix requirements per code, including air content table, exposure reference. (CI 129288)

SECTION 02751 (32 1313) - CONCRETE PAVING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Preparation and placement of Portland cement concrete parking areas.
2. Preparation and placement of Portland cement concrete roads and entrances.
3. Aggregate base below slab.
4. Exterior light pole bases.

B. Related Requirements:

1. Section 01330 - Submittal Procedures:
2. Section 02300 - Earthwork: Excavation, backfill, compaction for subgrades.
3. Section 02765 - Pavement Markings.
4. Section 03310 - Structural Concrete and Exterior Concrete Slabs: Truckwell slab, compactor and compressor equipment pads, drive-thru pharmacy driveway, and Automotive Center apron.
5. Appendix B – Testing, Inspection, and Observation by Owner.

1.3 SUBMITTALS

- A. Submittal Procedures: Unless otherwise specified herein, submit in accordance with procedures specified in Section 01330.
- B. Obtain CEC approval for Mix Design and Pavement Joint and Placement Plan prior to commencement of work.
- C. Submit submittal items required within this section in a single submittal. Do not submit submittals of this section together with submittals in section 03310 or any other section. Identify submittals explicitly in accordance with Procedures paragraphs in Section 01330.
- D. Sieve Analysis for Aggregate Base: Submit current sieve analysis report, sampled and tested within the last 60 days of submittal date, for aggregate base and choker material.
- E. Concrete Batch Plant Certifications: Submit name and address of the concrete supplier's batch plant and plant certification(s) by National Ready-Mix Concrete Association and/or State Department of Transportation.
- F. Mix Design:
 1. Fill out and submit attached Concrete Mix Design Submittal Form.
 2. Submit three copies of each proposed mix.

02751-2

3. Submit separate mix design for concrete to be placed by pumping in addition to the mix design for concrete to be placed directly from the truck chute.
 4. Submit mix design to the Civil Engineering Consultant of Record, the Owner's Construction Testing Laboratory, and the Owner's Assigned Concrete Sub-Consultant.
 5. Include applicable information shown on the Mix Design Submittal Form and the following:
 - a. Proportions of cementitious materials, fine and coarse aggregate, and water.
 - b. Water-cementitious material ratio, 28-day compressive design strength, slump, and air content.
 - c. Type of cement, fly ash, slag and aggregate.
 - d. Aggregate gradation.
 - e. Type and dosage of admixtures.
 - f. Special requirements for pumping.
 - g. Range of ambient temperature and humidity for which design is valid.
 - h. Special characteristics of mix which require precautions in mixing, placing, or finishing techniques to achieve finished product specified.
 6. Materials and methods for curing concrete.
- G. Attachments to Concrete Mix Design: Submit the following as attachments to be included with the Concrete Mix Design:
1. Cementitious materials mill test reports for the following:
 - a. Portland cement
 - b. Fly ash
 - c. Slag
 2. Designation, type, quality, and source (natural or manufactured) of coarse and fine aggregate materials.
 3. Sieve Analysis Reports: Provide separate sieve analysis of percentages passing for coarse and fine aggregate. Show values for each sieve size shown on the mix design form. Do not leave any line blank. Sieve analysis sampling and testing for each aggregate source shall be conducted within 60 days of concrete submittal date.
 4. Aggregate Supplier Statement:
 - a. Stating if aggregate is possibly alkali-reactive based on tests or past service.
 - b. Stating if aggregate can possibly cause pop-outs, "D" cracking, or other disruptions due to moisture gain, freezing, or other mechanisms, based on tests or past service.
 5. Product data for the following concrete materials admixtures:
 - a. Water reducing
 - b. Set retarding
 - c. Set accelerating
 - d. Data indicating chloride ion content information for each admixture
 6. Concrete compressive strength data as required by ACI 318.
 7. Concrete supplier approval of mix design.
 8. Chloride-Ion Content: Measured water-soluble chloride-ion content (percent by weight of cementitious materials) in accordance with ASTM C1218.
 9. Time of Initial Setting: Initial setting time in accordance with ASTM C403.
- H. Product Data: Submit certified laboratory test data or manufacturer's certificates and data for the items listed below certifying that materials are in conformance requirements specified herein. Submit to the Civil Engineering Consultant of Record and the Construction Testing Laboratory for review and approval and within 7 calendar days after receipt of Notice-to-Proceed. In addition, for projects with all-concrete parking lots, submit to the Wal-Mart Assigned Concrete Sub-Consultant.
1. Portland cement concrete mix design(s)
 2. Type and source of Portland cement, fly ash, and slag
 3. Aggregate gradations
 4. Joint back-up material
 5. Soft preformed joint filler
 6. Pavement joint sealant
 7. Dowel bars
 8. Tie bars
 9. Reinforcing steel bars
 10. Welded wire fabric
 11. Air entraining admixtures
 12. Water-reducing, set-retarding, and set-accelerating admixtures (if used)

- I. Pavement Joint and Placement Plan: For projects with all-concrete parking lots, provide a placement plan identifying the items listed below. In addition to submission to CEC, submit to Wal-Mart Assigned Concrete Sub-Consultant.
 - 1. Concrete truck access location.
 - 2. Extent of placements including width, length, slab placement area and volume.
 - 3. Locations of construction joints.
 - 4. Location of sawn contraction joints if different from those shown on the civil drawings.

- J. Pre-Slab Installation Meeting:
 - 1. Provide record of notification of pre-slab meeting including company name, persons contacted, and date and method of contact.
 - 2. Provide meeting minutes to all participants and Wal-Mart Construction Manager including sign-in sheet.

- K. Delivery Tickets:
 - 1. Copies of delivery tickets for each load of concrete delivered to site.
 - 2. Indicate information required by ASTM C 94 on each ticket including additional information required for slabs.
 - 3. Information on ticket shall include quantities of material batched including the amount of free water in the aggregate and the quantity of water that can be added at the site without exceeding the maximum water cementitious ratio of the approved mix design. Aggregate moisture corrections shall be based on ASTM definitions of aggregate moisture content and absorption.
 - 4. Mix identification number on ticket shall match number on submitted and approved mix design.
 - 5. Submit copies to Wal-Mart Testing Laboratory with each concrete delivery.

- L. Installation Certification: Submit certification in writing that final placement is in accordance with specification requirements.

- M. Statement of Approval of Concrete Supplier: Submit statement with information specified in Quality Assurance paragraph below.

1.4 QUALITY ASSURANCE

- A. Concrete Truck Inspection:
 - 1. Conform to ASTM C94, NRMCA, and Department of Transportation standards in state where project is located.
 - 2. Perform inspections immediately before starting concreting operations.
 - 3. Record acceptable truck numbers.
 - 4. Record the identification numbers of those trucks found to be acceptable on the basis of inspections.
 - 5. Do not bring on site for concreting operations, any truck whose identification numbers are not recorded as acceptable. Notify Wal-Mart Testing Lab if non-conforming trucks are used to deliver concrete for slabs and pavements.

- B. Tolerances:
 - 1. Conform to most stringent requirements of ACI 117 and ACI 301 except as specified herein.
 - 2. Conform to ACI 117 thickness tolerances for slabs-on-ground.

- C. Concrete Supplier Approval:
 - 1. The concrete supplier shall be fully approved and acceptable by the concrete subcontractor as the producer of concrete for which the subcontractor is to place and finish. Prepare Statement of Approval of Concrete Supplier stating project name, name of concrete supplier, along with the statement of approval and the signatures of the Contractor and concrete pavement subcontractor.

- D. Pre-installation Meeting: Convene a pre-installation meeting at the site at least two weeks prior to commencing work of this Section. Require attendance of parties directly affecting work of this Section, including, but not limited to, the Owner's representative, CTL's representative and inspector, Contractor, concrete sub-contractor and job foreman, concrete supplier, and base fine grading contractor.
 - 1. Contact Wal-Mart Construction Manager Thirty days prior to pre-installation conference to confirm schedule.

2. Record discussions of meeting and decisions and agreements (or disagreements) reached, and furnish copy of record to each party attending. Review foreseeable methods and procedures related to paving work, including the following:
3. CTL's testing and inspection procedures.
4. Concrete finishes and finishing.
5. Cold- and hot-weather concreting procedures.
6. Curing procedures.
7. Concrete design mixture and examine procedures for ensuring quality of concrete materials.
8. Proposed sources of concrete materials, including capabilities and location of plant that will manufacture concrete.
9. Tour, inspect and discuss condition of subgrade, drainage structures, and other preparatory work.
10. Requirements for protecting concrete work, including restriction of traffic during installation period and for remainder of construction period.
11. Review and finalize construction schedule and verify availability of materials.
12. Concrete paving requirements (drawings, specifications and other contract documents).
13. Required submittals, both completed and yet to be completed.
14. Weather and forecasted weather conditions, and procedures for coping with unfavorable conditions.
15. Safety precautions relating to placement of concrete.
16. Changes to the contract documents from recommendations or discussions at the Pre-Construction meeting shall be approved in writing by the Wal-Mart Construction Manager prior to implementation.

1.5 ENVIRONMENTAL REQUIREMENTS

A. Concreting in Hot, Dry, or Windy Weather:

1. Employ precautions to avoid cracking when the concrete rate of evaporation exceeds 0.1 pounds per square foot per hour or when any combination of concrete materials and weather conditions are favorable for the formation of plastic shrinkage cracks.
2. Maintain an accurate reading thermometer at the job site to check temperature of concrete.
3. Reject concrete if more than one slump adjustment, as defined in ASTM C 94, is required.
4. Do not place concrete when forms, subgrade, aggregate base, or reinforcing bars are more than 120 F or the temperature differential between the forms, aggregate base, or reinforcing bars and concrete will create conditions favorable for settlement cracks or thermal cracking.

B. Concreting in Cold Weather:

1. Conform to ACI 306.1 when temperature and other environmental conditions are as noted therein.
2. Subgrade shall be thawed to depth of 12 inches immediately before placing concrete.
3. Measure and record concrete temperature during protection period in each placement at regular time intervals, but not less than 3 times per 24 hour period.
4. Do not place slabs on subgrade or base that is more than 20°F cooler than concrete. Warm subgrade or base to decrease temperature differential to 20 F or less

1.6 PROJECT CONDITIONS

- A. Maintain access for vehicular and pedestrian traffic as required for other construction activities (and Wal-Mart customers at expansion projects). Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.
- B. Aggregate Base and Choker Materials:
 1. Aggregate Base Material:

- a. Aggregate base should conform to Caltrans Class II Aggregate Base with maximum 3/8-inch nominal size.
- 2. Aggregate Choker Material: Clean granular fill with less than 3% clay and/or friable particles. Use one of the following gradations:
 - a. ASTM 448 No. 10 with 6% to 12% passing No. 200 sieve.
 - b. Material meeting the following gradation:

Std. Sieve Size	% Passing
No. 4	85-100
No. 8	75-95
No. 16	55-75
No. 50	22-45
No. 100	10-30
No. 200	6-12

C. Reinforcement:

- 1. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A185. Furnish in flat sheets.
- 2. Reinforcing Bars: Deformed steel bars, ASTM A615, Grade 60.
- 3. Joint Dowel Bars: ASTM A36, square plain steel bars, cut bars true to length with ends square and free of burrs.
 - a. PNA Systems (install per project detail and manufacturer's recommendations)
 - 1) PNA Diamond Dowel System: Tapered plate dowels with sleeves for formed construction joints.
 - 2) PNA PD3 Basket Assembly: Tapered plate dowels and dowel baskets for sawcut contraction joints.
 - 3) PNA Square Dowels: Square dowels with sleeves for construction joints to existing pavement.
 - b. Sika Greenstreak Systems (install per manufacturer's recommendations)
 - 1) Sika Greenstreak Speed Plate System: Square plate dowels with sleeves for formed construction joints.
 - 2) Sika Greenstreak Double Tapered Basket: Tapered plate dowels and dowel baskets for sawcut contraction joints.
 - 3) Sika Greenstreak Speed Dowel: Square dowels with sleeves for construction joints to existing pavement.
 - c. Equivalent alternate systems proposed by the Contractor shall be submitted to the CEC within 30 days after award of Contract. Any equivalent alternate shall only be used if approved in writing by the CEC.

D. Cementitious Materials:

- 1. Portland Cement: ASTM C150, Type I, Use only one brand throughout project.
- 2. Fly Ash: ASTM C 618, Class C or F. Use only one type and source throughout project.
- 3. Slag: ASTM C989, Grade 100 or 120. Use only one type and source throughout project.

E. Pavement Joint Materials:

- 1. Joint Back-up Material: Polyethylene foam, 100% closed cell
- 2. Soft Preformed Joint Filler: Flexible closed-cell non-extruding synthetic foam expansion joint strips.
 - a. Ceramar Flexibe Foam Expansion Joint, by W.R. Meadows.
 - b. Deck-O-Foam Expansion Joint Filler, by W.R. Meadows
- 3. Sealant:
 - a. Dow 888, by Dow Corning.
 - b. 301 NS by Pecora.
 - c. Spectrum 800 by Tremco.

F. Concrete Aggregate:

- 1. Conform to ASTM C33.
- 2. Aggregate shall contain no coal or lignite in concrete that will not be covered by soil.
- 3. Fine Aggregate:
 - a. Conform to fine aggregate grading requirements as defined in section 6.1 of ASTM C 33 unless approved by the Civil Engineer.

- b. If manufactured sand is used, blend with minimum 25% natural sand unless otherwise approved by Civil Engineer.
- 4. Coarse Aggregate:
 - a. Nominal maximum coarse aggregate size shall be 1 inch for slabs \leq 5-1/2 inch thick.
 - b. The nominal maximum size of an aggregate is the smallest sieve size through which the major portion of the aggregate must pass, with a minimal amount retained on the maximum sieve size. Maximum 4% shall be retained on the nominal maximum size sieve.
- 5. Adjust proportions of combined coarse, intermediate, and fine aggregates to provide the following particle size distribution characteristics, unless otherwise approved:
 - a. Coarseness Factor of 60 to 75%.
 - 1) The Coarseness Factor (CF) is the percent of combined aggregate retained on the #8 sieve that is also retained on the 3/8" sieve.
 - 2) The Coarseness Factor is calculated as follows:
 - a) $CF = \text{Aggregate retained on } 3/8'' \text{ sieve} / \text{Aggregate retained on } \#8 \text{ sieve.}$
 - b. Adjusted Workability Factor
 - 1) The Workability Factor (WF) is the percent of combined aggregate that passes the #8 sieve.
 - 2) The Adjusted Workability Factor (Adj-WF) is calculated as follows:
 - a) $\text{Adj-WF} = WF + [(\text{Cementitious Material} - 564 \text{ lbs.}) / 37.6]$
 - 3) The range of accepted Adj-WF for a given CF is as follows:
 - a) $\text{Adj-WF} = [(11.25 - .15 CF) + 33] \pm 2.5$
 - 4) Combined percent retained on any given sieve size shall not exceed 24%.
 - c. Gradation requirement of ASTM C33 may be waived in order to meet ranges specified.

G. Water: ASTM C 1602.

H. Air Entrainment: ASTM C260.

- 1. Air-Mix or AEA-92, by Euclid.
- 2. MasterAir VR 10, MasterAir AE 90, or MasterAir E 200 by BASF Admixtures.
- 3. Daravair or Darex Series, by W.R. Grace.
- 4. Equivalent approved products.

I. Evaporation Retardant: Water-based polymer, sprayable.

- 1. Euco-Bar, by Euclid
- 2. MasterKure ER 50 by BASF Admixtures
- 3. Aquafilm, by Dayton Superior.

J. Liquid Membrane Curing and Sealing Compound: ASTM C 1315, Type I, Class A or B, 25% minimum solids content, clear non-yellowing with no styrene-butadiene.

- 1. Water Based, VOC less than 350 g/l:
 - a. Super Aqua Cure, by Euclid Chemical Corp.
 - b. MasterKure CC 1315WB by BASF Admixtures.

K. Dissipating Curing Compound (For use below 40F): ASTM C 309 Type 1, Class A or B.

- 1. Solvent base, VOC less than 350 g/l: Cetri Vex EnvioCure 100 by Vexcon.

2.2 CONCRETE MIX

A. Design mix shall produce normal weight concrete consisting of Portland cement, supplementary cementitious materials, aggregates, admixtures, and water to produce specified requirements.

B. Geographical Weather Exposure Classification: Geographical exposure classification shall be [Negligible F0] exposure.

C. Concrete Site Pavement and Light Pole Bases

- 1. ACI Exposure Category and classification:
 - a. Negligible exposure: F0
- 2. Compressive Strength: Strength at 28 days, unless otherwise indicated on the Drawings:
 - a. Negligible exposure classification: 3,500 psi.
 - b. .

02751-7

3. Maximum Water-Cementitious Material Ratio (Cement Quantity Includes Fly Ash or slag):
 - a. Negligible exposure: 0.55 by wt.
4. Slump Range: Slump at the point of placement shall be 2 to 4 inches for hand placed concrete, 1-1/4 to 3 inches for machine placed (slip form) concrete. Maximum slump variance shall be 2 inches.
5. Air Content: As shown in the table below.

D. Air Entrainment as shown below:

E.

Nominal Maximum Size Aggregate (Inch)	Average Air Content (%) +/- 1.5% By Exposure Category	
	Negligible - F0	Moderate or Severe – F2 & F3
3/8	4.5	7.5
1/2	4.0	7.0
3/4	3.5	6.0
1	3.0	6.0
1-1/2	2.5	5.5

F. Supplementary Cementitious Materials (SCM):

1. Concrete mix shall contain SCM at the amounts specified unless other amounts are approved by the Civil Engineer. Either fly ash or ground granulated blast furnace slag (GGBFS) may be used for the SCM but shall not be used together to form a ternary mix. Use of fly ash or GGBFS in the concrete mix is mandatory.
2. Fly Ash: Substitute fly ash for Portland cement at 20% of the total cementitious content.
 - a. If used to mitigate potential aggregate reactivity, up to 30% fly ash substitution of Portland cement is allowed. Only Type F fly ash may be used and shall have the following maximum properties: 1.5% available alkali and 8.0% CaO. When a maximum of 30% replacement is used, up to 10.0% CaO is permitted.
3. Ground Granulated Blast Furnace Slag (GGBFS): Substitute GGBFS for Portland cement at 25% of the total cementitious content.
 - a. If required to mitigate potential sulfate exposure or aggregate reactivity, up to 50% GGBFS substitution of Portland cement is allowed.
4. Maintain air-entrainment at specified levels.

G. Calcium Chloride:

1. Calcium chloride (Type L) may be used in solution form as part of the mixing water to accelerate concrete setting and early-strength development.
2. Amount of calcium chloride added shall not be more than necessary to produce the desired results and shall not exceed 2% by weight of cement.
3. The dosage range for the calcium chloride for the entire project shall not vary by more than 1%. Range is defined as the difference between the maximum and minimum dosages of calcium chloride for the entire project.
4. Calcium chloride shall not be used in the following applications unless approved by the Civil Engineer:
 - a. concrete containing embedded dissimilar metals or aluminum
 - b. slabs supported on permanent galvanized steel forms
 - c. concrete exposed to deicing chemicals
 - d. prestressed or post-tension concrete
 - e. concrete containing aggregates with potentially deleterious reactivity and concrete exposed to soil
 - f. concrete exposed to soil or water containing sulfates.
5. Use calcium chloride in accordance with manufacturer's recommendation.
6. Chloride-ion Concentration: Maximum water-soluble chloride-ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials, and admixtures shall not exceed the following limits unless approved by the Civil Engineer:

Type of Member	Maximum water-soluble chloride ion (Cl-) content in concrete (percent by weight of cement)

02751-8

Prestressed concrete	0.06
Reinforced concrete exposed to chloride in service	0.15
Reinforced concrete that will be dry or protected from moisture in service	1.00
Other reinforced concrete construction	0.30

7. When using calcium chloride or other admixtures containing chlorides, measure water-soluble chloride-ion content (percent by weight of cement) per ASTM C 1218. Sample shall be from concrete representing the submitted mix design and maximum chloride dosage anticipated for the project.

2.3 MIXING

- A. Mix concrete and deliver in accordance with ASTM C 94.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Proofroll prepared base material surface to check for unstable areas in accordance with Section 02300 including documentation and re-proof rolling as required. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.
- B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

3.2 AGGREGATE BASE PLACEMENT

- A. Unless otherwise specified on the Drawings, place aggregate base as specified herein.
- B. Aggregate Base:
 1. Install aggregate base where shown on Drawings.
 2. Compact to final thickness shown in layers not exceeding 6 inches with minimum of 2 passes per layer with vibratory compactor.
 3. Compact fill to 95% of aggregate's Standard Proctor as determined by Method D of ASTM D1557.
 4. Leave base up to 2 inches low until just prior to concrete placement.
- C. Aggregate Base Fine Grading:
 1. Compact to final thickness shown with 2 passes minimum vibratory compactor to produce smooth, flat, dense surface.
 2. Do not allow excess moisture in or on base at time of placing concrete.
 3. Level off aggregate base top surface with a maximum 3/4" thick aggregate choker material to achieve the following:
 - a. To reduce surface friction and to meet specified fine grade tolerances specified below.
 - b. To level areas exposed to rain, traffic, or excavations for buried utilities.
 - c. At areas where aggregate base material does not have sufficient fine particles to produce a surface that is free of exposed aggregate or surface voids greater than 3/8" in size at time of slab installation.
 4. Wal-Mart Construction Testing Laboratory shall verify adequate fines at surface immediately prior to concrete slab placement.
 5. Provide dry, smooth, flat, dense surface
 6. Proof-roll 48 hrs. maximum prior to concrete placement. Depression under a fully loaded ready mix truck shall not exceed 1/2 inch.
- D. Pavement Aggregate Base Fine Grade Tolerance: +0 inch, -3/4 inch with transition no greater than 3/4 inch vertically to 8 inches horizontally.

3.3 INSTALLATION

- A. Form Construction

1. Set forms to required grades and lines, rigidly braced and secured.
 2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
 3. Check completed formwork for grade and alignment to following tolerances:
 - a. Top of forms not more than 1/8-inch in 10'-0".
 - b. Vertical face on longitudinal axis, not more than 1/4-inch in 10'-0".
 4. Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
- B. Reinforcement: Fasten reinforcing bars or welded wire fabric (if required) accurately and securely in place with suitable supports and ties. Remove from reinforcement all dirt, oil, loose mill scale, rust, and other substances that will prevent proper bonding of the concrete to the reinforcement.
- C. Concrete Placement
1. Mix and place concrete when the air temperature in the shade and away from artificial heat is a minimum of 35 degrees F and rising. Hot and cold weather concreting shall be in accordance with ACI 305.1 (hot weather) and 306.1 (cold weather).
 2. Do not place concrete until base material and forms have been checked for alignment and grade. Concrete shall not be placed around manholes or other structures until they are at required finish elevation and alignment.
 3. Place concrete using methods that prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of reinforcing, dowels, and joint devices.
 4. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint.
- D. Contraction and Construction Joints: Construct contraction and construction joints straight with face perpendicular to concrete surface. Construct transverse joints perpendicular to centerline, unless otherwise detailed.
1. Contraction Joints: Provide joints at spacing of 12'-0" on centers, maximum each way. Construct control joints for depth equal to at least 1/4 of the concrete thickness, as follows:
 - a. Form tooled joints in fresh concrete by grooving top with recommended tool and finishing edge with jointer.
 - b. Sawed Contraction Joints:
 - 1) Use saws, blades, skid plates, and accessories by Soff-Cut International, Inc. or approved equal.
 - 2) Start cutting sawed joints as soon as concrete has hardened sufficiently to prevent raveling or dislodging of aggregates. This will typically be from 1 hour in hot weather to 4 hours in cold weather after completing finishing of slab in that joint location.
 - 3) Provide at least two "Soff-Cut" saws on site with blades capable of achieving the required depth of saw cut.
 - 4) Extend sawed joint to the slab boundaries and abutments, including columns, drains, and other penetrations in the path of a defined joint. Implement methods and timing of the saw cut beyond the limits of the Soff-Cut saw reach to provide a consistent depth of cut with minimal raveling of joint edges.
 2. Construction Joints: Place construction joints at end of placements and at locations where placement operations are stopped for period of more than 1/2 hour. Construct joints in accordance with details shown.
- E. Isolation and Fixed Object Joints: Construct joint at locations and in accordance with details shown.
- F. Pavement Joint Materials: Place joint fillers, back-up material, and sealants at locations shown and in accordance with manufacturer's instructions.
1. Soft Preformed Joint Fillers: Extend preformed joint fillers full-width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface. Furnish preformed joint fillers in 1-piece lengths for full width being placed, wherever possible. Where more than 1 length is required, lace or clip preformed joint filler sections together in a single plane.

3.4 CONCRETE FINISHING

02751-10

- A. After initial striking off and consolidating of concrete paving, smooth surface using either magnesium straight edge, wood, or magnesium channel float.
- B. Round edges of slabs and formed joints to 1/2-inch radius with edging tool. Eliminate tool marks on concrete surface.
- C. After completion of straightedge / floating and when excess moisture or surface sheen has disappeared, uniformly finish surface to provide a coarse, nonslip finish by scoring surface with stiff-bristled broom perpendicular to flow of traffic so as to produce regular corrugations not over 1/16 of an inch deep. Initial nonslip finishing shall be approved by the Wal-Mart Construction Manager.
- D. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects, as directed by Owner.

3.5 CURING AND PROTECTION

- A. Protect and cure finished concrete paving using curing compound. Cure for a period not less than 7 days.
- B. Use solvent based curing compound when compound is applied below 40 F.

3.6 CLEANING AND ADJUSTING

- A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.
- B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

3.7 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Field quality control testing and inspection shall be at the discretion of the Contractor as necessary to assure compliance with Contract requirements. Owner T&I shall not be considered a substitute for the Contractor's responsibility to perform similar routine, necessary, and customary testing and inspection of the methods and frequency suitable for the type of work involved.
- B. Responsibilities and Duties Relative to Owner Testing and Inspection:
 1. Notify Owner's CTL in advance of concrete placements to allow sufficient time to prepare for a site visit.
 2. Assist Owner's agency in securing field specimens.
 3. Provide and maintain for sole use of CTL, facilities for safe storage and proper curing of concrete test cylinders at project site as required by ASTM C31 and acceptable to Wal-Mart Testing Laboratory.
- C. Correction of Deficient Work:
 1. When directed by the Owner, remove and replace or repair concrete and related Work which does not conform to specified requirements including strength, tolerances, and finishes.
 2. Bear cost of corrections or delays to other work affected by, or resulting from, corrections to concrete Work.
 3. If results of compressive strength tests reveal deficiencies in concrete, meet requirements of ACI 318 and ACI 301.

PART 4 - OWNER TESTING AND INSPECTION (T&I) AND OBSERVATION

- A. The Owner will perform testing and inspection (T & I) as specified in Appendix B (Section 02751).
- B. Engineering Consultant Observation: The Owner's Civil Engineering Consultant (CEC) will perform special observations as specified in Appendix B (Section 01456).

D. **ATTACHMENTS:** Include the following with this Mix Design Report.

- Portland Cement mill test reports
- Fly ash mill test reports
- Slag mill test reports
- Designation, type, quality, and source (natural or manufactured) of coarse and fine aggregate materials
- Separate aggregate gradation reports including all required sieve sizes
 - All gradation sieve report tests dated within 60 days of this report
 - Report for each coarse and fine aggregate material in mix
- Statement if possible reactivity of aggregate, based on tests or past service
- Statement if possible aggregate pop-outs or their disruptions, based on tests or past service
- Product data for the following admixtures:
 - Chloride ion data and related calculations
 - Water reducing, set retarding, set accelerating, etc.
- Measured water-soluble chloride ion content in concrete (percent by weight of cement).
- Concrete compressive strength data used for standard deviation calculations

SECTION 02770 (32 1600) - CURBS AND SIDEWALKS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - Portland cement concrete curbs, gutters, and sidewalks except sidewalks adjacent to building.
- B. Related Requirements:
 - Section 02300 - Earthwork: Preparation of subgrades.
 - Section 03310 - Structural Concrete and Exterior Concrete Slabs: Exterior sidewalks adjacent to building.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.
- B. American Concrete Institute (ACI):

1.3 SUBMITTALS

A. Mix Design:

Fill out and submit attached Concrete Mix Design Submittal Form.

Submit three copies of each proposed mix.

Submit separate mix design for concrete to be placed by pumping in addition to the mix design for concrete to be placed directly from the truck chute.

Submit mix design to the Civil Engineering Consultant of Record, the Owner's Construction Testing Laboratory, and the Owner's Assigned Concrete Sub-Consultant.

Include applicable information shown on the Mix Design Submittal Form and the following:

- a. Proportions of cementitious materials, fine and coarse aggregate, and water.
- b. Water-cementitious material ratio, 28-day compressive design strength, slump, and air content.
- c. Type of cement, fly ash, slag and aggregate.
- d. Aggregate gradation.
- e. Type and dosage of admixtures.
- f. Special requirements for pumping.
- g. Range of ambient temperature and humidity for which design is valid.
- h. Special characteristics of mix which require precautions in mixing, placing, or finishing techniques to achieve finished product specified.
- i. Materials and methods for curing concrete.

B. Submit certified laboratory test data or manufacturer's certificates and data for the items listed below certifying that materials are in conformance requirements specified herein. Submit to the Engineering Consultant of Record and the Construction Testing Laboratory for review and approval and within 7 calendar days after receipt of Notice-to-Proceed.

Concrete mix design(s)

Type and source of Portland cement, fly ash, and slag

Aggregate gradations

Preformed expansion joint filler

Field molded/poured sealant

Dowel bars

Expansion sleeves

Tie bars

Reinforcing steel bars

Welded wire fabric

Air entraining admixtures

Water-reducing, set-retarding and set-accelerating admixtures (if used)

C. Test Reports: Submit field quality control test reports.

1.4 PROJECT CONDITIONS

A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Forms shall be of depth equal to depth of curbing or sidewalk, and so designed as to permit secure fastening together at tops. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.

B. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A185. Furnish in flat sheets.

C. Reinforcing Steel: Deformed steel bars, ASTM A615, Grade 60.

D. Portland Cement: Shall conform to ASTM C150, Type I.

02770-2

- E. Fly Ash: ASTM C618, Class C or F. Use only one type and source throughout project.
- F. Slag: ASTM C989, Grade 100 or 120. Use only one type and source throughout project.
- G. Exterior Pavement Joint Materials
 - Joint Back-up Material: Polyethylene foam, 100% closed cell.
 - Sealant:
 - a. Dow 888, by Dow Corning.
 - b. 301 NS by Pecora.
 - c. Spectrum 800 or 900 by Tremco.
- H. Aggregate: ASTM C33.
- I. Water: Clean and potable
- J. Dowel Bars: ASTM A615, grade 60, and plain steel bars.
- K. Air Entrainment: ASTM C260. .
 - Air-Mix or AEA-92, by Euclid Chemical Corp.
 - MasterAir VR 10, MasterAir AE 90, or MasterAir E 200 by BASF Admixtures.
 - Daravair or Darex Series, by W.R. Grace.
 - Equivalent approved products.
- L. Liquid Membrane Curing and Sealing Compound: ASTM C1315, Type I, Class A or B, 25% minimum solids content, clear non-yellowing with no styrene-butadiene.
 - Water Based, VOC less than 350 g/l:
 - a. Super Aqua Cure, by Euclid Chemical Corp.
 - b. MasterKure CC 1315WB by BASF Admixtures.
- M. Dissipating Curing Compound: ASTM C309 Type 1, Class A or B.
 - Solvent base, VOC less than 350 g/l: Cetri Vex EnvioCure 100 by Vexcon.

2.2 CONCRETE MIXING

- A. Mix concrete and deliver in accordance with ASTM C94. Design mix shall produce normal weight concrete consisting of Portland cement, supplementary cementitious materials, aggregates, admixtures and water to produce the following:
 - Compressive Strength: 3,500 psi minimum at 28 days unless otherwise indicated on the Drawings.
 - Slump Range: 2"-4" for hand placed concrete, 1-1/4" to 3" for machine placed (slipform) concrete.
 - Air Entrainment: 5 to 8 percent.
- B. Supplementary Cementitious Materials (SCM):
 - Concrete mix shall contain SCM at the amounts specified unless other amounts are approved by the Civil Engineer. Either fly ash or ground granulated blast furnace slag (GGBFS) may be used for the SCM but shall not be used together to form a ternary mix. Use of fly ash or GGBFS in the concrete mix is mandatory.
 - Fly Ash: Substitute fly ash for Portland cement at 15% of the total cementitious content.
 - a. If used to mitigate potential aggregate reactivity, only Type F fly ash may be used and shall have the following maximum properties: 1.5% available alkali and 8.0% CaO. When a maximum of 25% replacement is used, up to 10.0% CaO is permitted.
 - Ground Granulated Blast Furnace Slag (GGBFS): Substitute GGBFS for Portland cement at 20% of the total cementitious content.
 - b. If required to mitigate potential sulfate exposure or aggregate reactivity, up to 50% substitution of Portland cement is allowed.
 - Maintain air-entrainment at specified levels.
- C. Calcium chloride:
 - Calcium chloride (Type L) may be used in solution form as part of the mixing water to accelerate concrete setting and early-strength development.
 - a. Amount of calcium chloride added shall not be more than necessary to produce the desired results and shall not exceed 2% by weight of cement.

- b. The dosage range for the calcium chloride for the entire project shall not vary by more than 1%. Range is defined as the difference between the maximum and minimum dosages of calcium chloride for the entire project.
- c. Calcium chloride shall not be used in the following applications unless approved by the Civil Engineer:
 - 1) concrete containing embedded dissimilar metals or aluminum
 - 2) slabs supported on permanent galvanized steel forms
 - 3) concrete exposed to deicing chemicals
 - 4) prestressed or post-tension concrete
 - 5) concrete containing aggregates with potentially deleterious reactivity and concrete exposed to soil
 - 6) concrete exposed to soil or water containing sulfates.

Use calcium chloride in accordance with manufacturer's recommendation.

Chloride-ion Concentration:

- d. Maximum water-soluble chloride-ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious material, and admixtures shall not exceed the following limits unless approved by the Civil Engineer:

Type of Member	Maximum water-soluble chloride ion (Cl-) content in concrete (percent by weight of cement)
Prestressed concrete	0.06
Reinforced concrete exposed to chloride in service	0.15
Reinforced concrete that will be dry or protected from moisture in service	1.00
Other reinforced concrete construction	0.30

When using calcium chloride or other admixtures containing chlorides, measure water-soluble chloride-ion content (percent by weight of cementitious materials) per ASTM C1218. Sample shall be from concrete representing the submitted mix design and maximum chloride dosage anticipated for the project.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Begin paving work only after unsuitable areas have been corrected and are ready to receive paving.
- B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

3.2 INSTALLATION

- A. Form Construction
 - Set forms to required grades and lines, rigidly braced and secured.
 - Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
 - Check completed formwork for grade and alignment to following tolerances:
 - a. Top of forms not more than 1/8-inch in 10'-0".
 - b. Vertical face on longitudinal axis, not more than 1/4-inch in 10'-0".
 - Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
- B. Reinforcement: Fasten reinforcing bars or welded wire fabric (if required) accurately and securely in place with suitable supports and ties. Remove from reinforcement all dirt, oil, loose mill scale, rust, and other substances that will prevent proper bonding of the concrete to the reinforcement.
- C. Concrete Placement

Concrete shall be mixed and placed when the air temperature in the shade and away from artificial heat is a minimum of 35 degrees F and rising. Hot and cold weather concreting shall be in accordance with ACI 305R (hot weather) and 306.1 and 306R (cold weather). Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until set at required finish elevation and alignment.

Place concrete using methods that prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of reinforcing, dowels, and joint devices.

Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint. Automatic machine may be used for curb and gutter placement. Machine placement shall be at required cross section, line, grade, finish, and jointing as specified for formed concrete. If results are not acceptable, remove and replace with formed concrete as specified herein.

D. Joint Construction

Contraction Joints: Construct concrete curb or combination concrete curb and gutter, where specified on Construction Drawings, in uniform sections of approximately 10 feet in length. Form joints between sections either by steel templates, 1/8-inch in thickness, of length equal to width of curb and gutter, and with depth which will penetrate at least 2-inches below surface of curb and gutter; or with 3/4-inch thick performed expansion joint filler cut to exact cross section of curb and gutter; or by sawing to depth of at least 2-inches while concrete is between 4 and 24 hours old. If steel templates are used, they shall be left in place until concrete has set enough to hold its shape, but shall be removed while forms are still in place. Longitudinal Construction Joints: Tie concrete curb or combination concrete curb and gutter, to concrete pavement with 1/2-inch round deformed reinforcement bars 2 feet in length and 5 feet on center.

E. Joint Fillers: Extend joint fillers full-width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface where joint sealer is indicated. Furnish joint fillers in 1-piece lengths for full width being placed, wherever possible. Where more than 1 length is required, lace or clip joint filler sections together. Transverse

F. Joint Sealants: Install in accordance with manufacturer's recommendations.

3.3 CONCRETE FINISHING

A. After striking off and consolidating concrete, smooth surface by screeding and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10'-0" straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.

B. Work edges of sidewalks, gutters, back top edge of curb, and formed joints with edging tool, rounding edge to 1/2-inch radius. Eliminate tool marks on concrete surface. After completion of floating and trowelling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:

Curbs, gutters, and sidewalks: Broom finish by drawing fine-hair broom across surface perpendicular to flow of traffic. Repeat operation as necessary to produce fine line texture.

C. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects as directed Owner.

D. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner.

3.4 CURING AND PROTECTION

A. Protect and cure finished concrete paving using with curing compound or with acceptable moist-curing methods in accordance with "water-curing" section of ACI 308. Cure for a period not less than 7 days.

B. Use solvent based curing compound when compound is applied below 40 F.

3.5 BACKFILL

- A. After concrete has set sufficiently, spaces on either side of concrete curb, combination concrete curb and gutter, or concrete sidewalk shall be refilled to required elevation with suitable material compacted in accordance with Section 02300.

3.6 CLEANING AND PROTECTION

- A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.
- B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

3.7 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Field quality control testing and inspection shall be at the discretion of the Contractor as necessary to assure compliance with Contract requirements.

SECTION 02765 (32 1723) - PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Painting and marking of pavements, curbs, guard posts, and light pole bases.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. American Association of State Highway and Transportation (AASHTO):

1. AASHTO M247 - Glass Beads Used in Traffic Paints
2. AASHTO M248 - Ready-Mixed White and Yellow Traffic Paints

C. Master Painter's Institute (MPI):

1. MPI 32 – Traffic Marking Paint, Solvent Based.
2. MPI 97 – Traffic Marking Paint, Latex.

D. ASTM International (ASTM):

1. ASTM D4259 – Standard Practice for Abrading Concrete.
2. ASTM D4414 - Standard Practice for Measurement of Wet Film Thickness by Notched Gauges.

E. Federal Specifications (FS):

1. FS A-A-2886 - Paint, Traffic, Solvent Based (supersedes FS TT-P-85 and FS TT-P-115, Type I)
2. FS TT-B-1325 - Beads (Glass Spheres) Retro-Reflective
3. FS TT-P-1952 - Paint, Traffic And Airfield Marking, Waterborne

F. The Society for Protective Coatings (SSPC):

1. SSPC-SP13 – Surface Preparation of Concrete.

G. State of California Department of Transportation (CALTRANS):

1. 2018 Standard Specifications

H. City of Stockton Standard Specifications

1.3 ENVIRONMENTAL REQUIREMENTS

- A. Minimize dust emissions and provide equipment that suppresses dust.

- B. Dispose of construction waste in accordance with the requirements of Section 01351 Regulatory Compliance Supplement.

1.4 PROJECT CONDITIONS

- A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Pavement marking and striping material shall be thermoplastic paint conforming to Section 84-2, "Thermoplastic Traffic Stripes and Pavement Markings" of the CALTRANS 2018 Standard Specifications shall be used as the standard construction material for all pavement markings.
- B. Paint shall be waterborne or solvent borne, colors as shown or specified herein. Pavement marking paints shall comply with applicable state and local laws enacted to ensure compliance with Federal Clean Air Standards. Paint materials shall conform to the restrictions of the local Air Pollution Control District.
- C. Waterborne Paint: Paints shall conform to FS TT-P-1952 and have MPI 97 approval.
- D. Solvent Borne Paint: Paint shall conform to FS A-A-2886 or AASHTO M248 and have MPI 32 approval. Paint shall be non-bleeding, quick-drying, and alkyd petroleum base paint suitable for traffic-bearing surface and be mixed in accordance with manufacturer's instructions before application for colors White, Yellow, Blue, and Red.
- E. Glass Beads: AASHTO M 247, Type 1 or FS TT-B-1325, Type 1, Gradation A.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine the work area and correct conditions detrimental to timely and proper completion of the work. Do not proceed until unsatisfactory conditions are corrected.

3.2 PREPARATION

- A. Sweep and clean surface to eliminate loose material and dust.
- B. Where existing pavement markings are indicated on Construction Drawings to be removed or would interfere with adhesion of new paint, sodium bicarbonate (soda) blasting shall be used to remove the markings. Equipment employed shall not damage existing paving or create surfaces hazardous to vehicle or pedestrian traffic and shall be equipped with a manufacturer's recommended mist system for dust suppression. Within public rights-of-way, appropriate governing authority shall approve method of marking removal.
- C. New pavement surfaces shall be allowed to cure for not less than 30 days before application of marking materials.

3.3 APPLICATION

- A. Apply two coats of same color of paint as specified below, at manufacturer's recommended rate, without addition of thinner, with maximum of 100 square feet per gallon or as required to provide a minimum wet film thickness of 15 mils and dry film thickness of 7 ½ mils per coat. Paint shall be applied for a total dry film thickness of 15 mils. Apply with mechanical equipment to produce uniform straight edges. At sidewalk curbs and crosswalks, use straightedge to ensure uniform, clean, and straight stripe.
- B. Install pavement markings according to manufacturer's recommended procedures for the specified material.
- C. Following items shall be painted with colors noted below:
 - 1. Pedestrian Crosswalks: White
 - 2. Exterior Sidewalk Curbs and Guard posts: Yellow
- D. Apply glass beads at pedestrian crosswalk striping and at lane striping and arrows at driveways connecting to public streets. Broadcast glass beads uniformly into wet markings at a rate of 6 lb/gal.

3.4 FIELD QUALITY CONTROL

- A. Field quality control shall be the responsibility of the Contractor in accordance with Section 01452. Field quality control testing and inspection shall be at the discretion of the Contractor as necessary to assure compliance with Contract requirements.

3.5 CLEANING

- A. Waste materials shall be removed at the end of each workday. Upon completion of the work, all containers and debris shall be removed from the site. Paint spots upon adjacent surfaces shall be carefully removed by approved procedures that will not damage the surfaces and the entire job left clean and acceptable.

END OF SECTION

REVISION NOTES:

Rev 1: (10/01/13) Minor revision for QA/QC consistency. (CI 11724) (CI 12673)

SECTION 02822 (32 3114) - CHAIN LINK FENCES AND GATES (SITE RELATED)

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Chain link fences and gates associated with sitework.

B. Related Requirements:

1. Section 02821 – Chain Link Fences and Gates (Building Related): Fences and gates within or adjacent to building.

1.2 REFERENCES

A. American Society for Testing and Materials (ASTM)

1. ASTM A 392 - Zinc-Coated Steel Chain-Link Fence Fabric
2. ASTM C 94 - Ready-Mixed Concrete

B. Chain Link Fence Manufacturers Institute (CLFMI) latest edition Product Manual

1.3 SUBMITTALS

- A. Project Record Documents: Accurately record actual locations of property perimeter posts relative to property lines and easements.

1.4 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this Section with minimum 3 years documented experience.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Steel Posts: Type I or II or roll formed "C" Section steel conforming to CLFMI and as specified hereinafter.

- B. Fabric: No. 9 gage (0.148 nominal) galvanized steel wire in 2 inch mesh; ASTM A 392, top and bottom selvages twisted and barbed, height as shown. Furnish 1-piece fabric widths.

C. End, Corner, and Pull Posts: Minimum sizes and weights as follows:

1. Up to 13 Foot Fabric Height: Type I or II in accordance with CLFMI Product Manual.
2. 13 foot and over Fabric Height (If required):
 - a. Type I Posts: Round; 4.0 inch outside diameter pipe, 9.10 lbs/lin ft.
 - b. Type II Posts: 4.0 inch outside diameter pipe, 6.56 lbs/lin ft.

D. Line (Intermediate) Posts: Minimum sizes and weights as follows:

1. Up to 8 Foot Fabric Height: Type I, II, or "C" Section in accordance with CLFMI Product Manual.
2. Over 8 Foot Fabric Height:
 - a. Type I Posts:
 - 1) Round: 2.875 inch outside diameter pipe, 5.79 lbs/lin ft.
 - 2) Square: 2.5" x 2.5" outside dimension, 5.10 lbs/lin ft.
 - b. Type II Posts: 2.875 inch outside diameter pipe, 4.64 lbs/lin ft.

02822-1

- E. Gate Posts: Type I or II in accordance with CLFMI Product Manual.
- F. Top, Bottom, and Intermediate Rails: Type I or II in accordance with CLFMI Product Manual.
 - 1. Manufacturer's longest lengths.
 - 2. Couplings: Expansion type, approximately 6 inches long.
 - 3. Attaching Devices: Means of attaching top rail securely to each gate, corner, pull, and end post.
- G. Sleeves: Galvanized steel pipe not less than 6-inches long with inside diameter not less than ½ inch greater than outside diameter of pipe. Provide steel plate closure welded to bottom of sleeve of width and length not less than 1 inch greater than outside diameter of sleeve.
- H. Tension Wire: 7 gage galvanized steel conforming to CLFMI, Marcellled, located at bottom of fabric.
- I. Wire Ties: Class 1 galvanized steel, no less than 9 gage.
- J. Post Brace Assembly: Manufacturer's standard adjustable brace at end of gate posts and at both sides of corner and pull posts, with horizontal brace located at mid-height of fabric. Use same material as top rail for brace, and truss to line posts with 0.375-inch diameter rod and adjustable tightener.
- K. Post Tops: Galvanized steel, weather tight closure cap for each tubular post. Furnish caps with openings to permit passage of top rail.
- L. Stretcher Bars: Galvanized steel, 1 piece lengths equal to full height of fabric, with minimum cross-section of 3/16-inch x 3/4-inch. Provide one stretch bar for each gate and end post, and two for each corner and pull post.
- M. Stretch Bar Bands: Manufacturer's standard
- N. Gate Cross-bracing: 3/8-inch diameter galvanized steel adjustable length truss rods.
- O. Ready Mix Concrete: ASTM C94, mix design as follows:
 - 1. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce following:
 - a. Compressive Strength: 3,500 psi, minimum at 28 days, unless otherwise indicated on Construction Drawings.
 - b. Slump Range: 1 to 3 inches at time of placement
 - c. Air Entrainment: 5 to 8 percent
- P. Swinging Gate Hardware:
 - 1. Hinges: Size and material to suit gate size, non-lift-off type, offset to permit full 180-degree gate opening. Provide a pair of 1 1/2-inch hinges for each leaf over 6'-0" nominal height.
 - 2. Latch: Forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as integral part of latch.
- Q. Double Gates Hardware: Provide gate stops for double gates, consisting of mushroom type of flush plate with anchors set in concrete, to engage center drop rod or plunger bar. Include locking device and padlock eye as integral part of latch, using 1 padlock for locking both gate leaves.
- R. Sliding Gate Hardware: Provide manufacturer's standard heavy-duty track, ball-bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required.

2.2 GATE FABRICATION

- A. Fabricate swing gate perimeter frames of 1.90-inch OD pipe, galvanized steel. Provide horizontal and vertical members to ensure proper gate operation and attachment of fabric, hardware, and accessories. Space frame members maximum of 8'-0" apart.

- B. Assemble gate frames by welding or special fittings and rivets, for rigid connections. Install same fabric as for fence with stretcher bars at vertical edges. Install diagonal cross-bracing on gates as required ensuring rigid frame without sag or twist. Bars may be used at top and bottom edges. Attach stretchers to gate frame at 15 inches o.c. maximum.
- C. Attach hardware to provide security against removal or breakage.

2.3 FINISH

- A. Fabric, Framing, and Other Iron Parts: Hot dip zinc coated in accordance with CLFMI Product Manual.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install chain link fence in accordance with CLFMI Product Manual unless otherwise specified herein.
- B. Comply with recommended procedures and instructions of fencing manufacturer. Provide secure, aligned installation with line posts spaced at 10'-0" o.c. maximum.
- C. Methods for Setting Posts:
 - 1. Grade-Set Posts:
 - a. Drill or hand excavate to a depth approximately 3 inches lower than post bottom. Set post bottom not less than 36 inches below finish grade.
 - b. Excavate each post hole to 12 inch diameter, or not less than four times diameter of post.
 - c. Place concrete around posts and vibrate or tamp for consolidation. Check each post for vertical and top alignment, and hold in position during placement and finishing operations. Extend concrete footing 2-inches above grade and trowel crown to shed water.
 - d. Post shall be set plumb within 1/4" in 10 feet.
 - 2. Sleeve Set Posts: Anchor posts by means of pipe sleeves preset and anchored into concrete. After posts have been inserted into sleeves, fill annular space between post and sleeve solid with nonshrink, non-metallic grout, mixed and placed to comply with grout manufacturer's directions.
- D. Top Rails: Run rail continuously, bending to form radius for curved runs. Provide expansion couplings as recommended by manufacturer.
- E. Center Rails: Provide center rails where indicated. Install in 1 piece between posts and flush with post on fabric side, using special offset fittings where necessary.
- F. Brace Assemblies: Install braces so posts are plumb when diagonal rod are under proper tension.
- G. Tension Wire: Install tension wires through post cap loops before stretching fabric and tie to each post cap with not less than 6 gauge galvanized wire. Fasten fabric to tension wire using 11 gauge galvanized steel hog rings spaced 24-inches o.c.
- H. Fabric: Leave approximately 2 inches between finish grade and bottom selvage. Pull fabric taut and tie to posts, rails, and tension wires. Install fabric on security side of fence, and anchor to framework so that fabric remains in tension after pulling force is released.
- I. Stretcher Bars: Secure at end, corner, pull, and gate posts by threading through or clamping to fabric at 4 inches o.c. and secure to posts with metal bands spaced at 15 inches o.c.
- J. Tie Wires:
 - 1. Use U-shaped wire, conforming to diameter of pipe to which attached, clasping pipe and fabric firmly when ends twisted at least 2 full turns. Bend ends of wire to minimize hazard to persons or clothing.
 - 2. Tie fabric to line posts with wire ties spaced 12 inches o.c. Tie fabric to rails and braces with wire ties spaced 24 inches o.c. Tie fabric to tension wires with hog rings spaced 24-inches o.c.

02822-3

3. Manufacturer's standard procedure will be accepted if of equal strength and durability.

K. Fasteners: Install nuts for tension bands and hardware bolts on side of fence opposite fabric side. Peen ends of bolts or score threads to prevent removal of nuts.

L. Gates: Install gates plumb, level, and secure for full opening without interference. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubrication.

3.2 ADDITIONAL INSTALLATION PROVISIONS

A. Use U-shape tie wires, conforming to the diameters of pipe, that clasp the pipe and fabric firmly with ends twisted at least 2 full turns.

B. Bend ends of exposed wires to minimize hazards to persons or clothing.

C. Install nuts for fasteners on tension bands and hardware bolts on the side of the fence opposite the fabric. The ends of bolts, once secure and checked for smooth operation, shall be peened to prevent removal of nuts.

D. Repair coatings damaged in the field with methods and techniques as recommended by the manufacturer.

END OF SECTION

SECTION 32 84 00

LANDSCAPE IRRIGATION

PART 1 – GENERAL

1.01 SUMMARY

- A. Irrigation system required for this work includes but is not limited to the furnishing of all labor, tools, materials, appliances, tests, permits, taxes, etc., necessary for the installation of a landscape irrigation system as herein specified and shown on the drawings, and the removal of all debris from the site.
 - 1. Furnish and install all materials and equipment for a fully operational automatic irrigation system.
 - 2. Trenching, boring or drilling for all lines, backfilling and repair of all damage.
 - 3. Testing and startup of the irrigation system.
 - 4. Clean up and disposal of all excess and surplus material.
 - 5. Prepare as-built drawings and furnish all turnover materials.
 - 6. Maintenance of the irrigation system during the proscribed maintenance period.
- B. The system shall efficiently and evenly irrigate all areas and be complete in every respect and shall be left ready for operation to the satisfaction of the Owner's Representative.
- C. Coordinate with other trades as needed to complete work, including but not limited sleeves under paving and elsewhere, water and electrical Points of Connection (POC), equipment, and equipment pads.

1.02 RELATED DOCUMENTS

- A. Construction drawings and these specifications are a part of the contract documents. Refer to contract for a complete list of all contract documents. The documents are to be considered as one. Whatever is called for by any parts shall be as binding as if called for in all parts.

1.03 REFERENCE STANDARDS

- A. American Society of Testing Materials (ASTM): cited section numbers.
- B. National Sanitation Foundation (NSF): rating system.
- C. American Society of Agricultural and Biological Engineers (ASABE) ICC 802, latest edition.

1.04 VERIFICATION

- A. Irrigation piping and related equipment are drawn diagrammatically. Scaled dimensions are approximate only. Before proceeding with work, carefully check and verify dimensions and immediately notify the Owner's Representative of discrepancies between the drawings or specifications and the actual conditions. Although sizes and locations of plants and or irrigation equipment are drawn to scale wherever possible, it is not within the scope of the drawings to show all necessary offsets, obstructions, or site conditions. The Contractor shall be responsible to install the work in conformance to site conditions, complete, and in good working order.
- B. Piping and equipment is to be located within the designated planting areas wherever possible unless specifically defined or dimensioned otherwise.

1.05 PERMITS AND REGULATIONS

- A. The Contractor shall obtain and pay for all permits related to this section of the work unless previously excluded under provision of the contract or general conditions. The Contractor shall comply with all applicable laws and ordinances.

- B. Wherever references are made to standards or codes in accordance with which the work is to be performed or tested, the edition or revision of the standards and codes current on the effective date of this contract shall apply, unless otherwise expressly set forth.
- C. In case of conflict among any referenced standards or codes or between any referenced standards and codes and the specifications, the more restrictive standard shall apply unless determined otherwise by the Owner's Representative.

1.06 PROTECTION OF WORK, PROPERTY, AND PERSONS

- A. The Contractor shall adequately protect the work, adjacent property, and the public, and shall be responsible for any damages or injury due to the Contractor's actions.

1.07 CORRECTION OF WORK

- A. The Contractor shall re-execute any work that fails to conform to the requirements of the contract and shall remedy defects due to faulty materials or workmanship upon written notice from the Owner's Representative, at the soonest as possible time that can be coordinated with other work, and seasonal weather demands, but not more than 90 (ninety) days after notification.

1.08 DEFINITIONS

- A. Owner's Representative: The person appointed by the Owner to represent their interest in the review and approval of the work and to serve as the contracting authority with the Contractor. The Owner's Representative may appoint other persons to review and approve any aspects of the work.
- B. Substantial Completion: The date at the end of the Planting, Planting Soil, and Irrigation installation where the Owner's Representative accepts that all work in these sections is complete, and the Warranty period has begun. This date may be different than the date of substantial completion for the other sections of the project.
- C. Final Acceptance: The date when the Owner's Representative accepts that the plants and work in this section meet all the requirements of specification. It is intended that the materials and workmanship warranty for Planting, Planting Soil, and Irrigation work run concurrently.

1.09 SUBMITTALS

- A. Comply with general conditions, special conditions, Division 1 sections and other contract documents. All submittals shall be made at least 4 weeks prior to delivery of materials.
- B. Product data
 1. Submit list of all irrigation equipment to be used, including specification (cut) sheets, within 15 days after the notice to proceed. This submission may be done digitally, and all documents shall be submitted in one PDF document.
 2. The submittals shall be packaged and presented in an organized manner, in the quantity described in Division 1 of the specifications. Provide a table of contents of all submitted items.
 3. Clearly identify on each submitted sheet by underlining or highlighting (on each copy) the specific product being submitted for approval. Failure to clearly identify the specific product being submitted will result in a rejection for the entire submittal. No substitutions of material or procedures shall be made without the written approval by the Owner's Representative.
 4. Equipment or materials installed or furnished without prior approval of the Owner's Representative, may be rejected by the Owner's Representative and the Contractor shall be required to remove such materials from the site at their own expense.
 5. Approval of substitution of material and/or products, other than those specified shall not relieve the Contractor from complying with the requirements of the contract documents

and specifications. The Contractor shall be responsible, at their own expense, for all changes that may result from the approved substitutions, which affect the installation or operations other items of their own work and/or the work of other Contractors.

- C. Samples: Samples of the equipment may be required at the request of the Owner's Representative if the equipment is other than that specified.
- D. Other Submittals: Submit for approval:
 - 1. Documentation of the installer's qualifications (prior to bid).
 - 2. Testing data from all required hydrostatic pressure testing.
 - 3. Backflow prevention device testing: as required by 17 CCR § 7605 (d), provide testing as required by the local authority immediately upon installation or relocation.
 - 4. Booster pump certification: Certification from the manufacturer's representative of correct installation per the manufacturer's requirements.
 - 5. Irrigation controller certification (if applicable): Certification from the manufacturer's representative of correct installation per the manufacturer's requirements.
 - 6. Turnover materials as listed within this specification section.

1.10 OBSERVATION OF THE WORK

- A. The Owner's Representative may observe the work at any time. They may remove samples of materials for verification or testing. Rejected materials shall be immediately removed from the site and replaced at the Contractor's expense. The cost of testing materials not meeting specifications, and re-testing of replacement materials, shall be paid by the Contractor
- B. The Owner's Representative shall be informed of the progress of the work so that the work may be observed at the following key times in the construction process. Failure of the Owner's Representative to make field observations shall not relieve the Contractor from meeting all the requirements of this specification. The following observations are anticipated, with required advance notification times:
 - 1. Trenching, directional boring, and sleeving review: 7 days
 - 2. Hydrostatic pressure testing: 7 days
 - 3. Adjustment and coverage test: 7 days
 - 4. Pre-maintenance observation: 7 days
 - 5. Final acceptance / system malfunction corrections: 7 days

1.11 PRE-CONSTRUCTION CONFERENCE

- A. Schedule a pre-construction meeting with the Owner's Representative at least seven (7) days before beginning work to review any questions the Contractor may have regarding the work, administrative procedures during construction and project work schedule.

1.12 QUALITY ASSURANCE

- A. The contractor shall furnish and install a complete irrigation system, delivering sufficient water to maintain optimum plant health at all times and in an efficient manner. The irrigation system will provide water to all plants, even when not shown on the drawings.
- B. The Owner's Representative shall be the sole judge of the intent of the drawings and specifications and of the quality of all materials furnished in performance of the contract.
- C. The Contractor shall keep one copy of all drawings and specifications on the work site, in good order. The Contractor shall make these documents available to the Owner's Representative when requested.

- D. In the event of any discrepancies between the drawings and the specification, the more stringent shall apply, unless determined otherwise by the Owner's Representative.
- E. Installer Qualifications: The installer shall be a firm having at least 5 years of successful experience of a scope similar to that required for the work.
 - a. Installer Field Supervision: The installer shall maintain on site an experienced full-time supervisor who can communicate in English with the Owner's Representative.
 - b. Submit the installer's qualifications for approval.

1.13 WARRANTY:

- A. The Contractor shall Warrantee all workmanship and materials for a period of 1 year (s), following final acceptance. This warranty shall run concurrently with plant warranty under Section 32 90 00 – Landscape Installation.
- B. Any parts of the irrigation work that fails or is defective shall be replaced or reconstructed at no expense to the Owner including but not limited to: restoring grades that have settled in trenches and excavations related to the work. Reconstruction shall include any plantings, soil, mulch or other parts of the constructed landscape that may be damaged during the repair or that results from soil settlement.
- C. Neither the final acceptance nor any provision in the contract documents shall relieve the Contractor of responsibility for faulty materials or workmanship. The Contractor shall remedy any defects within a period of 7 days (s) from the date of notification.

1.14 SITE CONDITIONS

- A. It is the responsibility of the Contractor to be aware of all surface and sub-surface conditions, and to notify the Owner's Representative, in writing, of any circumstances that would negatively impact the installation of the work. Do not proceed with work until unsatisfactory conditions have been corrected.

1.15 DELIVERY, STORAGE, AND HANDLING

- A. All materials and equipment shall be stored properly and protected as required by the manufacturer. The Contractor shall be entirely responsible for damages or loss by weather or other cause to work under the contract. Materials shall be furnished in ample quantities and at such times as to ensure uninterrupted progress of the work.
- B. Deliver the products to the job site in their original unopened container with labels intact and legible at time of use.

1.16 PROTECTION

- A. The Contractor shall continuously maintain adequate protection of all their work from damage, destruction, or loss, and shall protect the owner's property from damage arising in connection with this contract. Contractor shall repair or make compensation for any such damage, destruction, loss or injury. Contractor shall adequately protect adjacent property as provided by law and the contract documents.
- B. The Contractor shall maintain sufficient safeguards, such as railings, temporary walks, lights, etc., against the occurrence of accidents, injuries or damage to any person or property resulting from their work, and shall alone be responsible for the same if such occurs.
- C. All existing paving, structures, equipment, work, and plant material shall be protected at all times from damage by workers and equipment. The Contractor shall follow all protection requirements including plant protection provisions. All damages shall be repaired or replaced at the Contractor's expense. Repairs and or replacement shall be to the satisfaction of the Owner's Representative, including the selection of a Contractor to undertake the repair or maintenance. Repairs shall be at no cost to the owner.

1. For trees damaged such that they are not expected to survive or which are severely disfigured, and that are too large to replace, the cost of damages shall be as determined by the Owner's arborist using accepted tree value evaluation methods.
 - D. Refrain from mechanical trenching within the drip line of any existing tree to remain. The Owner's Representative may require the Contractor to relocate proposed irrigation work, bore lines beneath roots, use hand tools, air spade, or similar technology to excavate trenches through and under the root system to avoid damage to existing tree root areas.
- 1.17 EXCAVATING AROUND UTILITIES
- A. Notification of Common Ground Alliance (C.G.A), 811, is required for all excavation.
 - B. Contractor shall carefully examine the civil, as-built, record, and survey drawings to become familiar with the existing underground conditions before digging. The Contractor is responsible for knowing the location and avoiding utilities that are not covered by USA.
 - C. Determine location of underground utilities and perform work in a manner that will avoid possible damage. Hand excavate, as required. Maintain stakes and or markings set by others until parties concerned mutually agree to their removal.
 - D. Damage to existing work, including utilities, shall be repaired at the contractor's sole expense.
- 1.18 POINT OF CONNECTION
- A. The contractor shall coordinate water and power sources. All electrical connections shall be made by a licensed electrical Contractor per governing codes at the location(s) shown on the drawings.
- 1.19 TEMPORARY UTILITIES
- A. All temporary water, power, piping, wiring, meters, panels and other related appurtenances required between source of supply and point of use shall be provided by the Contractor and coordinated with the Owner's Representative. Existing utilities may be used with the written permission of the owner.
- 1.20 CUTTING, PATCHING, TRENCHING AND DIGGING
- A. The Contractor shall do all cutting, fitting, trenching or patching of their work that may be required to make its several parts come together as shown upon, or implied by, the drawings and specifications for the completed project.
- 1.21 USE OF PREMISES
- A. Contractor parking, and material and equipment storage shall be limited to areas approved by the Owner's Representative.
- 1.22 AS BUILT DRAWINGS
- A. Immediately upon the installation of any buried pipe or equipment, the Contractor shall indicate on the progress record drawings the locations of said pipe or equipment. The progress record drawings shall be made available at any time for review by the Owner's Representative.
 - B. Provide a completed as built set of drawings, in .pdf format, showing the irrigation system work as built to the Owner's Representative. The drawings shall include all information shown on the original contract documents and revised to reflect all changes in the work. The drawings shall include the following additional information:
 1. All valves shall be numbered by station and corresponding numbers shall be shown on the as built set of drawings.
 2. All main line pipe and irrigation equipment including sleeves, valves, controllers, irrigation wire runs which deviate from the locations on the contract documents.

3. Controllers, backflow preventers, remote control valves, grounding rods, shut-off valves, wire splice locations, sleeves, and quick coupling valves shall be located by two (2) measured dimensions, to the nearest one-half foot. Dimensions shall be given from permanent objects such as buildings, sidewalks, curbs, walls, structures and driveways. All changes in direction and depth of main line pipe shall be noted exactly as installed. Dimensions for lines shall be shown at no greater than a 50 ft. maximum interval.
4. As built record set of drawings shall be signed and dated by the Contractor attesting to and certifying the accuracy of the as built record set of drawings. As built set of drawings shall be labeled on each sheet "As Built Drawings", and include the company name, address, phone number and the name of the person who created the drawing and the contact name (if different).

1.23 CONTROLLER CHARTS:

- A. Provide one controller chart for each automatic controller installed.
 1. Inside each automatic controller, prepare and mount a color-coded chart showing the valves, main line, and systems of that controller. All valves shall be numbered to match the operation schedule and the drawings. Only those areas controlled by that controller shall be shown. This chart shall be a plan, entire or partial, showing building, walks, roads and walls. The plan, reduced as necessary and legible in all details, shall be made to a size that will fit into the controller cover. The chart shall be approved by the Owner's Representative and shall be protected in laminated in a plastic cover and be secured to the inside back of the controller cabinet door.

1.24 TURNOVER MATERIALS

- A. Prepare and deliver to the Owner's Representative within ten calendar days prior to completion of construction, and in any case prior to final acceptance,
 1. Operations and Maintenance Binders: two 3-ring hard cover binders containing the following information:
 - a. Index sheet stating Contractor's address and telephone number, list of equipment with name and addresses of local manufacturers' representatives.
 - b. Catalog and parts sheets on all material and equipment.
 - c. Warranty statement on company letterhead. The start of the warranty shall be the date of final acceptance by the Owner.
 - d. Complete operating and maintenance instructions for all equipment.
 - e. Irrigation equipment manufacturers' warranties.
 - f. Controller Chart
 2. As-built drawings
 3. Backflow prevention device testing certification
 4. Pump and Controller certifications (if required)
 5. Equipment to be furnished under this section, including all parts, accessories, etc, and a minimum of (1) quick-coupler key, and an additional key for each (20) valves installed.

PART 2 – PRODUCTS

2.01 GENERAL

- A. All materials shall be new when installed.
- B. Approval of any items or substitutions indicates only that the product(s) apparently meet the requirements of the drawings and specifications based on the information or samples submitted. The Contractor shall be responsible for the performance of substituted items. If the substitution proves to be unsatisfactory or not compatible with other parts of the system, the Contractor shall replace said items with the originally specified items, including all necessary work and modifications to replace the items, at no cost to the owner.

2.02 PIPING

A. Plastic pipe:

1. All pipe shall be free of blisters, internal striations, cracks, or any other defects or imperfections. The pipe shall be continuously and permanently marked with the following information: manufacturer's name or trade mark, size, class and type of pipe pressure rating, quality control identifications, date of extrusion, and National Sanitation Foundation (NSF) rating.
2. Pipe shall be rigid virgin polyvinyl chloride (PVC) 1220, Type 1, Grade 2 conforming to ASTM D 1785 and D2665 (scheduled pipe) or ASTM D1784 and D2241 (Standard diameter ratio (SDR)).
3. Gaskets shall conform to ASTM F477 and the assembled gasketed joints shall conform to ASTM D3139.
4. Mainlines (constant-pressure):
 - a. Pipe up to 2 inch diameter shall be Schedule 40 with solvent welded joints.
 - b. Pipes 2-1/2" to 3 inches in diameter shall be Class 315 (SDR 13.5) with solvent welded (SW) joints.
5. Laterals (non-constant pressure) shall be Schedule 40, 3/4" minimum size, with solvent welded joints.
6. Sleeves shall be schedule 40, minimum twice the diameter of the pipe, conduit, or other item to be sleeved.

B. Metal pipe:

1. Brass pipe shall be used only where specifically identified on the drawings, and shall be red brass, conforming to Federal Specification WW-P-351, with threaded fittings.
2. Galvanized pipe shall be used only where specifically identified on the drawings, and shall be hot dip galvanized continuous welded, seamless, Schedule 40, conforming to applicable current ASTM standards, with threaded fittings.

2.03 FITTINGS AND CONNECTIONS:

- A. Polyvinyl chloride pipe fittings and connections: Type II, Grade 1, Schedule 40 or 80 conforming to ASTM D2466 and D2467, as indicated, high impact molded fittings, manufactured from virgin compounds as specified for piping tapered socket or molded thread type, suitable for either solvent weld or threaded connections. Machine threaded fittings and plastic saddle and flange fittings are not acceptable unless specifically noted. Furnish fittings permanently marked with following information: nominal pipe size, type and schedule of material, and National Sanitation Foundation (NSF) seal of approval.
 - a. All fittings at valve assemblies shall be schedule 80,
 - b. Unless otherwise specified, all other fittings shall be schedule 40
- B. Brass pipe fittings, unions and connections: standard 125 pound class 85% red brass fittings and connections, IPS threaded.
- C. PVC Schedule 80 threaded risers and nipples: Type I, grade 1, Schedule 80, high impact molded, manufactured from virgin compounds as specified for piping and conforming to ASTM D2464. Threaded ends shall be molded threads only. Machined threads are not acceptable.
- D. Galvanized pipe fittings shall be galvanized malleable iron ground joint Schedule 40 conforming to applicable current ASTM standards.

2.04 SOLVENT CEMENTS, PRIMERS, AND THREAD LUBRICANT

- A. Solvent cements shall be Low-VOC and comply with ASTM D2564. Primers shall be Low-VOC, any comply with ASTM F656. Socketed solvent welded joints shall be made per

recommended procedures for joining PVC plastic pipe and fittings with PVC solvent cement and primer by the pipe and fitting manufacturer and procedures outlined in the appendix of ASTM D2564.

- B. Thread lubricant shall be Teflon tape, "extra-heavy," or "full density", color: pink.
- C. Pipe Joint Compound (Pipe dope) shall be used on metal threaded connections only, contain PTFE (Polytetrafluoroethylene), and shall be suitable for use with plastic materials. Ensure no compound enters the lines.

2.05 BACKFLOW PREVENTION DEVICES

- A. Backflow prevention devices shall be certified to NSF/ANSI 372 shall be ASSE Listed 1013, rated to 180 degree F, on "List of Approved Backflow Prevention Assemblies maintained by the USC Foundation and available at <http://fccchr.usc.edu/list.html>, and supplied with full port ball valves at each side for testing.
- B. Backflow preventers shall be as indicated on the drawings.
- C. Provide freeze protection as indicated on the drawings. If not indicated, minimum accepted shall be a green lockable blanket, consisting of minimum R-13 fiberglass matte core and UV-resistant exterior polyvinyl shell, color: green, as manufactured by Bestchoice, Vallejo CA, or equal.

2.06 PRESSURE REGULATOR

- A. Pressure regulator shall be NSF/ANSI 372 certified, consisting of low lead cast bronze body (ASTM B 584), with a separate bronze (ASTM B 584) or brass (ASTM B 16) access cap threaded to the body.
- B. Pressure regulator shall be as indicated on the drawings.

2.7. Wye Strainer

- C. Wye strainer shall be as indicated on the drawings.

2.07 BACKFLOW PREVENTER ENCLOSURE

- A. A heavy-duty steel mesh enclosure with rust proof finish. The cage shall be sized to allow space for all piping and equipment associated with the Backflow Preventer. The enclosure shall include a tamper-resistant locking mechanism. Lock(s) shall be provided by the Owner. Enclosure shall be installed on a concrete pad, minimum 4" thick.
- B. Backflow Preventer enclosure shall be as indicated on the drawings.

2.08 BOOSTER PUMP

- A. Booster pump shall be housed in a sturdy, locking, weather-resistant enclosure, furnished for exterior protection, and installed on a concrete pad, minimum 4" thick.
- B. Booster pump shall be as indicated on the drawings.

2.09 SHUT OFF VALVES

- A. For constant pressure applications, shut-off valves shall be gate-type.
 - 1. For mainlines 3 inches in diameter or less, valves shall be rated for 200 PSI, cast bronze with threaded ends, Nibco T-113 or equal.
 - 2. For mainlines 4 inches in diameter or greater, valves shall be rated for 250 PSI, epoxy coated cast iron body with push-on ends, Leemco LMV series, American Series 2500, Nibco P-619 series, or equal.
- B. For Remote Control Valve (RCV) assemblies, shut-off valves shall be ball-type.
 - 1. For assemblies up to 2-1/2 inches in diameter, PVC schedule 80 rated for 235 psi or greater with integral unions and EDPM O-rings, Spears True Union, Cepex True Union,

- or equal.
 - 2. For assemblies 3 inches in diameter or greater, brass or bronze body with a continuous working pressure of at least 300 psi.
 - C. All ball valves located at a valve manifold shall be the same size as the sub-main line (1 inch minimum). Provide pipe-reducing adapters, as required. All ball valves in line shall be the same size as the pipe.
- 2.10 CHECK VALVES
- A. Point-of-Connection Swing or spring check valves 2 inch and smaller shall be 200 lbs., W.O.G., bronze construction with replaceable composition, neoprene or rubber disc and shall meet or exceed federal specification WW-V- 5ld, class a, type iv.
 - B. Anti-drain valves shall be of heavy-duty virgin PVC construction with female pipe thread inlet and outlet. Internal parts shall be stainless steel and neoprene. Anti-drain valves shall be field adjustable against draw out from 5 to 40 feet of head.
 - C. Inline Check Valves, as required to prevent low head drainage, where head exceeds available manufacturer's options for check valve(s) at emitter(s):
 - 1. Where emitters are higher in elevation relative to RCV's, install spring-assisted swing check valves (only install swing check valves if available pressure is insufficient)
 - 2. Where emitters are lower in elevation relative to RCV's install adjustable spring check valves to allow flow during normal operation, but restrict flow after control valve operation.
 - 3. Acceptable manufacturers include Spears, Dultimeter, or equal.
 - D. Other valves as indicated on the plans.
- 2.11 MAINLINE AIR RELIEF VALVES
- A. Valve shall be manufactured per AWWA C512, with cast iron body and stainless steel float, with a minimum working pressure of 150psi.
- 2.12 REMOTE CONTROL VALVES (RCV)
- A. Remote control valves shall be electrically operated, single seat, normally closed configuration, equipped with flow control adjustment and capability for manual operation.
 - B. Valves shall be actuated by a normally closed low wattage solenoid using 24 volts, 50/60 cycle solenoid power requirement. Solenoid shall be epoxy encased.
- 2.13 MASTER CONTROL VALVES
- A. Master Control Valve shall be compatible with the irrigation controller and shall be as indicated on the drawings.
- 2.14 FLOW SENSOR
- A. Flow sensor shall be compatible with the irrigation controller and shall be as indicated on the drawings.
- 2.15 QUICK COUPLER VALVES
- A. Quick coupler valves shall be a one or two-piece, heavy-duty brass construction with a working pressure of 150 PSI with a built in flow control and a self-closing valve.
 - B. Quick coupler shall be equipped with red brass cap covered with durable yellow thermo-plastic rubber cover. Key size shall be compatible with quick coupler and of same manufacturer.
 - C. Quick couplers shall be installed with anti-rotation wing stabilizers, either solid red brass or epoxy-coated ductile iron

2.16 HEADS, BODIES, EMITTERS, AND NOZZLES

- A. All equipment shall conform to ASABE ICC 802 and shall be as indicated on the drawings.
- B. All sprinkler bodies shall have check valves installed where required to prevent low head drainage. Swing joints, risers, and nipples for all heads shall be the same size as the riser opening in the sprinkler body and fabricated as shown on the drawings.
- C. All drip emitters shall be pressure compensating (PC).

2.17 AUTOMATIC CONTROLLER

- A. Controller shall be housed in a sturdy, locking, weather-resistant case, furnished for maximum exterior protection.
- B. Controller shall be equipped with evapo-transpiration (ET) sensor, which adjusts the controller programming based on local climatic conditions. The sensor shall also have a rain sensing shut-off switch, wind sensing shut off switch, and freeze sensing shut-off of switch.
 - 1. If a moisture sensor is used in lieu of an evapo-transpiration sensor an additional sensor, which has a rain-sensing shut-off switch, wind sensing shut-off switch, and freeze sensing shut-off switch shall be provided.
- C. Automatic controller shall be as indicated on the drawings.

2.18 CONTROLLER DECODERS

- A. All decoders shall be per the controller manufacturer's specifications.
- B. Decoder model number shall be as shown on the drawings.

2.19 ELECTRICAL CONTROL WIRING

A. LOW VOLTAGE, TWO-WIRE SYSTEMS

- 1. All wiring shall be per the controller manufacturer's specifications and recommendations, including sizing based on the longest leg or loop, and ASIC guidelines for grounding.
 - a. For Hunter ACC2 two-wire systems:
 - 1.) Two-wire cable shall be Hunter IDWIRE, Paige P7354D, or other approved two-conductor, minimum 14-gauge, solid-core copper wire, twisted with a minimum lay of 4", and PE insulation with a minimum wall thickness of .045". A protective overall jacket must be manufactured of HDPE, with a minimum wall thickness of .035", and approved for direct burial installation.
 - 2.) Wire splices and ends shall be made with Hunter DBRY-6, 3M-DBY/R-6, or equal wire nut and gel-filled encapsulating connectors.

B. HIGH VOLTAGE

- 1. Shall be of type as required by local codes and ordinances.
- 2. Shall be of proper size to accommodate needs of equipment served.

2.20 VALVE BOXES AND MATERIALS

- A. Valve boxes: valve boxes shall be constructed of ABS (acrylonitrile butadiene styrene) plastic, green for turf areas, brown for planting areas, with rigid base and sides and shall be supplied with bolted cover secured with stainless steel penta bolts (anit-tamper). Provide box extensions as required.
 - 1. Master valves, flow sensors, check valves, and remote-control irrigation valves shall use a 14 inch x 19 inch x 12 inch rectangular box (minimum size).
 - 2. Quick coupler valves, shut-off valves, wire d grounding rods shall use a 10 inch circular box.

2.21 CONCRETE THRUST BLOCKS

- A. Concrete thrust blocks shall be constructed for all lines 2-1/2" or greater without restrained joints, and sized per the pipe manufacturers' requirements, as indicated on the drawings, or per local requirements, whichever is most stringent.

2.22 VALVE IDENTIFICATION TAGS

- A. Valve Identification Tags shall be 2.25 inch x 2.65 inch polyurethane. Color: yellow for non-potable water; purple for recycled water. Tags shall be permanently attached to each RCV with tamper-resistant seals as indicated on the drawings. Tags shall be consistently labeled X-ZZ or XZZ (where X is the controller letter and ZZ is the valve number).

2.23 EQUIPMENT TO BE FURNISHED TO OWNER

- A. Two (2) sets of keys for each automatic controller.
- B. Two (2) 48 inch tee wrenches for operating gate valves 3" or larger.
- C. Three (3) sets of special tools required for removing, disassembling and adjusting each type of sprinkler and valve supplied on this project.
- D. Five (5) sprinkler heads, nozzles, shrub adapters, nozzle filter screens, for each type used on the project.
- E. Two (2) quick coupler keys to match manufacturer type of quick coupler.

2.24 INCIDENTAL MATERIALS AND EQUIPMENT

- A. Furnish all materials and equipment not specified above, but which are necessary for completion of the work as intended.

2.25 MAINLINE LOCATOR TAPE

- A. 3 inch wide plastic detectable locator tape.

2.26 BEDDING SAND

- A. Sand shall consist of natural or manufactured granular material, free of organic material, mica, loam, clay or other substances not suitable for the intended purpose.
- B. Sand shall be masonry sand ASTM C 144 or coarse concrete sand, ASTM C 33.

PART 3 – EXECUTION

3.01 GENERAL REQUIREMENTS

- A. Code requirements shall be those of state and municipal codes and regulations locally governing this work, providing that any requirements of the drawings and specifications, not conflicting therewith, but exceeding the code requirements, shall govern unless written permission to the contrary is granted by the Owner's Representative.
- B. Exercise extreme care in excavating and working in the project area due to existing utilities and irrigation systems to remain (if any). Contractor shall be fully responsible for expenses incurred in the repair of damages caused by their operation.
 - 1. The Contractor is responsible for identifying and maintaining existing irrigation main lines that supply water to areas on the site as noted on the drawings and outside of the proposed limit of work. The Contractor shall relocate or replace existing irrigation main line piping as required to provide uninterrupted sufficient water to maintain plant health to all irrigated areas on site. Providing water includes hand watering and/or watering trucks.
- C. Plan locations of backflow preventers, valves, controllers, irrigation lines, sleeves, and other equipment are diagrammatic and indicate the spacing and relative locations. Final locations shall be determined on-site and adjusted as necessary and as directed to meet existing and proposed conditions and obtain complete water coverage. Changes from locations shown

shall be made if necessary to avoid existing and proposed plants, piping, utilities, structures, etc. or when directed by the Owner's Representative and at the Contractor's expense.

- D. Prior to any work the Contractor shall stake out locations of all mainlines, valves, pumps, controllers, and backflow devices using an approved staking method and maintain the staking of the approved layout in accordance with the drawings and any required modifications. Flag or mark all overhead emitter locations. Verify all horizontal and vertical site dimensions prior to staking of heads. Do not exceed spacing shown on drawings for any given area.
- E. Stub out main line at all end runs and as shown on drawings. Stub out wires for future connection where indicated on plan and as directed.
- F. Permission to shut off any existing in-use irrigation or water line must be obtained 48 hours in advance, in writing from the Owner. The Contractor shall receive instructions from the Owner's Representative as to the exact length of time of each shut-off.
- G. No fittings shall be installed on pipe underneath pavement or walls.
- H. Prior to starting any work, Contractor shall measure the existing static water pressure (no flow condition) at the designated point of connection and immediately submit written verification of pressure with date and time of recording to Owner's Representative.

3.02 TRENCHING, DIRECTIONAL BORING AND SLEEVING

- A. Perform all trenching, directional boring, sleeving and excavations as required for the installation of the work included under this section, including shoring.
- B. The Contractor may directional bore lines where it is practicable or where required on the plans.
 - 1. Extend the bore 1' past the edge of pavement unless noted differently on the plans.
 - 2. Cap ends of each bore and locate ends at finished grade using 4 x 4 posts.
- C. Make trenches for mains, laterals and control wiring straight and true to grade and free of protruding stones, roots or other material that would prevent proper bedding of pipe or wire.
- D. Excavate trenches wide enough to allow a minimum of 3 inches between parallel lines and 8 inches from lines of other trades. All lines shall be able to be serviced or replaced without disturbing the other lines.
- E. Trenches for pipelines shall be made of sufficient depth to provide the minimum cover from finished grade as follows:
 - 1. Pressure mainline: 18 inches below finish grade in planted areas and 24 inches below paved areas in Schedule 40 PVC sleeves.
 - 2. Lateral lines: 12 inches below finish grade and 24 inches below paved areas in Schedule 40 PVC sleeves.
 - 3. Polyethylene drip distribution tubing: 4 to 6 inches below grade.
 - 4. Sub-surface inline drip tubing: 4 to 6 inches below grade.
 - 5. Control wiring: to the side of pressure main line and 24 inches below paved areas in Schedule 40 PVC sleeves.
- F. Backfill the trench per the requirements in paragraphs "Backfilling and Compacting" below.

3.03 PIPE INSTALLATION

- A. General Pipe Installation
 - 1. Exercise caution in handling, loading, and storing, of plastic pipe and fittings to avoid damage.
 - a. The pipe and fittings shall be stored under cover until using and shall be transported in a vehicle with a bed long enough to allow the length of pipe to lay flat so as not to be subjected to undue bending or concentrated external load at any point.
 - b. All pipe that has been dented or damaged shall be discarded.

2. Trench depth shall be as specified above from the finish grade to the top of the pipe.
 3. Installation of all pipe and fittings shall be in strict accordance with manufacturer's specifications.
- B. Polyvinyl Chloride Pipe (PVC) Installation
1. Under no circumstance is pipe to rest on concrete, rock, wood blocks, construction debris or similar items.
 2. No water shall be permitted in the pipe until a period of at least 24 hours has elapsed for solvent weld setting and curing.
 3. Install assemblies and pipe to conform to drawings and where shown diagrammatically on drawings. All fittings that are necessary for proper connections such as swing joints, offsets, and reducing bushings that are not shown on details shall be installed as part of the work.
 4. Solvent weld or threaded plastic pipe:
 - a. Pipe shall be cut using approved PVC pipe cutters where practicable. Sawed cuts 1" or smaller lines are disallowed. All field cuts shall be beveled to remove burrs and excess before gluing.
 - b. Welded joints shall be given a minimum of 15 minutes to set before moving or handling. Excess solvent on the exterior of the joint shall be wiped clean immediately after assembly.
 - c. Plastic to metal connections shall be made with schedule 80 nipples. No male metal threads shall be connected to plastic materials. Connection shall be made with two (2) wraps of Teflon tape and hand tightened plus one turn with a strap wrench.
 - d. Snake pipe in trench to allow one (1) foot of expansion and contraction per 100 feet of straight run.
 - e. Threaded pipe joints shall be made using Teflon tape. Solvent or Pipe-dope shall not be used with threaded joints. Pipe shall be protected from tool damage during assembly. All damaged pipe shall be removed and replaced. Take up threaded joints with light wrench pressure.
 - f. Load pipe at 10 foot intervals with backfill to prevent arching and slipping under pressure. Other than this preliminary backfill, all pipe joints, fittings and connections are to remain uncovered until successful completion of hydrostatic testing and written approval of the testing report.
 - g. Concrete thrust blocks shall be constructed behind all non-restrained pipe fittings 2-1/2" inches in diameter or larger at all changes of direction of 45 degrees or more.
- C. Metal Pipe Installation
1. All joints shall be threaded with Teflon tape or pipe joint compound used on all threads.
 2. Dielectric bushings shall be used in any connections of dissimilar metals.
- 3.04 TRENCHING, DIRECTIONAL BORING, AND SLEEVING REVIEW:
- A. Upon completion and installation of all trenching, directional boring, and sleeving, the Owner's Representative shall visually observe all installed irrigation control wiring, lines, and fittings. Do not cover any wires, lines or fittings until they have been tested and observed by the Owner's Representative unless authorized in writing.
- 3.05 FLUSHING
- A. Openings in piping system during installation are to be capped or plugged to prevent dirt and debris from entering pipe and equipment. Remove plugs when necessary to flush or complete system.
 - B. After completion and prior to the installation of any terminal fittings, the entire irrigation system shall be flushed to remove dirt, debris and other material.
- 3.06 HYDROSTATIC PRESSURE TESTING

- A. After flushing, and the installation of valves the following tests shall be conducted in the sequence listed below. The Contractor shall furnish all equipment; materials and labor necessary to perform the tests and all tests shall be conducted in the presence of the Owner's Representative.
- B. Water pressure tests shall be performed on all pressure main lines before any couplings, fittings, valves and the like are concealed.
- C. Immediately prior to testing, all irrigation lines shall be purged of all entrapped air or debris by adjusting control valves and installing temporary caps forcing water and debris to be discharged from a single outlet.
- D. Test all pressure main line at 150 PSI. For a minimum of four (4) hours with an allowable loss of 5 PSI. Pressure and gauges shall be read in PSI, and calibrated such that accurate determination of potential pressure loss can be ascertained.
- E. Re-test as required until the system meets the requirements. Any leaks, which occur during test period, will be repaired immediately following the test. All pipe shall be re-tested until final written acceptance.
- F. Submit a written, signed report to the Owner's Representative including the date, the start time and initial water pressure readings, the finish time and final water pressure readings, and the type of equipment used to perform the test.

3.07 BACKFLOW PREVENTER TESTING

- A. Test all installed backflow prevention devices as required by Title 17 of the California Code of Regulations Section 1706. Testing shall be performed by a Backflow Prevention Assembly Tester with a current certification from the American Water Works Association, and all local requirements.

3.08 CONTROLLER AND BOOSTER PUMP TESTING AND CERTIFICATION

- A. Booster Pump shall be certified by ATV-Power. Contact Chris Murray at 916-429-9724.
- B. Controller installation review to be conducted by Hunter representative.

3.09 BACKFILLING AND COMPACTING

- A. Irrigation trenches shall be backfilled with material free of rocks, clumps, or debris 1 inch in diameter or larger.
- B. Place backfill in lifts not exceeding 8" deep and compact as follows:
 - 1. Under pavement and within 1 foot of the edge of pavement: 95% or greater relative density.
 - 2. Backfill of subsoil in planting areas: Between 85 and 90% relative density.
- C. Finish grade of all trenches shall conform to adjacent grades without dips or other irregularities. Spread excess soil on site and dispose of debris off site at no additional cost to the Owner.
- D. Any settling of backfill material during the Establishment or Warranty period shall be repaired at the Contractor's expense, including any replacement or repair of soil, lawn, and plant material or paving surface.

3.10 RESURFACING PAVING OVER TRENCHES

- A. Restore all surfaces and repair existing underground installations damaged or cut as a result of the excavation to their original condition, satisfactory to the Owner's Representative.
- B. Trenches through paved areas shall be resurfaced with same materials quality and thickness as existing material. Paving restoration shall be performed by the project paving Sub-contractor or an approved Contractor skilled in paving work.

- C. The cost of all paving restoration work shall be the responsibility of the irrigation Contractor unless the trenching through the paving was, by previous agreement, part of the general project related construction.

3.11 EQUIPMENT INSTALLATION

A. General:

1. All equipment and accessories shall be installed per all installation requirements and recommendations of the product manufacturer.
2. Install all equipment at the approximately at the location(s) and as designated and detailed on the drawings. Verify all locations with the Owner's Representative.
3. Install all valves within a valve box of sufficient size to accommodate the installation and servicing of the equipment. Group valves together and locate in planted areas.
4. All irrigation systems that are using water from potable water systems shall require backflow prevention. All backflow prevention devices shall meet and be installed in accordance with requirements set forth by local codes and the health department.

B. Pressure Regulators:

1. Set adjustable regulators for required PSI per manufacturer's specifications.

C. Check Valve:

1. Install check valves at locations necessary to prevent low head run off, where elevation differences exceed manufacturer's option for in-head check valves.

D. Remote Control Valves (RCV):

1. Install one RCV per valve box.
2. Install boxes no closer than 8 inches from edge of paving and perpendicular to edge of paving and parallel to each other. Allow 12 inches clearance between adjacent valve boxes.

E. Quick coupler valve:

1. Install each quick coupler valve in its own valve box, aligned as indicated in the drawings.
2. Install one stabilizer/anchor per manufacturer's instructions. Anchor shall be ductile iron, epoxy coated, with stainless steel fastening bolt, as manufactured by Harco, Leemco, or equal.

F. Mainline Air Relief Valves

1. For mainlines longer than 2,000 l.f. or where booster pumps are used, install minimum of (1) continuous-operation air relief valve at the mainline high point to evacuate air and prevent water hammer. Install within round valve box.

G. Sprinkler Assemblies:

1. All main lines and lateral lines, including risers, shall be flushed and pressure tested before installing sprinkler heads.
2. Install specified sprinkler heads as shown on the drawings. Adjust layout for full head-to-head coverage. Spacing of heads shall not exceed the maximum spacing recommended by the manufacturer.
3. All sprinkler heads shall be offset from adjacent edges and set perpendicular to finish grade unless in sloped conditions as shown on the drawings.
4. Risers and Swing Joints: shall be sized equal to the inlet of the head.
 - a. For pop-up ABS bodies with spray, bubbler, or and rotary nozzles: pre-manufactured with marlex or polyethylene street ells and polyethylene tubing, minimum 0.49 inch outside diameter, rated to 150 psi; Hunter SJ-series or equal.
 - b. For pop-up ABS rotors: shall be pre-manufactured PVC with O-Ring seals and three axis movement, Hunter HSJ-series, Lasco G-series, or equal.

- c. For individual bubblers or drip emitters not on pop-up bodies: shall be premanufactured flexible risers, polyethylene or PVC, with male pipe thread ends, Hunter IH-series or equal, to include screen with integral check valve.

H. Irrigation Controllers:

1. Connect control wiring in the numerical sequence as shown on the drawings.
2. Controller shall be tested with completed electrical connections.
3. Ground controller per manufacturer's requirements. At minimum, grounding shall include:
 - a. one 5/8-inch x 8-foot copper rod installed per irrigation controller (and where multiple controllers are not connected to the same ground rod), at the first decoder along the two-wire path, and at decoders with intervals of every 300' (or the nearest decoder to the 300' interval) along the two wire path thereafter.
 - b. The top of each rod shall be installed inside a 10-inch round valve box, with the rod installed as close as practical to the controller. If a pedestal enclosure is used, the ground rod may be installed through the pedestal base. Under no circumstances shall the rods be shortened.
 - c. At controllers, a #6 AWG solid copper wire shall be used to connect from the ground lug of the transient protection board to the copper rod. Brass clamps specifically designed to secure the copper wire to the grounding rod shall be used. There shall be no kinks or sharp bends in the wire
 - d. Each wire may be wrapped around the rod and brazed in place as an alternative to clamping. Braze the wire to the rod for at least one circumference of the rod.

I. Wiring:

1. General:
 - a. All wire ends, including all wires from all decoders, valves, and other equipment, whether used or not, shall be encapsulated in waterproof connectors.
 - b. All wire insulation shall be intact and free of nicks and cuts. Wire shall not be bent.
 - c. Install lightning protection per the manufacturer's requirements and recommendations.
2. Two-Wire Low Voltage Control Wiring:
 - a. Per manufacturer's requirements and recommendations.
3. High Voltage
 - a. All electrical work shall conform to local codes, ordinances and any authorities having jurisdiction. All high voltage electrical work to be performed by licensed electrician.
 - b. The Contractor shall provide 120-volt power connection to the automatic controller unless noted otherwise on drawings.

J. Valve boxes:

1. Install one valve box for each type of valve, installed as shown on the drawings.
2. Gravel shall be installed after compaction of all trenches. Final portion of gravel shall be placed inside valve box after valve is backfilled and compacted.
3. Permanently label valve type on valve box lid by either: pre-lettered tags affixed with stainless steel rivets, or heat-branding using typeset tools, or other method approved by the Owner's Representative. Valves labeled as follows: check valve – CV; shut-off valve - SO; remote control valve – RCV; quick coupler – QC; master valve – MV; and flow sensor - FS.

K. Tracer wire:

1. Tracer wire shall be installed with non-metallic plastic irrigation main lines where controller wires are not buried in the same trench as the main line.
2. The tracer wire shall be placed on the bottom of the trench under the vertical projection of the pipe with spliced joints soldered and covered with insulation type tape.

3. Tracer wire shall be of a color not used for valve wiring. Terminate wire in a valve box. Provide enough length of wire to make a loop and attach wire marker with the designation "tracer wire".

L. Drip Installation:

1. Install pressure reducers when operating pressure exceeds specific drip tubing fitting recommendation or requirement.
2. Cap or plug all openings as soon as lines have been installed to prevent the intrusion of materials that would obstruct the pipe. Leave in place until removal is necessary for flushing or completion of installation.
3. Thoroughly flush all water lines before installing emitters.

3.12 ADJUSTMENT AND COVERAGE TEST

- A. Adjustment: The Contractor shall flush and adjust all sprinkler heads, valves and all other equipment to ensure function according to the manufacturer's data. Adjust all sprinkler heads not to overspray or runoff onto walks, roadways and buildings when under normal operating pressure and during times of normal prevailing winds.
- B. Coverage test:
 1. The Contractor shall perform a coverage test in the presence of the Owner's Representative after all sprinkler heads have been installed, flushed and adjusted. Test each valve or zone to demonstrate uniform and adequate coverage.
 2. Any adjustments shall be done by the Contractor prior to substantial completion at the direction of the Owner's Representative at no additional cost. Adjustments may include realignment of lines, addition or removal of heads, and changes in nozzle type or size.
 3. The entire irrigation system shall be operating properly prior to beginning any planting operations, unless approved otherwise by the Owner's Representative.

3.13 CLEAN-UP

- A. During installation, keep the site free of trash, pavements reasonably clean and work area in an orderly condition at the end of each day. Remove trash and debris in containers from the site no less than once a week.
 1. Immediately clean up any spilled or tracked soil, fuel, oil, trash or debris deposited by the Contractor from all surfaces within the project or on public right of ways and neighboring property.
- B. Once installation is complete, wash all soil from pavements and other structures.
- C. Make all repairs to grades ruts, and damage to the work or other work at the site.
- D. Remove and dispose of all excess soil, packaging, and other material brought to the site by the Contractor.

3.14 PROTECTION & MAINTENANCE

- A. The Contractor shall protect the work from damage due to operations during Landscape Installation, other Contractors, trespassers, and all other forces except natural disasters.
- B. Maintain the irrigation system through the Establishment Period, according to Section 32 98 00 – Landscape Maintenance, until final project acceptance.

END OF SECTION 32 84 00

SECTION 32 90 00

LANDSCAPE PLANTING

PART 1 – GENERAL

1.01 SUMMARY

- A. The scope of work includes all labor, materials, and any other items, facilities, transportation and services necessary for, and incidental to performing all operations in connection with furnishing, delivery, and complete installation of planting (also known as "landscaping"), as shown on the drawings and as specified herein.
- B. The scope of work in this section includes, but is not limited to, the following:
 - 1. Locate, purchase, deliver and install all specified plants.
 - 2. Care of installed plant material and related work, including watering, mulching, fertilizing, staking, and pruning.
 - 3. Finish grading of all planting areas
 - 4. Maintenance of work until the beginning of the warranty period.
 - 5. Clean up and disposal of all excess and surplus material.
 - 6. Maintenance of all specified plants during the Establishment Period.
 - 7. Warranty.

1.02 CONTRACT DOCUMENTS

- A. Construction drawings and these specifications are a part of the contract documents. Refer to contract for a complete list of all contract documents. The documents are to be considered as one. Whatever is called for by any parts shall be as binding as if called for in all parts.

1.03 REFERENCES

- A. The following specifications and standards of the organizations and documents listed form a part of the specification to the extent required by the references thereto. If the requirements of any referenced specifications and standards conflict with each other, the more stringent requirement shall apply unless determined otherwise by the Owner's Representative.
 - 1. State of California, Department of Food and Agriculture, Regulations for Nursery Inspections, Rules and Grading.
 - 2. ANSI Z60.1 American Standard for Nursery Stock, most current edition.
 - 1. ASTM D5268 - Topsoil used for Landscaping Purposes.
 - 3. ANSI A 300 – Standard Practices for Tree, Shrub and other Woody Plant Maintenance, most current edition.
 - 4. Interpretation of plant names and descriptions shall reference the following documents. Where the names or plant descriptions disagree between the several documents, the most current document shall prevail.
 - a. The New Sunset Western Garden Book, Oxmoor House, latest edition.
 - b. Manual of Woody Landscape Plants; Michael Dirr; Stipes Publishing, Champaign, Illinois; latest edition.
 - c. Glossary of Arboricultural Terms, International Society of Arboriculture (ISA), latest edition.

1.04 VERIFICATION

- A. All scaled dimensions on the drawings are approximate. Before proceeding with any work, the Contractor shall check and verify all dimensions and quantities and shall immediately inform the Owner's Representative of any discrepancies between the information on the drawings and the actual conditions, refraining from doing any work in said areas until given approval to do so by the Owner's Representative.

- B. In the case of a discrepancy in the plant quantities between the plan drawings and the plant call outs, list or plant legend, the number of plants or square footage of the planting area on the drawings shall be deemed correct and prevail.

1.05 PERMITS AND REGULATIONS

- A. The Contractor shall obtain and pay for all permits related to this section of the work unless otherwise noted. The Contractor shall comply with all laws and ordinances bearing on the operation or conduct of the work as drawn and specified. If a conflict exists between permit requirements and the work outlined in the contract documents, the Contractor shall promptly notify the Owner's Representative in writing, including a description of any necessary changes to the work and resulting changes to the contract price.
- B. Wherever references are made to standards or codes in accordance with which the work is to be performed or tested, the edition or revision of the standards and codes current on the effective date of this contract shall apply, unless otherwise expressly set forth.
- C. In case of conflict among any referenced standards or codes or between any referenced standards and codes and the specifications, the more restrictive standard shall apply unless determined otherwise by the Owner's Representative.

1.06 PROTECTION OF WORK, PROPERTY, AND PERSONS

- A. The Contractor shall adequately protect the work, adjacent property, and the public, and shall be responsible for any damages or injury due to his/her actions.

1.07 CORRECTION OF WORK

- A. The Contractor, at their own cost, shall re-execute any work that fails to conform to the requirements of the contract and shall remedy defects due to faulty materials or workmanship upon written notice from the Owner's Representative, at the soonest as possible time that can be coordinated with other work and seasonal weather demands.

1.08 DEFINITIONS

All terms in this specification shall be as defined in the "Glossary of Arboricultural Terms" or as modified below.

- A. Boxed plants: A container root ball package made of wood in the shape of a four-sided box.
- B. Container plant: Plants that are grown in and/or are currently in a container including boxed trees.
- C. Defective plant: Any plant that fails to meet the plant quality requirement of this specification.
- D. Final Acceptance: The date after completion of the establishment period when the Owner's Representative accepts the project. This period may extend past the time listed in this specification if maintenance during the establishment period is not performed satisfactorily, or if the project is not ready for acceptance at the end of the Establishment period.
- E. Field grown trees: Trees growing in field soil for at least 12 months prior to harvest.
- F. Healthy: Plants that are growing in a condition that expresses leaf size, crown density, color; and with annual growth rates typical of the species and cultivar's horticultural description, adjusted for the planting site soil, drainage and weather conditions.
- G. Establishment period: The time period, as defined in this specification, during which the Contractor provides maintenance until project acceptance.
- H. Planting Soil: native or imported topsoil in planting areas, amended as required by this section.
- I. Root ball: The mass of roots including any soil or substrate that is shipped with the tree within the root ball package.

- J. Root collar (root crown, root flare, trunk flare, flare): The region at the base of the trunk where the majority of the structural roots join the plant stem, usually at or near ground level.
- K. Shrub: Woody plants with mature height approximately less than 15 feet.
- L. Substantial Completion: The date when the work in this section is substantially complete and the Owner's Representative authorizes the establishment period to begin. The date of substantial completion may be different than the date of substantial completion for the other sections of the project.
- M. Stem girdling root: Any root more than 1/4 inch in diameter currently touching the trunk, or with the potential to touch the trunk, above the root collar approximately tangent to the trunk circumference or circling the trunk. Roots shall be considered as Stem Girdling that have, or are likely to have in the future, root to trunk bark contact.
- N. Structural root: One of the larger roots emerging from the root collar.
- O. Tree: Single and multi-stemmed plants with mature height approximately greater than 15 feet.

1.09 SUBMITTALS

- A. Comply with general conditions, special conditions, Division 1 sections and other contract documents. All submittals shall be made at least 4 weeks prior to delivery of materials.
 - 2. Product data: Submit manufacturer product data and literature describing all products required by this section to the Owner's Representative for approval.
 - 3. Samples: Submit samples of each product and material noted in the contract documents to the Owner's Representative for approval. Label samples to indicate product, characteristics, and locations in the work.
 - 4. Plant sources: within 30 days of award of contractor, and at least 30 days prior to delivery, submit sources of all plants and substitution requests, if any, to the Owner's Representative for approval.
 - 5. Soils Fertility Test Results: obtain soil samples, quantity as indicated on the drawings, from representative planting areas, and at anticipated plant rooting depths. Mix multiple samples together. Submit for agronomic testing to a certified laboratory.
- B. Materials Test Reports: Submit topsoil test reports to Landscape architect minimum 6 weeks prior to placement of topsoil.
 - 1. Provide location of topsoil borrow area if topsoil is to be imported.
 - 2. Provide name of independent soil testing laboratory.
 - 3. Provide date of sampling and testing.
- C. Submittals shall be available at all times to the Wal-Mart Construction Manager
- B. Close out submittals: Submit to the Owner's Representative for approval:
 - 1. Plant maintenance data and requirements.
 - 2. Warranty on company letterhead

1.10 QUALIFICATIONS

- A. Installer Qualifications: The installer shall be a firm having at least 5 years of successful experience of a scope similar to that required for the work, including the handling and planting of large specimen trees in urban areas. The same firm shall install or amend planting soil, establish final grades in planting areas, and install and plant material.
 - 1. Installer Field Supervision: When any planting work is in progress, installer shall maintain, on site, a full-time supervisor with a minimum of five years' experience with the work, and who can communicate in English.
 - 2. The installer's crew shall have a minimum of 2 years experienced in the installation of

Planting Soil, Plantings, and Irrigation (where applicable) and interpretation of plans and specifications.

3. Prior to bidding the work, submit references of past projects, employee training, and certifications that support that the Contractor(s) meet all the above installer qualifications and applicable licensures.

1.11 PRE-CONSTRUCTION CONFERENCE

- A. Convene a pre-work meeting minimum 30 days prior to commencing work on this Section. Review conditions of operations, procedures, and coordination with related work. The pre-work teleconference shall be set up as a conference call with the Landscape Architect and Irrigation Designer and will be combined with a discussion on irrigation.
 1. Review photographs provided by Contractor's tree grower nursery of trees to be approved by Landscape Architect.
 2. Review planting schedule and maintenance.
 3. Review required inspections, schedule of topsoil testing, and environmental procedures.

1.12 OBSERVATIONS

- A. The Owner's Representative may observe the work at any time. They may remove samples of materials for verification or testing. Rejected materials shall be immediately removed from the site and replaced at the Contractor's expense. The cost of testing materials not meeting specifications, and re-testing of replacement materials, shall be paid by the Contractor.
- B. The Owner's Representative shall be informed of the progress of the work so that the work may be observed at the following key times in the construction process. Failure of the Owner's Representative to make field observations shall not relieve the Contractor from meeting all the requirements of this specification. The following observations are anticipated, with required advance notification times:
 1. SITE CONDITIONS PRIOR TO THE START OF PLANTING: review the soil and drainage conditions: 7 days.
 2. PLANT LAYOUT REVIEWS(S): Review of the plant layout: 7 days.
 3. PLANT QUALITY: Review at the time of delivery and prior to installation: 7 days
 4. COMPLETION OF THE PLANTING: Review the completed planting: 10 days

1.13 WARRANTY

- A. Warranty shall begin on the date of Final Acceptance and continue for 1 year. If When the work is accepted in parts, the warranty periods shall extend from each of the partial Substantial Completion Acceptances to the terminal date of the last warranty period. Thus, all warranty periods for each class of plant warranty, shall terminate at one time.
- B. Plants determined to be defective by the Owner's Representative shall be removed by the contractor immediately upon notification by the Owner's Representative and replaced by the contractor without cost to the Owner, as soon as weather conditions permit and within the specified planting period.
- C. The Contractor is exempt from replacing plants, during the warranty period, that are removed by others, lost, or damaged due to occupancy of project, lost or damaged by a third party, vandalism, or any natural disaster.
- D. Replacements shall closely match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this specification. Make all necessary repairs due to plant replacements. Such repairs shall be done at no extra cost to the Owner.
- E. The warranty of all replacement plants shall extend for an additional one-year period from the date of their acceptance after replacement. If a replacement plant is not acceptable during or at the end of the extended warranty period, the Owner's Representative may elect alternate replacement items or credit. Alternate replacement items are not protected under a warranty

period.

1.14 SELECTION AND OBSERVATION OF PLANTS

- A. Submit to the Owner's Representative, for approval, plant sources including the names and locations of nurseries, and a list of the plants they will provide. The plant list shall include the botanical and common name and the size.
- B. For all trees greater than 24: box, submit photographs of plants or representative samples of plants. Photographs shall be legible and clearly depict the plant specimen. Each submitted image shall contain a height reference, such as a measuring stick. The approval of plants by the Owner's Representative via photograph does not preclude the Owner's Representative's right to reject material while on site.
- C. The Owner's Representative may review all plants, prior to delivery, during delivery, or after delivery. Unacceptable material shall be rejected, or if substandard elements can be corrected, corrective action may be taken by the contractor at his/her sole expense. Review or approval of any plant shall not prevent that plant from later rejection if the plant quality changes or previously existing defects become apparent that were not observed.
- D. All plants that are rejected shall be immediately removed from the site and acceptable replacement plants provided at no cost to the Owner.

1.15 PLANT SUBSTITUTIONS

- A. Submit all requests for substitutions of plant species, or size to the Owner's Representative, for approval, prior to purchasing the proposed substitution. Request for substitution shall be accompanied with a list of nurseries contacted in the search for the required plant. Requests shall include proposed substitutions with similar characteristics to the specified material.

1.16 SITE CONDITIONS

- A. It is the responsibility of the Contractor to be aware of all surface and sub-surface conditions, and to notify the Owner's Representative, in writing, of any circumstances that would negatively impact the health of plantings. Do not proceed with work until unsatisfactory conditions have been corrected.
 - 1. Should subsurface drainage or soil conditions be encountered which would be detrimental to the plant material, the Contractor shall notify the Owner's Representative in writing, stating the conditions and submit a proposal covering cost of corrections. If the Contractor fails to notify the Owner's Representative of such conditions, he/she shall remain responsible for plant material under the warranty.
- B. This specification requires that all Landscape Irrigation (if applicable) work be completed and accepted prior to the installation of any plants.
 - 1. Planting operations shall not begin until such time that the irrigation system is completely operational for the area(s) to be planted, and the irrigation system for that area has been observed and approved by the Owner's Representative.
- C. Planting shall be performed during those periods when weather and soil conditions are suitable in accordance with locally accepted horticultural practices.
 - 1. Do not install plants into saturated or frozen soils. Do not install plants during inclement weather, such as rain, snow, or during extremely hot, cold or windy conditions.

1.17 UTILITIES

- A. Notification of Underground Service Alert (USA), 811, is required for all planting areas.
- B. Contractor shall carefully examine the civil, as-built, record, and survey drawings to become familiar with the existing underground conditions before digging. The Contractor is responsible for knowing the location and avoiding utilities that are not covered by USA.

- C. Determine location of underground utilities and perform work in a manner that will avoid possible damage. Hand excavate, as required. Maintain grade stakes set by others until parties concerned mutually agree upon removal.
- D. Damage to existing work, including utilities, shall be repaired at the contractor's sole expense.

1.18 TEMPORARY UTILITIES

- A. All temporary water, power, piping, wiring, meters, panels and other related appurtenances required between source of supply and point of use shall be provided by the Contractor and coordinated with the Owner's Representative. Existing utilities may be used with the written permission of the owner.

PART 2 – PRODUCTS

2.01 PLANTS: GENERAL

- A. Standards and measurement: Provide plants of quantity, size, genus, species, and variety or cultivars as shown and scheduled in contract documents.
 - 1. Containerized Plants: class size shall conform to ANSI Z60.1 for each size and type of plant. Container stock shall have been grown in specified container size for at least 4 months, but not more than 18 months. Root ball shall be neither under-developed nor over-developed.
 - 2. All plants including the root ball dimensions or container size to trunk caliper ratio shall conform to ANSI Z60.1 "American Standard for Nursery Stock", unless modified by provisions in this specification. When there is a conflict between this specification and ANSI Z60.1, this specification section shall be considered correct.
 - 3. Plants larger than specified may be used if acceptable to the Owner's Representative. Use of such plants shall not increase the contract price. If larger plants are accepted the root ball size shall be in accordance with ANSI Z-60.1. Larger plants may not be acceptable if the resulting root ball cannot be fit into the required planting space.
- B. Proper Identification: All trees shall be true to name as ordered or shown on planting plans and shall be labeled individually or in groups by genus, species, variety and cultivar.
- C. Compliance: All trees shall comply with federal and state laws and regulations requiring observation for plant disease, pests, and weeds. Observation certificates, if required by law, shall accompany each shipment of plants.
- D. Plant Quality:
 - 1. General: Provide healthy stock, grown in a nursery and reasonably free of die-back, disease, insects, eggs, bores, and larvae. At the time of planting all plants shall have a root system, stem, and branch form that will not restrict growth, stability and health for the expected life of the plant. Plants shall be healthy with the color, shape, size and distribution of trunk, stems, branches, buds and leaves typical to the plant type specified.
 - 2. Plant quality above the soil line shall comply with branching structure details and the following.
 - a. Crown: The form and density of the crown shall be typical for a young specimen of the species or cultivar pruned to a central and dominant leader (requirement does not apply to plants that have been specifically trained in the nursery as topiary, espalier, multi-stem, clump, or unique selections such as contorted or weeping cultivars).
 - b. Leaves: The size, color, and appearance of leaves shall be typical for the time of year and stage of growth of the species or cultivar. Trees shall not show signs of prolonged moisture stress or over watering as indicated by wilted, shriveled, or dead leaves.
 - c. Trunk: The tree trunk shall be relatively straight, vertical, and free of wounds that

penetrate to the wood (properly made pruning cuts, closed or not, are acceptable and are not considered wounds), sunburned areas, conks (fungal fruiting bodies), wood cracks, sap leakage, signs of boring insects, galls, cankers, girdling ties, or lesions (mechanical injury). Trunk caliper and taper shall be sufficient so that the lower five feet of the trunk remains vertical without a stake. An auxiliary stake may be used to maintain a straight leader in the upper half of the tree.

- d. Branches:
 - 1.) Shoot growth (length and diameter) throughout the crown should be appropriate for the age and size of the species or cultivar. Trees shall not have dead, diseased, broken, distorted, or otherwise injured branches.
 - 2.) Main branches shall be distributed along the central leader not clustered together. They shall form a balanced crown appropriate for the cultivar/species.
 - 3.) Branch diameter shall be no larger than two-thirds (one-half is preferred) the diameter of the central leader measured 1 inch above the branch union.
 - e. Tree Branching structure:
 - 1.) Central Leader: Trees shall have one central leader. If the leader was headed, a new leader (with a live terminal bud) at least one-half the diameter of the pruning cut shall be present. All trees are assumed to have one central leader trees unless a different form is specified in the plant list or drawings.
 - 2.) The attachment of the largest branches (scaffold branches) shall be free of included bark.
 - 3.) Temporary branches, unless otherwise specified, can be present along the lower trunk below the lowest main (scaffold) branch, particularly for trees less than 1 inch in caliper.
 - f. Grafts: graft unions, where applicable, shall be completely closed without visible sign of graft rejection. All grafts shall be visible above the soil line.
3. Plant quality at or below the soil line:
- a. Plant roots shall be typical to the plant type specified. Root observations shall take place without impacting tree health. Root quality at or below the soil line shall comply with the project Root Structure details and the following:
 - 1.) The roots shall be reasonably free of scrapes, broken or split wood.
 - 2.) The root system shall be reasonably free of injury from biotic (e.g., insects and pathogens) and abiotic (e.g., herbicide toxicity and salt injury) agents. Wounds resulting from root pruning used to produce a high-quality root system are not considered injuries.
 - 3.) A minimum of three structural roots reasonably distributed around the trunk (not clustered on one side) shall be found in each plant. Root distribution shall be uniform throughout the root ball, and growth shall be appropriate for the species.
 - 4.) The root collar shall be within the upper 2 inches of the substrate/soil. Two structural roots shall reach the side of the root ball near the top surface of the root ball. The grower may request a modification to this requirement for species with roots that rapidly descend, provided that the grower removes all stem girdling roots above the structural roots across the top of the root ball.
 - 5.) The root system shall be reasonably free of stem girdling roots over the root collar or kinked roots (angled greater than 90 degrees).
 - 6.) At time of observations and delivery, the root ball shall be moist throughout. Roots shall not show signs of excess soil moisture conditions as indicated by stunted, discolored, distorted, or dead roots.

2.02 PLANTING SOIL

- A. Planting Soil shall be native or imported topsoil. Planting soil shall be fertile, friable soil containing less than 5% by volume of subsoil, refuse, rocks, clay (heavy, sticky or stiff), sticks, brush, or litter. Soil shall not contain weeds or seeds in quantities causing noticeable

weed growth in planting areas, or any material deleterious to plant growth. Obtain and submit a two-gallon soil sample and agronomic testing results for all proposed imported soils. Imported topsoil shall meet the following criteria:

1. Soil texture: USDA loam, sandy clay loam or sandy loam with clay content between 15 and 25%. And a combined clay/silt content of no more than 55%.
2. pH value shall be between 5.5 and 7.0.
3. Percent organic matter (OM): 2.0-5.0%, by dry weight.
1. Soluble salt level: Less than 2 mmho/cm.

2.03 SOIL AMENDMENTS

- A. Compost: shall be blended and ground leaf, wood and other plant-based material, composted for a minimum of 9 months and at temperatures sufficient to break down all woody fibers, seeds and leaf structures, free of toxic material. Compost shall be commercially prepared and meet US Compost Council STA/TMECC criteria. Compost shall comply with the following parameters:
 1. pH: 5.5 - 7
 2. Soil Salt (electrical conductivity): maximum 3 dS/m (mmhos/cm).
 3. Moisture content%, wet weight basis: 30-60.
 4. Particle size, dry weight basis: 98 percent passing through 3/4 inch screen.
 5. Stability carbon dioxide evolution rate: mg CO₂ -C/g OM/day<2.
 6. Solvita maturity test:> 6
 7. Physical contaminants, percent dry weight: <1percent.
 8. Chemical contaminants, mg/kg (ppm): meet or exceed US EPA Class A standard, 40 CFR & 503.13, Tables 1 and 3 levels.
 9. Biological contaminants meet or exceed US EPA Class A standard 40 CFR & 503.32 (a) level requirements.
- B. Gypsum: Agricultural grade product containing 98 percent minimum calcium sulfate.
- C. Iron Sulfate: 20 percent iron (expressed as metallic iron), derived from ferric and ferrous sulfate, 10 percent sulfur (expressed as elemental).
- D. Fertilizer: pelleted or granular form, mixed by a commercial fertilizer supplier, consisting of the following percentages by weight, if not otherwise recommended by agronomic testing:
 1. 16 percent nitrogen
 2. 6 percent phosphoric acid
 3. 8 percent potash
- E. Plant Fertilizer Tablets: slow-release as manufactured by Agriform, Best, or equal, with the following percentages by weight:
 1. 20 percent nitrogen
 2. 10 percent phosphoric acid
 3. 5 percent potash
 4. 2.6 percent combined calcium
 5. 1.6 percent combined sulfur
 6. 0.35 percent iron (elemental)

2.04 MULCH

- A. Mulch shall be "walk-on" grade, coarse, ground, from Douglas Fir, White Fir, or Red Fir. The size range shall have a minimum (less than 25% or less of volume) of fine particles 3/8 inch or less in size, and a maximum size of individual pieces (largest 20% or less of volume) shall be approximately 1 to 1-1/2 inch in diameter and maximum length of approximately 6 inches. Pieces larger than 5 inches long visible at the surface of the mulch shall be removed.

1. Acceptable products: SunUp Shredded Cedar, Redi-gro "Red Fir Walk-On Bark," K&M Forest Products "Walk-On Bark," or equal.
 2. Submit supplier's product specification data sheet and a one gallon sample for approval.
- B. After final walkthrough, but prior to turnover, apply polymer binder to bark mulch.
1. Acceptable products: "BarkBinder" by Technisoil Global, Inc, "Mulch-Lock" by United Industries Corporation, or equal.
 2. Submit supplier's product specification data sheet for approval.
 3. Follow all manufacturer's recommendations and requirements.
- 2.05 TREE STAKING AND GUYING MATERIAL
- A. Tree guying to be flat woven polypropylene material, 3/4 inch wide, and 900 lb. break strength, color: green. ArborTie, manufactured by Deep Root Partners, L.P., or equal.
- D. Tree ties: vinyl or nylon-reinforced vinyl, with UV inhibitors; Cinch-Tie by VIT, Super Tree Tie by Arthur Enterprises, or equal.
- B. Stakes shall be lodge pole stakes free of knots, minimum 2-inch diameter, lengths appropriate to the size of plant as required to adequately support the plant.
- 2.06 ROOT BARRIERS
- A. 18" or 24" deep (as indicated on drawings) linear polypropylene panels or roll, with stiffening ribs; UB-18-2/UB24-2 by DeepRoot Green Infrastructure LLC, EP-series by NDS, or equal.
- 2.07 SAND
- A. Clean, washed silica
- 2.08 DRAINAGE ROCK
- A. Crushed, angular rock, 1/4 to 1 inch in diameter, hard, durable, uniform, and free of any deleterious material.

PART 3 – EXECUTION

- 3.01 SITE EXAMINATION
- A. Examine the surface grades and soil conditions to confirm rough grading and all prior work is completed. Notify the Owner's Representative in writing of any unsatisfactory conditions. Beginning work constitutes acceptance of site conditions.
- 3.02 COORDINATION WITH PROJECT WORK
- A. The Contractor shall coordinate with all other trades and work that may impact this work.
- B. Coordinate the relocation of any irrigation lines, heads, or other items that conflict with tree locations. Root balls shall not be altered to fit around lines. Notify the Owner's Representative of any conflicts encountered.
- 3.03 LAYOUT AND PLANTING SEQUENCE
- A. General: Plant trees before other plants are installed. Relative positions of all plants and trees are subject to approval of the Owner's Representative. Make adjustments as required by the Owner's Representative including relocating previously installed plants.
- 3.04 PLANTING SOIL PREPARATION
- A. Prior to installing irrigation, fracture (rip) the top 18-24" of soil. Remove all stones, debris, organic matter, etc. larger than 1" in diameter that is brought to the surface.
- B. After approximate finish grades have been established, amend planting areas by tilling into the top 6-8" of soil amendments indicated by soils agronomic testing, local requirements, or

the following, whichever is most stringent:

1. Compost: 4 cubic yards per 1,000 square feet
2. Fertilizer: 15 lbs per 1,000 square feet
3. Gypsum: 50 lbs per 1,000 square feet
4. Iron Sulfate: 2 lbs per 1,000 square feet

3.05 PLANTING SOIL PROTECTION

- A. Protect soil from compaction during the delivery of plants to the planting locations, digging of planting holes and installing plants.
 1. Deliver and plant trees that require the use of heavy mechanized equipment (larger than 48" box) prior to final soil preparation and tilling. Where possible, restrict the driving lanes to one area instead of driving over and compacting a large area of soil. Where soil has been driven over, till soil to a depth of 6 inches, and ensure compaction is not above 85% relative density with 18 inches of finish grade.

3.06 ROOT BARRIER INSTALLATION

- A. Place root barrier flush and tight to back of adjacent work, plumb and straight, with top edge 1/2 inch above finish grade, and 1/2 to 1 inch below adjacent work.
- B. Roll stock shall be unrolled and straightened prior to installation. Joints shall be lapped 12" minimum and welded with manufacturer-specified solvent.
- C. "Surround" type configurations encircling plants or encroaching on planting area are not allowed and will be rejected.

3.07 PLANT DELIVERY, STORAGE, AND HANDLING

- A. Protect materials from deterioration during delivery and storage. Adequately protect plants from drying out, exposure of roots to sun, wind or extremes of heat and cold temperatures. If planting is delayed more than 24 hours after delivery, set plants in a location protected from sun and wind. Provide adequate water to the root ball package during the shipping and storage period.
 1. All plant materials must be available for observation prior to planting.
 2. Maintain soil moisture above the wilting point and below field capacity. Measure soil moisture using a soil moisture meter.
- B. Do not deliver more plants than can be stored on site. Provide a suitable storage and staging area for plants, materials, and equipment.
 1. The Owner's Representative shall approve the duration, method, and location of plant storage.
- C. Immediately prior to transporting, treat all plant material in full leaf with an anti-desiccant, following manufacturer's instructions. Provide protective covering over all plants during transporting.

3.08 PLANTING CONDITIONS

- A. Adverse weather conditions: No planting shall take place during extremely hot, dry, windy, or freezing weather.
- B. Volumetric soil moisture level, in both the planting soil and the root balls of all plants, prior to, during and after planting, shall be above permanent wilting point and below field capacity for each type of soil texture within the following ranges.

Soil type	Permanent wilting point	Field capacity
Sand, Loamy sand, Sandy loam	5-8%	12-18%
Loam, Sandy clay, Sandy clay loam	14-25%	27-36%

Clay loam, Silt loam	11-22%	31-36%
Silty clay, Silty clay loam	22-27%	38-41%

1. Volumetric soil moisture shall be measured with a digital moisture meter. The meter shall be the Digital Soil Moisture Meter, DSMM500 by General Specialty Tools and Instruments, or approved equivalent.
2. Verify soil moisture levels with a moisture meter. If the moisture is too high, suspend planting operations until the soil moisture drains to below field capacity.

3.09 PLANTING HOLE PREPARATION

- A. Excavation: Using hand tools or tracked mini-excavator, excavate the planting hole to the depth of the root ball measured after any root ball modification to correct root problems, and wide enough for working room around the root ball to the size indicated on the drawings, or at least twice the diameter of the root ball, whichever is greater.
 1. For trees and shrubs planted in soil areas that are NOT tilled or otherwise modified to a depth of at least 8 inches, over a distance of more than 10 feet from each tree, or 5 feet from each shrub, the soil around the root ball shall be loosened as follows:
 - a. The area of loosening shall be a minimum of 3 times the diameter of the root ball at the surface sloping to 2 times the diameter of the root ball at the depth of the root ball.
 - b. Loosening is defined as digging into the soil and turning the soil to reduce the compaction. Lifting and turning may be accomplished with a tracked mini excavator, or hand shovels.
 2. If an auger is used to dig the initial planting hole, the soil around the auger hole shall be loosened as defined above for trees and shrubs planted in soil areas that are NOT tilled or otherwise modified.
 3. The measuring point for root ball depth shall be the average height of the outer edge of the root ball after any required root ball modification.
 4. If motorized equipment is used to deliver plants to the planting area over exposed planting areas or used to loosen the soil or dig the planting holes, all soil that has been driven over shall be tilled to a depth of 6 inches.
- B. Where soil has been prepared to a depth deeper than the root ball depth, compact the soil under the root ball using a mechanical tamper to assure a firm bedding for the root ball. If there is more than 12 inches of planting soil under the root ball excavate and tamp the planting soil in lifts not to exceed 12 inches.
- C. Percolation testing: Test holes for 1 out of 5 trees planted, and at least one test of tree or shrub hole in every bioswale or stormwater feature. Fill holes with water and verify drainage within 24 hours. Where drainage does not occur, auger a minimum 1 foot diameter by 8 foot deep hole and backfill with drainage rock.
- D. Hardpan: where encountered, use powered equipment to break through the impervious layer at each tree and shrub location. Remove hardpan in an area at least 18" wider than the diameter of the plant. Backfill with Planting Soil.

3.10 PLANTING TREES AND SHRUBS

- A. Observe each plant after delivery and prior to installation for damage of other characteristics that may cause rejection of the plant. Replace such plants.
- B. No more plants shall be distributed than can be planted and watered on the same day.
- C. Remove containers carefully to avoid damage to the root system. Do not lift or handle plants by the tops, stems, or trunks. Do not mar or damage the bark of any plant.
- D. Observe the root system of each plant at planting to confirm that the roots meet the requirements for plant root quality. The Contractor shall perform all modifications to the root

system required by the Owner's Representative to meet these quality standards.

1. Modifications, at the time of planting, to meet the specifications for the depth of the root collar and removal of stem girdling roots and circling roots may make the plant unstable or stress the plant to the point that the Owner's Representative may choose to reject the plant rather than permitting the modification.
 2. Any modifications required by the Owner's Representative to make the root system conform to the plant quality standards outlined in Part 2 Products: Plants General: Quality, or other related requirements shall not be considered as grounds to modify or void the plant warranty.
- E. Container and Boxed Root Ball root pruning: remove all circling, descending, and matter roots from the outer surfaces of all plants in containers and boxes, including the top, sides, and bottom of the root ball. Slice root mass at four locations around the perimeter of the root ball. Where required for 15 gallon or larger plants, shave root ball to remove 1/2 inch to 2 inches of root mat to eliminate all root segments that are not growing approximately radial to the trunk. Shaving shall be performed using saws, knives, sharp shovels or other suitable equipment that is capable of making clean cuts on the roots.
- F. Set top outer edge of the root ball at the average elevation of the proposed finish. Set the plant plumb and upright in the center of the planting hole. The tree graft, if applicable, shall be visible above the grade. Do not place soil on top of the root ball. Set the plant in the same orientation as it was grown, however, the Owner's Representative may request that plants orientation be rotated when planted based on the form of the plant.
- G. Backfill the space around the root ball with the material excavated for the planting hole. Tamp Planting Soil around the lower portion of the root ball. Place additional Planting Soil around base and sides of ball in six-inch (6") lifts. Lightly tamp each lift using foot pressure or hand tools to settle backfill, support the tree and eliminate voids. DO NOT over compact the backfill or use mechanical or pneumatic tamping equipment. Over compaction shall be defined as greater than 85% relative density.
1. When the planting hole has been backfilled to three quarters of its depth, pour water around the rootball, and allow to soak in to settle the soil without flooding. Place Plant Fertilizer Tablets around rootball as indicated on the drawings. Air pockets shall be eliminated and backfill continued until the Planting Soil is at finish grade.
- H. Where indicated on the drawings, build and tamp a berm of Planting Soil around the outside of the root ball to retain water.

3.11 TREE STAKING AND GUYING

- A. Maintain all plants in a plumb position throughout the Establishment Period. Straighten all trees that move out of plumb including those not staked. Plants to be straightened shall be excavated and the root ball moved to a plumb position, and then re-backfilled. Do not straighten plants by pulling the trunk.
- B. Staking and guy trees with materials specified. Tie guys with a slack loop to prevent girdling. Refer to manufacturer's recommendations and planting details for installation.

3.12 PLANTING GROUNDCOVER, PERENNIALS, ORNAMENTAL GRASS, AND ANNUALS

- A. Preparation:
 1. Ensure that soil moisture is within the required levels prior to planting. Irrigation, if required, shall be applied at least 12 hours prior to planting to avoid planting in muddy soils. Ensure that soil grades in the planting areas are smooth and as shown on the plans. Schedule the planting to occur prior to application of the mulch. If the area is already mulched, pull the mulch from around the hole and plant into the soil. Do not plant the root system in the mulch. Pull mulch back so it is not on the root ball surface.

B. Installation:

1. Plants shall be planted in even, triangularly spaced rows, at the intervals called out for on the drawings, unless otherwise noted. The first row of Annual flower plants shall be 8 inches from the planting area edge unless otherwise directed.
Dig planting holes sufficiently large enough to insert the root system without deforming the roots. Set the top of the root system at the grade of the soil. Press soil to bring the root system in contact with the soil. Spread any excess soil around in the spaces between plants.

3.13 PRE-EMERGENT

- A. Apply pre-emergent to all planting areas after planting and prior to mulch. Use Dimension or equal and follow all manufacturer's directions. Do not apply to sensitive plants, bare-rooted plants, plugs, stolons, or seeded areas.

3.14 PRUNING TREES AND SHRUBS

- A. Do not allow plants to be topped, pruned, or trimmed prior to delivery.
- B. Prune plants to address structural deficiencies or as directed by the Owner's Representative. Follow recommendations within ANSI A 300. Except for plants specified as multi-stemmed or as otherwise instructed by the Owner's Representative, preserve or create a central leader.
- C. All pruning shall be performed by a person experienced in structural tree pruning. Pruning shall be done with clean, sharp tools. No tree paint or sealants shall be used.
- D. Pruning of large trees shall be done using pole pruners or if needed, from a ladder or hydraulic lift to gain access to the top of the tree. Do not climb in newly planted trees. Small trees can be structurally pruned by laying them over before planting.
- E. Remove and replace excessively pruned or malformed stock resulting from improper pruning.

3.15 PLANTING AREA FINISHING

- A. After planting, smooth out all grades between plants before mulching. Taper finish grade at all planting area edges as shown in the drawings.

3.16 MULCH

- A. Apply mulch to a depth of 3 inches after settlement, covering the entire planting area. Install no more than 1 inch of mulch over the top of the root balls of all plants. Taper mulch when abutting pavement.
- B. For trees planted in lawn areas the mulch shall extend to a 5 foot radius around the tree or to the extent indicated on the plans.
- C. Lift all leaves, stems, and other portions of plants out of the mulch if covered.

3.17 WATERING

- A. The Contractor shall ensure that adequate water is provided to all plants from installation until the date of Substantial Completion, and through the Establishment Period (if existing). The Contractor shall adjust the automatic irrigation system, if available, and apply additional or adjust for less water using hoses as required.
- B. Immediately after installation of all planting, hand water root balls of all plants, and sodded areas, to ensure that the roots and root balls have moisture above wilt point and below field capacity.

3.18 CLEAN-UP

- A. During installation, keep the site free of trash, pavements reasonably clean and work area in an orderly condition at the end of each day. Remove trash and debris in containers from the

site no less than once a week.

1. Immediately clean up any spilled or tracked soil, fuel, oil, trash or debris deposited by the Contractor from all surfaces within the project or on public right of ways and neighboring property.
- B. Once installation is complete, wash all soil from pavements and other structures. Ensure that mulch is confined to planting areas and that all tags, and markers are removed from the site. After observation by Owner's Representative, remove all nursery plant tags and ribbons.
- C. Make all repairs to grades, ruts, and damage by the plant installer to the work or other work at the site.
- D. Remove and dispose of all excess planting soil, subsoil, mulch, plants, packaging, and other material.

3.19 PROTECTION DURING CONSTRUCTION

- A. The Contractor shall protect planting and related work and other site work from damage due to planting operations, operations by other Contractors or trespassers. Maintain protection until Final Acceptance.
- B. Damage done by the Contractor, or any of their sub-contractors to existing or installed plants, or any other parts of the work or existing features to remain, including roots, trunk or branches of large existing trees, soil, paving, utilities, lighting, irrigation, other finished work and surfaces including those on adjacent property, shall be cleaned, repaired or replaced by the Contractor at no expense to the Owner. The Owner's Representative shall determine when such cleaning, replacement or repair is satisfactory.

3.20 SUBSTANTIAL COMPLETION / ESTABLISHMENT PERIOD

- A. Upon written notice from the Contractor, the Owner's Representative shall observe the work to determine if Landscape Installation is substantially complete.
 1. Notification shall be at least 7 days prior to the observation.
 2. The substantial completion review will not occur until all sodded, seeded, or hydroseeded turf areas demonstrate a full, even, vigorous stand of grass, or after the second mowing, whichever is later.
- B. The Establishment Period begins at date of written notification of substantial completion from the Owner's Representative. The date of substantial completion may be different than the date of substantial completion for the other sections of the project.
- C. The Establishment Period consists of plant and other maintenance as described in Section 32 98 00 – Landscape Maintenance. Any day of improper maintenance, as determined by the Owner's Representative, will extend the Establishment period.

3.21 PROJECT ACCEPTANCE / END OF WARRANTY OBSERVATION

- A. At the end of the Establishment Period, upon written notice from the contractor, the Owner's Representative shall observe the work to verify that all provisions of the contract are complete, and the work is satisfactory.
 1. Notification shall be at least 7 days prior to the date the contractor is requesting the observation.
 2. If the work is satisfactory, the Establishment Period will end on the date of the final observation.
 3. If the work is deemed unsatisfactory, the Establishment Period will continue at no additional expense to the Owner until the work has been completed, observed, and approved by the Owner's Representative.
 4. If the work fails to pass final observation, a subsequent observation must be scheduled.

The cost to the Owner for subsequent observations will be charged to the Contractor at the prevailing hourly rate of the Owner's Representative.

- B. At the end of the Warranty Period, the Owner's Representative shall again observe the work to verify that the Landscape Planting is healthy and satisfactory.

END OF SECTION 32 90 00

SECTION 32 92 00

NATIVE GRASSES

PART 1 - GENERAL

1.01 CONDITIONS

- A. The general provisions of the contract, including General and Supplementary Conditions and General Requirements apply to the work specified in this section.

1.02 SCOPE OF WORK

- A. Furnish all labor, material, equipment and services necessary to provide all landscape work, complete and in place, as indicated on Drawings and specified herein.
- B. Work specified in this Section, but is not limited to the following:
 - 1. Soil preparation
 - 2. Weed Control
 - 3. Hydroseeding
 - 4. Clean-up

1.03 QUALITY ASSURANCE

- A. Source Quality Control
 - 1. Native Grasses shall be from the same ecotype as the project.
 - 2. Hydroseeded native grasses shall exhibit a uniform growth, in good health, free of noxious or invasive weeds, with viable seed production (season permitting), competitiveness against non-native species at the time of final acceptance, and demonstrating at least 75% coverage at the end of the maintenance period (as measured by canopy coverage within a randomly selected one yard by one yard plot, one plot per 12,000 sf of hydroseeded area). Hydroseeded native grasses shall demonstrate at least 50% coverage at the end of the warranty period.
 - 3. Plugged native grasses shall be 95% viable and vigorously growing at the end of the first growing season (onset of summer, if planted in late fall or winter). Plugged native grasses shall be 90% viable and vigorously growing at the end of the warranty period.
- B. Acceptance of seed:
 - 1. Seed shall be tested according to the Association of Official Seed Analysts, International Seed Testing Association, and the Federal Seed Act standards. Tested seed shall be accompanied by a certificate of analysis furnished by a certified testing laboratory. All seed shall be subject to inspection and concurrence by the Contractor before the subcontractor is authorized to proceed with the seeding operation.
 - 2. Certify as tested the following for each individual seed species, variety, or mix:
 - a. Purity and Germination: Before seed is used, retest for germination all seed stored over six months from the date of the original acceptance test, and resubmit the results for inspection.
 - b. Prohibited Noxious Weed Seed: Seed shall contain no federal- or state-listed prohibited noxious weed seed (an amount within the tolerance of zero percent) as determined by a standard purity test.

- c. Restricted Noxious Weed Seed: Seed shall contain no more than 40 seeds per pound of any. Single species or 150 seeds per pound of all species combined, of restricted noxious weed seed. Restricted noxious weed seed is considered to be component of other crop and weed seed with limitations specified.
 - d. Weed Seed: Seed shall contain no more than 1 percent by weight, of weed seed of other crops and plant species as determined by standard purity tests.
3. Information regarding the seed mixture shall be provided by the seed vendor on each standard sealed container label. The labels shall include the following information:
- a. Seed mixture name
 - b. Lot number
 - c. Total net weight and PLS weight of each seed type
 - d. Percentages of purity and germination
 - e. Seed coverage, in acres, on a PLS basis
 - f. Percentage of maximum weed seed content clearly marked for each seed type.
- C. The Owner's Representative shall be the sole judge as to the condition of material. Material to be replaced within the guarantee period shall be replaced by the Contractor within fifteen (15) days of written notification.

1.04 SUBMITTALS

- A. Contractor shall submit the proposed source, ecotype, and demonstrate availability of the proposed seed.
- B. Submit a complete list of equipment, materials, or processes specified or proposed. Include product information sheets if available.
- C. Contractor shall submit a sample of all supplied materials accompanied by analytical data from an approved laboratory source illustrating compliance of bearing the manufacturer's guaranteed analysis.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Delivery
 - 1. The Contractor, shall provide receipts, delivery tickets, load tickets, etc. of all items delivered to the job site to verify products and total quantities.
 - 2. Deliver fertilizer to site in original unopened containers bearing manufacturer's guaranteed chemical analysis, name trademark, and conformance to State Law.

1.06 JOB CONDITIONS

- A. Install grasses after irrigation system is operable and has been accepted by the Owner (see Section 32 84 00 Landscape Irrigation).
- B. The contractor is responsible for ensuring sufficient water is applied to newly installed native grass areas to prevent any actual or apparent reduction in growth, drought stress, or other limits on plant growth due to insufficient water. Contractor shall monitor weather reports, and if needed, apply additional water without harming new installed material. This may include, but is not limited to, use of water trucks, manual watering via temporary hoses, and/or extension of the temporary irrigation system beyond what is shown in the drawings.

- C. Protect work and materials from damage due to construction operations by other contractors and trades and by vandalism. Maintain protection during installation and maintenance period.
- D. Native grass planting shall be performed during the following timeframe: October 1 to February 1, with adequate soil moisture present. Hydroseeding operations shall not take place if any of the following conditions are predicted in the next 24 hours:
 1. Temperatures above 80°F.
 2. Temperatures below 35°F.
 3. Windspeeds at or above 20 mph.
 4. Rainfall greater than one tenth of an inch

1.07 SAMPLES AND TESTS

- A. The Owner reserves the right to take and analyze samples of materials for conformity to specifications. The Contractor shall furnish samples upon request by the Owner's Representative. Rejected materials shall be removed from the site at Contractor's expense. Cost of testing of materials not meeting specifications shall be paid by Contractor.
- B. Soils Fertility (Agronomic) Testing: To ensure a suitable growing medium for plants, employ services of a certified agronomic soils testing laboratory to perform confirmatory soil testing at specified locations. Contractor is to provide documented locations for review by the Owner's Representative for approval before testing can proceed. Contractor is responsible for agronomic soil testing costs.
 1. Perform soil sampling of prepared planting soil once fine grading, weed control, soil amendments have been completed, and prior to planting.
 2. Soil test recommendations may take precedence over soil amendment procedures specified in this or other sections, if determined by the Owner's representative (note that soil amendment recommendations made for general landscape planting may not be applicable to establishment of native grasses, and applicability shall be determined by the Owner's representative).
 3. Take samples of site soil at following depths and quantity:
 - a. Areas for tree planting: twelve inches, 2 locations
 - b. Hydroseeded or plugged grass areas: six inches, 4 locations.
 4. Provide the following at each soil test location:
 - a. Chemical analysis report of each soil sample location to include the following:
 - (i) Percentage of organic matter.
 - (ii) salinity.
 - (iii) PH.
 - (iv) Mineral nutrients, including concentrations of nitrogen, phosphorus, potassium, calcium, and magnesium.
 - (v) Potential hazards of impediments to plant growth from salinity; sodium, boron, impaired soil structure or drainage.

- b. Request testing for fertility and suitability analysis with written recommendations for soil amendment application rates.
- c. Soil percolation rates.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Any commercially processed or packaged material shall be delivered to the site in the original unopened container bearing the manufacturer's guaranteed analysis.

2.02 MATERIALS

A. Soil Conditioner

- 1. Gro-Power Plus (no known equal): Humus (bacteria included) based fertilizer and soil conditioner with soil penetrant shall consist of the following percents by weight:
 - a. 5% nitrogen
 - b. 3% phosphoric acid
 - c. 1% potash
 - d. 50% humus
 - e. 15% humic acids

B. Organic Amendment

- 1. Per Section 32 90 00 Landscape Installation.

C. Soil Fertilizer

- 1. Organic, non-petroleum based NPK fertilizer which contains the following percentages by weight, or equivalent:
 - a. 7% nitrogen
 - b. 2% phosphoric acid
 - c. 6% potash

D. Hydroslurry Fertilizer

- 1. Organic (min. 93%), non-petroleum based NPK (nitrogen, phosphoric acid, potash) fertilizer which contains the following percentages by weight, or equivalent:
 - a. 7%-2%-1% (Biosol Forte as manufactured by Rocky Mountain Bio Products or eq.)
 - b. 3%-7%-2% (Sustane 3-7-2 as manufactured by Sustane or equal)
 - c. 7%-2%-3% (Pure 'N' Natural as manufactured by Gro-Power or equal)

E. Wood Cellulose Fiber Mulch (Hydromulching)

- 1. Mulch shall be specially prepared wood cellulose fibers with no growth or germination inhibiting factors, and dyed green to facilitate visual metering during application. Wood cellulose fiber shall have additional characteristics of dispersing rapidly in water to form homogeneous slurry and remain in such state when agitated in the hydraulic mulching unit.

2. Wood cellulose fiber mulch shall be supplied, compressed in packages containing 50 pounds of material having an equilibrium air dry moisture content at time of manufacture of 12%, plus or minus 2.
- F. Binders
1. Organic, natural tackifier derived from ground Psyllium.
 2. Organic, natural polysaccharide derived from Guar gum. (Verify application rates with manufacturer and include in submitted substitution request for approval: application rates listed below are for Psyllium-based products)
- G. Fungicide
1. "Subdue" (Ciba-Geigy) or equal.
- H. Herbicides
1. Per Section 32 90 00 Landscape Installation.
- I. Mycorrhizal Inoculant
1. Granular formulation of endomycorrhizal species suitable for incorporation with hydroslurry mix, minimum of 25,000 spores per pound.
 - a. MycoApply "Endo"
 - b. Bio Organics "Micronized Endomyorrhizal Inoculant (BEIM)"
 - c. Or equal.

2.03 PLANT MATERIAL

- A. Plant Mixes
1. See Plans for Slope Hydroseed Mix and Basin Bottom Hydroseed Mix
 2. Seed shall be weed free, fresh, re-cleaned, Grade A, new crop consisting of the percentages of mix as specified. Seed shall be labeled in accordance with the U.S. Department of Agriculture Rules and Regulations under the Federal Seed Act presently in effect.
 3. Seed shall be provided from and mixed by a certified dealer. Seed mixture shall be labeled with manufacturer's guaranteed analysis, germination rate and purity rate.

2.04 MULCH

- A. Mulch shall be as specified in 32 90 00 Landscape Planting.

2.05 EQUIPMENT

- A. Hydro-Seeder
1. Equipment used for application of slurry shall be a commercial-type Hydro-Seeder and have a built-in agitation system with an operation capacity sufficient to agitate, suspend and homogeneously mix slurry.
 2. Tank capacity shall be a minimum of 1,500 gallons and shall be mounted on a truck to allow access to the site.
 3. Distribution Lines: Large enough to prevent stoppage and allow for even distribution of slurry over the site.

4. The pump shall be able to generate 150 psi at the nozzle.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Per Section 32 90 00 Landscape Planting.

3.02 SOIL CLEANUP AND PREPARATION

- A. Per Section 32 90 00 Landscape Planting.

3.03 INSTALLATION

- A. Pre-plant Weed Control per Section 32 90 00 Landscape Planting.
- B. Hydroseed:
 1. If Psyllium-based tackifier is used, pre-moisten the application area.
 2. Apply Hydromulch in two applications:
 - a. Apply all seed, fertilizer, mycorrhizal inoculum, and 25% of hydrostraw fiber.
 - b. Apply 75% of hydrostraw fiber and 100% of hydromulch tackifier.
- C. Watering after installation:
 1. Hand water seeds after installation, thoroughly wet the surrounding area without allowing soil to become saturated or standing water to form. Do not allow seeds to dry prior to watering.
 2. Maintain optimum moisture to sustain germination and plant growth, tapering water off to emulate natural conditions as soon as possible.

3.04 OBSERVATION SCHEDULE

- A. Per Section 32 90 00 Landscape Planting

3.05 CLEAN UP

- A. Per Section 32 90 00 Landscape Planting

3.06 MAINTENANCE

- A. Per Section 32 90 00 Landscape Planting

3.07 REPLACEMENT:

- A. Re-apply hydroseed to all dead or unhealthy strands of grass with equal material as directed by the Owner's Representative, and at minimum the following times:
 - a. Substantial Completion or Final Landscape Inspection prior to the maintenance period
 - b. End of the maintenance period
 - c. End of the warranty period
- B. Per Section 32 90 00 Landscape Planting

END OF SECTION 32 92 00

SECTION 32 98 00

LANDSCAPE MAINTENANCE

PART 1 – GENERAL

1.01 SUMMARY OF WORK

- A. During the Establishment Period, or until project acceptance, whichever is longer, provide all maintenance to keep plants in a healthy state and the planting areas clean and neat. The Establishment Period will be as a minimum of **60 days**, or until the project is accepted. Any day of improper maintenance, as determined by the Owner's Representative, will extend the Establishment period.

1.02 QUALITY ASSURANCE:

- A. All work shall be undertaken by trained landscape maintenance workers under the supervision of a foreman with a minimum of 2 years experience supervising commercial landscape maintenance crews.
- B. All chemical and fertilizer applications shall be made by licensed applicators for the type of chemicals to be used. All work and chemical use shall comply with all applicable local, state, and federal requirements.

1.03 ACCESS AND SAFETY

- A. Assure that hoses and watering equipment and other maintenance equipment does not block paths or be placed in a manner that may create tripping hazards. Use standard safety warning barriers and other procedures to maintain the site in a safe manner for visitors at all times.
- B. All workers shall wear required safety equipment and apparel appropriate for the tasks being undertaken.
- C. The Contractor shall not store maintenance equipment at the site at times when they are not in use unless authorized in writing by the Owner's Representative.
- D. Maintenance vehicles shall not park on the site including walks and lawn areas at any time without the Owner's Representative's written permission.

1.04 RECORDS

- A. Maintain a detailed log of all maintenance activities including types of tasks, date of task, types and quantities of materials and products used, watering times and amounts, and number of each crew. Submit logs to the Owner's Representative monthly.
- B. Meet with the Owner's Representative at final acceptance to formally transfer the responsibilities of maintenance to the Owner's Representative. Provide all information on past maintenance activities and provide a list of critical tasks that will be needed over the next 12 months. Provide all maintenance logs and soil test data not previously submitted.
- C. Contractor's supervisor shall be available for a minimum of three months after the end of the Establishment Period to answer questions about past maintenance.

1.05 REPAIR

- A. Repairs shall be made within 24 hours of written notification by Owner's Representative. Repairs due to defective materials, improper work, or regular use shall be made at no cost to the owner.
- B. Repair of damage by visitors and events beyond normal use and wear, vandalism, or natural disasters, are not part of this maintenance. The Owner's Representative may request that the Contractor repair damage from such events at an additional cost. All additional work shall be

approved in advance by the Owner's Representative.

PART 2 – PRODUCTS

2.01 GENERAL

- A. As specified in Section 32 90 00 – Landscape Planting.

PART 3 – EXECUTION

3.01 WATERING

- A. Provide all water required to keep soil within and around the root balls at optimum moisture content for plant growth.
 - 1. Maintain Irrigation system and equipment, including a visual observation, by station, at least monthly. Adjust programming as required to provide optimum water, and to minimize overspray, runoff, or saturation below the root zone.
 - 2. Hand-water as required. Use a hose-end diffuser to prevent plant damage and soil disturbance.
 - 3. Monitor soil moisture to provide sufficient water. Check soil moisture and root ball moisture with a soil moisture meter on a regular basis and record moisture readings. Do not over water.

3.02 FERTILIZATION

- A. Soil nutrient levels: Take a minimum of 4 soil samples from around the site in the spring and fall and have them tested by an accredited agronomic soil testing lab for chemical composition of plant required nutrients, pH, salt and % organic matter. Test results shall include laboratory recommendations for nutrient applications. Apply fertilizers at rates recommended by the soil test.
 - 1. Make any other soil test and/or plant tissue test that may be indicated by plant conditions that may not be related to soil nutrient levels such as soil contaminated by other chemicals or lack of chemical uptake by the plant.

3.03 PRUNING

- A. Remove cross-over branches, shorten or remove developing co-dominant leaders, dead wood and winter-damaged branches.
- B. Unless directed by the Owner's Representative, or where a formal hedge is clearly indicated by plant type and spacing, do not shear plants.
- C. In no case shall pruning result in individually boxed or balled plantings. Adjacent plants of the same species shall be allowed to grow together. Head-back or pinch buds to encourage lateral growth filling in planter areas.

3.04 REPLACEMENT

- A. Replace all plants that are defective or unsatisfactory as described in Section 32 90 00 as soon as the plant decline is obvious and in suitable weather and season for planting as outlined in above sections. Plants that become defective during the maintenance period shall be covered and replaced under the warranty provisions.
- B. Replace all damaged materials with same materials as originally installed.

3.05 MULCHING

- A. Prior to final acceptance, top-off all mulched areas to assure complete coverage at an average depth of 3 inches, but do not over mulch. At no time shall the overall mulch thickness be greater than 4 inches. Do not re-apply mulch within 6 inches of the trunks or stems of any plants. Replacement mulch shall meet the requirements of the original approved material.

Mulch shall be no more than one inch on top of the root ball surface.

3.06 GENERAL

- A. Mowing: mow all turf areas once per week after establishment. From December through February, mowing frequency may be reduced to twice per month if warranted. Mow height shall maximize leaf area while maintaining turf function (ornamental, casual use, or sports use)
- B. Edging: trim turf area edges with a mechanical edge trimmer, maintaining a perpendicular edge between turf and adjacent materials. Do not over-cut edges. Trimming shall occur not less than every other week. Trim all groundcovers and other plants to maintain growth within planting areas.
- C. Debris removal: Remove trash, fallen leaves, spent flowers, fruit and plant part accumulations from beds and paved surfaces. Maintain all surface water drains free of debris. Debris removal shall be undertaken at each visit. Legally dispose of all debris off-site unless otherwise directed by Owner's representative.
- D. Settlement: Reset any plants that have settled or are leaning as soon as the condition is noticed. Repair any settlement in finished grades.
- E. Guying and staking: Maintain plant guys in a taught position. If left during maintenance, Remove all nursery stakes prior to final acceptance unless otherwise directed by Owner's Representative.
- F. Weed control: Keep all planting areas free of weeds. Hand-remove all weeds and any plants that do not appear on the planting plan. Chemical weed control is permitted only with the approval of the Owner's Representative. Schedule weeding as needed but not less than 8 times per year.
- G. Plant pest control: Maintain disease, insects and other pests at manageable levels. Manageable levels shall be defined as damage to plants that may be noticeable to a professional but not to the average person. Use least invasive methods to control plant disease and insect outbreaks.
 - 1. The Owner's Representative must approve all chemical pesticide applications in advance.

END OF SECTION 32 98 00

SECTION 02510 (33 1000) - WATER DISTRIBUTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Site water piping and fittings including domestic potable waterline and fire protection system supply waterline, valves, and fire hydrants.

B. Related Requirements:

1. Section 02300 – Earthwork: Trenching, backfill, and compaction for utilities.

1.2 REFERENCES

A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. American Society of Mechanical Engineers (ASME):

1. ASME B 16.22 - Wrought Copper and Copper Alloy Solder Joint Pressure Fittings.

C. ASTM International (ASTM):

1. ASTM B88 - Seamless Copper Water Tube.
2. ASTM D1784 - Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
3. ASTM D2241 - Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR-Series).
4. ASTM D2564 - Poly (Vinyl Chloride) (PVC) Solvent Cement.
5. ASTM D2672 - Poly (Vinyl Chloride) (PVC) Integrally Molded Bell Ends For Solvent - Cemented Pipe Joints.
6. ASTM D3139 - Joints for Plastic Pressure Pipes using Flexible Elastomeric Seals.
7. ASTM F477 - Elastomeric Gaskets And Lubricant.
8. ASTM F656 - Poly (Vinyl Chloride) (PVC) Cement Primer.

D. American Water Works Association (AWWA):

1. AWWA C104 - Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.
2. AWWA C105 - Polyethylene Encasement for Ductile Iron Piping for Water and other Liquids.
3. AWWA C116 - Protective Fusion-Bonded Epoxy Coatings for the Interior and Exterior Surfaces of Ductile-Iron and Gray-Iron Fittings for Watersupply Service.
4. AWWA C151 - Ductile-Iron Pipe, Centrifugally Cast, for Water or Other Liquids.
5. AWWA C153 - Ductile-Iron Compact Fittings for Water Service.
6. AWWA C504 - Rubber-Seated Butterfly Valves.
7. AWWA C509 - Resilient-Seated Gate Valves for Water Supply Service.
8. AWWA C550 - Protective Interior Coatings for Valves And Hydrants.
9. AWWA C600 - Installation of Ductile-Iron Water Mains and Appurtenances.
10. AWWA C605 - Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water.
11. AWWA C651 - Disinfecting Water Mains.
12. AWWA C900 - Polyvinyl Chloride (PVC) Pressure Pipe, 4 Inches Through 12 Inches, for Water Distribution.

E. National Fire Protection Association (NFPA):

1. NFPA 24 – Installation of Private Fire Service Mains and Their Appurtenances

F. State of California Water Code

G. City of Stockton Standard Specifications

1.3 QUALITY ASSURANCE

- A. Products, where marked for compliance with code or test standards, shall also mark specific standard as required in the Contract Documents.
- B. Perform installation in accordance with utility company or municipality requirements.
- C. Valves: Mark manufacturer's name and pressure rating on valve body.
- D. Perform disinfection of potable lines in accordance with AWWA C651

1.4 SUBMITTALS

- A. Furnish 1 copy of results of meter test and hydrostatic pressure test to Owner, Owners Civil Engineering Consultant (CEC), and utility company upon completion of water distribution backfilling operations.
- B. Project Record Documents:
 - 1. Disinfection report: Record the following:
 - a. Type and form of disinfectant used.
 - b. Date and time disinfectant injection start and time of completion.
 - c. Test locations.
 - d. Initial and 24 hour disinfectant residuals (quantity in treated water) in ppm for each outlet tested.
 - e. Date and time of flushing start and completion.
 - f. Disinfectant residual after flushing in ppm for each outlet tested.
 - 2. Bacteriological report: Record the following:
 - a. Date issued, project name, testing laboratory name, address, and telephone number.
 - b. Time and date of water sample collection.
 - c. Name of person collecting samples.
 - d. Test locations.
 - e. Initial and 24 hour disinfectant residuals in ppm for each outlet tested.
 - f. Coliform bacteria test results for each outlet tested.
 - g. Certification that water conforms, or fails to conform, to bacterial standards.
 - h. Bacteriologist's signature and authority.
 - 3. Accurately record actual locations of piping mains, valves, connections, and top of pipe elevations. Prepare and provide any record drawings to the utility company or municipality.
 - 4. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

PART 2 - PRODUCTS

2.1 PIPE

- A. Pipe sizes 3-inches and smaller for installation below grade and outside building shall comply with the following:
 - 1. Seamless Copper Tubing: Type "K" soft copper, ASTM B88.
 - a. Fittings: Wrought copper (95-5 Tin Antimony solder joint), ASME B 16.22.
 - 2. Ultra High Molecular Weight (UHMW) P.E. 3406, P.E. 3408, CS 255-63, Polyethylene as manufactured by ADS or an approved equal in one (1) inch iron pipe sizes only. Plastic pipe larger than one (1) inch and up to and including two (2) inch iron pipe sizes shall be PB 2110 Polybutylene. Connection of plastic pipe shall be made using Mueller 110 compression connections or approved equal.
- B. Pipe sizes 4 to 16 inches for installation below grade and outside building shall comply with one or combination of following:

02510-2

1. Ductile Iron Water Pipe: ANSI A21.51/AWWA C151, Pressure class 350 (4-12") Pressure Class 250 (14-16").
 - a. Fittings: Either rubber gasket, mechanical, flanged or push-on joint, ANSI A21.10/AWWA C110, and unless otherwise specified, the internal surfaces of ductile iron water pipe and fittings shall be lined with a uniform thickness of cement mortar then sealed with a bituminous coating in accordance with ANSI A21.4/AWWA C104. The outside surfaces of ductile iron pipe and fittings for general use shall be coated with a bituminous coating 1 mil (0.0254mm) thick in accordance with ANSI A21.6 or ANSI A21.51.
 - 1) Rubber gasket push-on joint, ASNI A21.11/AWWA C111
 - 2) Mechanical joint, ANSI A21.11/AWWA C111
 - 3) Flanged joint, ANSI B16.1, B.16.2 and A21.10/AWWA C110
 - 4) Flanged joint (threaded flanges), ANSI B2.1
2. Polyvinyl Chloride (PVC) Water Pipe: Pipe size shall be 6" through 12" only, AWWA C905, rated DR 18 (Class 150), continually marked as required. Pipe sizes 16" through 24" may be used for transmission lines; no house service taps/laterals are allowed in these sizes. Pipe shall be DR-18 only, conforming to the requirements of AWWA C905
 - a. Elastomeric gaskets and lubricant: ASTM D1869 and F477 for smaller pipes.
 - b. Pipe joints: Integrally molded bell ends, ASTM D3139.

2.2 VALVES

- A. Gate Valves, 3-Inches and Larger:
 1. Manufacturer and Model: Mueller Resilient Wedge Gate Valves or approved equal.
 2. AWWA C509, iron body, non-rising stem with square nut, single wedge, resilient seat, flanged or mechanical joint ends, control rod, post indicator where indicated on Construction Drawings, extension box and valve key.
- B. Ball Valves, 3-Inches and Smaller:
 1. Manufacturer and Model: Mueller Oriseal or approved equal.
 2. Brass body, teflon coated brass ball, rubber seats and stem seals, Tee stem pre-drilled for control rod, AWWA compression inlet end, compression outlet with electrical ground connector, with control rod, extension box and valve key.
- C. Butterfly Valves, From 2-Inch to 24-Inch: AWWA C504, Iron body, bronze disc, resilient replaceable seat, water or lug ends, infinite position lever handle.
- D. Check Valves, Post Indicator Valves, And Backflow Preventers: Refer to Section 13900 - Fire Suppression.
- E. Mark manufacturer's name and pressure rating on valve body.

2.3 FIRE HYDRANTS

- A. Fire Hydrants: Type as required by utility company/Local Fire Department and as shown on Construction Drawings.
- B. Hydrant Extensions: Fabricate in multiples of 6-inches with rod and coupling to increase barrel length.
- C. Hose and Steamer Connections: Match sizes with utility company, with two hose nozzles, one pumper nozzle.
- D. Finish: Apply primer and 2 coats of enamel or special coating to color as required by utility company.

2.4 ACCESSORIES

- A. Thrust Blocking: Place 2500 psi concrete to provide sufficient bearing area to transmit unbalanced thrust from bends, tees, caps, or plugs to undisturbed soil without loading undisturbed soil in excess of 2,500 pounds per square foot when water main pressure is 100 psi.

MINIMUM THRUST BLOCKING BEARING AREAS

Pipe Diameter	Tees Sq. Ft	90° Bend Sq. Ft	45° Bend Sq. Ft	22½° Bend Sq. Ft.	11¼° Bend Sq. Ft.	5 5/8 Bend Sq. Ft.	Cap/Plug Sq. Ft.
3"	1.0	1.0	1.0	1.0	1.0	1.0	1.5
4"	1.0	1.0	1.0	1.0	1.0	1.0	2.0
6"	1.5	2.0	1.0	1.0	1.0	1.0	3.0
8"	2.5	3.5	1.8	1.0	1.0	1.0	4.0
10"	4.0	5.5	2.8	1.5	1.0	1.0	6.0
12"	6.0	8.0	4.0	2.0	1.5	1.0	8.5
14"	8.0	11.0	5.5	3.0	2.0	1.5	12.0
16"	10.0	14.2	7.0	4.0	3.0	2.5	15.0
18"	21.0	21.0	12.0	6.0	4.0	3.5	24.0

- B. Locked mechanical joint fittings shall be installed where vertical changes in direction are required and, if approved by Owner and governing authority, can be installed in lieu of above thrust blocking requirements.
- C. Polyethylene Encasement: Single layer of two ply cross-laminated high density polyethylene encasement per AWWA C105, Section 4.1.2, Type III, Class C (Black), Grade 33, tensile strength 5,000 psi minimum, elongation 100 percent, thickness nominal 0.004 inch (4 mil).
- D. Trace Wire: Magnetic detectable conductor, (#12 Copper) brightly colored plastic covering imprinted with “Water Service” in large letters.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that building service connection and municipal utility water main size, location, and depth are as indicated on Construction Drawings.

3.2 PREPARATION

- A. Ream pipe and tube ends and remove burrs.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare pipe for connections to equipment with flanges or unions.
- D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

3.3 TRENCHING AND BEDDING

- A. Excavate pipe trench and place bedding material in accordance with Section 02300.

3.4 INSTALLATION – GENERAL

- A. Perform installation in accordance with utility company or municipality requirements which shall take precedence over requirements stated herein when difference exists.

3.5 INSTALLATION - PIPE AND FITTINGS

- A. Maintain separation of water main from sanitary and storm sewer piping in accordance with state or local codes.
- B. Install ductile iron pipe and fittings in accordance with AWWA C600.
- C. Install PVC pipe and fittings in accordance with AWWA C605.
- D. Ductile iron pipe and fittings shall be installed with polyethylene encasement around the pipe for the entire length of the project except where water main is within steel casing or is concrete encased. Install polyethylene encasement in accordance with AWWA C105, Method A.
- E. Install pipe to allow for expansion and contraction without stressing pipe or joints or as specified by pipe manufacturer.
- F. Install access fittings in accordance with local codes to permit disinfection of water system performed under this Section.
- G. Connections with Existing Pipelines: Where connections are made between new work and existing piping, make connection using suitable fittings for conditions encountered. Make each connection with existing pipe at time and under conditions with least interference with operation of existing pipeline and in compliance with local utility company.
- H. Form and place concrete for thrust blocks or other specified methods of retainage at each change of direction or end of pipe main.
- I. Place pipe to depth in accordance with Section 02300.
- J. Backfill trench in accordance with Section 02300.
- K. Install trace wire continuous over top of non-metal pipe. Bury a minimum of 6 inches below finish grade, and above pipeline.

3.6 INSTALLATION - VALVES AND HYDRANTS

- A. Install gate valves as indicated on Construction Drawings. Support valve on concrete pads with valve stem vertical and plumb. Install valve boxes in manner that will not transmit loads, stress, or shock to valve body. Center valve box over operating nut of valve vertical and plumb. Securely fit valve box together leaving cover flush with finished surface.
- B. Install fire hydrant assemblies as indicated on Construction Drawings in vertical and plumb position with steamer/pumper nozzle pointed perpendicular to traffic where hydrant is adjacent to street, roadway, or parking lot drive or toward protected building unless otherwise directed by local authorities. Support hydrant assembly on concrete pad and firmly brace on side opposite inlet pipe against undisturbed soil and concrete blocking. Place minimum of 6-cubic feet of crushed stone or gravel around hydrant base and barrel after thrust blocking has cured at least 24 hours. Maintain vertical position of hydrant backfilling and compacting.

3.7 FLUSHING OF PIPING

- A. Thoroughly flush underground piping from the water supply to the system riser, and lead-in connections to the system riser, before the connection is made to downstream fire protection system piping. Continue flushing for sufficient time to ensure through cleaning.
- B. The minimum rate of flow shall be not less than one of the following:
 1. 1,560 GPM for 8 in. piping; 2,440 GPM for 10 in. piping; and 3,520 GPM for 12 in. piping.
 2. Maximum flow rate available to the system under fire conditions.
 3. When supply cannot produce stipulated flow rates, obtain maximum available.

3.8 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM

- A. Perform disinfection of potable lines in accordance with AWWA C651.
- B. Disinfect distribution system with chlorine before acceptance for domestic operation. Chlorine dosage shall be not less than 50 parts per million. Flush lines before introduction of chlorinating materials and after contact period of not less than 24 hours. Flush with clean water after contact period until residual chlorine content is not greater than 1.0 part per million. Flush water discharged from water supply lines or hydrants shall not be allowed to discharge directly onto exposed soil or turf which could result in erosion of soil. If potential for erosion exists at discharge point, measures shall be taken to prevent erosion. Open and close valves in lines being disinfected several times during contact period. After disinfection, take water sample and bacteriological test in accordance with AWWA C651. Do not place distribution system in service until approval is obtained from local governing authorities.
- C. Provide a means of neutralizing the super-chlorinated water before releasing into the environment. This may be accomplished by either a method of dechlorination, direct release into a detention area approved by Wal-Mart, or any method acceptable to federal, state, and local codes. Direct release to open ground shall not be allowed, unless contained within an onsite detention facility with 6" permanent storage. In this case, the Contractor shall time the release to assure that no rainstorms are imminent. The intent of this condition is to allow the majority of the chlorine to evaporate into the atmosphere before a rainstorm has the opportunity to wash the residual downstream. Contractor shall not release super-chlorinated water directly into the sanitary sewer system, private or public, nor any storm drain system not directly discharging into the detention facility.

3.9 SERVICE CONNECTIONS

- A. Provide water service connection in compliance with utility company requirements including reduced pressure backflow preventer (if required) and water meter with by-pass valves and sand strainer.

3.10 FIELD QUALITY CONTROL

- A. Test water distribution system pipe installed below grade and outside building in accordance with the following procedures:
 1. Perform testing of pipe materials, joints, and other materials incorporated into construction of water mains and force mains to determine leakage and water tightness. In the event state or local code requires more stringent test, more stringent test shall take precedence.
 2. Conduct piping tests before joints are covered and after concrete thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water. Hydrostatically test at 200 psi, or 50 psi in excess of the system working pressure, whichever is greater, and shall maintain that pressure at +/- 5 psi for 2 hours. Increase pressure in 50-psig increments and inspect each joint between increments. Hold at test pressure for 1 hour; decrease to 0 psig. Slowly increase again to test pressure and hold for 1 more hour. Maximum allowable leakage shall be 2 quarts per hour per 100 joints. Remake leaking joints with new materials and repeat test until leakage is within allowed limits.
 3. Provide the completed Contractor's Material And Test Certificate For Underground Piping included at the end of this Section.
- B. Prepare reports of testing activities.

SECTION 02535 (33 3000) - SANITARY SEWAGE SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Sanitary sewer drainage piping, fittings, accessories, cleanouts, and bedding.
2. Connection of site sanitary sewer system to municipal sanitary sewer systems.

B. Related Requirements:

1. Section 02300 – Earthwork: Trenching, backfill, and compaction for utilities
2. Section 02536 - Sewer Manholes, Frames, and Covers
3. Section 03310 – Cast-in-place Structural Concrete

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. ASTM International (ASTM):

1. ASTM A74 - Cast Iron Soil Pipe and Fittings
2. ASTM A746 - Ductile Iron Gravity Sewer Pipe
3. ASTM C425 - Compression Joints for Vitrified Clay Pipe and Fittings
4. ASTM C564 - Rubber Gaskets for Cast Iron Soil Pipe and Fittings
5. ASTM C700 - Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated
6. ASTM D2241 - Poly (vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series)
7. ASTM D2657 - Heat-Joining Polyolefin pipe and Fittings
8. ASTM D3034 - Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings
9. ASTM D3035 - Polyethylene (PE) Plastic Pipe Using Flexible Elastomeric Seals
10. ASTM D3139 - Joints for Plastic Pressure Pipe Using Flexible Elastomeric Seals
11. ASTM D3261 - Butt Heat Fusion Polyethylene (PE) Plastic Fittings For Polyethylene Plastic Pipe And Tubing
12. ASTM F477 - Elastomeric Seals (Gaskets) for Joining Plastic Pipe
13. ASTM F1417 - Standard Test Method for Installation Acceptance of Plastic Gravity Sewer Lines Using Low-Pressure Air.

C. American Water Works Association (AWWA):

1. AWWA C111 - Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings
2. AWWA C600 - Ductile-Iron Water Mains And Their Appurtenances
3. AWWA C900 - Polyvinyl Chloride (PVC) Pressure Pipe, 4 In. Through 12 In, For Water Distribution
4. AWWA C901 - Polyethylene (PE) Pressure Pipe, Tubing And Fittings 1/2 Inch Through 3 Inches, For Water Distribution
5. AWWA C906 - Polyethylene (PE) Pressure Pipe And Fittings, 4 Inch Through 63 Inch, For Water Distribution

D. City of Stockton Standard Specifications

1.3 SUBMITTALS

A. Project Record Documents:

1. Accurately record actual locations of pipe runs, connections, cleanouts, and invert elevations.
2. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

1.4 PROJECT CONDITIONS

02535-1

- A. Coordinate work with termination of sanitary sewer connection outside building and connection to municipal sewer utility service.

PART 2 - PRODUCTS

2.1 SEWER PIPE, FITTINGS, AND JOINTS

- A. Polyvinyl Chloride Pipe (PVC): ASTM D 3034, rated SDR 26 unless otherwise specified by the utility company. Pipe shall be continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D 3034 classification.
 - 1. Pipe joints: Integrally molded bell ends, ASTM D 3034, Table 2, with factory supplied elastomeric gaskets and lubricant.
- B. Vitrified Clay Pipe (VCP): ASTM C700: Use only if required by local jurisdiction.
 - 1. Fittings: ASTM C700
 - 2. Joints: ASTM C425
 - 3. Gaskets: ASTM C425. Gaskets shall be manufactured from high grade, properly vulcanized elastomeric compound consisting of either basic natural or synthetic rubber. Gasket manufacturing tolerances shall comply with Rubber Manufacturer's Association tolerances for gaskets.
 - 4. Lubricant: Suitable for lubricating joint components; no deteriorating effects on gasket or pipe material, will not support growth of fungi or bacteria, and shall be of type recommended by gasket manufacturer.

2.2 PIPE ACCESSORIES

- A. Pipe Joints: Mechanical clamp ring type, stainless steel expanding and contracting sleeve, neoprene-ribbed gasket for positive seal.
- B. Fittings: Same material as pipe molded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps, etc.

2.3 CLEANOUTS AND MANHOLES

- A. Manholes shall conform to Section 02536.
- B. Lid and Frame: Provide in accordance with Section 02536. Provide traffic grade and rated covers and frames where cleanouts and manholes are within pavement, with the letters "SSCO" or "SANITARY SEWER" respectively cast into the cover.
- C. Shaft Construction: Cast iron shaft of internal diameter as specified on Construction Drawings with 2500 psi concrete collar for cleanouts.

2.4 APPURTENANCES

- A. Trace Wire: Magnetic detectable conductor (#12 copper), brightly colored plastic covering, imprinted with "Sanitary Sewer Service" in large letters.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Construction Drawings.

3.2 PREPARATION

- A. Hand trim excavations to required elevations. Correct over excavation with bedding material.

- B. Remove large stones or other hard matter that could damage pipe or impede consistent backfilling or compaction.

3.3 BEDDING

- A. Excavate trench and place bedding material in accordance with Section 02300.

3.4 INSTALLATION - PIPE

- A. Install type and class of pipe as shown on the drawings. Pipes shall be laid and maintained to the required line and grade with necessary fittings, bends, manhole risers, cleanouts and other appurtenances placed at the required locations. The pipe shall be installed with uniform bearing under the full length of the barrel of the pipe. The pipe shall be inspected for defects and cracks before being lowered into the trench. Defective, damaged or unsound pipe, or pipe that has had its grade disturbed after laying shall be taken up and replaced. Commence installation at lowest point with the bell end upgrade.
- B. No pipe shall be laid in water or when trench conditions are unsuitable for work.
- C. Pipe connecting to manholes or other structures shall terminate flush inside of the structure wall.
- D. Joints for PVC and CISP shall be thoroughly lubricated with an approved lubricant before pipe sections are slipped together. Open ends shall be fully protected with a stopper to prevent earth or other material from entering the pipe during construction. Carefully free interior of the pipe from dirt, cement and other deleterious material as the work progresses.
- E. Maintain separation of potable water main from sewer piping at crossings a minimum of 10 feet horizontal and 18 inches vertical.
- F. Install HDPE piping and fittings to AWWA C901 and C906. Butt fusion welded per ASTM D3261.
- G. Route pipe in straight line parallel to roads, buildings and adjacent utilities and as shown on the drawings.
- H. Establish elevations of buried piping with sufficient cover as recommended by pipe manufacturer to ensure not less than 3 feet of cover, except as noted on drawings.
- I. Form and place concrete for thrust blocks at each elbow of pipe force main. See construction drawing for details of construction.
- J. Backfill trench in accordance with Section 02300.
- K. Install trace wire continuous over top of non-metal pipe. Bury 6 inches minimum below finish grade, above pipe-line.

3.5 INSTALLATION – CLEANOUTS AND MANHOLES

- A. Form bottom of excavation clean and smooth to correct elevation.
- B. For cleanouts, form and place cast-in-place concrete base pad with provision for sanitary sewer pipe to be installed to proper elevations.
- C. For manholes, construct inverts according to the following guidelines:
 - 1. Invert channel shall be smooth and accurately shaped to a semicircular bottom to match with the inside of the adjacent sewer section.
 - 2. Invert channels and structure bottoms shall be shaped with mortar and lean concrete.
 - 3. Changes in size and grade of invert shall be made gradually and evenly.
 - 4. Changes in the direction of the sewer entering branch or branches shall have a true curve of as large a radius as the manhole will permit.

- D. For manholes, provide manhole rings, frame, and cover as shown on the construction drawings.

3.6 FIELD QUALITY CONTROL

- A. Field quality control shall be conducted by the Contractor in accordance with Section 01452.
- B. Pipes and joints shall not be completely backfilled until after inspection, testing, and approval by the Owner and local jurisdiction.
- C. Prior to testing for leakage, the pipe trench shall be backfilled to at least the spring line of the pipe. If required to prevent pipe movement during testing, additional backfill shall be added leaving the pipe joints uncovered to permit inspection.
- D. Air Pressure Exfiltration Test: Gravity systems shall be air tested between manholes at 3.5 psi for 5 minutes per ASTM F1417 for plastic pipes.
 - 1. Each section of sewer line between successive manholes shall be tested by plugging the upper and lower ends of the line using pneumatic plugs.
 - 2. The sewer line shall be filled to an air pressure of 4 psi and held for two minutes to allow for stabilization of the air pressure meter. After meter stabilization, the pressure shall be reduced to 3.5 psi and held for 5 minutes per ASTM F-1417 for plastic pipe.
 - 3. The allowable net pressure drop will be 0.5 psi
 - 4. An example Air Pressure Exfiltration Test Report is included in Appendix A. This form contains the minimum air pressure exfiltration testing and reporting standards to meet owner requirements. Contractor shall ensure minimum requirements of applicable AHJs are also performed and recorded.
 - 5. Report shall include photographs taken by the contractor during testing.
- E. Deflection Test:
 - 1. Deflection tests shall be conducted on all plastic pipe using a mandrel with a diameter equal to 95 percent of the inside diameter of the pipe. The test shall be performed without mechanical pulling devices.
 - 2. Allowable Deflection: Maximum allowable pipe deflection shall not exceed 5 percent of nominal inside diameter.
 - 3. Mandrel: Mandrel, go/no-go, device shall be cylindrical in shape and constructed with either 9 or 16 evenly spaced arms or prongs. Mandrels with fewer arms will be rejected as not sufficiently accurate. Contact length of mandrel's arms shall equal or exceed nominal inside diameter of sewer to be inspected. Critical mandrel dimensions shall carry tolerance of 0.01-inch maximum. Contractor shall provide mandrel and necessary equipment for mandrel test.
 - 4. Procedure: Mandrel shall be hand-pulled through flexible pipe sewer lines no earlier than 30 days after trench has been completely backfilled. Sections of sewer not passing mandrel shall be uncovered and rebedded, rerounded, or replaced to satisfaction of Owner or governing agency. Repaired section shall be retested.
 - 5. An example Deflection Test Report is included in Appendix A. This form contains the minimum deflection testing and reporting standards to meet owner requirements. Contractor shall ensure minimum requirements of applicable AHJs are also performed and recorded.
 - 6. Report shall include photographs taken by the contractor during testing.
- F. Hydrostatic Test: Force main piping shall be hydrostatically tested at 150 psi in accordance with AWWA C 600.
- G. Provide measuring devices, meters, water, materials, and labor for making the required tests.
- H. Tests shall be conducted in the presence of the Construction Manager or his designee. Test data shall be submitted to the Engineer for review and approval.
- I. All testing shall be completed prior to placing any line in service. The contractor shall be responsible for the safety of all participants and shall follow all OSHA mandated guidelines, including those for Confined Space Entries.

- J. The Design Engineer is required to provide certification that the sewer system has been installed as per the plans and specifications prior to final acceptance. The contractor must adhere to the following requirements in order for the Engineer to provide the required certification:
1. Submit a construction schedule to the Engineer a minimum of 14 days prior to beginning the sewer line construction.
 2. Do not begin public sewer line construction without the Engineer's representative on site.
 3. Do not cover any section of the sewer line that has not been inspected by the Engineer's representative.
 4. Provide all backfill density test results, as taken by the owner's on site testing laboratory and by the general contractor, to the Engineer.
 5. Perform required final exfiltration and deflection tests for gravity lines and pressure and leakage tests for force main in accordance with the Contract Documents. It shall be the Contractor's responsibility to ensure that all tests have been successfully performed prior to requesting the presence of the Engineer's representative for observation of the final tests.
 6. Provide written results, of all required tests, to the Engineer.
 7. Provide an as-built survey of the sewer system improvements, certified by a licensed surveyor, and which shows both horizontal and vertical alignment, to the Engineer.

SECTION 02536 (33 3913) - SEWER MANHOLES, FRAMES, AND COVERS

PART 1 - GENERAL

1.1 SUMMARY

1.2 Section Includes:

1. Monolithic concrete, modular precast concrete, masonry, and precast polyethylene manhole assemblies.

1.3 Related Requirements:

1. Section 01351 – Regulatory Compliance:
 - a. Disposal and removal of construction and universal waste.
 - b. Work practice control methods for airborne respirable dust.
2. Section 02300 - Earthwork. Excavation, backfill, and compaction.
3. Section 02535- Sanitary Sewer Systems.
4. Section 02630 - Storm Drainage.

1.4 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.
- B. ASTM International (ASTM):
 1. ASTM A48 - Gray Iron Castings.
 2. ASTM C55 - Concrete Building Brick.
 3. ASTM C94 - Ready Mixed Concrete.
 4. ASTM C478 - Precast Reinforced Concrete Manhole Sections.
 5. ASTM C990 - Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants
 6. ASTM D1248 - Polyethylene Plastics Molding and Extrusion Materials.
 7. ASTM D2412 - Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading.
- C. International Masonry Industry All-Weather Council (IMIAC):
 1. Recommended Practices and Guide Specification for Cold Weather Masonry Construction.
- D. Occupational Safety and Health Administration (OSHA):
 1. OSHA 01926.1153 Respirable Crystalline Silica.
- E. State of California Department of Transportation (CALTRANS):
 1. 2018 Standard Specifications
- F. City of Stockton Standard Specifications

1.5 ENVIRONMENTAL REQUIREMENTS

- A. Minimize dust emissions and provide equipment that suppresses dust when cutting concrete or masonry.

1.6 SUBMITTALS

- A. Shop Drawings: Indicate reference to Construction Drawings of manhole locations, elevations, piping with sizes, locations, and elevations of penetrations.

B.

PART 2 - PRODUCTS

2.1 MANHOLES

- A. Precast Concrete: Reinforced precast concrete barrel.
1. Manhole Sections: ASTM C478.
 2. Joints and Joint Sealant: Joint between manhole barrel sections shall conform to ASTM C990 using preformed flexible joint sealant.
 3. Pipe Connection Sealant: Joint material between manhole barrel and adjoining pipe shall be as shown on the drawings.
 4. Construct manholes of precast concrete sections as required by Construction Drawings to size, shape, and depth indicated.
 5. All sanitary manholes are to be tested for water tightness in accordance with ASTM C969 "Standard Practice for Infiltration and Exfiltration Acceptance Testing of Installed Precast Concrete Pipe Sewer Lines", or ASTM C1244 "Standard Test Method for Concrete Sewer Manholes by the Negative Pressure (Vacuum) Test".
- B. Mortar and Grout: Mortar for finishing and sealing shall be Class "C". Honeycombing less than 2-inches deep shall be repaired using Class "D" mortar.
- C. Brick Transition Reinforcement: Formed steel 8-gauge wire with galvanized finish.
- D. Configuration:
1. Barrel Construction: Concentric with eccentric cone top section.
 2. Shape: Cylindrical.
 3. Clear Inside Dimensions: 48-inches diameter minimum or as indicated on Construction Drawings.
 4. Design Depth: As indicated on Construction Drawings.
 5. Clear Lid Opening: 22-inches minimum.
 6. Pipe Entry: Provide openings as indicated on Construction Drawings.
 7. Main and Lateral Pipes: Neatly cut off main and lateral pipes flush with inside of manhole or inlet where they enter structure walls. Point up irregularities and rough edges with nonshrinking grout.
- E. Inverts: Shape inverts for smooth flow across structure floor as indicated on Construction Drawings. Use concrete and mortar to obtain proper grade and contour. Finish surface with fine textured wood float.

2.2 COMPONENTS

- A. Lid and Frame:
1. Manufacturer: One of the following or approved equal:
 - a. Bass & Hays Foundry.
 - b. Deeter Foundry, Inc.
 - c. East Jordan Iron Works.
 - d. Neenah Foundry.
 - e. U.S. Foundry & Manufacturing
 2. ASTM A48, Class 30B minimum, heavy duty cast iron construction, machined flat bearing surface.
 3. Removable lid, closed or open as indicated on Construction Drawings, with sealing gasket.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify items specified by other Sections are properly sized and located.

- B. Verify that built-in items are in proper location and ready for roughing into work.
- C. Verify that the excavation for manholes is correct.

3.2 PREPARATION

- A. Coordinate placement of inlet and outlet pipe or duct sleeves as indicated on Construction Drawings.

3.3 PRECAST MANHOLE CONSTRUCTION

- A. Place base pad to proper elevation and location and trowel top surface level for placement of manhole barrel.
- B. Place manhole barrel plumb and level to correct elevations and anchor to base pad.
 1. After completion of slab foundation, lower first joint of manhole barrel into position, grooved end first, and set level and plumb on concrete base. Align and adjust to proper grade prior to placing and forming invert. Pour invert immediately after setting of first section of manhole barrel.
 2. Prior to setting subsequent manhole barrel sections, apply primer to tongue and groove ends and allow to set in accordance with manufacturer's recommendations. Place joint sealant on tongue end. Lower next section into position, and remove excess material from interior of structure. Add additional material on exterior of joint, if necessary, for completely watertight joint.
- C. Set cover frames and lids level without tipping, to correct elevations. Utilize pre-cast rings or brick and mortar to achieve final rim elevation. Maximum limit, 4 courses.

3.4 FIELD QUALITY CONTROL

- A. Vacuum Test: All sanitary sewer manholes shall be vacuum tested in accordance with ASTM C1244-11, Standard Test Method for Concrete Sewer Manholes by the Negative Air Pressure (Vacuum) Test.
 1. Plug all manhole entrances and exits other than the manhole top access using suitably sized pneumatic or mechanical pipeline plugs and follow all manufacturer's recommendations and warnings for proper and safe installation of such plugs. Plugs should be inserted a minimum of 6" beyond manhole wall.
 2. Install the vacuum tester head assembly at the top access of manhole. (If using a "plate" style manhole tester, position the plate on the manhole ring assembly.)
 3. Attach the vacuum pump assembly to the proper connection on the test head assembly. Make sure the vacuum inlet/outlet valve is in the closed position.
 4. Following safety precautions and manufacturer's instructions, inflate sealing element to the recommended maximum inflation pressure.
 5. Start the vacuum pump and allow pre-set RPM to stabilize.
 6. Open the inlet/outlet ball valve and evacuate the manhole to 10" Hg. (approximately negative 5 psig, 0.3 bar).
 7. Close vacuum inlet/outlet ball valve and monitor vacuum for specified test period (see table). If vacuum does not drop in excess of 1" Hg., manhole is considered acceptable and the manhole passes the test. If manhole fails the test, complete necessary repairs and repeat test procedures until satisfactory results are obtained.
 8. Manholes in asphalted areas cannot be tested until subbase for asphalt has been stabilized.
 9. An example Vacuum Test Report is included in Appendix A. This form contains the minimum vacuum testing and reporting standards to meet owner requirements. Contractor shall ensure minimum requirements of applicable AHJs are also performed and recorded.
 10. Report shall include photographs taken by the contractor during testing.

END OF SECTION

SECTION 02630 (33 4000) - STORM DRAINAGE

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Storm sewer drainage piping, fittings, and accessories.
2. Storm drainage structures.

1.2 Related Requirements:

1. Section 02300 – Earthwork: Excavation, trenching, backfill, and compaction.
2. Section 02370 – Erosion and Sedimentation Control (Including SWPPP).
3. Section 02536 - Sewer Manholes, Frames, and Covers.
4. Section 03310 – Structural concrete and exterior Concrete Slabs: Materials for concrete: See Architectural / Building Specifications.
5. Section 03311 – Sitework Structural Concrete: Requirements and installation for concrete for storm drainage structures included in this Section.
6. Appendix B – Testing, Inspection, and Observation by Owner (includes 01456 CEC Site Observation Requirements).

1.3 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. American Association of State Highway and Transportation Officials (AASHTO):

1. AASHTO M 170 – Reinforced Concrete Culvert, Storm Drain and Sewer Pipe.
2. AASHTO M 190 - Bituminous Coated Corrugated Metal Culvert Pipe and Arches.
3. AASHTO M 252 - Corrugated Polyethylene Drainage Tubing, 3 to 10 Inch Diameter.
4. AASHTO M 294 - Corrugated Polyethylene Drainage Tubing, 12 to 60 Inch Diameter.
5. AASHTO M 306 - Drainage, Sewer, Utility, and Related Casting
6. AASHTO M 330 - Polypropylene Pipe, 300- to 1500-mm (12- to 60-in) Diameter

C. ASTM International (ASTM):

1. ASTM A 74 - Cast Iron Soil Pipe and Fittings.
2. ASTM A 185 - Steel welded Wire Fabric, Plain, for Concrete Reinforcement.
3. ASTM A 615 - Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
4. ASTM A 674 – Polyethylene Encasement for Ductile Iron Pipe for Water or Other Liquids.
5. ASTM A 746 - Ductile Iron Gravity Sewer Pipe.
6. ASTM A 760 - Corrugated Steel Pipe, Metallic-Coated For Sewers And Drains.
7. ASTM A 796 - Structural Design Of Corrugated Steel Pipe, Pipe-Arches, And Arches For Storm And Sanitary Sewers And Other Buried Applications.
8. ASTM A 798 - Factory-Made Corrugated Steel Pipe For Sewers And Other Applications.
9. ASTM A 929 - Steel Sheet, Metallic-Coated By The Hot-Dip Process For Corrugated Steel Pipe.
10. ASTM C 76 - Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
11. ASTM C 150 - Portland Cement.
12. ASTM C 206 - Finished Hydrated Lime.
13. ASTM C 443 - Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.
14. ASTM C 564 - Rubber Gasket for Cast Iron Soil Pipe and Fittings.
15. ASTM C 924 - Testing Concrete Pipe Sewer Lines by Low-Pressure Air Test Method.
16. ASTM C 969 - Infiltration and Exfiltration Acceptance Testing of Installed Precast Concrete Pipe Sewer Lines.
17. ASTM C 990 - Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants.

18. ASTM C 1628 – Joints for Concrete Gravity Flow Sewer Pipe, Using Rubber Gaskets.
19. ASTM D 2321 - Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity Flow Applications
20. ASTM D 3034 - Type PSM Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.
21. ASTM D 3212 - Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
22. ASTM F 477 - Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
23. ASTM F 949 - Poly (Vinyl Chloride)(PVC) Corrugated Sewer Pipe with Smooth Interior and Fittings.
24. ASTM F 1417 - Installation Acceptance of Plastic Gravity Sewer Lines Using Low-Pressure Air.
25. ASTM F 2306 - 12 to 60 Annular Corrugated Profile Wall Polyethylene (PE) Pipe and Fittings for Gravity-Flow Storm Sewer and Subsurface Drainage Applications.
26. ASTM F 2487 – Infiltration and Exfiltration Acceptance Testing of Installed Corrugated High Density Polyethylene Pipelines.
27. ASTM F 2736 - 6 to 30 in. (152 to 762 mm) Polypropylene (PP) Corrugated Single Wall Pipe and Double Wall Pipe.
28. ASTM F 2764 - 30 to 60 in. Polypropylene (PP) Triple Wall Pipe and Fittings for Non-Pressure Sanitary Sewer Applications.
29. ASTM F 2881 - 12 to 60 in. Polypropylene (PP) Dual Wall Pipe and Fittings for Non-Pressure Storm Sewer Applications

D. American Concrete Institute (ACI):

1. ACI 301 - Structural Concrete for Buildings.

E. UNI-Bell PVC Pipe Association:

1. UNI-B-6 – Recommended Practice for Low-Pressure Air Testing of Installed Sewer Pipe.

F. City of Stockton Standard Specifications

G. State of California Water Code, latest edition

1.4 SUBMITTALS

A. Project Record Documents:

1. Accurately record actual locations of pipe runs, connections, catch basins, cleanouts, and invert elevations. Prepare and provide any required record drawings to the utility company or municipality.
2. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

1.5 PROJECT CONDITIONS

- A. Coordinate work with termination of storm sewer connection outside building including connection to municipal storm sewer system.

PART 2 - PRODUCTS

2.1 PIPE AND FITTINGS

- A. Pipe and joint materials specified below for storm drainage shall be strictly limited to the extent shown or allowed on the drawings or as specified in Part 3 hereinafter. Metal conduits including corrugated metal pipe will not be acceptable in closed conduit system.
- B. Reinforced Concrete Pipe (RCP): ASTM C 76, Class III unless noted otherwise on Drawings.
1. Joint Material: Provide joints to the extent allowable in Part 3 Joints.
 - a. Rubber O-ring Gasket: ASTM C 443, ASTM C 1628.
 - b. Bitumen or Butyl-Rubber Sealant: ASTM C990.
 2. Flared End Sections: ASTM C 76 or, for sections with toe wall, AASHTO M 170.
 3. Conforming to California Department of Transportation Standard Specifications, Section 65.
- C. Ductile Iron Pipe (DIP): ASTM A 746.

09900-2

1. Fittings: Cast iron, ASTM A 74.
 2. Joint Material: Rubber Gasket, ASTM C 564 for compression joints.
- D. Polypropylene Pipe (PP): AASHTO M 330, ASTM F 2881, F2736, and F2764. Use only where specifically indicated on Drawings.
1. Joint Material: As shown in table in Part 3 for the type of joint allowed.
 - a. Rubber Gasket: ASTM F477
 - b. Rubber Gasket Joints: ASTM 3212.
- E. High Density Polyethylene Pipe (HDPE): AASHTO M 252 Type S or SP, M 294 Type S or SP, or ASTM F 2306 smooth interior/annular exterior. Use only where specifically indicated on Drawings.
1. Joint Material: As shown in table in Part 3 for the type of joint allowed.
 - a. Rubber Gasket: ASTM F477
 - b. Rubber Gasket Joints: ASTM 3212.
 - c. Corrugated Coupling Bands: As recommended by manufacturer.
- F. Polyvinyl Chloride (PVC) Pipe: ASTM D 3034, rated SDR 35, or ASTM F 949 for Profile Pipe, continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D3034 classification. Only permitted when specifically indicated on Drawings.
1. Joint Material: As shown in table in Part 3 for the type of joint allowed.
 - a. Rubber Gasket: ASTM F477
 - b. Rubber Gasket Joints: ASTM 3212.
- G. Corrugated Steel (Metal) Pipe (CSP or CMP): ASTM A 760, pipe gauge shall be as shown on the drawings. Galvanized, aluminized (Type 1R), or bituminous coated as specified on Drawings. Use only where specifically indicated on Drawings. Corrugated steel pipe may be round pipe, arch pipe, or slotted drainpipe as indicated on Drawings. Slotted drainpipe shall have 1.75-inches wide drain waterway openings and 6 inches minimum height drain guide.
1. CSP, bands and appurtenances shall be uniformly coated inside and outside with a 0.05 inch minimum thickness bituminous coating in accordance with AASHTO M 190.
 2. CSP shall be supplied with paved inverts or fully lined to provide a smooth interior, smooth flow lining only as indicated on the drawings.
 3. Joint Material:
 - a. Semi-corrugated "Hugger" type bands and "O" ring gaskets.
 - b. Semi-corrugated "Hugger" type bands.
- H. Spiral Rib Metal Pipe: ASTM A760 Type 1R or Type IIR. Coatings shall meet requirements of ASTM A 929 and shall be galvanized, aluminized, or bituminous coated as specified on Drawings. Use only where specifically indicated on Drawings.
1. Pipe gauge shall be as shown on the construction drawings. Standard corrugated steel pipe (CMP or CSP) shall not be substituted for Spiral Rib Metal Pipe.
 2. Acceptable manufacturers: Provide the following or approved equal:
 - a. Ultra Flo or Ultra Flo II by Contech, Inc.
 - b. Max Flow by Southeast Culvert, Inc.
 - c. Max Flow by St. Regis Culvert, Inc.
 - d. Max Flow by Thompson Culvert, Inc.
 3. Joint Material: Provide joints to the extent allowable in Part 3 Joints.
 - a. Semi-corrugated "Hugger" type bands and "O" ring gaskets.
 4. Semi-corrugated "Hugger" type bands.
- I. Subdrains: Perforated, PVC or flexible corrugated HDPE pipe as specified herein of the size indicated on the drawings.

2.2 ACCESSORIES

- A. Encasement for Piping: ASTM A 674. Where required for corrosion protection for underground iron pipe and fittings.

1. Material: High-density, crosslaminated polyethylene (PE) film of 0.004-inch (0.10-mm) minimum thickness.
2. Form: Sheet or tube.
3. Color: Black.

2.3 DRAINAGE STRUCTURES

- A. Manholes: Conform to Section 02536.
- B. Grates and Frames: Provide in accordance with details shown on Drawings or equivalent by one of the following acceptable manufacturers. Project needs vary depending on geographic region. To be connected with the best suited supplier, contact the manufacturer whose territory is nearest Project location.
 1. Acceptable Manufacturers:
 - a. South, Southeast, East Central: [US Foundry](#) (An Eagle Manufacturing Co.). Contact Roy Kohlier, (800) 432-9709 or (786) 402-3435. rkohlier@usfoundry.com
 - b. Central, West Central, and East of Mississippi River: EJ Infrastructure Access Solutions d/b/a. [East Jordan Iron Works](#). Contact Joe Lazzati, Director of Sales, (410)-833-6100; mobile (443) 324-4589. joe.lazzati@ejco.com.
 - c. West, Northwest, Southwest, West Central: [D&L Foundry and Supply](#) (801) 785-5015.
 - d. Central, North Central: [Deeter Foundry](#). (800) 234-7466. sales@deeter.com
 - e. Northeast: [Neenah Foundry](#). (800) 558-5075.
 2. Standard Grates and Frames: Heavy duty grates, AASHTO M 306 load rating of H-20, with maximum slot width of 1-1/8" and minimum width of 1". Where project and regional conditions allow, provide one of the following:
 - a. Model 4230V-3 Grate and Frame by East Jordan (WM custom design).
Model 2512-1002 Grate (2 required) and 2512-0010 Frame by Deeter (WM custom design).
 3. Siphonic Break Manhole Grate and Frame: Heavy duty grate, AASHTO M 306 load rating of H-20, with maximum slot width of 1/2" and minimum net open area of 1.5 square feet. Where project and regional conditions allow, provide the following:
 - a. Model R-2750 Grate and Frame by Neenah (WM custom design).
- C. Concrete: Cast-In-Place concrete for drainage structures including manholes, inlets, catch basins, collars, support blocks, headwalls and paved ditches shall conform to the concrete requirements specified in Section 03311.
- D. Cement Mortar used for paving inverts, filling lift holes, joints, patching and anchoring castings shall consist of one part Portland cement, type I, ASTM C 150, 1/4 part hydrated lime, ASTM C 206 and 2-1/2 parts clean, well-graded sand and water free of suspended matter, alkali, and containing no industrial or domestic waste.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Drawings.

3.2 PREPARATION

- A. Hand trim excavations to required elevations. Correct over-excavation with bedding material.
- B. Remove large stones or other hard matter that could damage piping or impede consistent backfilling or compaction.
- C. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

3.3 INSTALLATION – PIPE

- A. Install type of pipe shown on the drawings. Where type of pipe material is not shown or restricted on the drawings, provide only RCP or DIP. Installation provisions herein shall apply to the extent as applicable to the pipe and joints allowed.
- B. Inspect pipe for defects and cracks before being lowered into the trench, piece by piece. Remove and replace defective, damaged or unsound pipe or pipe that has had its grade disturbed after laying. Protect open ends with a stopper to prevent earth or other material from entering the pipe during construction. Remove dirt, excess water, and other foreign materials from the interior of the pipe during the pipe laying progress.
- C. Excavate pipe trench and place bedding material in accordance with Section 02300.
- D. Install pipe in accordance with manufacturer's written recommendations.
- E. Thermoplastic Pipe: Install pipe in accordance with pipe manufacturer's installation instructions and ASTM D 2321 and as indicated on the drawings.
- F. Corrugated or Spiral Rib Metal Pipe: Install as indicated on the drawings, as recommended by the manufacturer, and in accordance with ASTM A 798 and A 796 as they apply.
- G. HDPE Pipe: Install pipe in accordance with pipe manufacturer's installation Guidelines for Culvert Storm Drainage Applications and as indicated on the drawings.
- H. Install polyethylene corrosion-protection encasement around iron piping as indicated on the drawings, as recommended by the manufacturer, and in accordance with ASTM A 674.
- I. Commence installation at the lowest point for each segment of the route. Lay RCP with the groove or bell end upstream. Place riveted CSP with the inside circumferential laps pointing downstream. Repair damaged bituminous coating on CSP by applying bituminous material conforming to AASHTO M190.
- J. Lay pipe to the required line and slope gradients with the necessary fittings, bends, manhole, risers and other appurtenances placed at the required location as noted on Drawings.
- K. Do not displace or damage pipe when compacting.
- L. Do not place pipe in water or when trench conditions are unsuitable for such work.
- M. Joints: Construct joints as described herein and in accordance with manufacturer's installation instructions. Provide pipe joint type for soiltight, silttight, or watertight silttight or watertight only watertight joint performance in accordance with the following table. Rubber gasketed joints shall conform to ASTM D 3212. The table applies only to the extent as applicable to the pipe and joint type and the joint performance as shown or specified.

Pipe and Joint Type	Joint Performance		
	Watertight	Silttight	Soiltight
RCP			
Rubber O-Ring Gasket	x	x	x
Bitumen or Butyl Rubber Sealant			x
DIP			
Rubber Gasket	x	x	x
PP			
Rubber Gasket	x	x	x
HDPE			
Rubber Gasket	x	x	x
Corrugated Coupling Bands			x

09900-5

PVC			
Rubber Gasket	X	X	X
CMP or Spiral Rib Aluminum Pipe			
Hugger Band w/ O Ring Rubber Gasket		X	X
Hugger Band			X

3.4 INSTALLATION – MANHOLES, CATCH BASINS, INLETS, AND JUNCTION BOXES

- A. Construct drainage structures in accordance with details shown on Drawings and in accordance with Section 02536 as applicable.
- B. Precast Sections:
 - 1. Install precast section with bases in accordance with Section 02300 and 02536 or as shown on drawings.
 - 2. Align pipe openings to that of the pipe entering and leaving the manhole, etc. Properly Pipe with connections to manholes, etc. as shown on the drawings.
- C. Construction for Cast-In-Place sections as shown on the drawings and in accordance with the form requirements of Section 03311.
- D. Invert channels shall be smooth and accurately shaped to a semicircular bottom conforming to the inside of the adjacent sewer section. Shape invert channels and structure bottoms with cement mortar. Changes in size and grade of invert shall be made gradually and evenly. Changes in direction of the sewer entering branch or branches shall have a true curve of as large a radius as the manhole will permit.
- E. Frames and Covers:
 - 1. Set frames and covers to the proper elevation. Firmly embed frames in mortar approximately 1 inch thick and align to fit the top section of the structure.
 - 2. Limit bricks set in mortar and used to adjust the frame to finished grade to no more than four courses.
 - 3. Adjustment rings used to make adjustments in grade shall be made with the initial ring embedded in mortar and the exterior of the rings parge with mortar not less than 1/2 inch thick. No adjustment made in this manner shall exceed 8 inches.
- F. Construct concrete cradles as shown on the drawings and in accordance with the strength requirements of Section 03311 as needed when crossing over and under sewer pipe or utility lines.

3.5 SUBDRAINS

- A. Install subdrains in accordance with the details and at the locations shown on the drawings.

3.6 INSPECTION AND TESTING

- A. General:
 - 1. Clean, inspect, and test storm sewer systems and culverts, upon completion or at such time as directed. The system or culvert shall have a true grade and line. Actual elevations shall be within 0.08 feet of the elevations given on the drawings.
 - 2. After completion of the Work, or any part thereof, the job shall be tested to determine that it has been installed in accordance with the drawings and specifications. In general, the Work shall prove to be in good condition, installed in accordance with the drawings and specifications and ready for use.
- B. Cleaning and Testing:
 - 1. Visibly inspect and remove all debris and obstructions from storm pipe.
 - 2. Test for infiltration and exfiltration by hydrostatic testing per ASTM C 969. Manholes and concrete pipe shall conform to ASTM C 969 leakage criteria.

3. Test watertight joints in accordance with the requirements of jurisdictional authorities, UNI-B-6 and the following:
 - a. Option: Test plastic piping according to ASTM F 1417 or ASTM F 2487.
 - b. Option: Test concrete piping according to ASTM C 924 or ASTM C 969.
- C. Alignment Test: After backfill has been placed and compacted to a depth not less than one foot above top of pipe, a visual inspection shall be made by flashing a light between manholes. Correct displacement or misalignment of invert.

3.7 CIVIL ENGINEERING CONSULTANT (CEC) OBSERVATION

- A. Civil Engineering Consultant Observation: The Owner's Civil Engineering Consultant (CEC) will perform special observations as specified in Appendix B (Section 01456).

END OF SECTION

SECTION 02555 (33 5000) - NATURAL AND PROPANE GAS DISTRIBUTION

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
1. Pipe and fittings for site utility natural or propane gas distribution.
 2. Propane storage tanks and appurtenances.
 3. Connection of site natural gas system and private utility company system.
- B. Related Requirements:
1. Section 02300 – Earthwork: Trenching, backfill, and compaction for utilities

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.
- B. American Society of Mechanical Engineers (ASME):
1. ASME B16.3 - Malleable Iron Threaded Fittings
 2. ASME B16.11 -Forged Steel Fittings, Socket Welding and Threaded
 3. ASME B16.18 - Cast Copper Alloy Solder Joint Pressure Fittings
 4. ASME B16.22 - Wrought Copper and Copper Alloy Solder Joint Pressure Fittings
 5. ASME B31.8 - Gas Transmission and Distribution Piping Systems
 6. ASME S00081 – Boiler and Pressure Vessel Code, Sec VIII: Pressure Vessels
 7. ASME Q00090 - Boiler and Pressure Vessel Code, Sec. IX: Welding and Brazing Qualifications
 8. ASME Boiler and Pressure Code
- C. ASTM International (ASTM):
1. ASTM A53 - Pipe, Steel, Black and Hot-Dipped, Zinc Coated (Galvanized) Welded and Seamless
 2. ASTM A234 - Pipe Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperature
 3. ASTM B32 - Solder Metal
 4. ASTM B88 - Seamless Copper Water Tube
 5. ASTM D2513 - Thermoplastic Gas Pressure Pipe, Tubing, and Fittings
 6. ASTM D2517 - Reinforced Epoxy Resin Gas Pressure Pipe and Fittings
 7. ASTM D2683 - Socket-Type Polyethylene Fittings For Outside Diameter-Controlled Polyethylene Pipe and Tubing
 8. ASTM D 3261 - Butt Heat Fusion Polyethylene (PE) Plastic Polyethylene (PE) Plastic Pipe And Tubing
- D. American Welding Society (AWS):
1. AWS A5.8 - Brazing Filler Metal
- E. American Water Works Association (AWWA):
1. AWWA C105 - Polyethylene Encasement for Ductile-Iron Piping for Water and Other Liquids
- F. American National Standards Institute (ANSI):
1. ANSI B16.26 - Cast Copper Alloy Fittings for Flared Copper Tubes
 2. ANSI B31.2 - Fuel Gas Piping
- G. National Fire Protection Agency (NFPA):
1. NFPA 54 - National Fuel Gas Code

1.3 QUALITY ASSURANCE

02555-1

- A. Welding Materials and Procedures: Conform to ASME Boiler and Pressure Vessel Code and applicable state regulations.
- B. Welders Certification: In accordance with ASME Q00090, Sec IX.
- C. Conform to NFPA 54, ANSI B31.2, or ASME B31.8.

1.4 SUBMITTALS

- A. Project Record Documents:
 1. Accurately record actual locations of pipe mains, valves, connections, and top of pipe elevations.
 2. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, protect, and handle products to be included.
- B. Deliver and store valves in shipping containers with labeling in place.

PART 2 - PRODUCTS

2.1 PIPE

- A. Steel Pipe:
 1. Below Ground: ASTM A53, Schedule 40, type E or S, grade B, black:
 - a. Fittings: ASME B16.11, forged steel, or ASTM A234 forged steel welding type.
 - b. Joints: Welded and seamless.
 - c. Jackets: AWWA C105 polyethylene jacket, double layer, half lapped, 10-mil polyethylene tape.
 2. Above Ground: ASTM A53, Schedule 40, type E or S, grade B, black:
 - a. Fittings: ASME B16.3, malleable iron, ASME B16.11, forged steel, or ASTM A234, forged steel welding type.
 - b. Joints: Threaded.
- B. Copper Tubing (Propane Piping):
 1. Below ground: ASTM B88, Type K, internally tinned:
 - a. Fittings: ASME B16.18, cast copper, or ASME B16.22, wrought copper; internally tinned.
 - b. Joint: AWS A5.8 BCuP silver brazed.
 2. Above ground: ASTM B88, Type K, L or ASTM B75, Type GP; internally tinned:
 - a. Fittings: ASME B16.18 cast copper, ASME B 16.22, wrought copper, or ANSI B16.26, cast copper, internally tinned.
 - b. Joint: ASTM B32, Solder, Grade 95TA or AWS A5.8, Bcup silver brazed.
- C. Polyethylene Pipe (below ground only): ASTM D-2513, SDR 11.5.
 1. PE Fittings: ASTM D 2683, socket type or ASTM D 3261, butt type with dimensions matching ASTM D 2513, SDR 11, PE pipe.
 2. Joints: Mechanical or Compression fit.
- D. Reinforced Epoxy Resin Piping: ASTM D2517.
 1. Fittings: ASTM D2517.
 2. Joints: Bell and spigot with epoxy resin.

2.2 GAS COCKS

- A. 2 Inches and Smaller: 150 psig WOG, bronze body, bronze tapered plug, non-lubricated, Teflon packing, threaded ends with cast iron curb box, cover, and key.

- B. Larger than 2 inches: 125 psig WOG, Steel or Cast iron body and tapered plug, non-lubricated, Teflon packing, threaded ends, with cast iron curb box, cover, and key.
- C. For Applications with Line Pressure Greater than 60 psig: Over 2 Inches: Cast iron body and plug, pressure lubricated, Teflon packing, flanged ends, with cast iron curb box, cover, and key.

2.3 Mark manufacturer's name and pressure rating on valve body

2.4 PRESSURE REGULATING VALVES

- A. Single stage, malleable iron body, corrosion-resistant, pressure regulator with atmospheric vent, elevation compensator; with threaded ends for 2 inches and smaller or flanged ends for larger than 2 inches. Install earthquake actuated automatic shutoff valve, if required by local code or utility.
- B. Capacity: For inlet and outlet gas pressures, specific gravity, and flow rate indicated.

2.5 PROPANE STORAGE TANKS

- A. Construction: Closed, welded steel, tested and stamped in accordance with ASME S00081, Sec VIII; minimum 250 psig rating; cleaned, prime coated, and painted with 2 coats of silver anti-rust paint, and supplied with steel support saddles, pressure gage, tapping for installation of piping and accessories.
- B. Vaporizer: 1,000 watts, heating cable bedded in 1-inch of glass fiber insulation and covered by flexible stainless steel plate, with thermostat in weatherproof box set to turn on at -13 degrees Fahrenheit with manual off-on switch.
- C. Capacity: Diameter and length as shown on Construction Drawings.

2.6 TRACE WIRE

- A. Magnetic detectable conductor, brightly colored plastic covering, imprinted with "Natural Gas Service" in large letters.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify existing conditions.
- B. Verify that building service connection and utility gas main size, location, and depth are as indicated on Construction Drawings.

3.2 PREPARATION

- A. Ream pipe ends and remove burrs. Bevel plain end ferrous pipe over 2-inches diameter or thread ferrous pipe 2-inches diameter and under.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare piping connections with flanges or threading and unions.
- D. Comply with NFPA 54 on installation of gas lines.

3.3 BEDDING

- A. Excavate pipe trench and place bedding material in accordance with Section 02300.

3.4 INSTALLATION – GENERAL

- A. Perform installation in accordance with local utility company requirements in conjunction with requirements herein. Utility requirements shall take precedence when differences occur.

3.5 INSTALLATION - PIPING

- A. Maintain a minimum of 12 inches separation of gas line from sewer, water, or storm water piping in accordance with state or local code.
- B. Install piping to conserve space and not interfere with use of site space.
- C. Install piping to allow for expansion and contraction without stressing pipe or joints.
- D. Install cocks and other fittings as required.
- E. Establish elevations of buried piping in accordance with Section 02300.
- F. Wrap couplings and fittings of steel pipe with polyethylene tape and heat shrink over pipe in accordance with AWWA C105.
- G. Install trace wire continuous over top of pipe for nonmetallic pipe.
- H. Backfill trench in accordance with Section 02300.
- I. Center and plumb valve box over valve. Set box cover flush with finished ground surface. Prevent shock or stress from being transmitted through valve box to valve.
- J. Wrap valve and valve box with polyethylene tape and heat shrink or paint valves and valve boxes with red anti-rust primer and 1 coat of epoxy paint.

3.6 SERVICE CONNECTIONS

- A. Provide sleeve in foundation wall for gas service main. Caulk enlarged sleeve watertight.
- B. Anchor service main to interior surface of foundation wall.
- C. Install service regulator adjacent to building wall in specified location.
- D. Install service regulator and riser pipe to prevent undue stress on service pipe. For plastic service pipe, use steel pipe riser from below ground to regulator.
- E. Provide regulator vent with rain and insect proof opening, terminating not less than 5 feet away from building openings.

3.7 PROPANE TANK INSTALLATION

- A. Place tank legs on concrete pad, level within tolerance of 2 inches maximum.
- B. Prepare and grade an area outside the tank perimeter, for distance of 6 feet. Grade, place, and compact gravel fill to compacted depth of 3 inches minimum. Compact in accordance with Section 02300.
- C. Provide tank with relief valve, shutoff valve, pressure regulator, pressure gauge, and removable protection cover. Install piping, shutoff valve, and pressure gauge to underground piping.
- D. Set tank regulator to outlet pressure as indicated on Construction Drawings.

- E. Install vaporizer to underside of tank and secure to tank with aluminum tray and two stainless steel straps.
- F. Install weatherproof control box for vaporizer 40-inches above ground surface. Install on 4-inch x 4-inch cedar post, driven into ground 40 inches.
- G. Install control wire from vaporizer to control box 20 inches below ground surface. Install service wiring 24 inches below ground from control box to building.

END OF SECTION

REVISION NOTES:

Rev 1: (05/25/07) Added Field QC inspection by CTL in Part 3. (CI 7601)

Rev 2: (09/28/07) Changed field QC inspection from CTL to CEC. (CI 7785)

Rev 3: (02/15/11) Updated sign descriptions to coordinate with MUTCD and drawings. Added retroreflective sheeting provision. Added “All-Way” and 36 x 36 Stop Sign. Added square tubular and round steel pipe sign posts and deleted U-Channel posts. Added field painting reference. (WM/Richards)

Updated retroreflectivity type description in Part 2. (WM/Richards)SECTION 02890 (34 4113) - TRAFFIC SIGNS AND SIGNALS

PART 1 - GENERAL**1.1 SUMMARY****A. Section Includes:**

1. Traffic control signs.

B. Related Requirements:

1. Section 09900 - Painting. Painting for painted posts where shown on the Drawings.

1.2 REFERENCES

- A. The publications listed below form a part of this specification to the extent referenced. Publications are referenced within the text by the basic designation only.

B. ASTM International (ASTM):

1. ASTM A53 - Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless.
2. ASTM C94 - Ready Mix Concrete
3. ASTM D4956 - Retroreflective Sheeting for Traffic Control.

C. US Department of Transportation, Federal Highway Administration:

1. Manual on Uniform Traffic Control Devices (MUTCD).

PART 2 - PRODUCTS**2.1 SIGNS**

- A. Conform to US Department of Transportation [MUTCD](#). Sign classification, type, size, and color shall be as shown on the drawings

- B. Retroreflectivity: Microprismatic type, diamond grade reflective sheeting conforming to ASTM D 4956

2.2 POSTS

- A. Square Post: Square tubular steel sign post, galvanized, 12 ga, perforated full-length with 7/16 inch holes on four sides. Post size shall be as shown on the Drawings.

- B. Steel Pipe: ASTM A 53, Type E (electric-resistance welded) or Type S (seamless), Grade B, Schedule 40, size as shown on the Drawings.

2.3 CONCRETE

- A. Mix concrete and deliver in accordance with ASTM C 94.

- B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce following:
 - 1. Compressive Strength: 3,500 psi, minimum at 28 days, unless otherwise indicated on the Drawings.
 - 2. Slump Range: 1 to 3-inches at time of placement
 - 3. Air Entrainment: 5 to 8 percent

PART 3 - EXECUTION

3.1 PREPARATION

- A. Field verify underground utilities prior to sign installation. Primary utilities of concern of shallow depths are lawn sprinkler systems, electric, telephone, fiber optic, cable and gas.

3.2 INSTALLATION

- A. Install signs as shown on the Drawings and in accordance with MUTCD and manufacturer's instructions.
- B. Install signs of the type and at locations shown on the Drawings.
- C. Install posts of the type as shown on the drawing.
- D. Where shown as painted, field paint steel pipe posts in accordance with Section 09900.

END OF SECTION

APPENDIX B - CIVIL

TESTING, INSPECTION, AND OBSERVATION BY OWNER

Index of Sections (Quick Links): All sections listed may not be applicable to all projects.

1. [Section 01456 – Civil Engineering Consultant Site Observation](#)
2. [Section 02300 – Earthwork](#)
3. [Section 02340 – Soil Stabilization](#)
4. [Section 02621 – Foundation Drainage Piping](#)
5. [Section 02715 – Base Course](#)
6. [Section 02740 – Asphalt Concrete Paving](#)
7. [Section 02751 – Concrete Paving](#)
8. [Section 02900 – Planting](#)
9. [Section 03311 – Site Structural Concrete](#)

SECTION 01456 – CIVIL ENGINEERING CONSULTANT SITE OBSERVATION

1.1 CONTRACTOR AND OWNER COORDINATION AND SCHEDULING

- A. Contractor Responsibilities are specified in Specification Section 01456.
- B. Owner’s Civil Engineering Consultant (CEC) will perform site observation at no cost to the Contractor.

1.2 CEC OBSERVATIONS

- A. CEC will perform observations in accordance with the Civil Engineering Consultant Special Observations Guideline located in the Design Collective at the Owner’s Bldg Portal website.
- B. Perform site observations as agreed to with the Owner as listed below or as otherwise requested by the Authority Having Jurisdiction or Owner’s Construction Manager to check a sample of the constructed Work for general conformance with the Contract Documents.
- C. Perform a minimum of the following site observations as outlined in the Owner’s Civil Engineering Consultant Special Observation Guidelines located on the Owner’s Bldg Portal website.
 1. First visit 16 to 18 weeks (or approximately 120 days) prior to possession.
 2. Second visit 8 to 9 weeks (or approximately 60 days) prior to possession.
 3. Third visit 1 to 2 weeks (or approximately 10 days) prior to possession.

[The following paragraph applies to accelerated, small format projects only (for both SWPPP and Site Related)]

- D. Perform a minimum of the site observations as follows for accelerated, small format projects as outlined in the Owner’s Civil Engineering Consultant Special Observation Guidelines located on the Owner’s Bldg Portal website.
 1. 60 days prior to the possession date.
 2. 14 days prior to the possession date.
 3. Date of possession.
- E. The observations listed above are the minimum number of observations to be performed. Additional visits as considered necessary by CEC as listed below shall also be performed by the CEC. Should there be outstanding items of non-conformance with the Contract Documents that warrant additional site observations to be performed by the CEC, the CEC shall receive approval from Owner prior to performing an additional site observation.

- F. Deviations from the Contract Documents shall be entered into the on-line Owner's Observation Log by the CEC as required and will be tracked and noted by the CEC when resolved by subsequent conformance by the Contractor.
- G. Observation Log: www.bldgportal.com, enter username and password, select Observation Log. Follow instructions on the Observation Log website.
- H. The CEC shall not have control over or responsibility for construction means, techniques, sequences of operations or for safety programs and procedures in connection with the construction work.
- I. Work will be checked as it progresses, but failure to detect any defective work or materials shall in no way prevent later rejection if defective work or materials are discovered, nor shall it obligate Owner to accept such work

SECTION 02300 - EARTHWORK

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Testing and inspection shall be either continuous or periodic as defined in Part 1 of this Appendix and as follows:
 - 1. Continuous: Perform in areas supporting a structure including, but not limited to, building pad area, retaining walls, etc. When continuous testing and inspection is in progress, conduct testing and inspection in areas outside building pad or structure at the frequencies stated herein. This shall include, but not limited to, the CTL requesting and reviewing GC proofrolling documentation to assure correctness and completeness of proofrolling and any associated corrective actions taken by the Contractor.
 - 2. Periodic: In addition to continuous inspections specified above, perform unannounced periodic testing visits as follows when continuous testing is not being performed as described above:
 - a. Two days during the first week when earthwork starts in a paved area.
 - b. Two days each week thereafter until earthwork is complete.
 - c. For days when periodic testing is not provided, an Owner T&I Technician that is already on-site performing other tests and inspections, shall provide a daily, random observation of earthwork activities for general compliance with the specification.
- C. Test Frequency:
 - 1. Number of tests to be taken at each site visit shall be the test frequencies stated based on quantities or occurrences which have accumulated up to, in between, or during each periodic visit.
 - 2. Not less than one specified test shall be conducted each periodic visit when material has been placed since last visit.
 - 3. In addition, at least one specified test shall be conducted on work being placed during each periodic visit.
- D. Field testing, frequency, and methods may vary as determined by and between the Owner and the CTL.
- E. Work shall be performed by a Special Inspector – Technical I unless specified otherwise. Report of testing and inspection results shall be made upon the completion of testing.
- F. Classification of Materials: Perform test for classification of materials used and encountered during construction in accordance with ASTM D2488 and ASTM D2487.
- G. Laboratory Testing Of Materials: Perform laboratory testing of materials (Proctor, Sieve Analysis, Atterberg Limits, Consolidation Test, etc.) as specified.
- H. Proofrolling: Document and explain proofrolling inspection procedures and results in the laboratory inspection report.

- I. Field Density Tests
 - 1. Building Subgrade Areas, Including 5'-0" Outside of Exterior Building Lines: In cut areas, not less than one compaction test for every 2,500 sq. ft and at locations along all continuous wall footings with intervals not exceeding 100 feet and at each column spread footing. In fill areas, same rate of testing for each 8-inch lift, measured loose and at locations along continuous wall footings with intervals not exceeding 100 feet and at each column spread footing.
 - a. Density tests on top of building subgrade shall be performed within 48 hours prior to placement of overlying materials. If inclement weather occurs after testing, retest prior to placement of overlying materials.
 - 2. Paving Areas and other Areas of Construction Exclusive of Building Subgrade:
 - a. In cut areas, not less than one compaction test for every 10,000 sq. ft. In fill areas, same rate of testing for each 8-inch lift, measured loose.
 - b. Outparcels: In cut areas, not less than one compaction test for every 2,500 sq. ft. In fill areas, same rate of testing for each 8-inch lift, measured loose.
 - c. Utility Trench Backfill: Intervals not exceeding 200-feet of trench for first and every other 8-inch lift of compacted trench backfill.
 - 3. Test Method: In-place nuclear density, ASTM D6938.
- J. Observation and Inspection:
 - 1. Observe all subgrades/excavation bases below footings and slabs and verify design bearing capacity is achieved as required. Work shall be performed by a Special Inspector – Technical II.
 - 2. Observe and document presence of groundwater within excavations.

1.2 RETESTING AND RE-INSPECTION BY OWNER CTL

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

SECTION 02340 - SOIL STABILIZATION

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner’s Construction Testing Laboratory (CTL).
- B. Unconfined compression tests on lime, fly ash, or Portland cement treated mixture shall be conducted in accordance with ASTM D1633. Mold three specimens for each mix design submitted by the Contractor to verify mix design meets the specified requirements. Cure each specimen at a constant moisture content and temperature for 28 days. Test for unconfined compressive strength and compare to the specified design strength. Perform test minimum of three weeks prior to proposed stabilization activities.
- C. Field Density: Field in-place density shall be determined as specified in Appendix Section 02300.

SECTION 02715 - BASE COURSE

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner’s Construction Testing Laboratory (CTL).
- B. Testing and inspection shall be during unannounced visits on a periodic basis according to definition in Part 1 of this Appendix and as follows:
 - 1. One day when placement begins.
 - 2. One day when placement is approximately 25% complete.
 - 3. One day when placement is approximately 50% complete.
- C. Field testing, observation, and inspection shall be conducted only during the periodic site visits.

1. Test frequencies stated shall be based on quantities or occurrences which have accumulated up to, in between, and during each periodic visit.
 2. Not less than one specified test shall be conducted each periodic visit when material has been placed since last visit.
 3. In addition, at least one specified test shall be conducted on work being placed during each periodic visit.
- D. Field tests for in-place materials will be performed in accordance with the following:
1. Density: Nuclear Method, ASTM D6938. One test in each lift for each 20,000 sq. ft. of in-place base material area.
 2. Base Material Thickness: One test for each 20,000 sq. ft. of in-place base material area. All areas tested for thickness shall meet or exceed the base thickness shown on the drawings.
 3. Verify Contractor's measurements of base course elevation
- E. Prepare and distribute test reports as specified in Part 1 of this Appendix.

1.2 RETESTING AND RE-INSPECTION BY OWNER CTL

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

SECTION 02740 - ASPHALT CONCRETE PAVING

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. The testing and inspection shall be during unannounced visits on a periodic basis according to the definition in Part 1 above, and as follows:
1. One day on the day when the density control strip is placed.
 2. One day when pavement placement is approximately 25% complete.
 3. One day when pavement placement is approximately 50% complete.
- C. Field testing, observation, and inspection shall be conducted only during the periodic site visits except as required for subgrade testing for density control strip specified in PREPARATION paragraph in Specification Section 02740.
1. Number of tests to be taken at each site visit shall be the test frequencies stated based on quantities or occurrences which have accumulated up to, in between, or during each periodic visit.
 2. Not less than one specified test shall be conducted each periodic visit when material has been placed since last visit.
 3. In addition, at least one specified test shall be conducted on work being placed during each periodic visit.
- D. Core Sampling and Testing: Asphalt surface and base courses shall be randomly cored at minimum rate of 3 cores per day's placement per mix type, but not less than 3 cores in light duty areas and 3 cores in heavy-duty areas shall be obtained. In addition to cores taken during periodic site visits, sampling shall be performed at the rate of one sample per 1000 sq. yds., or fraction thereof, of pavement placed during the absence of the CTL. Asphalt concrete pavement samples shall be tested for conformance with density and thickness requirements. Cores shall be cut from minimal loading areas representative of project.
- E. Surface Smoothness Test: In areas of obvious depressions or bumps, suspect areas of each lift shall be checked with a 10'-0" straightedge both parallel with, and at right angles to, centerline of the paved area. The variation of the surface between two contact points shall not exceed 1/4-inch.
- F. Pavement Thickness: The CTL will measure thickness of each core sample taken. At each core location, the thickness of the course shall meet or exceed the thickness shown. If the thickness of a lower course of asphalt is less than the thickness shown, it shall be identified as a deviation and recorded. The Contractor shall either remove and replace the deficient pavement or increase the thickness of the upper course so that the total thickness of the pavement meets or exceeds the design thickness, provided that the specified compaction of the lower lift is achieved.

- G. Field Density Test For In-Place Materials:
 1. Density tests shall be conducted on each core sample taken in accordance with ASTM D1188 or D2726 (AASHTO T166, T275, T331) as applicable.
- H. Volumetric Properties: Perform testing as follows on samples provided by the Contractor:
 1. Superpave Mix: Compact into specimens in accordance with AASHTO T312. Test each specimen for determination of relative density, VMA, VFA, and dust-to-binder ratio.
 2. Marshall Mix: Compact into specimens using compactive blows equal to mix design per side with the Marshall hammer as described in AASHTO T245. Temperature shall be equal to temperature at paving machine with reheating. Test each specimen for determination of laboratory air voids, Marshall stability, and flow.
- I. Asphalt Content and Aggregate Gradation: Asphalt content extraction and gradation of extracted aggregate testing shall be performed in accordance with AASHTO T 308 or AASHTO T164 and ASTM D5444 respectively and local State Highway Department Specifications requirements. At least one asphalt content and one gradation test shall be taken for each 2000 tons or each day pavement is placed.

1.2 RETESTING AND RE-INSPECTION BY OWNER CTL

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

SECTION 02751 - CONCRETE PAVING

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner’s Construction Testing Laboratory (CTL).
- B. The testing and inspection shall be during unannounced visits on a periodic basis in accordance with definition in Part 1 of this Appendix and as follows:
 1. One day when pavement placement begins.
 2. One day when pavement placement is approximately 25% complete.
 3. One day when pavement placement is approximately 50% complete.
- C. Field testing, observation, and inspection shall be conducted only during the periodic site visits.
 1. Number of tests to be taken at each site visit shall be the test frequencies stated based on quantities or occurrences only as it occurs during each periodic visit.
 2. In addition, at least one specified test shall be conducted on work being placed during each periodic visit.
- D. Field testing, frequency, and methods may vary as determined by and between the Owner and the Owner’s Testing Laboratory.
- E. Review the Contractor's proposed materials and mix design for conformance with specifications.
- F. Perform testing in accordance with ACI 301 and testing standards listed herein.
- G. Strength Tests:
 1. Secure composite samples in accordance with ASTM C172. Sample at regularly spaced intervals from middle portion of the batch. Sampling time shall not exceed 15 minutes.
 2. Mold and cure specimens in accordance with ASTM C31.
 - a. A minimum of four concrete test cylinders shall be taken for every 100 cubic yards or less of each class of concrete placed each day and not less than once for each 5000 square feet of paved area.
 - b. During the initial 24 hours (plus or minus 8 hours) after molding, the temperature immediately adjacent to the specimens shall be maintained in the range of 60 to 80 degrees F. Control loss of moisture from the specimens by shielding from the direct rays of the sun and from radiant heating devices.
 - c. Specimens transported prior to 48 hours after molding shall not be demolded, but shall continue initial curing at 60 to 80 degrees F until time for transporting.

- d. Specimens transported after 48 hours age shall be demolded in 24 hours (plus or minus 8 hours). Curing shall then be continued but in saturated limewater at 73.4 degrees (plus or minus 3 degrees F) until the time of transporting.
- e. Wet cure cylinders under controlled temperature until testing.
- 3. Test cylinders in accordance with ASTM C39.
 - a. Size of specimen test cylinder shall be 6" x 12" or 4" x 8".
 - b. Date test cylinders and number consecutively. Give each cylinder of each set an identifying letter (i.e. A, B, C, D). Prepare a sketch of the site plan for each test set identifying location of placed concrete.
 - c. Test one cylinder (A) at 7 days for information..
 - d. Test two cylinders (B and C) at 28 days and the average of the breaks shall constitute the compressive strength of the concrete sample.
 - e. Retain fourth cylinder (D) for further testing if needed, but do not retain cylinder more than 90 days.
- 4. Evaluation and Acceptance:
 - a. Strength level of concrete will be considered satisfactory if the average of all sets of three consecutive strength tests equal or exceed specified strength and no individual strength test (average of two cylinders) results are below specified compressive strength by more than 500 psi.
 - b. Complete concrete work will not be accepted unless requirements of ACI 301, have been met, including dimensional tolerances, appearance, and strength of structure.
 - c. Where average strength of cylinders, as shown by tests is not satisfactory, Owner reserves the right to require Contractor to provide improved curing conditions of temperature and moisture to secure required strength. If average strength of laboratory control cylinders should fall so low as to cause portions of structure to be in question by Owner, follow core procedure set forth in ASTM C42. If results of core test indicate, in opinion of Owner, that strength of structure is inadequate, provide without additional cost to Owner, replacement, load testing, or strengthening as may be ordered by Owner. If core tests are so ordered and results of such tests disclose that strength of structure is as required, cost of test will be paid by Owner.
- H. Slump Test: Conduct slump test for each cylinder set taken in accordance with ASTM C143. Make additional slump tests for every other load from a stationary mixer or truck to test consistency. Sampling shall be in accordance with ASTM C172.
- I. Air Content: Conduct air content test for each cylinder set for concrete in accordance with ASTM C 231, ASTM C 173, or ASTM C 138. Indicate test method on report. Make test at same time as slump test.
 - 1. Perform air content test for first and second truck for each class of concrete placed each day. If either test fails, perform air test on every truck until two consecutive air tests comply with the requirements of the project specifications.
- J. Unit Weight: ASTM C 138.
- K. Temperature Test: Conduct temperature test for each cylinder set taken in accordance with ASTM C1064. Test hourly when air temperature is 40 F and below or 80 F and above. Determine temperature of concrete sample and ambient air for each strength test.
- L. In addition to required information noted previously in this Section, record the following information on concrete compression reports:
 - 1. Test cylinder number and letter.
 - 2. Specific foundations or structures covered by this test.
 - 3. Proportions of concrete mix or mix identification.
 - 4. Maximum size coarse aggregate.
 - 5. Specified compressive strength.
 - 6. Tested compressive strength.
 - 7. Slump, air-content.
 - 8. Concrete plastic unit weight.
 - 9. Concrete Temperature.
 - 10. Elapsed time from batching at plant to discharge from delivery truck at project.

11. Date and time concrete was placed.
 12. Ambient temperature, wind speed, and relative humidity during concrete placement.
 13. Name of technician securing samples.
 14. Curing conditions for concrete strength test specimens (field and laboratory).
 15. Date strength specimens transported to laboratory.
 16. Age of strength specimens when tested.
 17. Type of fracture during test.
- M. At the start of each day's mixing, report any significant deviations from approved mix design including temperature, moisture and condition of aggregate.
- N. Review each delivery ticket of concrete. Report type of concrete delivered, amount of water added and time at which cement and aggregate were loaded into truck, and time at which concrete was discharged from truck
- O. In Place Pavement Testing:
1. Randomly core pavement during periodic site visits. Sampling shall be performed at the rate of one sample per 1000 sq. yds., or fraction thereof, of pavement placed during the absence of the CTL. Sample and test cores in accordance with ASTM C42. Core will be tested for thickness and quality of aggregate distribution. Core holes shall be patched by the Contractor immediately with Portland cement concrete and shall be finished to provide level surface as specified herein.
 2. Establish and maintain required lines and elevations.
 3. Check surface areas at intervals necessary to eliminate ponding areas.
- P. Additional Tests: Additional in-place tests shall be conducted as directed by the Wal-Mart Construction Manager when specified concrete strengths and other characteristics have not been attained in the structures.

SECTION 02900 – PLANTING

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. The Contractor shall provide imported topsoil analysis as specified in Specification Section 02900.
- C. The CTL will perform topsoil testing for verification of depth of topsoil placement as follows:
 1. Open Lawn Areas: Test at 50 feet on center, minimum 1 inspection per area
 2. Parking Islands: One test per 200 square feet of sod and seed bed preparation area, minimum one per island.
 3. Submit test reports in accordance with requirements in Part 1 of this Appendix.

SECTION 03311 – SITE STRUCTURAL CONCRETE

1.2 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Exterior Light Pole Bases: Make cylinder sets for compressive strength testing once at beginning of base placement each day light pole base concrete is placed. Mold, cure, and test samples in accordance with the Strength Tests requirements in Section 02751 within this Appendix B. No additional testing is required for light pole bases.

END OF SECTION

APPENDIX B – TESTING, INSPECTION, AND OBSERVATION BY OWNER

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Administrative and procedural requirements for Owner’s quality control. Refer to Civil Specifications manual for site work Appendix B requirements.
- B. Owner’s testing, inspection, and observation services are required to verify compliance with requirements specified or indicated. These services do not relieve Contractor of responsibility for compliance with the Contract Document requirements.
- C. Unless otherwise specified, provisions specified herein are included as requirements for Owner’s Construction Testing Laboratory (CTL), Owner’s consultants, or other testing or inspections agencies hired by the Owner and shall be considered information only to Contractor.
 - 1. Refer to Article 2.1 for list of Sections containing responsibilities of Owner’s Construction Testing Laboratory (CTL).
 - 2. Refer to Article 2.2 for list of Sections containing responsibilities of Owner’s consultants or other testing or inspections agencies.
- D. Related Requirements:
 - 1. Construction Contract between Walmart and Contractor: Inspections, testing, and approvals required by public authorities. Contractor obligations to perform work in accordance with Contract Documents.
 - 2. Section 01452 - Contractor Quality Control: Administrative and procedural requirements for Contractor quality assurance and quality control.

1.2 REFERENCES

- A. Refer to end of Section for list. Publications are referred to within the text by the basic designation only.

1.3 DEFINITIONS

- A. Testing: Evaluation of systems, primarily requiring physical manipulation and analysis of materials, in accordance with approved standards.
- B. Inspection: Evaluation of systems primarily requiring observation and engineering judgment.
- C. Observation: Evaluation of systems primarily requiring observation and professional judgment.
- D. Quality Assurance: Activities, actions, and procedures performed by the Contractor before and during execution of the Work to guard against defects and deficiencies and substantiate that proposed construction will substantially comply with construction documents.
- E. Quality Control: Tests, inspections, procedures, and related actions performed by the Contractor during and after execution of the Work to evaluate that actual products incorporated into the Work and completed construction substantially comply with construction documents.
- F. Construction Testing Laboratory (CTL): The independent testing and inspection agency employed by the Owner.
- G. Contractor: The General (prime) Contractor for the Project. Also referred to as GC.
- H. Architect of Record (AOR): The prime consultant in charge of overall design and coordination of the building.
- I. Engineer of Record (EOR): The Registered Engineer in responsible charge of engineering design for the project.

APP B-1

- J. Refrigeration Engineer of Record (REOR): The registered engineer in responsible charge of refrigeration engineering design for the project.
- K. Structural Engineer of Record (SER): The Registered Engineer in responsible charge of the structural design for the project.
- L. Civil Engineering Consultant (CEC): The Registered Engineer in responsible charge of the civil design for the project. Refer to the Civil Specifications manual.
- M. Fire Protection Consultant: Consultant that provides professional design services and construction documents related to fire protection for the project.
- N. Architect - Engineer (A/E): A collective term to include the AOR, CEC, SER, and the Mechanical, Electrical, and Fire Protection EOR.
- O. Independent Test and Balance Agency (ITBA): The Independent HVAC test and balance company employed by the Owner.
- P. Building Official: The Officer or his duly authorized representative charged with the administration and enforcement of the local building code.
- Q. Special Inspector (SI): The Special Inspector under the direct supervision of a registered civil/structural engineer (unless otherwise specified) regularly engaged in inspection, and experienced with the type of work requiring related testing and inspection. The categories of special inspector are:
 1. Technical I (TI): A Technician who is an employee of a qualified and approved testing laboratory. Lab work shall be performed in a qualified testing laboratory.
 2. Technical II (TII): A Technician with a minimum of 2 years' experience, or a graduate engineer, and is an employee of a qualified and approved testing laboratory.
 3. Technical III (TIII): An engineer regularly engaged in related work with a minimum of 4 years of experience, licensed in the State in which the project is located, and is an employee of a qualified and approved testing laboratory. This licensed engineer shall review and approve all final field reports.
 4. Structural I (StI): A graduate civil/structural engineer, or other trained and experienced personnel acceptable to the SER, with experience in the testing and inspection of related structural systems.
 5. Structural II (StII): A civil/structural engineer regularly engaged in related work with a minimum of 4 years of experience, licensed in the State in which the project is located. The licensed engineer shall review and approve all inspection reports.
 6. Independent Roofing Inspector (IRI): A technician employed or subcontracted by the CTL for the purpose of field observation of roofing installation. The IRI shall be certified as a Registered Roofing Observer (RRO) by the Institute of Roofing, Waterproofing, and Building Envelope Professionals (RCI) (Formerly Roof Consultants Institute).
 7. Roofing Technician: A technician employed by the CTL with training and experience in roofing construction or inspection. The Roofing Technician shall be under the direct supervision of the IRI and shall provide continuous inspection during roofing work.
 8. Unique special inspector requirements, for specific materials and system, are noted in related technical specification sections.
- R. Continuous Inspection: The full-time observation of work requiring inspection by an approved Special Inspector who is present in the area where the work is being performed.
- S. Periodic Inspection: The part-time or intermittent observation of work requiring inspection by an approved Special Inspector who is present in the area where the work has been or is being performed and at the completion of the work.
- T. Deviation: Any item or component of work that does not substantially conform to the requirements of the construction plans and/or specifications and which has not been corrected by the end of business on the day it is identified. A life-safety deviation is any construction deviation that poses a serious hazard to any person.

1.4 CONSTRUCTION TESTING LABORATORY (CTL) QUALITY REQUIREMENTS

- A. CTL shall comply with requirements of ASTM C 1077, ASTM C 1093, ASTM D 3740, ASTM D 3666, ASTM E 329, ASTM E 543, ASTM E 699, and AASHTO R18.
- B. CTL shall be authorized to operate in state in which Project is located.
- C. CTL Testing Equipment shall be calibrated at reasonable intervals with devices of an accuracy traceable to either National Institute of Standards and Technology (NIST) standards or accepted values of natural physical constants.
- D. CTL shall have and maintain a written Quality Manual (QM) for its laboratory conforming to the Appendix requirements ASTM E 329 or AASHTO R18. The QM shall be available for review by the Owner's Construction Manager upon request. The QM shall be organized similar to Quality Manual Requirements of AASHTO R18 and include the following:
 - 1. Organization and Organizational Policies.
 - 2. Staff.
 - 3. Equipment.
 - 4. Test Data Control and Reports.
 - 5. Diagnostic and Corrective Action.
 - 6. Internal Quality System Review.
 - 7. Subcontracting.
 - 8. Statement certifying compliance with ASTM standards specified above.

1.5 OWNER RESPONSIBILITIES

- A. Employment and payment for services of the Construction Testing Laboratory (CTL), Special Inspector (SI), and other third party testing, inspection, and observation firms to perform specified testing and inspecting will be by the Owner under separate contract.
- B. The Owner will perform testing and inspection (T & I) but only as a means to satisfy the Owner of contract compliance and as assurance to the Owner of Contractor quality control performance.
- C. Owner T&I specified herein below will be performed by the Owner's Construction Testing Laboratory (CTL) unless otherwise specified.

1.6 CONSTRUCTION TESTING LABORATORY AND SPECIAL INSPECTOR RESPONSIBILITIES

- A. Responsibilities include inspections, tests, and related actions including reports performed by testing or inspection service. They do not include Contract enforcement activities performed by the Owner's Construction Manager or authorities having jurisdiction.
 - 1. Provide the Architect of Record a copy of the contractual provisions defining the CTL's and SI's scope of services.
- B. The CTL/SI representative shall attend a pre-construction meeting prior to actual start of the Project. Except for the roofing inspection, the CTL/SI representative shall be the Registered Professional Engineer assigned to the project.
- C. Maintain a copy of Contract Drawings and Specifications with all Addenda and Change Orders. Use the Contract Documents supplemented by the approved shop drawings and applicable material and workmanship provisions of the Code for testing and inspection of the work.
- D. Provide qualified personnel at site to comply with schedule and submit reports for each test and inspection as defined hereinafter. Testing and inspection, except roofing inspection, shall be under supervision of the Registered Professional Engineer (P.E.) in the state where Project is located.
- E. Perform specified inspection, sampling, and testing of work, materials, and equipment in accordance with specified standards.

- F. Ascertain compliance of materials and mixes with requirements of Contract Documents.
- G. Perform testing and inspections in a timely manner to avoid delay of work. Schedule and coordinate testing and inspections with Contractor and appropriate sub-contractors and installers.
- H. Coordinate and consolidate specified testing and inspection to be concurrent, to the maximum extent practicable, during each required site visit in order to minimize number of visits.
- I. If observed deviations from the Contract Drawings, Specifications, or building code will be probable cause of subsequent rejection of work or material, notify Contractor, the Owner's Construction Manager, Sitework Engineering Consultant, and Architect of Record, sufficiently in advance for determination to continue operations or take corrective measures before continuing. If uncorrected after a reasonable period of time, bring the situation to the attention of the Structural Engineer of Record, the Building Official, and to the Architect of Record.
- J. Track resolutions and remedial repairs to deviations and subsequent conformance to the Contract Documents on the Observation Log.
- K. Report any observed life safety issue immediately to Contractor and Owner's Construction Manager. After notification is given to the Contractor and the Owner's Construction Manager, the CTL/SI shall also log the life safety issue on Owner's Observation Log.
- L. Perform retesting due to non-conformance with the Contract Documents based on CTL testing.
- M. Provide a final conformance letter to Owner, SER, AOR and, if determined to be required, the AHJ. An example is attached at the end of this Appendix. CTL shall upload an electronic copy (pdf) to the Walmart Workspace in the Walmart Building Portal (www.bldgportal.com), CTL Reports/Letter of Conformance. CTL shall upload an electronic copy (pdf) to the Walmart Workspace in the Walmart Building Portal (www.bldgportal.com), CTL Reports/Letter of Conformance
- N. Testing and inspection by the Building Official do not preclude the normal field involvement and site observations by Architect or Structural Engineer of Record, nor shall it relieve the Contractor of any responsibility to complete the work in accordance with the approved drawings and specifications.
- O. Construction Testing Laboratory And Special Inspector Limits On Authority: The CTL or SI may not:
 - 1. Release, revoke, alter, or enlarge on requirements of Contract Documents.
 - 2. Approve or accept any portion of the Work.
 - 3. Assume any duties of Contractor.
 - 4. Stop the Work.
- P. Testing and inspecting services performed by the CTL (Construction Testing Laboratory) are required to verify compliance with requirements specified or indicated.
 - 1. CTL services do not relieve Contractor of responsibility for compliance with the Contract Document requirements nor limit Contractor's quality assurance and quality control procedures that facilitate compliance with the Contract Document requirements.
 - 2. Specific testing and inspection requirements for individual construction activities shall be as specified in the individual Appendix Sections.
 - 3. Requirements for Contractor to provide quality assurance and quality control services required by Architect, Owner, Construction Manager, or authorities having jurisdiction do not limit responsibilities of the CTL.

1.7 CONTRACTOR RESPONSIBILITIES

- A. Cooperate with CTL/SI and other third party personnel, and provide access to the Work and to manufacturer's facilities.
- B. Provide incidental labor and facilities to provide access to Work to be tested, to obtain and handle samples at the site or at source of products to be tested, to facilitate tests and inspections, and to provide storage and curing of test samples. Provide lift equipment as required for inspection personnel of the Owner or the Owner's representatives.

- C. Provide CTL 24 hour notice prior to expected time for operations requiring inspecting and testing services.
- D. Notify in writing the Owner's Construction Manager three working days prior to expected time for operations requiring inspecting and testing services.
- E. Provide the CTL/SI with access to the internet for the purpose of logging deviations onto the Wal-Mart Observation Log on the Wal-Mart Building Portal website.

1.8 REPORTS

- A. The CTL or other Owner's testing or inspection firm shall submit reports for T&I and other items as required herein.
- B. CTL Information: Testing laboratory name, address, and telephone number, and names of full time Registered Engineer and responsible officer.
- C. Roof Observation Program.
- D. Test and Inspection Reports:
 - 1. Submit test and inspection reports showing the following information:
 - a. Date issued.
 - b. Project title and number.
 - c. Facility number.
 - d. Firm name, address and telephone number
 - e. Name of responsible officer(s).
 - f. Name and signature of tester or inspector.
 - g. Name and seal of registered engineer in responsible charge (as applicable).
 - h. Date and time of sampling.
 - i. Date of test or inspection.
 - j. Identification of product and specification section.
 - k. Location in project, including elevations, grid location and detail.
 - l. Type of test or inspections.
 - m. Results of tests or inspections and interpretation of same.
 - n. Observations regarding compliance with Contract Documents or deviations therefrom.
- E. Submit required reports and other items to the following:
 - 1. CEC: 1 copy. (Site work T&I only). Refer to Civil Specifications for submittal requirements.
 - 2. SER: 1 copy (Construction Administration Leader) (Bldg T&I only)
 - 3. AOR: 2 copies (Construction Administration Leader).
 - 4. Contractor: 3 copies.
 - 5. Building Official: Quantities as required.
- F. Submit a separate final signed report stating the work requiring inspection is, to the best of the inspector's knowledge, in conformance with the Contract Documents.
- G. Reports shall be made on 8-1/2 by 11 white paper, suitable for photocopying and binding in booklet form. Sheets shall have the testing/inspection firm's letterhead (including phone number and address). Larger sheets shall be folded and bound into the booklet.
- H. Submit Test and Inspection Reports within 3 working days of T&I occurrence. CTL shall also upload an electronic copy (pdf) to the Walmart Workspace in the Walmart Building Portal (www.bldgportal.com), CTL Reports.
- I. Tests and inspections indicating non-conformance (deviations) to the Contract Documents shall be brought to the attention of the Contractor, Sitework Engineering Consultant, and Architect of Record upon discovery in the form of hard copy reports and entered into the Wal-Mart Observation Log within 24 hours.

- J. Deviations from the Contract Documents, as defined above, shall be logged onto the Wal-Mart Observation Log by the CTL/SI representative on site. (www.bldgportal.com), enter username and password, select Observation Log. Follow instructions on the Observation Log website for entry of information.
- K. Owner's Construction Manager in conjunction with the CTL and/or SI will determine when to involve the AOR or EOR for remedial action.

PART 2 - and PART 3 - PRODUCTS and EXECUTION

2.1 TESTING AND INSPECTION BY OWNERS CONSTRUCTION TESTING LABORATORY (CTL)

- A. General Requirements: Testing and inspection by CTL shall be conducted as specified hereinafter listed by sections corresponding to section numbers of the Specifications. Where Section is included in CTL scope (noted by checked 'Y' box), refer to individual Section requirements specified hereinafter.
 - 1. Section 03310 - Structural Concrete and Exterior Concrete Slabs Y N
 - 2. Section 03314 – Interior Cast-in-Place Concrete Slabs Y N
 - 3. Section 03410 – Plant Precast Structural Concrete Panels Y N
 - 4. Section 05090 - Post-Installed Concrete and Masonry Anchors Y N
 - 5. Section 05120 - Structural Steel Y N
 - 6. Section 05300 - Metal Deck Y N
 - 7. Section 05400 - Cold Formed Metal Framing Y N
 - 8. Section 05510 – Metal Stairs with Handrails Y N
 - 9. Section 05520 – Metal Pipe and Tube Railings Y N
 - 10. Section 09511 - Acoustical Panel Ceilings Y N
 - 11. Tests and inspections shall, as a minimum, be performed by Technical I (TI) inspector if not otherwise specified in the individual section.
 - 12. If inspection of fabricators' work is required, the Owner's representative may require testing and inspection of the work at the plant before shipment.
 - 13. Testing and inspection shall be performed in accordance with the industry standard used as the reference for the specific material or procedure unless other criteria are specified. In the absence of a referenced standard, tests shall be accomplished in accordance with generally accepted industry standards.
 - 14. Work shall be checked as it progresses, but failure to detect any defective work or materials shall in no way prevent later rejection if defective work or materials are discovered, nor shall it obligate Owner to accept such work.
- B. Testing or inspection in addition to that specified herein, may be performed by the CTL as directed by the Owner for in-place work as further verification of Work or as verification of Contractor performed Quality Control testing and inspection.

2.2 OBSERVATION BY PROFESSIONALS OF RECORD

- A. Observation by Owner's Professionals of Record (POR). Professionals of Record include the following as defined in Part 1:
 - 1. Architect (AOR)
 - 2. Structural Engineer (SER)
 - 3. Mechanical or Electrical Engineer (EOR)
 - 4. Fire Protection Engineer (EOR)
- B. Sections herein related to POR observation include the following (refer to individual Section requirements specified hereinafter):
 - 1. Section 01454 - Architect Engineer Site Observation
 - 2. Section 13900 - Fire Suppression

2.3 TESTING, INSPECTION, AND OBSERVATION BY OWNER'S INDEPENDENT INSPECTORS

- A. Sections herein which include testing, inspection or observation by Owner hired independent entities include the following (refer to individual Section requirements specified hereinafter):
 - 1. Section 07500 - Membrane Roofing: Owner's Independent Roofing Inspector (IRI).
 - 2. Section 16050 – Basic Electrical Materials and Methods: Owner's Independent Power Systems Study Consultant (PSSC).

SECTION 01454 - ARCHITECT-ENGINEER SITE OBSERVATION

2.1 CONTRACTOR AND OWNER COORDINATION AND SCHEDULING

- A. Contractor Responsibilities are specified in Specification Section 01454.
- B. Owner's Architect-Engineers (A/E) will perform site observation at no cost to the Contractor.

2.2 QUALITY ASSURANCE OBSERVATION

- A. The A/E will perform construction site observations as agreed to with the Owner as listed below or as otherwise requested by the Authority Having Jurisdiction or Owner's Construction Manager to check a sample of the constructed Work for general conformance with the Contract Documents.
- B. Owner's A/E Consultant Quality Assurance Observation Schedule:
 - 1. AOR:
 - a. Observations as required by the Authority Having Jurisdiction or as directed by Owner.
 - 2. EOR:
 - a. Observations as required by the Authority Having Jurisdiction or as directed by Owner.
 - 3. SER:
 - a. Observations as required by the Authority Having Jurisdiction or as directed by Owner.
 - 4. Fire Protection Consultant:
 - a. One week prior to date of construction completion. Refer to Section 13900.
- C. Specific items to be witnessed during the construction site observation (including but not limited to) are listed below in more detail by discipline to assist in scheduling the site observation at the proper time.
- D. Architectural: Architectural consultant site observation shall be by a competent representative of the AOR having complete knowledge of the project.
 - 1. Observe construction in progress and work completed, to determine if project is being constructed to meet the requirements of the Construction Documents.
 - 2. Review architecturally related construction documents currently used by the Contractor to assure that revisions and Construction Change Directives are incorporated and executed.
 - 3. Complete Construction Observation Report and upload completed report and accompanying photographs to Sharepoint. Upload location is Store folder/Project folder/Store Planning & Construction/Construction Observation.
- E. Structural:
 - 1. Verify concrete reinforcing, foundation sizes, anchor bolt placement, structural steel members, structural steel connections, metal decking type, and metal decking attachment.
 - 2. Additional visits shall be as required to review repair of previous deviations.
- F. Fire Protection:
 - 1. Verify the fire sprinkler systems are in conformance with the Contract Documents and shop drawings, review sprinkler head locations, main and branchline installation, and system testing.

- G. The A/E shall monitor the construction schedule and coordinate with the Contractor at least 21 days prior to scheduled date of construction completion to schedule site visits to occur at the most appropriate time. The A/E shall notify the Contractor and Owner's Construction Manager 14 days in advance of the date and time of each scheduled site visit.
- H. Testing and inspections by the Building Official shall not preclude the normal field involvement and site observations by the A/E, nor will it relieve the Contractor of any responsibility to complete the work in accordance with the approved drawings and specifications.
- I. The A/E shall not have control over or responsibility for construction means, techniques, sequences of operations or for safety programs and procedures in connection with the construction work.
- J. Work will be checked as it progresses, but failure to detect defective work or materials shall in no way prevent later rejection if defective work or materials are discovered, nor shall it obligate Owner to accept such work.

2.3 DEFICIENCY PROVISIONS

- A. The observation site visits listed above are to be performed at Owner's expense. Should there be outstanding items of non-conformance with the Contract Documents that warrant additional site visits to be performed by the A/Es, the A/Es shall receive approval from Owner prior to performing additional construction site observations until all deviations have been corrected by the Contractor and closed by the A/E. Reimbursement by the Contractor for costs for additional A/E site visits will be as specified in Section 01452.
- B. Deviations from the Contract Documents shall be entered into the on-line Wal-Mart Observation Log by the consultants as required and will be tracked and noted by the consultants when resolved by subsequent conformance by the Contractor.
 - 1. Observation Log: www.bldgportal.com, enter username and password, select Observation Log. Follow instructions on the Observation Log website.
- C. Deviations/observations noted by the AOR will be noted in the Construction Observation Report. Construction Observation Report and photos will be uploaded location in Sharepoint in Store folder/Project folder/Store Planning & Construction/Construction Observation.

SECTION 03310 - STRUCTURAL CONCRETE AND EXTERIOR CONCRETE SLABS

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. CTL will perform tests and inspections as specified herein and in Tables A and B hereinafter.
- C. CTL will keep records of the testing and inspections.
- D. CTL is neither authorized to change any specified requirement nor to approve any portion of the work.
- E. Failure to detect defective material or Work will neither prevent rejection when defects are discovered later nor will it obligate Owner to make final acceptance.
- F. Qualifications: Unless otherwise specified, work shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I. In addition to the Inspector and CTL qualifications specified in this Section, the following qualifications shall apply for all Cast-in-Place Concrete inspections.
 - 1. Technical I: ACI Certified Grade I inspector.
 - 2. Technical II: ACI Certified Grade II inspector.
 - 3. CTL: C.C.R.L. certification at the National Bureau of Standards. (For multi-story projects only).
 - 4. Lead technician shall have at least five years' experience in projects of this size and complexity.
 - 5. Other technicians shall have at least two years' experience.

- G. Review the Contractor's proposed materials and mix design for conformance with specifications.
- H. Perform testing and inspections in accordance with ACI 301 and testing standards listed in this Section.
- I. Field Testing:
 - 1. Compressive Strength: Make cylinder sets for compressive strength testing per ASTM C31 at the following frequency:
 - a. Building Foundations: Once each day a given mix design is placed, and not less than once for each 150 cubic yards of each mix placed each day, nor less than once for each 5,000 square feet of each mix for wall or slab surface area placed each day.
 - b. Retaining Walls. Once each day a given mix design is placed, and not less than once for each 150 cubic yards of each mix placed each day, nor less than once for each 5,000 square feet of each mix for wall surface area placed each day. Only one side of the wall shall be considered when calculating surface area.
 - 2. Slump, Air Content, Temperature and Unit Weight: Conduct slump, air content, temperature, and unit weight tests as follows:
 - a. Test Methods:
 - 1) Slump - ASTM C143.
 - 2) Air content - ASTM C173, C 231 or C 138. Indicate test method on report.
 - 3) Concrete materials temperature - ASTM C1064.
 - 4) Unit weight - ASTM C138.
 - b. Test Frequencies:
 - 1) Building Foundations: Conduct tests when concrete is sampled for compressive strength testing. Notify the Owner's Construction Manager upon failure of any second failing test.
 - 2) All Other Concrete Placed:
 - a) Perform slump and temperature tests for first truck load of concrete and every other truck thereafter. If the initial slump and temperature fails, make additional slump and temperature tests for every other load from a stationary mixer or truck to test consistency. Test temperature hourly when air temperature is 40 F and below or 80 F and above. Provide test reports to Owner's Construction Manager.
 - b) Perform air test for first truck and every 27cubic yards minimum thereafter. Make test at same time as slump test. If initial test fails, perform air test in every other load to insure consistency. Provide test reports to Owner's Construction Manager and other involved parties.
 - 3) When Type F fly ash is used and concrete is exposed to weather, perform air content test for first and second truck for each mix of concrete placed each day. If either test fails, perform air content test on every truckload until two consecutive air content tests comply with specified requirements.
 - 4) Conduct temperature test hourly when air temperature is 40 degrees F and below or 80 degrees F and above.
 - 5) Determine temperature of concrete sample and ambient air for each strength test.
 - 6) When pumping concrete, take samples for slump tests at point of delivery from pumping line in addition to first slump test noted above for concrete with mid-range or high-range water-reducer.
 - 3. Flexural Strength: Make beam sets for flexural strength testing per ASTM C78 at the following frequency:
 - a. Interior Slab on Grade: Once for each 2000 cubic yards of each mix placed.
 - b. Interior Slab on Metal Deck: Once for each 2000 cubic yards of each mix placed.
 - 4. Note trends of decreasing quality in concrete due to changing seasons, conditions of curing, or other causes and bring to attention of the Owner's Construction Manager. Report and log comments on Non-Conformance Correction Log.
 - 5. Report any significant deviations from approved mix design including temperature, moisture and condition of aggregate.
- J. Laboratory Testing Requirements:
 - 1. Test items such as reinforcing steel, aggregates, and other products suspected of not meeting specified requirement as directed by Owner's Construction Manager to verify compliance. Provide test report to Owner's Construction Manager. In-place tests in accordance with ASTM C 42 shall be conducted as directed

- by the Owner's Construction Manager when specified concrete strengths and other characteristics have not been attained in the structures.
2. In-place tests in accordance with ASTM C 42 shall be conducted as directed by the Owner's Construction Manager when specified concrete strength and other characteristics have not been attained in the structures.
 3. Strength Tests:
 - a. Secure composite samples in accordance with ASTM C 172. Sample at regularly spaced intervals from middle portion of the batch. Sampling time shall not exceed 15 minutes.
 - b. Mold and cure specimens in accordance with ASTM C 31.
 - 1) During the initial 24 hours (plus or minus 8 hours) after molding, the temperature immediately adjacent to the specimens shall be maintained in the range of 60 to 80 degrees F. Control loss of moisture from the specimens by shielding from the direct rays of the sun and from radiant heating devices.
 - 2) Specimens transported prior to 48 hours after molding shall not be demolded, but shall continue initial curing at 60 to 80 degrees F until time for transporting.
 - 3) Specimens transported after 48 hours age shall be demolded in 24 hours (plus or minus 8 hours). Curing shall then be continued but in saturated limewater at 73.4 degrees (plus or minus 3 degrees F) until the time of transporting.
 - 4) During transportation, protect the specimens with suitable cushioning material to prevent damage from jarring. During cold weather, protect specimens from freezing with suitable insulation material. Transportation time shall not exceed four hours.
 - 5) Date test cylinders and number consecutively. Give each cylinder of each set an identifying letter (i.e. A, B, C, D). Prepare a sketch of the building plan for each test set identifying location of placed concrete.
 - c. Test cylinders in accordance with ASTM C 39.
 - 1) Test one cylinder (A) at 7 days for information. If the compressive strength of the concrete sample is equal to or above the 28 day specified strength, test another cylinder (B) at 7 days. The average of the breaks shall constitute the compressive strength of the concrete sample.
 - 2) Test two cylinders (B and C) at 28 days and the average of the breaks shall constitute the compressive strength of the concrete sample.
 - 3) Retain fourth cylinder (D) for further testing if needed, but do not retain cylinder more than 60 days.

K. Reporting:

1. Record the following information as applicable on reports and submit to Owner's Construction Manager and others as specified in this Section:
 - a. Test cylinder number and letter.
 - b. Specific foundations or structures covered by this test.
 - c. Proportions of concrete mix or mix identification.
 - d. Maximum size coarse aggregate.
 - e. Specified compressive strength.
 - f. Tested compressive strength.
 - g. Specified flexural strength.
 - h. Tested flexural strength.
 - i. Slump.
 - j. Air content.
 - k. Concrete temperature.
 - l. Concrete plastic unit weight.
 - m. Elapsed time from batching at plant to discharge from delivery truck at project.
 - n. Date and time concrete was placed.
 - o. Ambient temperature, wind speed, and relative humidity during concrete placement.
 - p. Name of technician securing samples.
 - q. Curing conditions for concrete strength test specimens (field and laboratory).
 - r. Date strength specimens transported to laboratory.
 - s. Age of strength specimens when tested.
 - t. Type of fracture during test.
2. Field Test Reports: Submit reports of field tests and inspections to Owner's Construction Manager and others as specified in this Section.

- L. Inspections: Conduct inspection below for pedestals, walls, and foundations supporting CMU, precast and concrete walls and retaining walls only.
1. Concrete Form Work:
 - a. Verify formwork dimensions will result in member size and configuration shown.
 - b. Structural adequacy of formwork is the sole responsibility of the Contractor.
 2. Concrete Reinforcement:
 - a. Verify reinforcing bar grade.
 - b. Verify reinforcing bars are free of dirt, excessive rust, and damage.
 - c. Verify reinforcing bars are adequately tied, chaired, and supported to prevent displacement during concrete placement.
 - d. Verify proper clear distances between bars and to surfaces of concrete.
 - e. Verify reinforcing bar size and placement.
 - f. Verify bar laps for proper length and stagger.
 3. Embedded Items:
 - a. Verify specified size, type, spacing, configuration, embedment length, and quantity of anchor bolts and embedded items.
 - b. Verify proper concrete placement and means have been taken to achieve consolidation around bolts and embedded items.
 4. Concrete Foundations Structural Inspections: Inspect foundations and report on the following:
 - a. Concrete footing size and depth.
 - b. Footing bar size, spacing, and placement (cover).
 - c. Placement and vibration of concrete.
 - d. Dowel bar size, orientation, embedment, and spacing.
 5. Concrete Mix:
 - a. Verify mixer truck trip ticket conforms to approved mix design.
 - b. Verify that total water added to mix on site does not exceed that allowed by concrete mix design.
 - c. Verify that concrete quality is indicative of adequate mixing time, consistency, and relevant time limits.
 - d. Work shall be performed by a Special Inspector - Technical I. Report of results shall be made daily.
 6. Preparation and Placement: Inspect preparation and placement of concrete.
 - a. Verify acceptable general condition of concrete base prior to placement.
 - b. Verify that concrete conveyance and depositing avoids segregation and contamination.
 - c. Verify that concrete is properly consolidated.
 - d. Verify reinforcement remains at proper location.
 7. Protection and Curing: Observe protection and curing methods.
 - a. Verify specified curing procedures are followed.
 - b. Verify that specified hot and cold weather procedures are followed.
 8. Inspection Frequencies: Inspection frequencies shall be as shown in Table B at the end of this Section.
- M. Testing and inspection visits for the various required testing and inspection shall be combined and coordinated to the greatest extent practicable to minimize number of visits.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

TABLE A - SECTION 03310 TESTING BY OWNER (CTL) SCHEDULE		
Description of Testing-Work	Frequency	Section Reference Appendix B - 03310
Compressive strength for building foundations supporting CMU, concrete, and precast walls; and retaining walls including sampling, molding, and curing concrete specimens.	Appendix B – 03310 Section 1.1.I	2.1.I.1 2.1.J.3

Air content, temperature, slump, and unit weight for building foundations supporting CMU, concrete, or precast walls; retaining walls		2.1.I.2
---	--	---------

**TABLE B - SECTION 03310
INSPECTION BY OWNER (CTL) SCHEDULE**

Description of Inspection Work	Frequency	Section Reference Appendix B - 03310
All inspections below shall apply only to building foundations supporting CMU, precast, and concrete foundations; and to retaining walls		
Concrete Form Work	One inspection at each formed concrete structural member prior to concrete placement.	2.1.L.1
Concrete Reinforcement.	One inspection at each concrete structural member prior to concrete placement.	2.1.L.2
Embedded Items	Periodic	2.1.L.3
Foundation Structural Inspection	One inspection at each concrete structural member prior to concrete placement.	2.1.L.4
Concrete Mix.	One inspection at each compressive cylinder test.	2.1.L.5
Preparation and Placement	Continuous throughout each concrete placement	2.1.L.6
Protection and Curing	One inspection per project	2.1.L.7

SECTION 03314 – INTERIOR CAST-IN-PLACE CONCRETE SLABS

2.3 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner’s Construction Testing Laboratory (CTL).
- B. Keep records of the testing and inspections.
- C. CTL is neither authorized to change any specified requirement nor to approve any portion of the work.
- D. Owner’s Concrete Consultant (SSI) is not authorized to change any specified requirement or to approve execution of any portion of the work.
- E. Failure to detect defective material or Work will neither prevent rejection when defects are discovered later nor will it obligate Owner to make final acceptance.
- F. Qualifications: Unless otherwise specified, work shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I. In addition to the Inspector and CTL qualifications specified in this Appendix, the following qualifications shall apply for all Cast-in-Place Concrete inspection.
 - 1. Technical I: ACI Certified Grade I inspector.
 - 2. Technical II: ACI Certified Grade II inspector.
 - 3. CTL: C.C.R.L. certification at the National Bureau of Standards. (For multi-story projects only)
 - 4. Lead technician shall have at least five years’ experience in projects of this size and complexity.
 - 5. Other technicians shall have at least two years’ experience.

- G. Review the Contractor's proposed materials and mix design for conformance with specifications.
- H. Perform testing in accordance with testing standards listed herein.
- I. Field Testing:
 - 6. Slump, Air Content, and Concrete Materials Temperature Tests:
 - a. Test Methods:
 - 1) Slump - ASTM C 143.
 - 2) Concrete materials temperature - ASTM C 1064.
 - 3) Air content - ASTM C 173 or C 231.
 - 4) Unit weight - ASTM C138.
 - 5) Compressive Strength- ASTM C31, 39
 - b. Periodic Test Frequencies:
 - 1) Conduct slump, air content, and temperature tests for the first placement of concrete and every 150 CY placed thereafter for each mix of concrete placed each day. If any test fails on the first placement, test at 50 CY for the corresponding failing test. If any test fails during normal 150 CY test intervals, test at next 50 CY for the corresponding failing test. Notify the Owner's Construction Manager upon failure of any second failing test.
 - 2) Make cylinder sets for compressive strength testing once each day a given mix design is placed, and not less than once for each 150 cubic yards of each mix placed each day, nor less than once for each 5,000 square feet of each mix for slab surface area placed each day.
 - 3) If pumping concrete is approved, take the same number of additional samples as noted herein for slump tests at point of delivery from pumping line.
 - 7. Flatness and Levelness Testing:
 - a. Test floor slab finished surface areas shown on drawings for flatness and levelness in accordance with ASTM E 1155, except as specified herein.
 - b. Perform testing at random on the first placement of the exposed sales floor slab and randomly on other placements as directed by the Owner's Construction Manager or as directed by Owner.
 - c. F-Number requirements shall be as follows for all interior sales floor slabs.
 - 4) FF /FL minimum overall for composite of measured values (SOV) for entire day's concrete placement; FF /FL minimum for any individual floor section (MLV) as specified in Tolerances paragraph.
 - d. Bound individual floor sections for testing purposes by the following that provide the smallest sections: construction joints, contraction joints or column and half-column lines.
 - e. Conform to F-numbers specified for floor areas within 2 feet of construction and isolation joints, in lieu of ASTM E 1155 requirements that exclude these areas.
 - f. Ensure top of entire floor falls within tolerances specified in Tolerances paragraph for finished floor elevation.
 - 8. Complete testing, identify defective areas, and give verbal report to Owner's Construction Manager within 24 hours after placement.
 - 9. Submit written report by electronic means or hand deliver to parties concerned within 36 hours or next regularly scheduled working day (Mon-Sat), after placement. Include costs for retesting replaced or repaired defective areas.
 - 10. Note trends of decreasing quality in concrete due to changing seasons, conditions of curing, or other causes and bring to attention of the Owner's Construction Manager. Report and log comments on Non-Conformance Correction Log.
 - 11. Verify each delivery ticket of concrete. Report type of concrete delivered, amount of water added and time at which cement and aggregate were loaded into truck, and time at which concrete was discharged from truck.
 - 12. Verify that the proper amount of densifier has been applied to the concrete floor slab surface.
- J. Laboratory Testing Requirements:
 - 13. Test items such as reinforcing steel, aggregates, and other products suspected of not meeting specified requirement as directed by Owner's Construction Manager to verify compliance. Provide test report to Owner's Construction Manager.
 - 14. In-place tests in accordance with ASTM C 42 shall be conducted as directed by the Owner's Construction Manager when specified concrete strengths and other characteristics have not been attained in the structures.
 - 15. Tests:

- a. Secure composite samples in accordance with ASTM C 172. Sample at regularly spaced intervals from middle portion of the batch. Sampling time shall not exceed 15 minutes.
 - b. Mold and cure specimens in accordance with ASTM C 31.
 - 1) During the initial 24 hours (plus or minus 8 hours) after molding, the temperature immediately adjacent to the specimens shall be maintained in the range of 60 to 80 degrees F. Control loss of moisture from the specimens by shielding from the direct rays of the sun and from radiant heating devices.
 - 2) Specimens transported prior to 48 hours after molding shall not be demolded, but shall continue initial curing at 60 to 80 degrees F until time for transporting.
 - 3) Specimens transported after 48 hours age shall be demolded in 24 hours (plus or minus 8 hours). Curing shall then be continued but in saturated limewater at 73.4 degrees (plus or minus 3 degrees F) until the time of transporting.
 - 4) During transportation, protect the specimens with suitable cushioning material to prevent damage from jarring. During cold weather, protect specimens from freezing with suitable insulation material. Transportation time shall not exceed four hours.
 - 5) Date test cylinders and number consecutively. Give each cylinder of each set an identifying letter (i.e. A, B, C, D). Prepare a sketch of the building plan for each test set identifying location of placed concrete.
 - c. Test cylinders in accordance with ASTM C 39.
 - 1) Test one cylinder (A) at 7 days for information. If the compressive strength of the concrete sample is equal to or above the 28 day specified strength, test another cylinder (B) at 7 days. The average of the breaks shall constitute the compressive strength of the concrete sample.
 - 2) Test two cylinders (B and C) at 28 days and the average of the breaks shall constitute the compressive strength of the concrete sample.
 - 3) Retain fourth cylinder (D) for further testing if needed, but do not retain cylinder more than 60 days.
- K. Reporting:
- 16. Record the following information on concrete material reports and submit to Owner's Construction Manager and others as specified hereinbefore.
 - a. Slump.
 - b. Air content.
 - c. Concrete temperature.
 - d. Concrete plastic unit weight.
 - e. Elapsed time from batching at plant to discharge from delivery truck at project.
 - f. Date and time concrete was placed.
 - g. Ambient temperature, wind speed, and relative humidity during concrete placement.
 - h. Name of technician performing tests.
 - i. Test cylinder number and letter.
 - j. Specific foundations or structures covered by this test.
 - k. Proportions of concrete mix or mix identification.
 - l. Maximum size coarse aggregate.
 - m. Specified compressive strength.
 - n. Tested compressive strength.
 - o. Curing conditions for concrete strength test specimens (field and laboratory).
 - p. Date strength specimens transported to laboratory.
 - q. Age of strength specimens when tested.
 - r. Type of fracture during test.
 - 17. Field Test Reports: Submit reports of field tests to Owner's Construction Manager and others as specified hereinbefore. In addition to other required information noted in this Section, record the following concrete materials information on "Wal-Mart Interior Slabs on Ground Observation Report":
 - a. Date and time concrete was placed.
 - b. Time of batching at plant (As shown on delivery ticket)
 - c. Relative humidity, ambient temperature, and base temperature during concrete placement in accordance with ACI 305.1.
 - d. Time of placing and finishing tasks at location where sampled concrete is placed.
 - 1) Discharge from delivery.
 - 2) Start of initial floating.

3) Start of initial troweling.

- L. Batch Plant Quality Control: Quality control of materials and batching operations during batching operations shall be the full responsibility of the batch plant operators. CTL or Owner's Concrete Consultant will not be required to perform observation, testing, or inspection at the batch plant during batching operations.

SECTION 03410 – PLANT-PRECAST STRUCTURAL CONCRETE PANELS

1.1 OWNER TESTING AND INSPECTION (T&I)

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL)
- B. Field welds will be visually inspected and nondestructively tested according to ASTM E 165 or ASTM E 709. All high-strength bolted connections shall be inspected.
- C. Observe and verify that the following are in accordance with specified requirements:
 - 1. Foundations for elevation, width, and general location.
 - 2. Grout proportioning.
 - 3. Hot and cold weather procedures.
- D. Provide periodic inspection of erection of precast concrete members by a Special Inspector – Technical I in compliance with the requirements of ACI 318: Ch. 26.
 - 1. At start of panel erection and at 50% and 75%.
- E. Visually inspect in-place panels for stress cracks or other damage or deficiency.
- F. Construction Testing Laboratory will prepare and report test results promptly and in writing to designated Building Official, Contractor, Structural Engineer, and Walmart Construction Manager

SECTION 05090 - POST-INSTALLED CONCRETE AND MASONRY ANCHORS

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- C. Section Includes:
 - 1. Post-installed mechanical and adhesive anchors for structural members, equipment supports.
- D. Periodically verify and inspect the following for each anchor specified in Section 05090:
 - 1. General compliance with manufacturer's published instructions.
 - 2. Product name and description.
 - 3. Adhesive expiration date for adhesive anchors.
 - 4. Compliance of drill bit with manufacturer's specifications.
 - 5. Adhesive application technique for adhesive anchors.
 - 6. Concrete type, compressive strength, and member thickness.
 - 7. Hole diameter, depth, location, and edge distance.
 - 8. Cleanliness of hole and anchor.
 - 9. Anchor diameter, length, and steel grade.
 - 10. Anchor embedment and spacing.
 - 11. Required tightening torque for mechanical anchors.
- E. Testing: Perform pullout or shear tests to determine adequacy of suspected malfunctioning anchors when directed to do so by the Owner's Construction Manager upon recommendation by the CTL.

SECTION 05120 - STRUCTURAL STEEL

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- C. In addition to the Special Inspector qualification stated in this Section, the Technical II Inspector shall be an American Society for Non-destructive Testing (ASNT) Non-destructive Testing Technician, TC-1A Level I, or an American Welding Society (AWS) Certified Associate Weld Inspector (C.A.W.I.)
- D. CTL shall report results after each observation visit.
- E. High Strength Bolting (Field Installed):
 - 1. General:
 - a. Visually inspect mating surfaces and bolt type for all slip-critical bolted connections prior to bolting.
 - b. Verify that bolts, nuts, washers, paint and installation/tightening standards are met.
 - c. Observe calibration procedures and verify that selected procedure is used to tighten bolts.
 - d. Test high strength bolted connections in accordance with bolting standard specified above.
 - 2. Slip Critical and Tension Bolts: Test bolt tightening in 100% of bolts. Verify that surfaces of connected elements have been brought into contact at 100% of connections. Verify all tips are removed from twist-off bolts.
 - 3. Bearing Bolts: Visually inspect to confirm surfaces of connected elements have been brought into contact, at 100% of connections. This shall apply only to bolts designed for values not requiring exclusion of threads from failure plane. All other bolts shall be tested as for tension bolts.
- F. High Strength Bolting (Shop Installed): Self performed by the Fabricator as part of their compliance with AISC Quality Certification Program - Category I requirements. For shop fabricated work, perform tests if more stringent requirements are required by either the AHJ or the SER. Shop bolting inspection requirements are same as field bolting requirements.
- G. Welding (General):
 - 1. Prior to start of fabrication, determine if fabrication shop meets the criteria for exempting shop welds from inspection and confirm in writing to Building Official and SER.
 - 2. Verify qualifications of welders as AWS certified.
 - 3. Verify proposed welding procedures and materials.
 - 4. Verify adequate preparation of faying surfaces.
 - 5. Verify preheat and interpass temperatures of steel, proper technique and sequence of welding, and cleaning and number of passes are provided as required.
- H. Welding (Field):
 - 1. Visible and uncovered at the time of each inspection for proper inspection procedures.
 - 2. Single Pass Fillet Welds: Visually inspect 100% of single pass fillet welds for size, length, and quality, per AWS D1.1.
 - 3. Multi-pass Fillet Welds: Visually inspect 100% of multi-pass fillet welds for size, length, and quality, per AWS D1.1.
 - 4. Partial Penetration Welds: Test 100% of partial penetration welds exceeding 5/16 inch, using Ultrasonic Testing per AWS. D1.1. Test 100% of partial penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 - 5. Complete Penetration Welds: Test 100% of complete penetration welds exceeding 5/16 inch, using Ultrasonic Testing per A.W.S. D1.1 Test 100% of complete penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 - 6. Miscellaneous Metals, Inserts and Prefabricated Components: Where integrity of the connections impact life safety or performance of the building structure, provide testing and inspection as for typical welds previously specified.

- I. Coordinate and schedule inspections such that completed bolts and welds are visible and uncovered at the time of each inspection for proper inspection procedures.
- J. Welding (Shop): Perform inspections as for field welding except weld testing may be reduced or deleted if fabrication shop satisfies AISC Quality Certification Program - Category I, or more stringent criteria, and is approved by Building Official and SER.
- K. Submittal Verification: Verify mill test reports and other submitted documentation for compliance with Contract Documents.
- L. Materials Verification: Verify materials delivered to Site comply with Contract Documents and approved shop drawings. Materials and verifications include:
 - 1. Structural Steel:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certified mill test reports.
 - 2. High Strength Bolts, Nuts, and Washers:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certificate of compliance.
 - 3. Welding Electrodes:
 - a. Identification markings to conform to AWS specification.
 - b. Manufacturer's certificate of compliance.
- M. Verification of Detail Compatibility.
 - 1. Inspection shall coincide with welding inspections.
 - 2. Review project documents affecting integrity of the structure, including Contract Documents and pertinent submittals including approved shop drawings.
 - 3. Perform review of the structure and visually confirm general compliance with Contract Documents.
 - 4. Inspect the following to verify member orientation, configuration, type, and size comply with details indicated in Contract Documents and approved shop drawings:
 - a. Bracing and stiffening members.
 - b. Structural member locations.
 - c. Proper applications of joint details at connections for structural members.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor. Retesting shall follow the procedures for correction of deficiencies described above.

SECTION 05300 - METAL DECK

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. If inspection of fabricator's work is required, testing agent may test and inspect structural steel at plant before shipment. Owner and SER reserve right to reject material not complying with Contract Documents at any time before final acceptance.
- C. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- D. CTL will prepare report of results after each observation visit and submit report to Owner.
- E. Metal Deck Fasteners:
 - 1. Visually inspect welded and screw fasteners for specified size, spacing, embedment, and location.
 - 2. Inspect 100% of side lap connectors over entire roof area for type, size, and spacing of side lap connectors. Verify that the side lap connection connects all layers of the deck tightly.

3. Inspect 100% of primary deck attachments to continuous steel members (joists, joist girders, and perimeter angles).
 4. For TEK screw connections, inspect for complete depth of penetration.
 5. For welded connections inspect for fusion and size.
- F. Coordinate and schedule inspections such that completed welds and fasteners are visible and uncovered at the time of each inspection for proper inspection procedures.
- G. Submittal Verification: Verify mill test reports and other submitted documentation, for compliance with Contract Documents.
- H. Materials Verification:
1. Verify materials delivered to Site comply with Contract Documents and approved shop drawings. Materials include:
 - a. Welding Electrodes:
 - b. Identification markings to conform to AWS specification.
 - c. Manufacturer's certificate of compliance.
 - d. Mechanical fasteners.
 - e. Deck: Select 6 random sheets for each type of deck used. Inspect for deck thickness, type, and material.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

SECTION 05400 - COLD FORMED METAL FRAMING

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- C. Welding (General):
1. Verify qualifications of all welders as AWS certified.
 2. Verify proposed welding procedures and materials.
 3. Verify adequate preparation of faying surfaces.
 4. Verify preheat and interpass temperatures of steel, proper technique and sequence of welding, and cleaning and number of passes are provided as required.
- D. Welding (Field):
1. Cold Formed Metal Framing Welds: Visually inspect 100% of welds for specified length, size, and continuity in accordance with AWS D1.3 for metal less than 1/8" in thickness, for work designed as a structural element.
 2. Miscellaneous Metals, Inserts and Prefabricated Components: Where integrity of the connections impact life safety or performance of the building structure, provide testing and inspection as for typical welds previously specified.
- E. Welding (Shop): Perform inspections as for field welding except weld testing may be reduced or deleted if fabrication shop satisfies AISC Quality Certification Program - Category I, or more stringent criteria, and is approved by building official and SER.
- F. Miscellaneous Mechanical Fasteners: Visually inspect fasteners that are part of the building structural system for specified size, spacing, and location.
- G. Submittal Verification: Verify mill test reports and other submitted documentation for compliance with contract documents.

- H. Material Verification: Verify materials delivered to site comply with contract documents and approved shop drawings. Materials include:
 - 1. Welding Electrodes
 - a. Identification markings to conform to AWS specifications.
 - b. Manufacturer's certificate of compliance.
 - 2. Mechanical fasteners
- I. Coordinate and schedule inspections such that completed welds and fasteners are visible and uncovered at the time of each inspection for proper inspection procedures.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor.

SECTION 05510 – METAL STAIRS WITH HANDRAILS

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).
- B. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- C. In addition to the Special Inspector qualification stated in this Section, the Technical II Inspector shall be an American Society for Non-destructive Testing (ASNT) Non-destructive Testing Technician, TC-1A Level I, or an American Welding Society (AWS) Certified Associate Weld Inspector (C.A.W.I.)
- D. CTL shall report results after each observation visit.
- E. High Strength Bolting (Field Installed):
 - 1. General:
 - a. Visually inspect mating surfaces and bolt type for all slip-critical bolted connections prior to bolting.
 - b. Verify that bolts, nuts, washers, paint and installation/tightening standards are met.
 - c. Observe calibration procedures and verify that selected procedure is used to tighten bolts.
 - d. Test high strength bolted connections in accordance with bolting standard specified above.
 - 2. Slip Critical and Tension Bolts: Test bolt tightening in 100% of bolts. Verify that surfaces of connected elements have been brought into contact at 100% of connections. Verify all tips are removed from twist-off bolts.
 - 3. Bearing Bolts: Visually inspect to confirm surfaces of connected elements have been brought into contact, at 100% of connections. This shall apply only to bolts designed for values not requiring exclusion of threads from failure plane. All other bolts shall be tested as for tension bolts.
- F. High Strength Bolting (Shop Installed): Self performed by the Fabricator as part of their compliance with AISC Quality Certification Program - Category I requirements. For shop fabricated work, perform tests if more stringent requirements are required by either the AHJ or the SER. Shop bolting inspection requirements are same as field bolting requirements.
- G. Welding (General):
 - 1. Prior to start of fabrication, determine if fabrication shop meets the criteria for exempting shop welds from inspection and confirm in writing to Building Official and SER.
 - 2. Verify qualifications of welders as AWS certified.
 - 3. Verify proposed welding procedures and materials.
 - 4. Verify adequate preparation of faying surfaces.
 - 5. Verify preheat and interpass temperatures of steel, proper technique and sequence of welding, and cleaning and number of passes are provided as required.
- H. Welding (Field):
 - 1. Visible and uncovered at the time of each inspection for proper inspection procedures.

2. Single Pass Fillet Welds: Visually inspect 100% of single pass fillet welds for size, length, and quality, per AWS D1.1.
 3. Multi-pass Fillet Welds: Visually inspect 100% of multi-pass fillet welds for size, length, and quality, per AWS D1.1.
 4. Partial Penetration Welds: Test 100% of partial penetration welds exceeding 5/16 inch, using Ultrasonic Testing per AWS. D1.1. Test 100% of partial penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 5. Complete Penetration Welds: Test 100% of complete penetration welds exceeding 5/16 inch, using Ultrasonic Testing per A.W.S. D1.1 Test 100% of complete penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 6. Miscellaneous Metals, Inserts and Prefabricated Components: Where integrity of the connections impact life safety or performance of the building structure, provide testing and inspection as for typical welds previously specified.
- I. Coordinate and schedule inspections such that completed bolts and welds are visible and uncovered at the time of each inspection for proper inspection procedures.
 - J. Welding (Shop): Perform inspections as for field welding except weld testing may be reduced or deleted if fabrication shop satisfies AISC Quality Certification Program - Category I, or more stringent criteria, and is approved by Building Official and SER.
 - K. Submittal Verification: Verify mill test reports and other submitted documentation for compliance with Contract Documents.
 - L. Materials Verification: Verify materials delivered to Site comply with Contract Documents and approved shop drawings. Materials and verifications include:
 1. Structural Steel:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certified mill test reports.
 2. High Strength Bolts, Nuts, and Washers:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certificate of compliance.
 3. Welding Electrodes:
 - a. Identification markings to conform to AWS specification.
 - b. Manufacturer's certificate of compliance.
 - M. Verification of Detail Compatibility.
 1. Inspection shall coincide with welding inspections.
 2. Review project documents affecting integrity of the structure, including Contract Documents and pertinent submittals including approved shop drawings.
 3. Perform review of the structure and visually confirm general compliance with Contract Documents.
 4. Inspect the following to verify member orientation, configuration, type, and size comply with details indicated in Contract Documents and approved shop drawings:
 - a. Bracing and stiffening members.
 - b. Structural member locations.
 - c. Proper applications of joint details at connections for structural members.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor. Retesting shall follow the procedures for correction of deficiencies described above.

SECTION 05520 – METAL PIPE AND TUBE RAILINGS

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. Owner T&I will be performed by the Owner's Construction Testing Laboratory (CTL).

- B. Owner T&I shall be performed by a Special Inspector - Technical II or Special Inspector - Structural I.
- C. In addition to the Special Inspector qualification stated in this Section, the Technical II Inspector shall be an American Society for Non-destructive Testing (ASNT) Non-destructive Testing Technician, TC-1A Level I, or an American Welding Society (AWS) Certified Associate Weld Inspector (C.A.W.I.)
- D. CTL shall report results after each observation visit.
- E. High Strength Bolting (Field Installed):
 - 1. General:
 - a. Visually inspect mating surfaces and bolt type for all slip-critical bolted connections prior to bolting.
 - b. Verify that bolts, nuts, washers, paint and installation/tightening standards are met.
 - c. Observe calibration procedures and verify that selected procedure is used to tighten bolts.
 - d. Test high strength bolted connections in accordance with bolting standard specified above.
 - 2. Slip Critical and Tension Bolts: Test bolt tightening in 100% of bolts. Verify that surfaces of connected elements have been brought into contact at 100% of connections. Verify all tips are removed from twist-off bolts.
 - 3. Bearing Bolts: Visually inspect to confirm surfaces of connected elements have been brought into contact, at 100% of connections. This shall apply only to bolts designed for values not requiring exclusion of threads from failure plane. All other bolts shall be tested as for tension bolts.
- F. High Strength Bolting (Shop Installed): Self performed by the Fabricator as part of their compliance with AISC Quality Certification Program - Category I requirements. For shop fabricated work, perform tests if more stringent requirements are required by either the AHJ or the SER. Shop bolting inspection requirements are same as field bolting requirements.
- G. Welding (General):
 - 1. Prior to start of fabrication, determine if fabrication shop meets the criteria for exempting shop welds from inspection and confirm in writing to Building Official and SER.
 - 2. Verify qualifications of welders as AWS certified.
 - 3. Verify proposed welding procedures and materials.
 - 4. Verify adequate preparation of faying surfaces.
 - 5. Verify preheat and interpass temperatures of steel, proper technique and sequence of welding, and cleaning and number of passes are provided as required.
- H. Welding (Field):
 - 1. Visible and uncovered at the time of each inspection for proper inspection procedures.
 - 2. Single Pass Fillet Welds: Visually inspect 100% of single pass fillet welds for size, length, and quality, per AWS D1.1.
 - 3. Multi-pass Fillet Welds: Visually inspect 100% of multi-pass fillet welds for size, length, and quality, per AWS D1.1.
 - 4. Partial Penetration Welds: Test 100% of partial penetration welds exceeding 5/16 inch, using Ultrasonic Testing per AWS. D1.1. Test 100% of partial penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 - 5. Complete Penetration Welds: Test 100% of complete penetration welds exceeding 5/16 inch, using Ultrasonic Testing per A.W.S. D1.1 Test 100% of complete penetration welds less than 5/16 inch, using Magnetic Particle Testing per ASTM E 709, performed on root pass and on finished weld.
 - 6. Miscellaneous Metals, Inserts and Prefabricated Components: Where integrity of the connections impact life safety or performance of the building structure, provide testing and inspection as for typical welds previously specified.
- I. Coordinate and schedule inspections such that completed bolts and welds are visible and uncovered at the time of each inspection for proper inspection procedures.
- J. Welding (Shop): Perform inspections as for field welding except weld testing may be reduced or deleted if fabrication shop satisfies AISC Quality Certification Program - Category I, or more stringent criteria, and is approved by Building Official and SER.

- K. Submittal Verification: Verify mill test reports and other submitted documentation for compliance with Contract Documents.
- L. Materials Verification: Verify materials delivered to Site comply with Contract Documents and approved shop drawings. Materials and verifications include:
 - 1. Structural Steel:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certified mill test reports.
 - 2. High Strength Bolts, Nuts, and Washers:
 - a. Identification markings to conform to ASTM standards.
 - b. Manufacturer's certificate of compliance.
 - 3. Welding Electrodes:
 - a. Identification markings to conform to AWS specification.
 - b. Manufacturer's certificate of compliance.
- M. Verification of Detail Compatibility.
 - 1. Inspection shall coincide with welding inspections.
 - 2. Review project documents affecting integrity of the structure, including Contract Documents and pertinent submittals including approved shop drawings.
 - 3. Perform review of the structure and visually confirm general compliance with Contract Documents.
 - 4. Inspect the following to verify member orientation, configuration, type, and size comply with details indicated in Contract Documents and approved shop drawings:
 - a. Bracing and stiffening members.
 - b. Structural member locations.
 - c. Proper applications of joint details at connections for structural members.

2.2 RETESTING AND RE-INSPECTION BY OWNER CTL:

- A. CTL will conduct retesting and re-inspection as necessary until corrections are fully completed by the Contractor. Retesting shall follow the procedures for correction of deficiencies described above.

SECTION 07500 - MEMBRANE ROOFING

2.1 OWNER TESTING AND INSPECTION

- A. Roof Observation Program: The CTL will develop a comprehensive Roof Observation Program to be administered by the IRI. The Program is described in the "Roof Observation Program paragraph herein above.
- B. Roof Inspection:
 - 1. The Owner's Independent Roofing Inspector (IRI) will conduct roof inspections as specified herein. The IRI responsibilities will, in general, be as follows:
 - a. Provide full time inspection during roof installation.
 - b. Complete Roof Inspection Checklist.
 - c. Oversee remedial repairs in the field.
 - d. Enter roofing defects and required repairs defined as deviations by the IRC into the online Owner's Observation Log.
 - e. Issue Certification of Quality of Roof Construction upon completion of roof installation.
- C. The activities and responsibilities of the IRI shall not preclude any quality control responsibilities by the Contractor, the Roofing Contractor, or the Manufacturer's Technical Representative as specified herein.
- D. The IRI is neither authorized to change any specified requirement nor to approve any portion of the work.
- E. Failure to detect defective material or Work will neither prevent rejection when defects are discovered later nor will it obligate Owner to make final acceptance.

COMPREHENSIVE FINAL ROOF INSPECTION

INSTRUCTIONS

TOOLS AND SUPPLIES: Provide the following during inspections:

- Copy of roof plan and copy and specifications.
- Tape measure, metal thickness gauge, paint for marking defects on roof, roof coring tools and repair materials, and seam probe (to be supplied by Roofing Contractor).

INSPECTION PROCEDURE

- The Manufacturer's Technical Representative shall arrange and conduct inspection and complete checklist and identify defects and enter into Owner's Observation Log.
- All undersigned parties shall accompany inspection.
- Inspect underside of decking from inside of building for proper insulation fastener spacing and sheet fastener spacing.
- Roof Inspection shall start at the parapet wall on the GM side of the building, at the back corner.
- Proceed around perimeter.
- Continue across front wall and down sidewall at GR.
- Inspect metal flashings, roof edge fascia system, perimeter attachments, perimeter membrane sheet layout, parapet waterproofing membrane, and accessories.
- Inspect condition of paint on exterior walls. Inspect CMU for proper paint coverage.
- Inspect painted metals for proper coverage.
- Inspect back wall gutter or internal drainage system.
- Inspect field of roof system, beginning approx. 10 feet from back wall, walking side to side of building.
- Inspect roof area no more than 10 feet on each side of walking paths, from back, to front of building.
- Inspect checklist items at field seams, flashings, RTUs, mechanical equipment, skylights, refrigeration units, gas lines, expansion joints, crickets, walkpads, and other roof accessories.
- Mark defects on roof by paint markings and identify each defect using corresponding defect number.
- After roof inspection is complete, email signed inspection form to Owner's Construction Manager within 24 hours.

COMPLETION OF CHECKLIST AND DEFECTS FORM

- Answer each checklist item Yes or No.
- Mark "N/A" on checklist items which do not apply.
- Identify defects on the Owner's Observation Log. (www.bldgportal.com, enter username and password, select Observation Log)
- Number each defect as follows:
 - Identification Symbol-Checklist Item No.-Defect No. (E.g. MF-1-3)
 - Identification symbol and checklist item number shall correspond to the Roof Inspection Checklist. The defect number shall be numbered in sequence for each checklist item.
- Complete applicable information in the Observation Log including the resolution of each item.

SECTION 09511 - ACOUSTICAL PANEL CEILINGS

2.1 OWNER TESTING AND INSPECTION (T&I):

- A. CTL shall perform periodic special inspection during installation of acoustical panel ceilings, including acoustical panel placement, ceiling grid suspension system installation and connection to structure.

[Example Conformance Letter from Testing and Inspection Agency (CTL) - all items in parentheses are items to be edited for the project]

[Mr. Construction Manager]

Wal-Mart Construction
Sam M. Walton Development Complex
2001 S. E. 10th Street
Bentonville, Arkansas 72716

[Re: Supercenter (Store #xxx) - City, State]

[Dear Construction Manager:]

The purpose of this letter is to state to Wal-Mart, the Architect of Record and the Engineer of Record that, to the best of our knowledge, the construction on the above referenced project has been completed in substantial conformance with the approved Contract Documents and with the provisions of the applicable building code. In the capacity of owner's testing and inspecting agency, periodic reports as well as a final report have been issued. Those reports state that all of the on-site inspection and testing has been performed. Work requiring inspection was, to the best of the inspector's knowledge, in conformance with the approved plans, specifications, and applicable workmanship provisions of the code.

To our knowledge no outstanding items exist except as otherwise may be entered and shown on the Wal-Mart Observation Log.

Sincerely,

[Testing and Inspection Agency]

[Include a seal, signature and date of signature]

cc: [ARCHITECT OF RECORD]

[ENGINEER OF RECORD]

WWPA	Western Wood Products Association

Reference in the Standard Specifications or special provisions to any of the publications of the above listed associations, organizations or authorities as a specification included, shall be taken to mean the latest current edition at time of bidding unless specifically stated otherwise.

1-1.02B Abbreviations (Word)

#4	1/2" Rebar
AB	Aggregate base
ABS	Acrylonitrile-butadiene-styrene
AC	Alternating current
AC	Asphalt concrete
ACP	Asbestos cement pipe
AKA	Also Known As
AMP	Ampere
AS	Aggregate sub-base
AV	Average
Ave	Avenue
BC	Beginning of curve
Blvd	Boulevard
BM	Bench mark
BMP	Best Management Practice
BTU	British Thermal Unit
BVC	Beginning of vertical curve
BWG	Birmingham Wire Gage (iron and steel wire)
CB	Catch basin
CC or C/C	Center to center
CF	Cubic feet
CFM	Cubic feet per minute
CFS	Cubic feet per second
CIP	Cast in place
CIPCP	Cast in place concrete pipe
CL or \mathcal{C}	Center line
cm	Centimeter
CMP	Corrugated metal pipe
Conc	Concrete
Const	Construct
Cu	Cubic
CY	Cubic yard
D	Diameter of pipe inside height of semi-elliptical conduit, or D-load
d	Penny
Deg.	Degree or degrees
DF	Douglas fir
Dia	Diameter
Dwg	Drawing
E	East
Ea	Each

EC..... End of curve
El or Elev Elevation
EP..... Edge of pavement
Eq..... Equation
ESCP..... Extra strength concrete pipe
EVC End of vertical curve
EW Each Way
Ex or Exist..... Existing
FC (or FOC) Face of Curb
FH Fire hydrant
FL or L Flow line
fpm Feet per minute
fps..... Feet per second
ft Foot or feet
g..... Gram
Ga Gauge
Gal Gallon
Galv Galvanized
General Permit General Construction Activity Storm Water Permit
GL..... Ground line
GPM Gallons per minute
Gr..... Grade
H High or height
HP Horsepower
HR..... Hour
Hor..... Horizontal
IN Instrument Number
IP..... Iron pipe
KVA..... Kilo Volt Amps
KW..... Kilowatts
L Length
Lb..... Pound
LF Linear foot
LH..... Lamp hole
LS Lump sum
Lin Linear
Long..... Longitudinal
Lt..... Left
M Meter
Max Maximum
MEP..... Maximum Extent Practicable
MFBM Thousand feet board measure
MGD Million gallons per day

MH..... Maintenance Hole
M Gal..... Thousand gallon
Mi Mile
Min Minimum
mm Millimeter
Mon..... Monument
N North
NE Northeast
NW Northwest
No Number
NOI Notice of Intent
OC..... On center
OG..... Original ground
OD..... Outside diameter
OR..... Official Records of County
Oz..... Ounce
PCC Point of compound curve or Portland Cement Concrete
PG&E Pacific Gas & Electric Co.
PI..... Point of intersection
P/L or R_L Property line
PP..... Power pole
pphm Parts per hundred million
ppm Parts per million
PRC Point of reverse curve
Prop..... Proposed
psf Pounds per square foot
psi Pounds per square inch
PT..... Point of tangency
PacBell..... Pacific Bell
PUE Public Utility Easement
PVC Polyvinyl chloride
Pvmt Pavement
Q Rate of flow or quantity
Qt..... Quart
R..... Radius
RP Reduced Pressure
RCP Reinforced concrete pipe
Rdwy Roadway
Ret Wall Retaining wall
Rt Right
R/W Right of way
S..... South or slope

San	Sanitary
SC	Sewer Connection
SD	Storm drain (aka Storm Sewer)
Sec	Seconds
SF	Square foot
SE	Southeast
Spec	Specifications (aka Standard Specifications)

1-1.03 Definitions

The following are additional definitions or definitions included in Caltrans Standard Specifications, which have been added to or modified for City of Stockton uses.

Acceptance - The formal written acceptance by the City of Stockton of an entire contract which has been completed in all respects in accordance with the Standard Specifications and Plans and any modifications thereof previously approved.

Arterial (Street Classification) - That part of the roadway system serving as the principal network for through traffic flow. The routes connect areas of principal traffic generation and important rural highways entering the city.

Classification questions should be directed to the Traffic Engineering Section of the Public Works Department of the City of Stockton.

Attorney General - This term is to be interpreted to mean the City Attorney for the City of Stockton.

Auxiliary Lane - That portion of the roadway adjoining the traveled way for speed change or other purposes supplementary to through traffic movement

California - Shall be interpreted to mean Stockton where it is used as a point of delivery.

California Storm Water Best Management Practice Handbooks;

Volume 1: Municipal BMP Handbook;

Volume 2: Commercial/Industrial BMP Handbook;

Volume 3: Construction BMP Handbook; - Refer to Chapter 13, Stockton Municipal Code

Caltrans - The State of California, Business & Transportation Agency, Department of Transportation.

City - The City of Stockton, California.

City Attorney - The City Attorney of the City of Stockton. Any reference to the Attorney General in Caltrans specifications shall mean the City Attorney of the City of Stockton.

City Council - The Stockton City Council.

Code - The terms Government Code, Labor Code, etc. refer to codes of the State of California.

Collector (Street Classification) - A collector street is defined as a street which serves traffic movements within subdivision and connects this area with an arterial street or other collector street.

Classification questions should be directed to the Traffic Engineering Section of the Public Works Department of the City of Stockton.

Commercial - Refer to Chapter 16 of the Stockton Municipal Code.

Contract Price - The total amount of money for which the contract is awarded.

Contract Unit Price - The contractor's original bid for a single unit of an item of work in the Proposal.

Days - Unless otherwise designated, days as used in the Standard Specification will be understood to mean working days.

Deeplift Asphalt Concrete - (See Full Depth Asphalt Concrete)

Deep Strength Asphalt Concrete - (See Full Depth Asphalt Concrete)

Department - The Department of Public Works of the City of Stockton. Any reference to the terms "Department" or "Department of Transportation" in Caltrans Standard Specifications shall mean the Department of Public Works of the City of Stockton when referring to the administration of the project.

Director of Public Works - The executive officer of the Department of Public Works as created by law or the executive officer's assigned representative. Any reference to the terms "Director" or "Director of Transportation" in Caltrans Standard Specifications shall mean the Director of Public Works of the City of Stockton. Any reference to the terms "Director" or "Director of Public Works" shall also mean the Director of Municipal Utilities or Director's assigned representative on projects or contracts for which the Municipal Utilities Department is the responsible department.

Electrolier - Street light assembly complete, including foundation, standard, luminaire arm, luminaire, etc.

Engineer - The City Engineer of the City of Stockton acting either directly or through properly authorized agents, such agents acting within the scope of the particular duties delegated to them. Any reference to the terms "Engineer" or "City Engineer" shall also mean the Director of Municipal Utilities on projects or contracts for which the Municipal Utilities Department is the responsible department.

Engineer's Estimate - The list of estimated quantities of work to be performed as contained in the "Bid Proposal."

Full Depth Asphalt Concrete - The term FULL-DEPTH (registered by The Asphalt Institute with the U.S. Patent Office) certifies that the pavement is one in which asphalt mixtures are employed for all courses above the subgrade or improved subgrade. A FULL-DEPTH asphalt pavement is laid directly on the prepared subgrade. (The mathematical symbol T_a denotes Full-Depth or Total Asphalt.) (May also be referred to as Deep Lift or Deep Strength Asphalt Concrete)

Highway - The whole right-of-way or area which is reserved for and secured for use in constructing the roadway and its appurtenances. Where the work is not specifically highway or street work, the term "highway" or "highway right-of-way" shall be interpreted to mean the property line or the bounded area of the site of the improvement/work or be deleted, where applicable.

Holiday – An undesirable discontinuity or break in the anticorrosion protection on pipe or tubing.

Industrial - Refer to Chapter 16 of the Stockton Municipal Code.

Laboratory - The established laboratory of the City of Stockton and/or the laboratory chosen by, or approved by the City of Stockton and authorized to test materials and work involved in the contract.

Liquidated Damages - The amount prescribed in the special conditions to be paid to the City of Stockton or to be deducted from any payments due or to become due to the Contractor for each day's delay in completing the whole or any specified portion of the work beyond the time allowed in the Standard Specifications.

Local (Street Classification) - Roadways used primarily for direct access to residential, commercial, industrial or other abutting property. They do not include roadways carrying through traffic. A local street is defined as a facility having the sole function of providing access to immediately adjacent land.

Clarification questions should be directed to the Traffic Engineering section of the Public Works Department of the City of Stockton.

Lowest Responsible Bidder - The company or firm whose bid is arithmetically lowest and who meets the criteria set forth in Stockton Municipal Code Section 3-025.

Luminaire - The lamp housing including the optical and socket assemblies (and ballast if so specified).

Other Agencies - Whenever reference is made to any Federal, State or County agency or officer, such reference shall be deemed made to any agency or officer succeeding in accordance with law to the powers, duties, jurisdiction, and authority of the agency or officer mentioned.

Plans - (aka Standard Plans and/or Project Plans as applicable) Refer to the definitions under

Standard Specifications and Plans later in this section.

Project Plans - The project plans are specific details and dimensions peculiar to the work and are supplemented by the Standard Plans insofar as the same may apply. The Standard Plans shall also be interpreted to mean those Standard Plans incorporated within the document.

Proposal Guaranty - The cash, cashier's check, certified check, or bidder's bond accompanying the proposal submitted by the bidder, as a guaranty that the bidder will enter into a contract with the City of Stockton for the performance of the work if the contract is awarded to the bidder.

Residential - Refer to Chapter 16 of the Stockton Municipal Code.

Right-of-Way - Any reference to the term "right-of-way" or "highway right-of-way" shall be interpreted to mean the property right-of-way, property line or the bounded area of the side of work, where applicable.

Sand - aka Class 4 aggregate subbase shall conform to the provisions of Sections 19 and 25 of CalTrans standard specifications. Class 4 aggregate subbase material shall be clean and free from vegetable matter and other deleterious substances. The percentage composition by weight of Class 4 aggregate subbase material shall conform to the following grading when determined by test method No. California 202.

<u>Sieve Sizes</u>	<u>Percentage Passing</u>
2 1/2	100%
NO. 200	2 - 35%

Class 4 aggregate subbase material shall also conform to the quality requirements shown in the following table

<u>Tests</u>	<u>Test Method No. Calif.</u>	<u>Requirements</u>
Sand Equivalent	217	20 min.
Resistance	301	55 min.

Service Connection - Service connections are all or any portion of the conduit, cable or duct, including meter, between a utility distribution line and an individual consumer.

Sewer - Any conduit intended for the reception and transfer of sewage and fluid industrial waste.

Sewer (Private) - A sewer, wholly within private property and maintained privately.

Sewer Connection - A sewer, within a public street, a public utility easement right of way, proposed to connect any parcel, lot or part of a lot with a main line sewer.

Specifications - (aka Standard Specifications) The written directions, provisions, and requirements contained in the "Standard Specifications and Plans" as published by the City of Stockton and as supplemented by the Special Provisions.

Special Provisions - The special provisions are specific clauses setting forth conditions or requirements peculiar to the work and supplementary to these Standard Specifications and Plans. The State of California, Department of Transportation publication entitled "Labor Surcharge and Equipment Rental Rates and General Prevailing Wage Rates" are to be considered as a part of the special provisions.

Standard Specifications and Plans - The official Project Plans and Standard Plans, profiles, typical cross sections, general cross sections, working drawings and supplemental drawings, or reproductions thereof signed by the City Engineer, which show the location, character, dimensions and details of the work to be performed. All such documents are to be considered as part of the Standard Plans whether or not reproduced in the special provisions.

In the above definition, the following terms are defined as follows:

- (a) Standard Plans - The Standard Detail Drawings of the Department of Public Works published as part of the Standard Specifications and Plans as may be adopted, or adopted and modified in the project plans.
- (b) Project Plans - The project plans are specific details and dimensions peculiar to the work and are supplemented by the Standard Plans insofar as the same may apply. The Standard Plans shall also be interpreted to mean those Standard Plans incorporated within the document.
- (c) Standard Specifications - The written directions, provisions, and requirements contained in the "Standard Specifications and Plans" as published by the City of Stockton and as supplemented by the Special Provisions.
- (d) Special Provisions - The special provisions are specific clauses setting forth conditions or requirements peculiar to the work and supplementary to these Standard Specifications and Plans. The State of California, Department of Transportation publication entitled "Labor Surcharge and Equipment Rental Rates and General Prevailing Wage Rates" are to be considered as a part of the special provisions.

State - The State of California. Any reference to the terms "State" or "State of California" in Caltrans Standard Specifications with reference to administration of the project, shall mean the City of Stockton, where applicable.

State Treasurer - Shall be interpreted to mean the City of Stockton Finance Department, where applicable.

Storm Drain - (aka Storm Sewer) Any conduit and appurtenances intended for the reception and transfer of storm water.

Storm Water Management Program - The City of Stockton's Storm Water Management Program as delineated in the City's NPDES Permit for Storm Water Discharges from Municipal separate storm sewer systems.

Street - Any road, highway, parkway, freeway, alley, walk, or way.

Subcontractor - The individual, partnership, corporation or other legal entity entering into a contract with the contractor to perform a portion of the work.

Surety - Any individual, firm or corporation, bound with and for the contractor for the acceptable performance, execution, and completion of the work, and for the satisfaction of all obligations incurred.

Traveled Way - That portion of the roadway for the movement of vehicles, exclusive of shoulders and auxiliary lanes.

Utility - Tracks, overhead or underground wires, pipe lines, conduits, ducts, or structures, sewers or storm drains owned, operated, or maintained in or across a public right of way or private easement.

Welding Specifications - The directions, provisions and requirements contained in these Standard Specifications as modified and as supplemented by the special provisions. Caltrans "Standard Specifications for Welding Structural Steel" dated January 1981 is to be considered a part of these Standard Specifications. Whenever the term "these specifications" is used in this book, it means the provisions set forth in the City of Stockton Standard Specifications and Plans and Caltrans "Standard Specifications for Welding Structural Steel."

SECTION 2

BIDDING

2-1.06A Bid Documents – General – Replace with the following: The City of Stockton Specifications and Standard Drawings can be viewed and download from the City’s website:

<http://www.stocktongov.com/government/departments/publicWorks/enginStand.html>

The Notice to Bidders and Special Provisions and project plans may be viewed at the City of Stockton Bid Flash website:

<http://www.stocktongov.com/services/business/bidflash/default.html>

The City will furnish to each bidder a standard bid form packet, with instructions which, when properly executed and submitted shall be the bidder's bid. Bids, not presented on forms so furnished, or when the Instructions to Bidder are not followed, shall be considered non-responsive.

Bid forms are furnished with the Special Provisions and Project Plans and can be downloaded from the Bid Flash website shown above.

2-1.12 – 2-1.27 – These sections of Caltrans Specifications are to be deleted. Please refer to the City’s Instructions to Bidders which replaces the deleted information.

2-1.30 Job Site and Document Examination - The following is to be added: Oral interpretations or clarifications of the Standard Plans and Specifications, Special Provisions or other project-related documents shall have no legal or binding effect. Any such requests for interpretation or clarification shall be made in writing and will be answered in writing. If errors are found, the bidder shall provide written notification as soon as possible prior to the bid opening in order that letters of clarification can be prepared and given to all bidders.

Where the City has made investigations of subsurface conditions in areas where work is to be performed under the contract, or in other areas, some of which may constitute possible local material sources, such investigations are made only for the purpose of study and design. Where such investigations have been made, bidders or Contractors may, upon written request, inspect the records of the City as to such investigations subject to and upon the conditions hereinafter set forth.

The records of such investigations are not a part of the contract and are shown solely for the convenience of the bidder or contractor. It is expressly understood and agreed that the City assumes no responsibility whatsoever in respect to the sufficiency or accuracy of the investigations thus made, the records thereof, or of the interpretations set forth therein or made by the City in its use thereof and there is no warranty or guaranty, either express or implied, that the conditions indicated by such investigations or records thereof are representative of those existing throughout such areas or any part thereof, or that developments, not specifically looked for, may not occur, or that materials other than, or in proportion different from those indicated, may not be encountered.

The availability of information described in this Section is not to be construed in any way as a waiver of the provisions of the second paragraph of this Section and each prospective bidder and Contractor is cautioned to make such independent investigations and examinations as each of them may consider necessary to sufficiently inform itself as to the conditions to be encountered in the performance of the Work, and, with respect to possible local material sources, the quality and quantity of material available from such sources and the type and extent of processing that may be required in order to produce material conforming to the requirements of the contract. No information derived from such inspection of records of investigations or interpretations thereof made by the City or from the City shall in any way relieve any prospective bidder or Contractor from any risk or from properly fulfilling the terms of the contract.

2-1.31 Department of Industrial Relations Registration Requirements (DIR) - Every contractor or subcontractor bidding on a contract for public works must register with the California Department of Industrial Relations. Pursuant to Labor Code Section 1771.1 the DIR contractors will not be determined to be qualified to bid, be listed on bid proposals or perform any contract work unless currently registered and qualified to perform public work. Contractors may register with the DIR for a fee by going to: <http://www.dir.ca.gov/Public-Works/Contractor-Registration.html>

The City will not accept bids from those contractors that are not registered with the DIR.

2-1.32 Certified Payroll Records - Contractors and Subcontractors are required to submit certified electronic payroll records to the California Labor Commissioner.

2-1.33 Bid Document Completion - The following supersede Caltrans Specifications 2-1.33 entirely: Prospective bidders shall obtain the bid form from the City of Stockton website as shown in Section 2-1.06A. The bid form will state the location and description of the contemplated construction and if applicable show the approximate estimate of the various quantities and kinds of work to be performed or materials to be furnished, with a schedule of items for which bid prices are asked.

The quantities given in the bid form and contract are approximate only, being given as a basis for the comparison of bids. The City does not expressly or by implication, agree that the actual amount of work will correspond therewith, and reserves the right to increase or decrease the amount of any class or portion of the work, or to omit portions of the work, as may be deemed necessary or advisable by the Engineer.

The bidder shall set forth for each item of work, in clearly legible figures, an item price and a total for the item in the respective spaces provided, and shall be signed by the bidder, who shall fill out all blanks in the bid form as therein required.

All bids shall be clearly and distinctly written and if any erasure or interlineation occurs therein, before the bid is filed with the City Clerk, said erasure or interlineation shall be initialed by the person authorized to prepare and execute the bid.

Each sealed bid shall be marked "BID" and shall indicate the project name, number, and bid opening date, and shall be mailed or delivered to the Office of the City Clerk, City Hall, at the

time and place designated in the notice inviting bids. Bids so received shall be publicly opened, examined, and declared by the City Clerk. A bid received after the specified time shall not be accepted and will be returned to the bidder unopened. A bid that is not properly marked may be rejected at the discretion of the City. Bidders and the public are invited to be present at the declaration of said bids. A contract will be awarded to the lowest responsible bidder as defined in the Stockton Municipal Code; provided, however, that the City Council reserves the right to reject any and all bids and to re-advertise for bids or to provide for the work to be done by the City of Stockton.

2-1.33D Opt out of Payment Adjustments for Price Index Fluctuations - This section of Caltrans Specifications is to be deleted.

2-1.34 Bidder's Security – The following is to supersede Caltrans Specification 2-1.34 entirely: All bids shall be presented under sealed cover and accompanied by one of the following forms of bidder's security:

Cash, a cashier's check, a certified check, or a bidder's bond executed by an admitted surety insurer, made payable to the City of Stockton. The security shall be in an amount equal to 10 percent of the amount of bid. A bid will not be considered unless one of the above described forms of bidder's security is enclosed with it.

If the bidder to whom the contract is awarded shall, for 30 days after receipt of such award, fail or neglect to enter into the contract and file any required performance bond and/or labor and material bond, the bid security shall be forfeited and the City Finance Director shall draw the money due on such bid security and pay the same, or any cash deposited, into the City Treasury. The bid security shall not be returned to the defaulting bidder in such case unless the City Council approves the return in whole or in part.

2-1.35 SSPC QP Certification Preaward Qualification - This section of Caltrans Specifications is to be deleted.

2-1.40 Bid Withdrawal - The following is to supersede Caltrans Specification 2-1.40 entirely: Any bid may be withdrawn at any time prior to the time fixed in the public notice for the opening of bids only by written request for withdrawal of the bid filed with the City Clerk. The request shall be executed by the bidder or the bidder's duly authorized representative. The withdrawal of a bid does not prejudice the right of the bidder to file a new bid. Whether or not bids are opened exactly at the time fixed in the public notice for the opening of bids, a bid will not be received after that time, nor may any bid be withdrawn after the time fixed in the notice for the opening of bids.

2-1.47 Bid Relief - The following is to supersede Caltrans Specification 2-1.47 entirely: If the bidder claims a mistake was made in the bidder's bid, the bidder shall give the City written notice in the manner and time specified in the Public Contract Code of the alleged mistake, specifying in the notice in detail how the mistake occurred.

After review of the mistake claimed by the bidder, the City may waive a minor irregularity that does not give a competitive advantage to another bidder. The City is not obligated to waive

irregularities.

2-1.51 Bid Protests – All parties wishing to file a protest shall comply with the procedures set forth below.

All protests regarding the bidding process or the award, or intended award, of any contract must be submitted in writing to the City Attorney on or before 5:00 p.m. of the fifth business day following the opening of all bids, unless a different time period is specified in the Notice Inviting Bids or other bid solicitation documents. All protests must be addressed to: City Attorney, City of Stockton, 425 North El Dorado Street, 2nd Floor, Stockton, CA 95202. The party filing the protest must have actually submitted a bid for the work. A subcontractor of a bidder may not submit a bid protest.

The protest shall contain a full and complete statement specifying in detail the grounds of the protest and the facts in support thereof. The protest must be hand delivered or sent via mail so that it is received by the City Attorney within the time period set forth above. The protest document must include the following:

- A complete statement of the factual and legal basis for the protest;
- The protest must include the name, address and telephone number of the person representing the protesting party; and
- The protesting party must concurrently transmit a copy of the written protest document and any attached documentation to all other bidders who may have a reasonable prospect of receiving the award depending upon the outcome of the protest.

The procedure and time limits set forth herein are mandatory and the bidder's sole and exclusive remedy in the event of protest. No bidder may bring an action or proceeding challenging the bidding process or any award, or intent to award, any contract unless the above procedures are followed. The failure of a party originating a protest to comply with these procedures shall constitute a waiver of any right to further pursue the protest, including filing a government code claim or legal proceeding. The City reserves the right to modify the bid protest procedures in the Notice Inviting Bids or other bid solicitation documents and to require any protesting party to submit additional or clarifying information or documentation in support of any protest.

SECTION 3

CONTRACT AWARD AND EXECUTION

3-1.04 Contract Award – The following is to supersede Caltrans Specifications 3-1.04 entirely: The City reserved the right to reject any and all proposals. The award of the contract, if it be awarded, will be to the lowest responsible bidder whose proposal complies with all the requirements prescribed. Such award, if made, will be made as stated in the special provisions. If the lowest responsible bidder refuses or fails to execute the contract, the City of Stockton may award the contract to the second lowest responsible bidder.

All bids will be compared on the basis of the Engineer's Estimate of the quantities of work to be done.

3-1.05 Contract Bonds – The following is to supersede Caltrans Specifications 3-1.05 entirely: The Contractor will be required to furnish a surety bond for the faithful performance of the Contractor's contract and also a labor and material bond, each in the sum of one hundred percent (100%) of the contract price.

The Faithful Performance Bond will be retained by the City of Stockton for twelve (12) months following final acceptance by the City of the improvements to guarantee correction of failure attributable to workmanship and materials. Upon said final acceptance by the City, the amount of the Faithful Performance Bond may be reduced to ten percent (10%) of the actual improvement construction costs.

The bonds required of the Contractor shall be furnished by a company authorized to do a surety business in the State of California: said bonds shall be executed by the Surety and Contractor before or concurrently with the signing of the contract. The form of said bonds shall be approved by the City Attorney and the surety of Sureties shall be approved by the Director of Finance.

All alterations, extensions of time, extra or additional work and other changes authorized by these Standard Specifications, or any part of the contract may be made without securing the consent of the Surety on the contract bonds.

3-1.06 Contract License - The following shall be added: In additions to the Contractor's license, the Contractor shall obtain a business license from the City of Stockton.

3-1.07 Insurance Policies - The following is to supersede Caltrans Specifications 3-1.07 entirely: The successful bidder must submit the insurance Policies requirements as identified in the Instruction to Bidders packet.

3-1.08 – 3-1.11 - These sections of Caltrans Specifications are to be deleted.

3-1.18 Execution of the Contract - The following is to supersede Caltrans Specifications 3-1.18 entirely: The contract shall be executed within ten (10) days not including Saturdays and Sundays and legal holidays, after the bidder has received the contract.

Failure of the lowest, the second lowest, or the third lowest to execute the contract and file acceptable bonds as provided herein within 10 days not including Saturdays, Sundays and legal holidays, after the bidder has received the contract, shall be just cause for the forfeiture of the proposal guaranty. The successful bidder may file with the City Clerk a written notice, signed by the bidder or the bidder's authorized representative, specifying that the bidder will refuse to execute the contract if presented to the bidder. The filing of such notice shall have the same force and effect as the failure of the bidder to execute the contract and furnish acceptable bonds within the time herein before prescribed.

3-1.19 Bidder's Securities – The following is to supersede Caltrans Specifications 3-1.19 entirely: Within 10 days after the award of the contract to the lowest and best responsible bidder, the City of Stockton will return the proposal guaranties accompanying the proposals no longer being considered.

The proposal guarantee of the lowest responsible bidder will be held until evidence of insurance, a current City of Stockton business license, and satisfactory bonds are provided and the contract is fully executed and filed with the City Clerk.

SECTION 4

SCOPE OF WORK

4-1.05A Changes and Extra Work - General - The following is to be added: The City reserves the right to make such alterations, deviations, additions to or omissions from the plans and specifications, including the right to increase or decrease the quantity of any item or portion of the work, as may be deemed by the Engineer to be necessary or advisable and to require such extra work as may be determined by the Engineer to be required for the proper completion or construction of the whole work contemplated. Such changes, no matter how many, shall be within the contemplation of this Contract and shall not be the basis for a compensable delay. Any such changes will be set forth in a contract change order which will specify, in addition to the work to be done in connection with the change made, adjustment of contract time, if any, and the basis of compensation for such work. A contract change order will not become effective until approved by the authorized City official and/or the City Council. A reservation of rights, non-waiver of claims, or similar exceptions or reservations by the Contractor on a Change Order for additional time, money, or anything else shall not be permitted and are of no force or effect. It is the intent of the City to have all Change Orders issued comprehensively to address all issues known and unknown relating to time and/or costs.

For contracts approved by the City Council for initial prices of less than One Hundred Thousand Dollars (\$100,000), individual and/or cumulative change orders of Seventy Five Thousand Dollars (\$75,000) or that amount approved by City Council Action or greater require City Council approval. For contracts approved by the City Council with initial prices of One Hundred Thousand Dollars (\$100,000) or more, individual and/or cumulative changes orders which exceed Seventy Five Thousand Dollars (\$75,000) or that amount approve by City Council Action plus ten percent (10%) of the initial contract price over One Hundred Thousand Dollars (\$100,000) require City Council approval.

Change orders not meeting the above criteria require approval by the authorized CITY official executing the contract. The dollar amounts of change orders approved by specific City Council action, plus the dollar amounts of any change orders which predate such specific City Council action, shall be counted in computing the new authority limits set forth above for CITY officials to approve change orders hereunder.

When the compensation for an item of work is subject to adjustment under the provisions of this Section 4-1.05A, the Contractor shall, upon request, promptly furnish the Engineer with adequate detailed cost data for said items of work.

In the opinion of the Engineer, if work cannot reasonably be performed concurrently with other items of work and if a controlling item of work is thereby delayed, an adjustment to the Contract time of completion will be granted in writing upon receipt of a written request from the Contractor and no additional compensation shall be allowed.

In emergency situations, the authorized City official may issue a change order beyond the authority

limits described above in order to:

- (a) Prevent interruption of the work which would result in a substantial increase in the costs to, or liability of the City; or
- (b) Protect the work, equipment, materials to be used in the work, human safety, or the environment at or near the work from substantial and immediate danger or injury; or
- (c) Protect, where damage or injury has occurred, the work, equipment or materials to be used in the work, human safety, or the environment from further or additional damage or injury or deterioration.

The authorized City official shall have the authority to issue change orders in such sums as is reasonably necessary for such emergency purposes. After issuing a change order in an emergency situation described above, the authorized City official shall report such action and the reasons therefor to the City Council in writing not later than its next regularly scheduled meeting or as soon thereafter as is practicable. Upon receipt of an approved contract change order, the Contractor shall proceed with the ordered work. If ordered in writing by way of a field order directive, the Contractor shall proceed with the work so ordered prior to actual receipt of an approved contract change order therefor. In such cases, the Engineer will, as soon as practicable, issue an approved contract change order for such work.

The Contractor shall obtain a field order directive or contract change order from the Engineer **PRIOR** to performing any extra work otherwise the Extra Work will not be compensated.

4-1.06 Differing Site Conditions - During the progress of the work, if subsurface or latent physical conditions, differing materially from those indicated in the Contract, are encountered at the site or if unknown physical conditions of an unusual nature, differing materially from those ordinarily encountered and generally recognized as inherent in the work provided for in the Contract, are encountered at the site, the party discovering such conditions shall promptly notify the Engineer in writing of the specific differing conditions before they are disturbed and before the affected work is performed. In the event that the differing site conditions are discovered after work has begun, written notice is required within 48 hours after discovery of such conditions.

Upon written notifications, the Engineer will investigate the conditions to determine if the site conditions substantially differ to cause an increase or decrease in the cost or time required for the performance of any work under the Contract. At the discretion of the Engineer, an adjustment may be made and the Contract may be modified in writing accordingly. The Engineer will notify the Contractor of his/her determination whether or not an adjustment of the Contract is warranted.

No Contract adjustment which results in a benefit to the Contractor will be allowed unless the Contractor has provided the required written notice. No Contract adjustment will be allowed under the provisions specified in this section for any effects upon unchanged work.

Any Contract adjustment warranted due to differing site conditions will be made in accordance

with the provisions in Section 4-1.05, "Changes and Extra Work," of the Standard Specifications.

4.1.07 Value Engineering - This section of Caltrans Specifications is to be deleted.

SECTION 5

CONTROL OF WORK

5-1.02 Contract Components - The following supersedes Caltrans Section 5-1.02 in total: A component in one Contract part applies as if appearing in each. The parts are complementary and describe and provide for a complete work.

If a discrepancy exists:

1. The governing ranking of Contract parts in descending order is:
 - 1.1 Contract, including change orders
 - 1.2 Project Special Provisions
 - 1.3 Project Plans
 - 1.4 City's Standard Specifications
 - 1.5 City's Standard Drawings
 - 1.6 Revised Caltrans Standard Specifications
 - 1.7 Caltrans Standard Specifications
 - 1.8 Revised Caltrans Standard Plans
 - 1.9 Caltrans Standard Plans
 - 1.10 Supplemental Project Information
2. Written numbers and notes on a drawing govern over graphics
3. A detail drawing governs over a general drawings
4. A detail specification governs over a general specification
5. A Specification in a section governs over a specification referenced by that section

If a discrepancy is found or confusion arises, submit an RFI.

5-1.02A Plans and Working Drawings - Record drawings of all improvements shall be provided by the Contractor involved in constructing the improvement. Record drawings shall be neatly and accurately done on a set of Project Plans and delivered to the Department of Public Works as a condition precedent to acceptance of the project.

The Engineer shall review working drawings before any work involving these plans is performed.

On private development work, at the conclusion of construction, the Engineer who prepared the improvement plans will add to the Project Plans, for City record purposes, construction data based on information compiled and furnished by the Engineer, contractors, inspector and others.

On those facilities that will be extended in the future (such as sanitary lines, storm drain lines, water lines and curb and gutter installations), the Engineer shall shoot the grades at the end of the facilities and include the "as constructed" grades on the record drawings.

5-1.03 Engineer's Authority - The following is to be added: Unless otherwise stated, the words *directed, required, permitted, ordered, instructed, designated, considered necessary, prescribed,*

reviewed, approved, acceptable, satisfactory, or words of like import, refer to actions, expressions, and prerogatives of the Engineer.

5-1.09 Partnering - This section is expressly deleted and is not applicable to work done for the City of Stockton. This will be applied on a case by case basis and shall be stated in the special provisions.

5-1.12 Assignment - The following is to be added: No contract or portion thereof may be assigned without consent of the City of Stockton except that the contractor may assign money due, or which will accrue to them, under the contract. If given written notice, such assignment will be recognized by the City of Stockton to the extent permitted by law, but any assignment of money shall be subject to all proper setoffs and withholdings in favor of the City of Stockton and to all deductions provided for in the contract. All money withheld, whether assigned or not shall be subject to being used by the City of Stockton for completion of the work, should the contract be in default.

5-1.13A Subcontracting - General - The following is to be added: The Engineer may also determine, on a case by case basis, items to be designated "Specialty Items." Where an entire item is subcontracted, the value of work subcontracted will be based on the contract item bid price.

5-1.13C Disabled Veteran Business Enterprises - This section of Caltrans Specifications is to be deleted.

5-1.13D Non-Small Businesses - This section of Caltrans Specifications is to be deleted

5-1.26 Construction Surveys - The following is to be added: The Engineer will set one bench mark on the job site and at the option of the Contractor will either (1) stake the center line, (2) stake an offset line, or (3) stake a base line with necessary grades as required one time only. It is expected that on small projects the City will provide the field services. On all subdivisions, or on large and complicated projects, the special conditions will set forth the extent of field service to be provided by the City and whether or not a licensed surveyor or civil engineer shall perform all or part of the engineering work. On Public Works contracts, however, engineering layout will be provided by the City of Stockton as noted in Items 1, 2, or 3 above. Where the City of Stockton does provide staking, it shall be preserved carefully by the Contractor and will only be replaced by the City in the case of malicious mischief or vandalism perpetrated by a third party.

The Contractor shall preserve all monumentation potentially affected by the work in accordance with Section 8771 of the Professional Land Surveyors Act in the Business and Professions Code of the State of California. Locations of known existing monumentation within the area of work shall be indicated on the plans. If required, tie-out of existing monuments shall be completed and appropriate documentation submitted to the City Engineer prior to beginning work. Unless otherwise specified, all construction staking or survey work shall be performed by an appropriately licensed land surveyor or civil engineer.

5-1.31 Job Site Appearance - The following is to be added: The Contractor shall conduct and cause all working forces at the site to maintain the site in a neat orderly manner throughout the construction operations. The work shall be conducted in a manner that will control the dust.

When ordered to provide dust control, the Contractor shall use water or turn soil to reduce the dusty conditions, all to the satisfaction of the Engineer and in accordance with Section 10 of the Standard Specifications. During construction, the Contractor shall remove all rubbish and debris as it is generated to the satisfaction of the Engineer.

Contractor's activities shall conform to the requirements of the Storm Water Management Program and/or BMPs delineated in the project SWPPP. All appropriate provisions of the General Permit including Post-Construction Storm Water Management shall be adhered to.

Nothing herein, however, shall require the Contractor to remove warning, regulatory, and guide signs prior to formal acceptance by the City.

Full compensation for all site maintenance and cleanup will be considered as included in the prices paid for the various contract items of work and no separate payment will be made therefor.

5-1.36E Use of Private Property - The following is to be added: Should the Contractor intend to use privately owned property for the storage of any type of material, or equipment, or for vehicle parking or for any other purpose related to the work, the Contractor shall make the necessary arrangements and shall, precedent to such use, provide the Engineer with satisfactory written evidence that the owner of such property has granted permission of such uses. Prior to the final acceptance of the work, the Contractor also shall provide to the Engineer an acceptable written release from such owner indicating that all of the conditions of such agreement are satisfied.

5-1.37B Load Limits - The following is to be added: The Contractor will be permitted to operate unladen vehicles and to haul Portland cement concrete for paving on completed cement treated base, provided that:

- (1) The cement treated base has cured for 7 days;
- (2) Hauling is limited to the lane immediately adjacent to the median in each direction;
- (3) Maximum weight limitations set forth in Division 15 of the Vehicle Code are not exceeded; and
- (4) Block cracking does not occur under hauling operations.

If block cracking occurs, the Engineer may order said loads to be reduced so that the maximum weight upon any one wheel, or wheels, supporting one end of an axle, and resting upon the roadway, will not exceed 9,000 pounds. The Contractor shall not be entitled to any additional compensation nor extension of contract time by reason of such load reduction.

5-1.38 Maintenance and Protection Relief - Delete the entire section in Caltrans and replace it with the following: Upon the request of the Contractor, the Director may relieve the

Contractor of the duty of maintaining and protecting certain portions of the work which have been completed in all respects in accordance with the requirements of the contract and to the satisfaction of the Engineer, and thereafter except with the Contractor's consent, the Contractor will not be required to do further work thereon. In addition, such action by the Director will relieve the Contractor of responsibility for injury or damage to said completed portions of the work resulting from use by public traffic or from the action of the elements or from any other cause but not from injury or damage resulting from the Contractor's own operations or from the Contractor's negligence.

However, nothing in this Section 5-1.38 providing for relief from maintenance and responsibility will be construed as relieving the Contractor of full responsibility for making good defective work or materials found at any time before the formal written acceptance of the entire contract by the Director.

5-1.43E Alternative Dispute Resolution - This section of Caltrans Specifications is to be deleted.

5-1.46 Acceptance of Contract - The following is to be added: When the Engineer has made the final inspection and determines that the contract work has been completed in all respects in accordance with the Standard Specifications and Plans, the Engineer will file a "Notice of Completion" with the County Recorder.

The Contractor hereby unconditionally guarantees that the work will be done in accordance with the requirements of the contract, and further guarantees the work of the contract to be and remain free of defects of workmanship and materials for a period of one (1) year from the date of acceptance of the work as complete, unless a longer guarantee period is specifically required. The Contractor hereby agrees to repair or replace any and all work, together with any other adjacent work which may be displaced in so doing, that may prove to be not in accordance with the requirements of the contract or that may be defective in its workmanship or material within the guarantee period specified, without any expense whatsoever to the City, ordinary wear and tear and unusual abuse or neglect excepted.

Contract bonds are to be in full force and effect during the guarantee period.

The Contractor further agrees, that within ten (10) calendar days after being notified in writing by the Department of Public Works of any work not in accordance with the requirements of the contract or any defects in the work, the Contractor will commence and prosecute with due diligence all work necessary to fulfill the terms of this guarantee, and to complete the work within a reasonable period of time, and in the event the Contractor fails to so comply, the Contractor does hereby authorize the City to proceed to have such work done at the Contractor's expense and the Contractor will pay the cost thereof upon demand.

Notwithstanding the foregoing paragraph, in an event of an emergency constituting an immediate hazard to the health and safety of the City's employees, property or the public at large, the City may undertake at the Contractor's expense without prior notice all work necessary to correct such hazardous condition when it was caused by work of the Contractor not being in accordance with contract requirements.

SECTION 6

CONTROL OF MATERIALS

6-2.03 City Furnished Materials - The following supersedes Caltrans Section 6-2.03 in total: Materials furnished by the City will be available at locations designated in the special provisions or if not designated in the special provisions they will be delivered to the project. Said materials shall be hauled to the site of the work by the Contractor at the Contractor's expense, including any necessary loading and unloading that may be involved. The cost of handling and placing City furnished material shall be considered as included in the price paid for the contract item involving such City-furnished material.

The Contractor will be held responsible for all materials furnished to the Contractor, and he shall pay all demurrage and storage charges. City-furnished materials lost or damaged from any cause whatsoever shall be replaced by the Contractor. The Contractor will be liable to the City for the cost of replacing City-furnished material and such costs may be deducted from any monies due or to become due the Contractor.

6-2.04 Foreign Materials - The following supersedes Caltrans Section 6-20.4 "Local Materials" in total: The Contractor, at no cost to the City, shall supply the facilities and arrange for any testing required in Stockton which the City is not equipped to perform. All testing by the Contractor shall be subject to witnessing by the Engineer.

Where structural materials requiring mill test reports are obtained from foreign manufacturers, such materials shall be furnished only from those foreign manufacturers who have previously established, to the satisfaction of the Engineer, the sufficiency of their in-plant quality controls, as deemed necessary by the Engineer or his representative, to give satisfactory assurance of their ability to furnish material uniformly and consistently in conformance with these Standard Specifications. At the option of the Engineer, such sufficiency shall be established either by submission of detailed written proof thereof or through in-plant inspection by the Engineer or the Engineer's representative or such testing, by a local laboratory certified to be capable to perform the testing, as is determined to be necessary by the Engineer.

6-3.01 Quality - General – The following is to be added: Materials shall be stored in such a manner to reduce their potential to pollute storm water runoff from the site. Storage practices and storm water management from the storage area shall conform to the BMPs in the SWPPP and the requirements of the General Permit.

SECTION 7

LEGAL RELATIONS AND RESPONSIBILITY TO THE PUBLIC

7-1.02 Laws– The following is to be added: The Contractor shall observe and comply with all requirements of the Storm Water Management Program, and the General Permit.

7-1.02K(2) Prevailing Wage – The following is to supersede Caltrans Specifications 7-1.02K(2) entirely: Attention is directed to the requirements in the City's "Instructions to Bidder". The general prevailing wage rates for each craft, classification or type of workman are on file at the City Public Works Department. A copy of said wage rates shall be posted by the Contractor in a prominent place at the site of the work.

7-1.02K6 Occupational Safety and Health Standards - The following shall be added: In all operations connected with the work herein specified, the Contractor shall observe the provisions of the Worker's Compensation and Safety Laws of the State of California, Division IV and V of the Labor Code, and shall use all of the accepted and best safety practices for the public and/or the Contractor's employees.

7-1.02K(6)(b) Excavation Safety - The following shall be added: Excavation for any trench 5 feet in depth or more shall not begin until the Contractor has obtained a permit per State of California Construction Safety Orders Section 1539 and Chapter 3.2 Article 2, Section 341 of the California Occupational Safety and Health Regulations (Cal/OSHA). For information regarding this provision Contractor is directed to contact Cal/OSHA in Modesto. A copy of this permit shall be available at the construction site at all times.

The Contractor shall furnish all labor, equipment and materials required to design, construct and remove all shoring, sheeting, lagging, cribbing, piling, or types of support for the walls of the project.

In making excavations for any project, the Contractor shall be fully responsible for providing and installing adequate sheeting, shoring and bracing as may be necessary as a precaution against slides or cave-ins and to fully protect all existing improvements of any kind from damage.

The Contractor shall obtain a permit from the Division of Industrial Safety (Cal-OSHA) and shall submit a copy of the approved permit to the City Engineer prior to the start of excavation. The cost of the permit shall be included in the total bid cost. Nothing in this section shall be construed to impose tort liability on the awarding body or any of its employees.

The criteria given by the California Department of Industrial Relations are MINIMAL. In addition to shoring any excavation, it shall be the Contractor's responsibility to provide any and all additional shoring required to support the sides of the excavation against the effects of loads which may

exceed those derived by using the criteria set forth by said governing agency. The Contractor shall be solely responsible for any damages which may result from the Contractor's failure to provide adequate shoring to support the excavations under any or all of the conditions of loading which may exist or which may arise during construction.

Full compensation for performing the work described above shall be considered as included price paid for the various contract items of work and no additional compensation will be allowed therefor.

7-1.020 Vehicle Code - The following sections of the California State Vehicle Code shall be added: The lighting requirements in Section 25803; the brake requirements in Division 12, the following sections of the State of California Vehicle Code; the splash apron requirements in Section 27600; and, when operated on completed or existing treated base, surfacing, pavement or structures, except as otherwise provided in Section 5-1.37B, "Load Limits," the weight limitation requirements contained in Division 15. Any other requirements which the City will require compliance with, will be set forth in the special provisions.

7-1.03 Public Convenience - The following is to be added: Adequate ingress and egress shall be maintained for fire, police and other emergency vehicles. Adequate ingress and egress shall be maintained at all times for residents, property owners, and business owners. The Contractor may be required to cover certain signs which regulate or direct public traffic to roadways that are not open to traffic.

In the event of a suspension of the work, attention is directed to Section 8-1.06, "Suspensions."

7-1.04 Public Safety - The flagmen shall perform their duties, and the work of furnishing and placing such signs, lights, flags, and other warning and safety devices shall all be performed as set forth in the current "Work Area Traffic Control Handbook" as published by Building News, Inc., Los Angeles, California (310-202-7775, 8:30 AM.-5 PM, M-F).

All safety devices and their maintenance shall conform to the latest requirements of Cal-OSHA and to the applicable provisions of the "Work Area Traffic Control Handbook."

7-1.05 Indemnification - The following is to be added: References in Section 7-1.05 to the "State" shall mean the City of Stockton, its Mayor, Council, officials, representatives, agents, employees, and volunteers. The duty of the Contractor to indemnify and save harmless, as set forth herein, shall include the duty to defend, as set forth in Section 2778 of the California Civil Code provided, however, that nothing herein shall be construed to require the Contractor to indemnify the City against any responsibility or liability in contravention of Section 2782 of the California Civil Code. Contractor's indemnification obligations stated herein are in addition to, and shall not reduce or lessen, the contractor's indemnification obligations set forth in the contract, Instructions to Bidder, or other project-related documents.

7-1.06 Insurance - The insurance provisions stated herein are in addition to, and shall not reduce or lessen, the insurance provisions, and Contractor’s obligations thereunder, set forth in the contract, Instructions to Bidder, or other project-related documents. The following is to be added: The Contractor shall, during the life of the contract, take out and maintain insurance coverage with an insurance carrier authorized to transact business in the State of California as will protect the Contractor or any subcontractor or anyone directly or indirectly employed by any of them or by anyone for whose acts any of them may be liable, from claims for damages because of bodily injury, sickness, disease, or death of the Contractor's employees or any person other than the Contractor's employees, or for damages because of injury to or destruction of tangible property, including loss of use resulting therefrom. Contractor shall be aware that the maintenance of proper insurance coverage is a material element of a contract with the City and that failure to maintain or renew coverage or to provide evidence of renewal may be treated as a material breach of contract.

The minimum limits of liability for such insurance coverage which shall include commercial general and automobile liability, including contractual liability assumed under the contract, shall be as follows:

1. Limit of Liability for Injury or Accidental Death:

One Person	\$1,000,000
One Accident or Occurrence	\$1,000,000
Aggregate	\$2,000,000

2. Limit of Liability for Property Damage:

Per Occurrence	\$1,000,000
Aggregate	\$2,000,000

Such liability insurance policies shall name the City, its Mayor, Council, officials, employees, agents, and volunteers as additional insureds (“Additional Insureds”) by separate endorsement and shall agree to defend and indemnify the City against loss arising from operations performed under the contract and before permitting any subcontractors to perform work under the contract, the Contractor shall require subcontractors to furnish satisfactory proof that insurance has been taken out and is maintained similar to that provided by the Contractor as it may be applied to the subcontractor's work.

The Contractor shall, during the life of the contract, effect and maintain standard form builder's risk property insurance coverage with an insurance carrier authorized to business in the State of California, which shall include extended coverage, malicious mischief, vandalism, and windstorm coverage, and such coverage shall be applicable to those portions of the work that are subject, but not limited to, fire, theft, and vandalism. Coverage shall be the amount of one hundred percent (100%) of the insured value thereof, including surplus materials and supplies incident to the work, and such scaffoldings, stagings, towers, forms and equipment as are not owned or rented by the Contractor, the cost of which is included in the cost of the work but shall not cover any tools owned by mechanics, any tools, equipment, scaffolding, staging, towers, and forms owned or rented by

the Contractor, the capital value of which is not included in the cost of the work. The City shall be named as loss payee with the Contractor in such builder's risk property insurance policies and they shall be open to City's inspection upon City's request. The foregoing Builders Risk Insurance will not be required on work being performed exclusively on public street right-of-ways or utility easements.

The City and the Contractor waive all rights against each other for damages caused by fire or other perils to the extent covered by insurance under such builder's risk property policies, except such rights as they may have to the proceeds of such insurance coverage and the Contractor shall require similar waivers by subcontractors.

If the Contractor fails to effect and maintain the required builder's risk property insurance coverage, the City may insure its own interest. The City may deduct the cost of taking out, effecting and maintaining such liability and/or builder's risk property insurance coverages from any sums which may be due, or become due, to the Contractor, under the contract.

Evidence of both liability and builder's risk property insurance coverages shall be furnished to the City with form of certificates with endorsements prior to the commencement of the work and said certificates with endorsements shall contain a provision that the coverage or coverages thereunder will not be canceled until at least thirty (30) days prior written notice has been given to the City.

7-1.06C(6) Worker's Compensation - The following is to be added: Pursuant to the requirements of Section 1860 of the Labor Code, the Contractor will be required to secure the payment of Worker's Compensation to the employees in accordance with the provisions of Section 3700 of the Labor Code.

The successful bidder previous to the entering of the contract to do the said work shall take out and maintain in full force and effect worker's compensation insurance with an insurance carrier authorized to transact business in the State of California, covering the bidder's full liability for compensation to any persons employed who may be injured in the carrying out of said contract or the dependents thereof. Evidence of such worker's compensation insurance shall be furnished to the City of Stockton by certificates in duplicate prior to the commencement of the work and said certificate shall contain a provision that the coverage thereunder will not be canceled until at least thirty (30) days prior written notice has been given to the City.

7-1.07 Legal Actions Against the City – In the event litigation is brought against the City concerning compliance by the City with State or Federal laws, rules, or regulations applicable to highway/road work, the provisions of Caltrans Section 7-1.07 shall apply.

SECTION 8

PROSECUTION AND PROGRESS

8-1.04B Standard Start - The following includes changes and/or additions: The Contractor shall begin work after the contract has been approved by the City Council and within ten (10) days after being given notice to proceed or otherwise as may be stated in the Special Provisions. Once started the Contractor shall diligently prosecute the same to completion within the time limit provided in the special provisions.

The Contractor shall arrange a pre-construction conference with the Public Works Department. Notice shall be given to the Public Works Department at least 72 hours in advance of the Contractor's intent to have a pre-construction conference. No work may be performed prior to a pre-construction conference.

8-1.05 Time – The following includes and/or additions: A working day is defined as any day, except Saturdays, Sundays, and City of Stockton legal holidays and days on which the Contractor is specifically required by the special provisions to suspend construction operations, and except days on which the Contractor is prevented by inclement weather or conditions resulting immediately therefrom adverse to the current controlling operation or operations, as determined by the Engineer, from proceeding with at least 75 percent of the normal labor and equipment force engaged on such operation or operations for at least 60 percent of the total daily time being currently spent on the controlling operation or operations.

Should the Contractor choose to work on a Saturday, Sunday, or on a holiday recognized by the Labor Unions and/or the City, the Contractor shall reimburse the City of Stockton the actual cost of engineering, surveying, inspection, superintendence, and/or other overhead expenses which are directly chargeable to the contract. Should such work be undertaken at the request of the City, reimbursement will not be required.

8-1.07 Delay - The following is to be added: The Contractor will be required to cooperate with the utilities and others during the rearrangement of utility and other improvements or street facilities, and any delay caused by the rearrangement will not be considered as right of way delays.

8-1.10 Liquidated Damages – The following is to be added: It is agreed by the parties to the Contract that time is of the essence in the completion of this Work, and that in case all the Work called for under the Contract is not completed before or upon the expiration of the time limit as set forth in these Contract Documents, as modified by extensions of time granted by the City, damage will be sustained by the City. As it is impracticable to determine the actual delay damage, it is, therefore, agreed that the Contractor shall pay liquidated damages to the City in the amount set forth below or in the Special Provisions or Contract, per day for each and every day's delay beyond the time prescribed to complete the Work. The Contractor agrees to pay such liquidated damages and in case the same are not paid, agrees that the City may deduct the amount thereof from any monies due or that may become due the Contractor under the Contract.

SECTION 9

MEASUREMENT AND PAYMENT

9-1.00 Lump Sum Contracts - When required by the Special Provisions or requested by the Engineer, the Contractor shall submit to the Engineer within 15 days after award of contract, a detailed schedule of values, to be used only as a basis for determining progress payments on a lump sum contract or any designated lump sum bid item. This schedule shall equal, in total, the lump sum bid and be in such form and sufficiently detailed as to satisfy the Engineer that it correctly represents a reasonable apportionment of the lump sum.

9-1.045 Determination of Rights - The following includes changes and/or additions: If the total monetary amount of all the Contractor's claims arising under or by virtue of the contract does not exceed \$25,000, such claims are subject to determination of rights under the contract by a hearing officer of the City Council of the City of Stockton.

The party seeking a determination of rights shall give notice in writing of the claim to the other party and to the City Council of the City of Stockton, setting forth therein the facts on which the claim is based. Such notice shall be given not later than 6 months after the issuance of the final estimate.

The City Council of the City of Stockton will appoint a hearing officer to hear such claim within 60 days after such notice but not before completion of the contract unless the City consents to earlier appointment. The hearing officer will hear and determine the controversy and render the hearing officer's decision in writing within 60 days after the hearing officer's appointment unless otherwise agreed to by the parties or unless for good cause the hearing officer extends such time. Each party shall bear its own costs and shall pay 1/2 of the cost of the hearing.

Rules and regulations adopted by the City Council of the City of Stockton pursuant to Section 14380 of the Government Code will govern the conduct of the hearings, including requirements as to pleadings and other documents to be filed. The rules and regulations may be obtained from the City Council of the City of Stockton.

Compliance with the notice requirements of this section does not relieve the Contractor of responsibility for complying with any notice or protest requirements specified in these Standard Specifications (e.g., Sections 4-1.05, "Changes and Extra Work," 8-1.10, "Liquidated Damages, and sections 5-1.43A and 5-1.43D " Potential Claim and Dispute Resolution") nor does compliance with the notice requirements of this section relieve the Contractor of responsibility for complying with the claims submission requirements in Section 9-1.17D, "Final Payment and Claims."

The notices required by this section shall be sent as follows: (a) to the City Council of the City of Stockton, 425 N. El Dorado Street, Stockton, California 95202; (b) to the Department; (c) to the Contractor: such notices will be sent to the business address set forth in the proposal.

If the address to which the notice to the City Council of the City of Stockton or to the Department is to be changed, the Department will notify the Contractor in writing of such change. The Contractor may change the address to which such notices are to be sent to the Contractor by giving the Department written notification of such change of address.

9-1.06 Changed Quantity Payment Adjustments - Delete all of Section 9-1.06 from Caltrans Specifications and replace it with the following: All statement or implications of approval of a Contract change order requires City Manager and/or City Council approval. The City, at its sole discretion, may increase or decrease the quantities of the items of work to be completed. In such an event, compensation for all work completed shall be paid at the contract unit price bid regardless of the final quantity of work actually completed.

Any such changes will be set forth in a contract change order, which will specify, in addition to the work to be done in connection with the change made, adjustment of contract time, if any, and the basis of compensation for such work.

9-1.06A Eliminated Items - The City reserves the right to eliminate any contract item of work prior to the award of the contract without incurring any obligation to pay therefor. Should any contract item of the work be eliminated in its entirety following the award of the contract and in the absence of an executed contract change order covering such elimination, payment will be made to the Contractor for actual costs incurred in connection with such eliminated contract item if incurred prior to the date of notification in writing by the Engineer of such elimination.

9-1.07 Payment Adjustments For Price Index Fluctuations - This section in Caltrans specifications is to be deleted and is not applicable to projects with the City of Stockton, unless specified otherwise.

9-1.11 Time Related Overhead - This section in Caltrans specifications is to be deleted and is not applicable to projects with the City of Stockton, unless specified otherwise.

9-1.16A Progress Payment - General – The following is to be amended:
Delete “3. Amount for material on hand” on Caltrans Specifications unless specified otherwise.
Add “5% Retention” to the list.

9-1.16C Materials on Hand - This section in Caltrans Specifications is to be deleted and is not applicable to projects with the City of Stockton, unless specified otherwise.

9-1.16F Retentions - The following supersedes Caltrans Section 9-1.16F in total: The retention proceeds withheld from any payment by a public entity from the original contractor, by the original contractor from any subcontractor, and by a subcontractor from any subcontractor thereunder shall not exceed 5 percent of the payment and in no event shall the total retention proceeds withheld exceed 5 percent of the contract price, all subject to Public Contract Code 7201.

The 5% retention withheld will remain with the City until 35 days after the date of recordation of the Notice of Completion.

9-1.17D Final Payment and Claims - Delete all of Section 9-1.17D from Caltrans Specifications and replace it with the following:

After the work is completed, the Engineer will provide a proposed balancing change order, in writing, stating the total amount payable to the Contractor, including therein an itemization of said amount, segregated as to contract item quantities, extra work and any other basis for payment, and shall also show therein all dedications made or to be made for prior payments and amounts to be kept or retained under the provisions of the contract. All prior estimates and payments shall be subject to correction in the proposed balancing change order. The Contractor shall check the balancing change order and submit a written statement of all claims the Contractor has arising under or by virtue of the contract. No claim will be considered that was not included in which a notice or protest is required under the provision in Section 5-1.43 "Potential Claims and Dispute Resolution", unless the Contractor has complied with the notice or protest requirements in said section. On the Contractor's approval, or if the Contractor files no claim prior to signing the balancing change order, the following will take place:

1. The balancing change order, when signed by the Contractor, indicates that the Contractor agrees to the quantities contained therein as final quantities and the City of Stockton is then to pay up to 95% of the entire contract.
2. At this time, the City will file the Notice of Completion, which constitutes the City's acceptance of the work.
3. Sixty (60) days after the date the Notice of Completion is recorded, the 5% Retention will be released and constitutes the final payment for the work.

If the Contractor files claims prior to signing the balancing change order, the City will revise the balancing change order accordingly if the claims are approved. Such balancing change order and payment shall be conclusive and binding against both parties to the contract on all questions relating to the amount of work done and the compensation payable therefor except as otherwise provided in Sections 5-1.27 "Records," and 9-1.21 "Clerical Errors."

The claims filed by the Contractor shall be in sufficient detail to enable the Engineer to ascertain the basis and amount of said claims. The Engineer will consider and determine the Contractor's claims and it will be the responsibility of the Contractor to furnish within a reasonable time such further information and details as may be required by the Engineer to determine the facts or contentions involved in the Contractor's claims. Failure to submit such information and details will be sufficient cause for denying the claims.

The Director of Public Works will make the final determination of any claims, which remain in dispute after review by the Engineer administering the contract. A board or person designated by said Director will review such claims and make a written recommendation thereon. The Contractor may meet with the Review Board or their staff to make a presentation in support of such claims.

Upon final determination of the claims, the Engineer shall then make and issue the Engineer's final balancing change order in writing and within 30 days thereafter the City will pay the entire sum, if

any, found due thereon. Such final balancing change order shall be conclusive and binding against both parties to the contract on all questions relating to the amount of work done and the compensation payable therefor, except as otherwise provided in Sections 5-1.27 "Records," and 9-1.21 "Clerical Errors."

SECTION 12

TEMPORARY TRAFFIC CONTROL

12-1.01 Temporary Traffic Control - General - The following is to be added: Whenever work is performed within the right-of-way of any roadway classified as an "Arterial" or "Collector" type roadway, as defined in these Standard Specifications, a detailed detour plan shall be required.

Clarification questions should be directed to the Traffic Engineering Section of the Public Works Department of the City of Stockton. The plan shall be designed and signed by an engineer registered with the State of California as a Professional Civil or Traffic Engineer. This detour plan shall be submitted to the Public Works Department for approval a minimum of 10 working days before the beginning of any roadwork. The cost of implementing and maintaining the detour plan shall be borne by the Contractor, utility company, or developer.

12-1.03 Flagging Cost - The following supersedes Caltrans Section 12-1.03 in total: The costs to furnish flaggers, including transporting flaggers, to provide passage of public traffic through the work will be the sole responsibility of the Contractor and no separate payment will be made therefor.

12-1.04 Lane Closure - Whenever a lane closure is made, the Contractor shall close the lane by placing fluorescent traffic cones, portable delineator, or other devices reviewed by the Engineer, along a taper and along the edge of the closed lane adjacent to public traffic. One telescoping flag tree with flags shall be placed at the beginning and at the end of the taper.

Fluorescent traffic cones shall be of good commercial quality, flexible material suitable for the purpose intended. The outer section of the portion above the base of the cone shall be at least 28 inches. The base shall be of sufficient weight and size or shall be anchored in a manner such that the traffic cone will remain in an upright position.

Portable delineators shall conform to the provisions in Section 12-3.04, "Portable Delineators." If the traffic cones or portable delineators are damaged, displaced or are not in an upright position from any cause, said cones or portable delineators shall immediately be replaced or restored to their original location, in an upright position, by the Contractor.

Telescoping flag trees shall be of good commercial quality material, suitable for the purpose intended and shall be capable of maintaining an upright position at all times while in use.

The fluorescent traffic cones or portable delineators shall be placed at intervals as directed by the Engineer, but not to exceed 50 feet.

If the work requires that fluorescent traffic cones or portable delineators be placed in the lane open to public traffic, said cones or portable delineators shall be placed on a 1-1/2 foot width of the lane open to traffic along the side adjacent to the lane to be closed.

Traffic cones or portable delineators, telescoping flag trees with flags, and signs shall be placed before beginning work each day and shall be removed from the site of the work at the end of each working day.

The contractor shall specify the time limits of lane closure upon approval by the City Engineer.

The provisions for lane closure in this Section 12-1.04 will nowise relieve the Contractor from the Contractor's responsibility to provide such devices or measures as may be necessary to comply with Section 7-1.04, "Public Safety."

12-3.04A Portable Delineators - General - The following is to be added: Portable delineators shall be furnished, placed and maintained in accordance with the provisions in Section 7-1.03, "Public convenience," and 7-1.04, "Public Safety," and as provided in the special provisions.

If the portable delineators are damaged, displaced or are not in an upright position, from any cause, said delineators shall immediately be replaced or restored to their original location, in an upright position, by the Contractor.

Only one type of portable delineator shall be used on the project. The type of portable delineator proposed for use on the project shall be submitted to the Engineer for approval prior to placement on the project.

When work is in progress in a trench or other excavation adjacent to the traveled way, the portable delineators shall be placed on the edge of pavement. At other times, the portable delineators shall be placed off of and adjacent to the edge of pavement.

The portable delineators shall be spaced as necessary for proper delineation as directed by the Engineer but not to exceed 50 feet.

The requirements in this Section 12-3.04A will in no way relieve the Contractor from the Contractor's responsibility to provide such devices or measures as may be necessary to comply with the provisions in Section 7-1.04, "Public Safety."

When no longer required for delineation, the portable delineators shall be removed from the site of the work.

SECTION 16

CLEARING AND GRUBBING

16-1.03B Clearing - The following is added:

Where roots of existing trees are to be pruned, the following specification shall be followed:

All roots pruned shall be cut as smooth as possible with the least amount of surface wood exposed or at a 90 degree angle to the root end cut.

All root cuts made over one (1) inch in diameter shall be painted to seal with an approved type of tree seal paint.

SECTION 17

NON-POTABLE WATER SYSTEMS

Specifications and Plans for non-potable water systems shall be prepared in accordance with the Municipal Utilities Department's Non-Potable Water System Guidelines, and as approved by the Municipal Utilities Department.

SECTION 19

EARTHWORK

19-1.01 General - The following is to be added: Lime stabilization may be acceptable as part of roadway structural section design, subject to approval by the Engineer. If approved, Lime Stabilization shall be in conformance with SECTION 24-2: LIME STABILIZED SOIL

19-3.03I Controlled Density Fill – The following supersedes Caltrans Section 19-3.03I in total: CDF will be accepted in lieu of the standard backfill specifications. It shall be mandatory in all situations where the prevention of subsequent settlement after placement of backfill is required and in trenches eight (8) inches wide or less.

19-3.03I(1) Strength Requirements - Non-structural controlled density fill that can be excavated by hand shall produce unconfined compressive 28-day strengths from 50 psi to a maximum of 200 psi. Controlled density fill that is to be excavated by hand shall contain aggregate no larger than 3/8" top size nor shall the 3/8" aggregate comprise more than 30% of the total aggregate content.

Structural controlled density fill shall produce unconfined compressive 28 day strengths from 200 - 1,200 psi, as determined by the project requirements. Coarse aggregate top size and coarse to fine aggregate ratios and contents shall be determined by the clearances surrounding embedded members and the workability requirements.

19-3.03I(2) Materials - Cement shall meet the standards as set forth in ASTM C-150, Type II Cement.

Fly ash shall meet the standards as set forth in ASTM C-618, for Class F pozzolans. The fly ash shall not inhibit the entrapment of air.

Air entraining agent shall meet the standards as set forth in ASTM C-260.

Aggregates need not meet the standards as set forth in ASTM C-33. Any aggregate, producing performance characteristics of the CDF, for any project will be accepted for consideration as follows. The amount of material passing a #200 sieve shall not exceed 12% and no plastic fines shall be present.

19-3.03I(3) Mix Proportions - CDF shall be a mixture of cement, Class F pozzolan, sometimes coarse aggregate, air entraining agent and water. CDF shall be batched by a ready mixed concrete plant and delivered to the job site by means of transit mixing trucks.

The actual mix proportions shall be determined by the producer of the controlled density fill to meet job site conditions, minimum and maximum strengths and unit weight. Entrained air content shall be established for each job with the materials and aggregates to be used to meet the placing and unit weight requirements. Entrained air content may be as high as 20% for fluidity

requirements.

19-3.03I(4) Placement - CDF shall be discharged from the mixer by any reasonable means into the area to be filled. CDF shall be brought uniformly to the elevation as shown on the Standard Plans. Trench sections to be filled with CDF shall be contained at either end by bulkheads of earth fill.

All CDF is to be protected (plated) from traffic loading for at least 72 hours. Exception 4-inch wide trenches need not be plated but may not be paved for 72 hours. All CDF is to be protected from freezing for at least 72 hours after placement and may not be placed at temperatures less than 40F. Nonstructural CDF is to be used for installations that may require future maintenance.

19-3.03I(5) Mix Design - Mix design shall be reviewed and approved by the Engineer.

Structural (200-1200 psi) (current spec 150-1200 psi)

With Aggregate

100 lbs Cement
450 lbs Fly Ash
342 lbs (41 gal) Water
1800 lbs Sand
815 lbs Pea Gravel

Without Aggregate (4-inch wide trenches)

100 lbs Cement
450 lbs Fly Ash
342 lbs (41 gal) Water
2625 lbs Sand

Nonstructural (50-200 psi) (current spec 50-150 psi)

With Aggregate

50 lbs Cement
400 lbs Fly Ash
342 lbs (41 gal) Water
1900 lbs Sand
815 lbs Pea Gravel

Without Aggregate (4-inch wide trenches)

50 lbs Cement
400 lbs Fly Ash
342 lbs (41 gal) Water
2725 lbs Sand

Note: Sand and pea gravel weights are dry weights. For all mixes, slump is greater than 8-inches. These are known to be loose, self-consolidating product / process. If for some reason a lower

slump (stiffer mixture) is desired, the mix design and work process must be submitted for approval.

The engineer will select the appropriate mix design for the application at the site. The typical mix designs may be modified to suit local conditions and materials.

19-5.03B Relative Compaction (95 Percent) - The following supersedes Caltrans Section 19-5.03B in total:

A Relative Compaction of not less than 95 percent shall be obtained for a minimum depth of 6 inches (0.5 foot) below the grading plane for the full width of any street and trench section.

19-5.03C Relative Compaction (90 Percent) - The following supersedes Caltrans Section 19-5.03C in total:

A Relative Compaction of not less than 90 percent shall be obtained in all material except as specified herein to be 95 percent or as may be otherwise specified in the Special Provisions, contract plans, or in the City of Stockton Standard Specifications and Plans.

SECTION 24-2

LIME STABILIZED SOIL

24-2.01A Summary– Add the following: The use of lime stabilization shall be subject to submittal of a mix design prepared by a Contractor-provided licensed geotechnical engineer and approval of same by the Engineer. The approved mix design shall be based on the actual soils to be used and shall specify the type and amount of lime and the type and amount of curing seal to be applied.

The maximum allowable R-value attributable to lime-stabilized soil for purposes of roadway structural design shall be 50.

The maximum allowable design compressive strength attributable to lime-stabilized soil shall be 200 psi.

The gravel equivalency factor for lime-stabilized soil shall be 1.1.

The in-place moisture content of the soil immediately below the lime-stabilized layer shall be maintained above the optimum moisture content, as determined by California Test 373, prior to application of the lime.

A minimum of 4” of aggregate base shall be installed between lime-stabilized soil and asphalt concrete paving unless otherwise approved by the Engineer.

The preparation, spreading, mixing, compaction, rolling, grading and curing of lime-stabilized soil shall be completed under the observation of a Contractor-provided licensed geotechnical engineer who shall submit a Certificate of Compliance for the lime-stabilized soil prior to acceptance by the City.

24-2.03C Applying Lime - Add the following: The area to be stabilized by lime treatment shall extend a minimum of two feet beyond the edge of pavement.

24-2.03D Mixing - Add the following: The minimum depth of lime-stabilized soil shall be 12 inches. An additional three inches of lime-stabilized soil shall be added to all roadway structural design sections as a safety factor.

SECTION 39

HOT MIX ASPHALT

39-1.41 Full Depth Asphalt Concrete – Where a Full Depth section is specified, it shall be placed on a previously prepared subgrade as specified in 19-5.03B (Relative Compaction) to a tolerance of 0.05 foot above or below the subgrade established by the Engineer.

In placement and compaction shall conform to Section 39-3 “Method Construction Process” of Caltrans Specifications. The final grade of the lift below the surfacing course shall not vary more than 0.05 foot above or below the planned grade for that course.

The thickness of the surface course shall be as specified in the project Special Provisions, all other asphalt concrete below this point is considered base course.

Tack coat (paint binder) shall be SS-1h or CSS-1h type emulsion conforming to Caltrans Specifications Section 94 of the Standard Specifications. Tacking between base courses required at the rate of 0.02 to 0.10 gallons per square yard of the surfaced covered. The exact rate will be determined by the Engineer. Application in excess of 0.02 gallon per square yard will be at Contractor's expense.

Where Full Depth sections are placed in existing streets with established gutter sections, a continuous wedge shape section of asphalt paving shall be placed against the gutter edge, held below the gutter lip by the amount of the thickness of the surface course and feathered to subgrade in a width of not less than three feet before placement of the level courses, unless otherwise permitted by the Engineer.

Upon completion of all portions of the construction, including utility grade adjustments to finish grade, the surface course shall be placed, gutter lip to gutter lip, for the entire length of the project to provide a smooth uniform riding surface with a minimum of transverse joints for the entire project.

Paving shall feather smoothly into existing pavement. Side street construction shall have a section varying from a uniform cross-slope at ends of curb return to variable or parabolic section as required to match the existing street section. Transition shall be smooth and uniform between the points described above.

39-1.42 Material – Hot Mix Asphalt (HMA) shall conform to the provisions of Section 39 of the Caltrans Standard Specification. HMA must be Type A or Type B. Unless otherwise specified, asphalt concrete shall be Type B. Asphalt binder must be PG 64-10 or PG 70-10 and must comply with section 39-1.02D of Caltrans Standard Specifications.

For surface course and base course paving on low or medium local streets, asphalt concrete shall be Type B, ½" nominal maximum aggregate size.

Unless otherwise specified or approved by the Engineer, HMA for base and surface course paving for all other streets shall be Type A, ¾" maximum, medium aggregate.

For non-City projects, the precise asphalt binder content shall be in accordance with a mix design pre-approved by the City Engineer within twelve months of placement of the asphalt concrete. For City projects, the asphalt oil content shall be as specified in the project specification special provisions. An HMA Mix designs shall conform to Caltrans Specifications section 39-1.03 "Hot Mix Asphalt Mix Design Requirements" and must be submitted.

39-1.43 Spreading and Compaction – Unless specified in the project Special Provisions, spreading and compaction must be in accordance to section 39-3 "Method Construction Process". The maximum compacted thickness of any one base course of asphalt concrete shall be three (3) inches. The maximum compacted thickness of the surface course (1/2" aggregate) of asphalt concrete shall be two (2.0) inches, and the minimum thickness shall be one (1) inch after compaction.

A mechanical paving machine shall only be required for spreading the surface course and any leveling courses required.

HMA base courses may be spread and compacted by such mechanical means as will provide a surfacing of uniform smoothness and texture in such a manner as to prevent segregation of materials. Approval will be based on demonstrated performance of such equipment.

A prime coat of SC250 or MC250 shall be applied to all aggregate bases to be surfaced. The prime coat shall be applied at a rate of 0.2 gallon per square yard over the entire roadway area to be surfaced.

Rolling of Full Depth base courses shall be from the center of the paving pass to the edge.

The Contractor shall furnish a minimum of one (1) steel wheel tandem roller with a gross static weight of at least 7.5 tons and one (1) 15-ton pneumatic tired roller. At the Engineer's discretion, a third steel 2 axle roller of a minimum weight of 7.5 tons may be required.

Alternate compacting equipment or substitution of a vibratory roller for a pneumatic-tired roller will not be permitted, approved or reviewed.

Tire pressure of the pneumatic tire roller at the time of breakdown rolling shall be 60 psi minimum and maintained such that the air pressure does not vary more than 5 psi. It is suggested that the pneumatic tire roller have twenty (20) inch rims to help prevent bogging down. The pneumatic tire roller shall be used to break down the spread of asphalt concrete bases and shall operate immediately behind the paver or spreader.

Roller tires shall be preheated and operated hot and dry or have proper spray equipment for use of Roller-Ease to prevent pick up of hot mix.

All courses shall be compacted with a pneumatic roller. In truck routes, each course shall be pneumatic and steel rolled. Rolling shall continue until ruts are eliminated and the proper degree of compaction is achieved. Final rolling of the surface course shall be accomplished with a steel wheel tandem roller, vibrator turned off, at the minimum temperature specified in section 39-3.04 of Caltrans Standard Specifications.

The surface of the completed base course at any point shall not vary more than 0.02 feet above or below the grade established for surface course placement.

The Contractor will be responsible for construction grades. The City will set a base line and furnish cuts for gutter flowlines and pavement centerline or edge of pavement grade. Base course surface prior to placement of surface course which does not meet the above requirements shall be planed or filled at the contractor's expense in a manner acceptable to the Engineer that will not damage the existing compacted base and will obtain the required material compaction at required temperature.

SECTION 71

SANITARY SEWERS AND STORM SEWERS

NOTE: THIS SECTION IS ADDED IN ITS ENTIRETY TO THE BLANK SECTION IN THE CALTRANS STANDARD SPECIFICATIONS.

Unless specifically differentiated herein, references to Sanitary Sewers also references Storm Sewers (aka. Storm Drains).

71-1.01 Description - This work shall consist of laying sewer pipe and constructing sewer structures as shown on the Project Plans, in accordance with these Standard Specifications and Plans, the Special Provisions and as directed by the Engineer.

The type of sewer pipe and sewer structures will be designated in the contract items.

71-1.02 Materials - Pipe, fittings, miscellaneous materials and the most common joint materials are described in this Section 71-1.02.

Portland cement used in the production of concrete products set forth in this Section 71-1.02 shall be Type II Modified cement conforming to the provisions in Section 90, "Concrete."

71-1.02A Reinforced Concrete Pipe (RCP) - Reinforced concrete pipe shall conform to A.S.T.M. Designation C-76 for the size and classes indicated on the Project Plans. For sanitary sewer applications, RCP shall be used only on sewer lines 36-inch and larger. All RCP sewers 36" and larger shall be coated with epoxy.

71-1.02B Clay Pipe - Vitrified clay pipe shall conform to the specifications for extra strength pipe of A.S.T.M. Designation C-700 and C-301.

71-1.02C Ductile Iron Pipe - Ductile iron pipe shall comply with ANSI A21.51 (AWWA C151).

71-1.02D Acrylonitrile-Butadiene-Styrene (ABS) Pipe (Sewer Pipe) – Pipe sizes four (4) inch and six (6) inch diameter shall conform to ASTM D2751-80 with minimum wall thickness determined by SDR 26.

Pipe sizes eight (8) through fifteen (15) inch diameter shall conform to ASTM D2680-80 with Type OR or Type SC joints.

71-1.02E Polyvinyl Chloride (PVC) Pipe - All solid wall pipe and fitting in 4" through 15" diameters shall be type PSM SDR-26 PVC, ASTM 3034; 18" through 24" shall be type PS 46 PVC, ASTM F679. Pipe and fittings shall be marked as per ASTM requirements.

Profile wall polyvinyl chloride pipe (PWPVC) may be used for pipe sizes 21-inch through 48-inch.

PWPVC shall be manufactured from a PVC compound having a minimum cell classification of 12364A as defined in ASTM D 1784. Gasket shall meet the requirements of ASTM F 477.

PWPVC shall be closed profile, ASTM F 1803-97 for 21" – 48" diameters with a bell and spigot gasketed joint. The joint shall meet the requirements of ASTM D 3212. The pipe shall have a minimum pipe stiffness when tested in accordance with ASTM D 2412.

Tests for compliance with this specification shall be made according to the applicable ASTM Specifications at the time of manufacturing. The manufacturer shall provide a certificate of compliance with this specification. In addition, the CITY may, at his own expense, station a representative or third party inspector at the site of manufacture to continuously monitor the manufacturing process, and to independently test the pipe to verify conformance with the project specification. Pipe tests and frequency shall be determined by the City.

PWPVC Nominal Dimensions:

Nominal Diameter (in.)	Outside Diameter (in.)	Inside Diameter (in.)
21	22.110	20.75
24	25.040	23.50
27	28.232	26.50
30	31.430	29.50
36	37.800	35.50
42	44.200	41.50
48	50.57	47.50

Unless otherwise approved by the CITY, all pipe shall be unloaded in the original packaging using a forklift with fork arms long enough to reach beyond the last pipe bundle. Do not roll the pipe off of the truck. Pipe shall not be handled or secured using chains or cables; a nylon or textile strap is recommended.

In addition to the requirements reflected in Section 71-1.05 Pipe Laying, the pipe bedding shall be carefully placed and compacted in the haunching. The haunching area extends from the bottom of the pipe to the springline of the pipe. Bedding shall be placed in 6" loose lifts on alternate sides of the pipe. A Tamping bar or shovel shall be used to facilitate bedding consolidation on the lower quadrant of the pipe. The bedding shall be mechanically compacted using hand operated equipment in accordance with the manufacturer's recommendations. The bedding material and its proper placement are the most important factors affecting the performance (side support) of the pipe.

Initial Backfill shall be placed to protect the pipe from dropping of large rocks, large mechanical compaction equipment or other impact loads that may occur during final backfill.

Pipe Deflection Testing: Pipe testing shall be performed in accordance with Section 71-1.11B.

71-1.02F Miscellaneous Iron and Steel - Miscellaneous iron and steel items shall conform to the provisions in Section 75, "Miscellaneous Metal."

71-1.02G Reinforcement - Reinforcement shall conform to the provisions in Section 52, "Reinforcement."

71-1.02H Concrete - Concrete shall conform to the provisions in Section 51, "Concrete Structures," and Section 90, "Concrete."

71-1.02I High Density Polyethylene Pipe (HDPE) - HDPE pipe and fittings shall be made of high density, high molecular weight, Type III, Class C, Category 5, Grade P34 polyethylene meeting the requirements of ASTM D1248 and ASTM F894 unless specified otherwise herein. Wall configurations and thicknesses shall meet the deflection requirements of this section. Crushing and buckling strengths shall exceed that required from the loads anticipated. Pipe selection and deflection design shall also be based upon a pipe stiffness not less than 20 psi and a modulus of soil reaction no greater than 1400. Pipe stiffness shall be tested prior to installation in accordance with ASTM D2412 with a 5% deflection at a rate of 1/2 inches per minute.

71-1.03 Excavation and Backfill - Excavation and backfill shall conform to the provisions shown on City of Stockton Standard Plans No. R-36 and R-41.

The pipe shall be laid in a trench excavated to the lines and grades designated by the Engineer. The bottom of the trench shall be graded and prepared to provide a firm and uniform bearing throughout the entire length of the pipe barrel.

Suitable excavation shall be made to receive the bell of the pipe and the joint shall not bear upon the bottom of the trench. All adjustment to line and grade shall be made by scraping away or filling in with sand, gravel, or granular material under the body of the pipe, and not by wedging or blocking.

Trenches shall not be left open farther than 100 feet in advance of pipe laying operations or 100 feet to the rear thereof.

The excavation shall be supported so that it will be safe and that the ground alongside the excavation will not slide or settle and all existing improvements, either on public or private property, will be fully protected from damage.

All supports shall be removed after construction is completed and shall be withdrawn in a manner that will prevent the caving of the sides of the excavation. All openings caused by the removal of supports shall be filled with suitable material properly compacted.

71-1.04 Bedding - Bedding shall be defined as that material supporting, surrounding and extending to one foot above the top of the pipe. Where it becomes necessary to remove boulders or other interfering objects at subgrade for bedding, any void below such subgrade shall be filled with the bedding material designated on the Project Plans. Where concrete is specified to cover the pipe, the top of the concrete shall be considered as the top of the bedding.

If soft, spongy, unstable, or other similar material is encountered upon which the bedding material or pipe is to be placed, this unsuitable material shall be removed to the depth specified by the Engineer and replaced with bedding material suitably densified.

Bedding material shall first be placed so that the pipe is supported for the full length of the barrel with full bearing on the bottom segment of the pipe equal to a minimum of 0.5 times the outside diameter of the barrel. Densification of bedding for pipe shall be accomplished after the sheeting or shoring has been removed from the bedding zone. Alternate methods of pipe laying which are recommended by the pipe manufacturer may be used if reviewed by the Engineer. The bedding zone for PVC, ABS, and HDPE pipe shall be mechanically compacted before the remainder of trench is compacted.

Bedding material shall be sand, gravel, crushed aggregate, native free-draining granular material having a sand equivalent of not less than 20 as specified on Standard Plans Nos. R-36 and R-41 for trench backfilling.

Pea gravel is not acceptable. No aggregate shall exceed 1".

In cases where native material is suitable for use as bedding, the trench may be excavated to point above the invert grade and the trench bottom hand-shaped so that the bottom segment of the pipe is firmly supported on undisturbed material.

Bedding material for HDPE, VCP, PVC, and ABS pipe shall be 3/4" crushed rock. The portion of the material that is larger than will pass a 3/8" sieve shall contain at least 50% of particles having three or more fractured faces. Not over 5% shall be pieces that show no such faces resulting from crushing. The gradation of the crushed rock shall be as follows:

<u>Sieve Size</u>	<u>¾"</u>
1 ½"	-
1 "	100
¾ "	90-100
½ "	30-60
3/8"	0-20
No. 4	0-5
No. 8	-

This material shall be compacted to the density and level shown on Drawing R-42.

71-1.05 Pipe Laying - Pipe shall be protected during handling against impact shocks and free fall. Pipe will be carefully inspected in the field before and after laying. If any cause for rejection is discovered in a pipe after it has been laid, it shall be subject to rejection. Any corrective work shall be reviewed by the Engineer and shall be at no cost to the City.

When connections are to be made to any existing pipe, conduit, or other appurtenances, the actual elevation or position of which cannot be determined without excavation, the Contractor shall excavate for, and expose, the existing pipe improvement before laying any pipe or conduit. The Engineer shall be given the opportunity to inspect the existing pipe or conduit before connection is made. When the new facilities interfere with the existing flow of sewage, the Contractor shall provide satisfactory bypass facilities at the Contractor's expense.

The pipe shall be laid without break upgrade from structure to structure, with bell end upgrade, unless otherwise permitted by the Engineer.

All joints shall be cleaned and then sealed with the type of materials specified or required by the City. In the absence of such requirements the pipe shall be jointed with materials recommended by the pipe manufacturer for the purpose intended, and reviewed by the Engineer, in order to obtain a watertight joint against leakage and infiltration under all conditions of expansion, contraction, and settlement.

Whenever the work ceases for any reason, the end of the pipe shall be securely closed with a tight fitting plug or cover.

Whenever existing pipes are to be cut or abandoned, the open ends of said pipes shall be securely closed by a tight fitting plug or wall of concrete slurry with a maximum density not to exceed 90 lbs/cubic foot not less than 0.5 foot thick, or by a tight brick wall 0.67 foot thick with cement mortar joints.

Where ground water occurs, the bottom of the trench shall be kept entirely free of water during the pipe laying, filling the joints, and as long thereafter as directed by the Engineer.

All joints shall be carefully cleaned on the inside.

Stoppers for pipes and branches left unconnected shall be made of the same material as the pipe or of resilient joint material conforming to Section 71-1.02J, "Resilient Joint Material." After placing the stopper, it shall be covered with a layer of sealant. The sealant shall be sufficiently fluid to insure free flow around the stopper.

Concrete pipe with elliptical reinforcement shall be laid with the minor axis of the reinforcement cage in a vertical position.

Pipe shall be laid true to line and grade. Any pipe, which is not in true alignment or shows any undue settlement after lying shall be taken up and re-laid at the Contractor's expense.

Pipe sections shall be laid and joined in such a manner that the offset of the inside of the pipe at any joint will be held to a minimum at the invert. The maximum offset at the invert of pipe shall be 1 percent of the inside diameter of the pipe or 3/8 inch (9.5 mm), whichever is smaller.

In joining socket and spigot pipe, the spigot of each pipe shall be so seated in the socket of the adjacent pipe as to give a minimum of 3/8 inch (9.5 mm) annular space all around the pipe in the socket. Unavoidable offsets shall be distributed around the circumference of the pipe in such a manner that the minimum offset occurs at the invert.

Pipe shall be laid true to line and grade. Any pipe which deviates from the engineering alignment by 1/2" or grade by 1/4" or results in a reverse slope or shows any undue settlement after laying shall be taken up and re-laid.

After the joints have been made, the pipe shall not be disturbed in any manner.

During installation, linear expansion and contraction shall be kept below the manufacturer's recommendations. Strutting shall be mandatory for size 36" and larger. A strutting detail shall be reviewed by the City Engineer prior to installation. Pre-deflecting the pipe shall only be permitted subsequent to approval from the City Engineer.

71-1.06 Pipe Joints

71-1.06A Vitrified Clay Pipe - Either polyvinyl chloride or polyurethane compression joints may be used. Materials shall conform to A.S.T.M. Designation C-425.

Joints shall contain two sealing components, one bonded to the outside of the spigot and the other bonded to the inside of the socket. Sealing components shall be a plasticized polyvinyl chloride compound or polyurethane elastomer bonded to pipes and fittings at the pipe factory, and shall be cured to a uniform hardness and compressibility. The sealing components shall be shaped, sized, bonded, and cured in such a manner as to form a tight, dense, and homogenous compression coupling when the joint is assembled. Any imperfection in the sealing components will be cause for rejection.

Upon installation, the meeting surfaces shall be wiped clean of dirt and foreign matter, then an approved lubricant shall be applied to the joint surfaces. The spigot shall be positioned inside the socket and the joint shoved home. For large diameter pipe, a lever attachment or bar cushioned with a wooden block shall be used to shove the joint into place.

In no case shall a bar be used on an unprotected joint surface. Mating surfaces shall be in tight contact with each other upon completion of the joint installation.

Polyvinyl chloride joints may be used on curves, provided that the radius of curvature is not less than shown in the following table, unless beveled pipe or shorter lengths are provided:

Pipe Size Inches	Maximum Pipe Length Feet	Minimum Radius of Curvature Feet	Maximum Deflection
6	5	100	2° 00'
8	5	100	2° 00'
8	6	115	2° 00'
10	5	185	1° 33'
10	6	220	1° 33'
12	5	215	1° 20'
12	6	260	1° 20'
15	5	275	1° 03'
15	6	330	1° 03'

Polyurethane joints may be permitted for use on curves, provided that the radius of curvature is not less than shown in the following table, unless beveled pipe or shorter lengths are provided.

Pipe Size Inches	Maximum Pipe Length Feet	Minimum Radius of Curvature Feet	Maximum Deflection
6	5	100	2° 00'
8	5	100	2° 00'
8	6	115	2° 00'
10	5	170	1° 41'
10	6	205	1° 41'
12	5	150	1° 54'
12	6	180	1° 54'
15	5	190	1° 32'
15	6	225	1° 32'
18	5	225	1° 16'
18	6	275	1° 16'
21	5	265	1° 06'
21	6	315	1° 06'
24	5	240	1° 12'
24	6	290	1° 12'
27	5	270	1° 04'
27	6	325	1° 04'
30	5	300	0° 58'
30	6	360	0° 58'
33	5	275	1° 03'
33	6	330	1° 03'
36	5	295	0° 59'
36	6	355	0° 59'
39	5	325	0° 54'
39	6	385	0° 54'
42	5	345	0° 50'
42	6	415	0° 50'

71-1.06B Reinforced Concrete Pipe. All reinforced concrete sanitary sewer pipe shall be joined with rubber gasket joints.

Rubber gasket joints shall conform to the requirements of A.S.T.M. Designation: C443 and shall be flexible and able to withstand expansion, contraction and settlement.

All rubber gaskets shall be stored in as cool a place as practicable, preferably at 70° or less, and in no case shall the rubber gaskets be exposed to the direct rays of the sun for more than 72 hours.

Rubber gaskets, of the type requiring lubrication, shall be lubricated with the lubricant recommended and supplied by the manufacturer of the pipe.

The ends of the pipe shall be so formed that when the pipes are laid together and joined, they shall make a continuous and uniform line of pipe with a smooth and regular surface.

Joints shall be water-tight and flexible. Each joint shall contain a solid gasket of rubber or other material approved by the Engineer, which shall be the sole element responsible for water-tightness of the joint. This gasket shall be of circular cross section unless otherwise approved by the Engineer. The length and cross sectional diameter of the gasket, the annular space provided for the gasket, and all other joint details shall be such as to produce a water-tight joint. The slope of the longitudinal gasket contact surfaces of the joint with respect to the longitudinal axis of the pipe shall not exceed 2°.

Under ordinary laying conditions, the work shall be scheduled so that the socket end of the pipe faces in the direction of laying. Prior to placing the spigot into the socket of the pipe previously laid, the spigot groove, the gasket and the inside of the socket shall be thoroughly cleaned. Then the spigot groove, the gasket and the first 2 inches (50.8 mm) of the inside surface of the socket shall be lubricated with a soft vegetable soap compound.

The gasket shall be uniformly stretched when placing it on the spigot so that the gasket is distributed evenly around the circumference. The gasket shall be lubricated as per manufacturer's recommendations.

For pipe in which the inside joints are to be pointed, suitable spacers shall be placed against the inside shoulder of the socket to provide the proper space between abutting ends of the pipe.

After the joint is assembled, a thin metal feeler gage shall be inserted between the socket and the spigot and the positions of the gasket checked around the complete circumference of the pipe. If the gasket is not in the proper positions, the pipe shall be withdrawn, the gasket checked to see that it is not cut or damaged, the pipe relaid, and the gasket position again checked.

71-1.06C Ductile Iron Pipe. Ductile iron pipe joints shall comply with the following requirements:

<u>Type of Joint</u>	<u>Specification</u>
Rubber Gasket Push-On Joint	ANSI A21.11 (AWWA C111)
Mechanical Joint	ANSI A21.11 (AWWA C111)
Flanged Joint	ANSI B16.1, B.16.2, and A21.10 (AWWA C110)
Flanged Joint (Threaded Flanges)	ANSI B2.1

All rubber gasket, push-on, mechanical and flanged joint fittings for ductile iron pipe shall be manufactured in accordance with ANSI A21.10 (AWWA C110).

Slip-On Joint - The gasket and gasket seal inside the socket shall be wiped clean before the gasket is inserted. A thin film of soft vegetable soap compound shall be applied to the gasket and the outside of the spigot end of the pipe. The spigot shall then be positioned inside the socket and shoved home. Lubricant other than that furnished with the pipe shall not be used.

Mechanical Joints - The outside of the spigot and the inside of the socket shall be thoroughly cleaned of foreign matter. The gland and gasket shall then be slipped onto the spigot end of the pipe. The gasket shall be pressed evenly into the socket only after the spigot is seated in the socket. The gland shall be brought up evenly by tightening alternately the nuts spaced 180° apart. Bolts and nuts shall be coated with mastic following tightening.

Flanged Joints - Flanged Joints shall be firmly and fully bolted with machine bolts of proper size. Full circle reinforced neoprene rubber gaskets 1/16" thick shall be used at all flanged joints. Bolts and nuts shall be coated with mastic following tightening.

71-1.06D ABS Sewer Pipe

1. Pipe lengths and fittings shall be joined by utilizing elastomeric gaskets as referenced in A.S.T.M. D-2680 and D-2751 and meeting the requirements of A.S.T.M. D-3212 "Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals," or solvent weld joints.

Solvent weld joint or usage shall conform to A.S.T.M. F-402 "Safe Handling of Solvent Cements and Primers Used for Joining Thermoplastic Pipe and Fittings," and the following requirements:

- a. All ABS pipe joints, fittings and surfaces to be joined by solvent welding shall be connected with adhesive cement conforming to A.S.T.M. D2680 for ABS composite sewer pipe or to A.S.T.M. D2751 for 4-inch and 6-inch ABS solid wall pipe.
- b. Prior to joining ABS pipe joints, fittings and surfaces, dirt, mud or any other foreign material shall be thoroughly removed and cleaned from the joints, fittings and surfaces to be joined.
- c. A coat of adhesive cement shall be liberally and thoroughly applied to the joints, fittings and surfaces to be joined. After application of the adhesive cement, the pipe joints, fittings, and surfaces to be joined shall be immediately fitted and joined without interruption.

For bell and spigot connections, the spigot end of each pipe shall be fitted to the full depth of the bell socket.

- d. When the temperature is below 40° F., a primer shall be applied to the pipe surface to be cemented and joined.

2. Reducing Wyes:

- a. Reducing wyes for service laterals shall be either saddle type wyes or in-line bell and spigot type wye fittings. All reducing wyes shall be premoulded and factory fabricated.

- b. Saddle Fittings:

1. In addition to the solvent welding of the saddle to the main pipeline, the saddle type wye shall be attached to the main pipeline with a stainless steel clamp.
2. Tapping hole for saddle fittings shall be cut with a cutting instrument. The hole shall be of the same size and shape of the lateral pipe surface.

3. Exposed Pipe Cross-Sections:

Exposed cross-sections of the ABS composite sewer pipe shall be coated with adhesive cement prior to connection of pipe joints, fittings and surfaces.

4. Maintenance Hole Connections:

Maintenance hole connections shall be by rubber ring water stop installed on pipe and cast in center of maintenance hole wall or four (4) inches from outside face of maintenance hole base. Pipe section on water stop at maintenance hole shall have bell flush with outside of maintenance hole or no more than ten (10) inches outside maintenance hole.

71-1.06E PVC Pipe

1. All joints shall be integral wall bell and spigot configuration, factory formed in accordance with ASTM D3212. All rubber rings shall conform to A.S.T.M. F-477.
2. Reducing wyes for service laterals shall be in line bell and spigot type, factory moulded.
3. Saddle fittings for lateral connection will be permitted; solvent welded.
4. Maintenance hole connections shall be by rubber ring water stop installed on pipe and cast in center of maintenance hole wall or four (4) inches from outside face of maintenance hole base. Pipe section on water stop at maintenance hole shall have bell flush with outside of maintenance hole or no more than ten (10) inches outside maintenance hole.

71-1.06F HDPE Pipe

Joints for HDPE shall be bell and spigot or butt-fusion type. Bell and spigot types shall have an elastomeric gasket which will be compressed radially to form a watertight seal. The joint shall be designed to avoid displacement of the gasket when installed with the manufacturer's recommendations.

71-1.07 Deformation Testing - Following the placement and compaction of backfill and prior to placement of permanent pavement, the Contractors shall perform a deflection test on the pipe. If the pipe should fail the deflection test, the Contractor shall uncover the pipe and make adjustments in the bedding and/or backfill conditions that will be necessary to achieve a passing test. The trench shall be backfilled and street subgrade shall be recompacted and the pipe retested. Any corrective measures found necessary to meet the deflection requirements, including recompaction and regrading of the street subgrade, shall be included in the unit price bid for the sanitary sewer pipe.

See Section 71-1.11 for method and extent required.

- a. Maximum deflection for ABS composite sewer pipe installed is 4%.

71-1.08 Existing Maintenance Holes - Existing maintenance holes shall be adjusted to grade, remodeled or abandoned as shown on the Project Plans and in accordance with the provisions in Section 15, "Existing Highway Facilities."

When designated on the Project Plans, or directed by the Engineer, existing maintenance hole frames and covers shall be reset on new structures. Upon completion of the adjustment of existing maintenance holes to grade, the maintenance hole cover shall conform to the planned surface as specified for the finished asphalt concrete surface, Section 39.

All existing maintenance holes, lampholes and terminal cleanout frames and covers that are removed become the property of the City of Stockton.

71-1.09 Sewer Structures - New maintenance holes, terminal cleanout structures, and pipe chimneys for sewers shall be constructed in accordance with the details shown on the Standard Plans, as specified in this Section 71-1.09 and as directed by the Engineer.

Precast maintenance hole, pipe maintenance holes shall conform to the Standard Plans, the Project Plans, and the applicable sections in Section 70.

Maintenance hole frames shall be secured to the maintenance hole cover and riser barrels with full mortar bed or full circle concrete collar that will effectively secure the frame to the maintenance hole structure and provide a uniform bearing for the frame.

Concrete for sewer structures shall be Class A as described in Section 90-1.01. Concrete for sewer maintenance bases shall be Class B.

When the maintenance hole is located in the pavement area, it shall not be constructed to final grade until pavement has been completed.

Where new work is jointed to the surface of unfinished work, the latter shall be thoroughly cleaned.

All joints on the inside of structures and sewers shall be neatly struck and pointed where plastering is not specified on the plans.

The inside bottoms of existing maintenance holes, where new connections are made, and of new maintenance holes shall be shaped to provide channels conforming to the size and shape of the lower portion of the inlets and outlets of the maintenance holes. The channels shall vary uniformly in size and shape from inlet to outlet.

No pipe shall project more than 0.17 foot into a maintenance hole and in no case shall the bell of a pipe be built into the wall of a maintenance hole or structure.

All concrete shall be cured for a period of not less than 10 days after being placed and shall be protected from damage.

71-1.09A Maintenance Hole Interior Coatings

General - The interior of all new maintenance holes along sanitary sewer lines 24" and larger, which will be maintained by the City, shall be coated. In addition, the interior of any existing City Maintenance hole(s), downstream from a new Sanitary Sewer system, determined by the City Engineer, to be adversely affected by the additional sewage, shall be either lined or coated.

The coating shall be resistant to attack from the following: bleaches; sulfuric, acetic, hydrochloric, phosphoric, nitric, chromic, oleic, and stearic acids; sodium and calcium hydroxides; ammonium, sodium, calcium, magnesium, and ferric chlorides; ferric sulfate, hydrogen sulfides, petroleum oils and greases, vegetable and animal oils, fats, greases, soaps and detergents. The coating shall be impermeable to sewage gases and liquids and shall be non-conducive to bacterial or fungus growth.

Acceptable coatings are as follows (or approved equal):

<u>PRODUCT NAME</u>	<u>PRODUCT TYPE</u>	<u>MANUFACTURER</u>
SewerGard 210	Epoxy	Sauereisen
Raven 405	Epoxy	Raven Lining Systems
Hydro-pox 204	Epoxy	Con-Tech
Mainstay DS-4	Epoxy	Madewell Products Corporation
SprayWall	Epoxy	SprayRoq, Inc.

The City Engineer, at the City Engineer's discretion may, at any time, determine that a product is not suitable for specific applications. Additionally, this list may be reviewed annually by the Materials Review Committee and products may be determined not suitable for specific applications.

Surface Preparation - For coatings, it is the intent of this standard that the application surface be clean and dry. Surfaces shall be cleaned to achieve an ASTM D-4259 Standard by abrasive blast cleaning methods. All surfaces shall be cleaned to remove all dirt, dust, corrosion products, loose concrete, debris, grease, oils, growths and foreign matter. On new concrete and metal surfaces, a sandblasting shall be used to remove all laitance. Coatings shall be applied only to a sound clean surface profile consistent with the manufacturer's published recommendation.

New concrete shall be aged no less than 30 days prior to application.

Cracks, joints, eroded and damaged areas shall be sealed with a compatible grout/putty as recommended by the coating manufacturer prior to the application of the coating material.

Application - All coating materials shall be applied in a manner and thickness consistent with the manufacturer's published recommendation.

All coatings shall be applied in a manner consistent with all applicable environmental and health and safety regulations. At a minimum, during application, the applicators shall use protective clothing, eye protection, chemical resistant gloves, and air respirators.

The coating shall be free of blisters, pinholes, holidays, or discontinuities.

Inspection - All coating work shall be performed in the presence of the designated City construction inspector. All coating work done in the absence of the inspector is subject to rejection unless specifically allowed by the inspector. The inspector shall be provided access to the construction site and to those areas subject to the performance of work under this standard.

Testing - All testing shall be performed by the contractor in the presence of a City inspector. All lining and coating work shall be high-voltage spark tested at a minimum 125 volts per mil film thickness of coating. Contractor shall verify to the City that the test equipment is in proper working condition prior to spark testing. Use Tinker-Razor AP-W test equipment or approved equal.

Repairs of Holidays or Pinholes - All areas to be repaired, as determined by inspection and testing, shall be repaired in accordance with the product manufacturer's recommendations.

71-1.10 Trench Resurfacing - Trenches in existing streets, except streets which are to be closed or abandoned, shall be resurfaced with the type and thickness of bases, surfacing or pavement, as shown in these Standard Specifications and Plans. The Contractor shall proceed immediately to resurface any part of any excavation upon notice from the Engineer without waiting for completion of the full length of the sewer. All trenches shall be backfilled or covered at the end of each working day. Any temporary trench patching shall be approved by the City Engineer.

71-1.11 Testing:

71-1.11A Cleaning - Prior to performing tests, the pipe installation shall be thoroughly cleaned. Cleaning shall be performed by the Contractor by means of an inflatable rubber ball. The ball shall be of a size that will inflate to fit snugly into the pipe to be tested. The ball shall be controlled with a tag line. The ball shall be placed in the last lamphole or maintenance hole on the pipe to be cleaned, and water shall be introduced behind it. The ball shall pass through the pipe with only the pressure of the water impelling it. All debris flushed out ahead of the ball shall be removed at the first maintenance hole where its presence is noted. In the event cement or wedged debris or a damaged pipe shall stop the ball, the Contractor shall remove the obstruction.

71-1.11B Deflection Test for ABS, PVC, (Solid Wall and Profile Wall), and HDPE Sanitary Sewer Pipe – A short-term deflection test shall be conducted no sooner than 30 days after the placement and densification of backfill. The Contractor shall furnish all equipment needed to complete this

test. The cost for the deflection test shall be included in the unit price bid for the sanitary sewer pipe.

For PVC pipe, the allowable short-term deflection shall be 5%. The minimum allowable I.D. (O.D. of the mandrel) shall be established by the pipe manufacturer.

For ABS Pipe - All mainline pipe shall be cleaned and then mandrelled to measure for obstructions (deflection, joint offsets, lateral intrusions, etc.). A rigid mandrel with a circular cross-section having a diameter at least 96% of the specified average inside diameter shall be pulled through the pipe. The method of measuring the deflection shall be reviewed by the City Engineer. Any pipe through which the mandrel will not pass shall be said to have failed and will be repaired by the Contractor at the Contractor's expense.

For HDPE pipe--maximum long term deflection for HDPE pipe shall be no more than 5%. Long-term deflection shall be calculated as the short-term deflection multiplied by a deflection lag factor based upon the average inside diameter of the pipe. In no case shall a deflection lag factor of less than 1.5 be accepted. Mandrel deflection tests may be required during installation as specified by the City Engineer. Mandrels used in testing shall have an odd number of legs totaling no less than nine. Pipe sections not meeting the deflection requirements shall be excavated, re-installed, and subject to an additional 30-day deflection test.

At the Engineer's option, the Engineer may require a sample of ten percent (10%) of the laterals randomly selected by the inspectors shall also be tested for deflection. If difficulty is encountered in passing the mandrel test, the inspector may direct that a larger sample of laterals be tested up to and including one-hundred percent (100%) of all laterals.

The Contractor shall furnish properly sized mandrels for size and type of pipe installed. Certification of proper mandrel size shall be required and mandrel identified in a manner to identify with certification.

At the Contractor's expense, all locations with deflection greater than allowable shall be excavated, repaired or replaced, backfilled and retested.

71-1.11C General - All leakage tests shall be completed and approved following the placement and densification of the back fill, but prior to placing of permanent surfacing.

When leakage or infiltration exceeds the amount allowed by the specifications, the Contractor at its expense shall locate the leaks and make the necessary repairs or replacements in accordance with the specifications to reduce the leakage or infiltration to the specified limits. Any individually detectable leaks shall be repaired, regardless of the results of the tests. Leakage tests shall be made on completed pipelines as follows:

1. Gravity Sanitary Sewer (24 inches (610 mm) or less in diameter where difference in elevation between inverts of adjacent maintenance holes is 10

feet (3.05 M) or less) - Water exfiltration test or water infiltration test as directed. The Engineer may allow substitution of an air pressure test for the water exfiltration test.

2. Gravity Sanitary Sewers (24 inches (610 mm) or less in diameter where difference in elevation between inverts of adjacent maintenance holes is greater than 10 feet (3.05 M)) - Air pressure test.
3. Gravity Sanitary Sewers (greater than 24" (610 mm) in diameter) - Air pressure test or water infiltration test as directed.
4. Pressure Sewers (force mains) - Water pressure test at 50 psi (345 kPa) over pipe pressure classification or designation.

71-1.11D Water Exfiltration Test - Each section of sewer shall be tested between successive maintenance holes by closing the lower end of the sewer to be tested and the inlet sewer of the upper maintenance hole with stoppers. The pipe and maintenance hole shall be filled with water to a point 4 feet (1.22 M) above the invert of the sewer at the center of the upper maintenance hole; or if ground water is present, 4 feet (1.22 M) above the average adjacent ground water level.

The allowable leakage will be computed by the formulae:

$E = 0.0001 LD \sqrt{H}$ for mortared joints.

$E = 0.00002 LD \sqrt{H}$ for all other joints.

where:

L is the length of sewer and house connections tested, in feet.

E is the allowable leakage in gallon per minute of sewer tested.

D is the internal diameter of the pipe in inches.

H is the difference in elevation between the water surface in the upper maintenance hole and the invert of the pipe at the lower maintenance hole; or if ground water is present above the invert of the pipe in the lower maintenance hole, the difference in elevation between the water surface in the upper maintenance hole and the ground water at the lower maintenance hole.

However, the maximum shall not exceed 200 gallons per inch of internal diameter per mile per day.

The Contractor shall, at its expense, furnish all water, materials and labor for making the required test. All tests shall be made in the presence of the Engineer.

71-1.11E Water Infiltration Test - If, in the opinion of the Engineer, ground water is encountered in the construction of a section of the sewer, the Engineer may require the pipe be tested by the Water Infiltration Test as follows:

The end of the sewer at the upper structure shall be closed sufficiently to prevent the entrance of water, and pumping of ground water shall be discontinued for at least 3 days, or until the ground water has recovered its normal status level, after which the section shall be tested for infiltration.

The infiltration into each individual reach of sewer between adjoining maintenance holes shall not exceed that allowed by the formula in Section 71-1.11D where H is the difference in the elevation between the ground water surface and the invert of the sewer at the downstream maintenance hole.

Unless otherwise specified, infiltration will be measured by the Engineer using measuring devices furnished by the City.

All visible leaks shall be repaired by the Contractor regardless of volume involved.

71-1.11F Air Pressure Test - The Contractor shall furnish all materials, equipment and labor for making an air test. Air test equipment shall be approved by the City prior to the beginning of the test.

Each section of sewer shall be tested between successive maintenance holes by plugging and bracing all openings in the main sewer line and the upper ends of all sewer connections. Prior to any air pressure testing, all pipe plugs shall be checked with a soap solution to detect any air leakage. If any leaks are found, the air pressure shall be released, the leaks eliminated, and the test procedure started over again.

The final leakage test of the sewer main line and branching sewer connections, shall be conducted in the presence of the Engineer in the following manner:

1. Clean pipe to be tested by propelling snug fitting inflated rubber ball through the pipe with water.
2. Plug all pipe outlets with suitable test plugs. Brace each plug securely.
3. If the pipe to be tested is submerged in ground water, insert a pipe probe by boring or jetting, into the backfill material adjacent to the center of the pipe, and determine the pressure in the probe when air passes slowly through it. This is the back pressure due to ground water submergence over the end of

the probe. All gauge pressures in the test should be increased by this amount.

4. Add air slowly to the portion of the pipe installation under test until the internal air pressure is raised to 4.0 psig.
5. After an internal pressure of 4.0 psig is obtained, allow at least two minutes for air temperature to stabilize, adding only the amount of air required to maintain pressure.
6. When pressure decreases to 3.5 psig, start stop watch.
- 6a. The following applies to all pipes other than PVC and ABS (see 6b):

Determine the time in seconds that is required for the internal air pressure to reach 2.5 psig. Minimum permissible pressure holding times are indicated by the following formula and table in seconds:

$$t = k \left(\frac{d}{g} \right)$$

where t = minimum required time in seconds

k = constant 0.022

d = nominal pipe diameter in inches

g = allowable air loss rate per unit
area, 0.003 cu. ft./min./sq. ft.
of internal/surface area

psig = pounds per square inch gage

**MINIMUM HOLDING TIME IN SECONDS REQUIRED FOR PRESSURE TO DROP
FROM 3 ½ TO 2 ½ PSIG**

NOTES: (1) TO BE USED WHEN TESTING ONE DIAMETER ONLY

(2) The above air pressure test procedure is based on ASTM C828. Any special situations or conditions shall conform to this ASTM Standard.

- 6b. For PVC and ABS lines the following table lists the minimum times allowed for a pressure drop from 3.5 psi to 3.0 psi in excess of the ground water pressure at the top of the pipe.

Pipe Dia (in)	Min Time (min sec)	Lgth for Min Time (ft)	Time for Lngr Lgth (sec)	Specification Time for Length (L) shown (min:sec)								
				100ft	150ft	200ft	250ft	300ft	350ft	400ft	450ft

SAFETY NOTE:

The air test may be dangerous if, because of ignorance or carelessness, a line is improperly prepared. It is extremely important that the various plugs be installed and braced in such a way as to prevent blowouts. Inasmuch as a force of 250 lbs. is exerted on an 8" plug by an internal pipe pressure of 5 psi, it should be realized that sudden expulsion of a poorly installed plug or of a plug that is partially deflated before the pipe pressure is released can be dangerous.

As a safety precaution, pressurizing equipment should include a regulator set at perhaps 10 psi to avoid over-pressurizing and damaging an otherwise acceptable line. No one shall be allowed in the maintenance holes during testing.

IF THE TIME LAPSE IS LESS THAN THAT SHOWN IN THE TABLE, THE CONTRACTOR SHALL MAKE THE NECESSARY CORRECTIONS TO REDUCE THE LEAKAGE TO ACCEPTABLE LIMITS.

71-1.11G Televising of Sanitary Sewers - Following the placement and compaction of backfill and completion of other required testing, but prior to the placing of pavement, the Contractor shall televise all sewer lines for conformance to the Project Plans and specifications. A CD and log of the televising shall be delivered to the Engineer within a week of televising. If defective pipes or conditions are discovered they shall be corrected at no cost to the City. Any corrective work proposed shall be approved by the Engineer.

The City may also televise sewer lines prior to the expiration of the one year warranty. If a defective condition is found, it shall be presumed to be caused by defective workmanship or materials. The developer and/or Contractor shall be notified and shall correct the work in a manner approved by the Engineer.

71-1.12 Measurement - Sewer work performed under Section 71, "Sewers," will be designated in the contract item by size, type, thickness, quality, or whatever information is necessary for identification.

The lengths of the various types of sewer pipe to be paid for by the linear foot; measured from centerline of maintenance hole to center line of maintenance hole between structures or to end of line not terminated at a structure.

Pipe bends, wyes, tees and other branches will be measured by the linear foot for the sizes of pipes involved. Bends will be measured along centerlines. Wyes, tees, and other branches will be measured along centerlines to the point of intersections.

Quantities of precast concrete pipe sewer maintenance holes, terminal cleanout structures, and pipe chimneys will be determined as units from actual count, except new frames and covers.

New frames and covers will be considered as a part of the structure to which the frame and cover is attached and no additional compensation will be allowed therefor.

The quantities of permanent trench resurfacing to be paid for shall be the actual quantities placed within limits up to a maximum width of 3 feet greater than the outside diameter of the pipe or structure. Temporary trench resurfacing shall be paid for by the Contractor.

Trench quantities in excess of the above shall be at the Contractor's expense unless approved otherwise by the Engineer.

71-1.13 Payment - Items of work, measured as provided in Section 71-1.12, "Measurement," will be paid for at the contract price per linear foot for the various sizes of pipes, types of sewer maintenance holes, terminal cleanout structures, and the contract price per ton or square foot for the various types of surfacing.

Full compensation for structure excavation; structure backfill; bar reinforcing steel and concrete will be considered as included in the contract price paid for the various items of sewer work and no separate payment will be made therefor.

Shaping the bottoms of new maintenance holes will be considered as a part of the maintenance hole and no separate payment will be made therefor.

Full compensation for all tunneling and jacking of pipe, capping open ends of pipe, joining of pipe to other pipe or structure, shaping bottoms of existing maintenance holes, utility support and

protective work operations required to accommodate or safeguard public traffic, testing the sewer line, furnishing and disposing of water and equipment used for testing and all other incidental work and material required to construct the sewer system shall be considered as included in the prices paid for the various contract items of sewer work and no additional compensation will be allowed therefor.

The above prices and payments shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing sewers, complete in place, as shown on the Project Plans, and as specified in these specifications and the special provisions, and as directed by the Engineer.

71-1.14 Abandonment - Sanitary sewer lateral abandonment shall be done at the property line. Provide bell end or collar with air tight plug, as specified in the U.P.C., at the end of the line.

SECTION 74

PUMPING EQUIPMENT AND CONTROLS

This section of Caltrans Standard Specifications is deleted in its entirety.

Replace with the following:

Specifications and Plans for pumping plant equipment shall be prepared in accordance with the Municipal Utilities Department Pump Station Guidelines and as approved by the Director of Municipal Utilities.

SECTION 75

MISCELLANEOUS METAL

75-1.02B Maintenance Hole Frames and Covers – The following shall be added: Gray iron castings shall conform to and/or exceed the requirements of ASTM A48-76, Class 30 and test bar size shall be as stated in Table I.

A "Certificate of Compliance" signed by an authorized agent of the manufacturer or supplier shall be required.

Each certificate so furnished shall be accompanied by a copy of test results stating that the material has been sampled, tested, and inspected in accordance with the provisions of the latest issue of ASTM A-48, Gray Iron Castings. Test bars shall be cast and tested for the first lot of casting and every four (4) months thereafter. If production is interrupted for any period longer than four months, test bars shall be cast and tested from the initial lot after production is resumed and every four (4) months thereafter. The first lot is defined as the first castings produced after January 1st of each year. The tension tests specified shall be performed and the results certified by an independent testing laboratory located in the United States of America.

In addition, current certified test reports for testing in accordance with AASHTO HS-20 loading shall be furnished.

Units furnished shall be identifiable with reference to the above tests.

Machined surface tolerances shall produce true, uniform bearing surfaces.

All frames and lids shall be interchangeable with like seat design. Dimensional fit tolerances shall not exceed those allowed on designated specified units detailed on Standard Drawing No. S-8.

Maintenance hole frame and covers and catch basin frames and covers shall be wire brushed removing all dirt and loose mill scale and rust and given a coat of coal tar pitch at 180° F.

75-1.02D Identifying Castings – All gray iron castings shall be marked on the top surface with the English name of the country of origin; manufacturer's name, lot number, and initials or logo type. In addition, the month and year of manufacture shall be cast on the frame and cover adjacent to the name of the manufacturer. Such marking shall be made by means of stamping, cast-in-mold lettering, etching, or engraving.

SECTION 78

DOMESTIC WATER FACILITIES

NOTE: THIS SECTION IS ADDED IN ITS ENTIRETY TO THE BLANK SECTION IN CALTRANS STANDARD SPECIFICATIONS.

78-1.01 Description - This work consists of furnishing and installing pressure water pipe control valves, thrust blocks, fire hydrant tees, fire hydrants and service lines, all as shown on the Project Plans or as directed by the Engineer, and as specified in the Standard Specifications and Plans and the special provisions.

78-1.01A Right of Way - All City owned domestic water facilities located on private property shall be installed within a 10' (min.) wide easement which shall have been dedicated to the City of Stockton.

78-1.01B Facilities Standards - Unless otherwise noted, all domestic water facilities shall be designed in accordance with the California Water Works Standards and the American Water Works Association.

78-1.02 Materials - All pipe and fittings (except valves) shall have a minimum working pressure of one hundred twenty five (125) pounds/square inch and conform to the following requirements:

78-1.02B Ductile Iron Pipe - Ductile iron pipe for water and other liquids shall be furnished in the sizes; classes; grades or nominal thicknesses; and joint types designated on the Project Plans or in the Special Provisions.

Ductile iron pipe shall comply with ANSI A21.51 (AWWA C151) and have cathodic protection and test stations.

Ductile iron pipe is to be used on all water crossings or where required by State Health Code sanitary sewer water line clearance regulations. Pipe shall utilize either flange, mechanical or push on rubber gasket joints. Pipe shall be minimum standard thickness with standard cement lining (USA Std. A21.4).

Ductile iron pipe joints shall comply with the following requirements for the types:

<u>Type of Joint</u>	<u>Specifications</u>
Rubber Gasket Push-on Joint	ANSI A21.11 (AWWA C111)
Mechanical Joint	ANSI A21.11 (AWWA C111)
Flanged Joint	ANSI B16.1, B.16.2 and A21.10 (AWWA C110)
Flanged Joint (Threaded Flanges)	ANSI B2.1.

All rubber gasket, push-on, mechanical and flanged joint fittings for ductile iron water pipe shall be manufactured in accordance with ANSI A21.10 (AWWA C110).

Unless otherwise specified, the internal surfaces of ductile iron water pipe and fittings shall be lined with a uniform thickness of cement mortar then sealed with a bituminous coating in accordance with ANSI A21.4 (AWWA C104). The outside surfaces of ductile iron pipe and fittings for general use shall be coated with a bituminous coating 1 mil (0.0254mm) thick in accordance with ANSI A21.6 or ANSI A21.51.

78-1.02C Polyvinyl Chloride (PVC) Pipe - Polyvinyl Chloride pipe shall be furnished in the classes, sizes, and grades designated on the Project Plans and Special Provisions.

Polyvinyl Chloride pipe shall meet the requirements of AWWA C-905 "Polyvinyl Chloride (PVC) Pressure Pipe." Pipe sized shall be 6" through 12" only - AWWA Class 150 minimum. All Class 150 pipe shall meet the requirements of DR 18 and Class 200 pipe shall meet the requirements of DR 14 with O.D.

However, pipe sizes from 16" through 24" may be used for transmission lines; no house service taps/laterals are allowed in these sizes. Pipe shall be DR-18 (235 psi) only, conforming to the requirements of AWWA C-905 "Polyvinyl Chloride (PVC) Water Transmission Pipe" in O.D. sizes. Pipe embedment zone (O.D. plus 12") shall conform to City of Stockton Standard Drawing No. R-36.

All pipes shall be suitable for use as a pressure conduit. Provisions shall be made for expansion and contraction at each joint with an "O" ring elastomeric gasket seal meeting the requirements of ASTM D-1869 and F-477. Solvent welded joints will not be permitted. The bell section shall be designed to be at least as strong as the pipe wall.

78-1.02D Valves - This specification includes three (3) inch through twelve (12) inch diameter gate valves and twelve (12) inch or larger diameter butterfly valves and operators intended for buried service in a domestic water system.

Gate valves shall be resilient seat C509 or equal meeting or exceeding the latest revisions of AWWA C-500 with a design working pressure of one hundred seventy-five (175) psi.

Butterfly valves shall meet or exceed the latest revisions of AWWA C-504 with a design working pressure of 150 psi. Operators for butterfly valves twenty (20) inches and smaller shall be Class 150; larger operator will be as specified in the special provisions and designed for actual line conditions as covered in AWWA C-504, Appendix A. Valve ends shall be mechanical joint or flanged in accordance with AWWA C-500 unless otherwise specified.

Valves for use with flanged pipe shall be cast with Class 125 flanges, dimensions and drilling shall conform to ASA B 16.1. Flange boltholes shall be spot faced if flange fillets interfere with both heads and nuts.

Tapping sleeves for A.C. and cast iron water mains shall be full body shell, with full body gasket or

split sleeve, end and side gasket seal. Inlet flange and tapping gate valve flanges shall be Class 125 flange. Tapping sleeves shall be M & H 1174 and 1274 (all sizes); Romac SST and Clow 3490-AS (over 12 inch only) or an approved equal. Taps for steel pipe, CMC and/or CML, will require review and approval by the City Engineer.

All stem seals, gate valves and butterfly valves, shall be O-rings only.

Wrench nuts shall be made of top grade cast iron, fitting the top of the valve stem and secured by nut or key. Wrench nuts shall be one and fifteen sixteenth (1-15/16) inch square at the top and two (2) inches square at the bottom.

Valves requiring operating wrenches exceeding six (6) feet in length shall have extension and guides installed in valve boxes.

The open direction shall be left (counter-clockwise) and the closed direction right (clockwise).

78-1.02F Valve Boxes - Valve boxes and covers shall conform to City of Stockton Standard Plan No. W-11.

78-1.02G Gaskets - Gaskets for flanged joints shall be full circle one-sixteenth (1/16) inch thick asbestos composition gaskets.

78-1.02H Thrust Blocks - Thrust blocks shall conform to City of Stockton Standard Drawings. Concrete for thrust blocks shall be Class B with one and one-half (1-1/2) inch max. size aggregate in accordance with Section 90 of the Standard Specifications.

78-1.02I Fire Hydrants - Fire hydrants shall conform to the requirements of the Fire Department of the City of Stockton as shown on the Standard Plan No. W-13 and the following:

- a. All hydrants shall comply with AWWA C502, latest revision.
- b. All operating valves shall be located below grade and protected by "break-off" features so that no water flows if hydrant is knocked off.
- c. Hydrant main valve seat shall be a minimum 5-1/4 inches.
- d. Hydrant valve shall be molded non-swelling rubber.
- e. Hydrant main valve seat shall be threaded into a bronze to bronze subseat.
- f. Hydrant bury shall be 36 inches from connection to ground flange. Materials to extend the length of bury shall be readily available.

78-1.02J Service Lines - Service lines up to and including meter connection shall be as detailed in City of Stockton Standard Plan Nos. W-3 and W-4, as applicable for the service intended and with the AWWA Standard C-800.

1. Service line connections are not permitted on pipe sizes 16" and greater.
2. Threads for line pipes shall be as specified in the AWWA standard for threads for underground service line fittings.
3. Type of service line pipe shall be limited to the following:
 - a. Copper water tube, Type K or ASTM B-88.
 - b. Ultra High Molecular Weight (UHMW) P.E. 3406, P.E. 3408, CS 255-63, Polyethylene as manufactured by ADS or an approved equal in one (1) inch iron pipe sizes only. Plastic pipe larger than one (1) inch and up to and including two (2) inch iron pipe sizes shall be PB 2110 Polybutylene. Connection of plastic pipe shall be made using Mueller 110 compression connections or approved equal.
 - c. Services two (2) inches and larger shall be considered as a special condition and will require the prior approval of the Water Superintendent and City Engineer.
 - d. Saddles or service clamps shall be used on all PVC taps and shall be designed specifically for PVC pipe. Saddles or service clamps shall be Rockwell No. 381 or approved equal.
4. Service lines, if abandoned, must be severed at the main.

78-1.02K Water Meters - Unless otherwise specifically noted, water meters will be purchased and installed by the City of Stockton.

For meters larger than two inch it will be the Contractor's responsibility to contact the City of Stockton prior to installation of meter boxes to ascertain the dimensions of the meters currently in stock.

It shall be the Contractor's responsibility to set meter box and service fittings in such a manner that City meter can easily be dropped in place. See Standard Plans for minimum clearance dimensions.

78-1.03 Installation

78-1.03A Installation of Water Mains

78-1.03A(1) Description - The Contractor shall, unless specified otherwise, furnish all material, equipment, tools and labor necessary to do the work required, and unload, haul and distribute all pipe, castings, fittings, valves, hydrants and accessories. The Contractor shall also remove pavement as stipulated; excavate trenches and pits to the required dimensions; excavate bell holes; construct and maintain all bridges for traffic control sheet, brace, and support the adjoining ground or structures where necessary; handle all drainage or ground water; provide barricades,

guards, and warning lights; lay and test the pipe, castings, fittings, valves, hydrants, and accessories; backfill and consolidate the trenches and pits; restore the roadway surface unless otherwise stipulated; remove surplus excavated material; clean the site of the work; and maintain the street or other surface over the trenches as specified. All connections to existing lines shall be flanged by fittings with isolation plates.

78-1.03A(2) Excavation - Trench excavation shall conform to the requirements of the City of Stockton Standard Plans No. R-36 and No. R-41.

The bottom of the trench shall be carefully graded as indicated in Section 71-1.03 of the Standard Specifications.

78-1.03A(3) Jacking - Jacking shall conform to the City of Stockton Standard Plan No. S-14.

78-1.03A(4) Pipe Laying - The pipe shall be handled with care at all times and in a manner that meets the approval of the Engineer. Extreme care shall be exercised in the use of any mechanical devices used in laying the pipe to avoid scarring or other damage.

The Engineer shall be the judge of whether a pipe is seriously damaged and any pipe so classified shall be permanently removed from the site of the work.

The inside of all pipes and couplings shall be free from dirt, grease, or other deleterious materials. The open ends of all pipe previously laid shall be adequately plugged water tight whenever pipe laying operations are suspended at the end of each work day, or for any other reason.

Select fine damp earth shall be placed and thoroughly compacted across the bottom of the trench to provide full support of all the pipe. Bells and/or couplings shall have soil removed to provide a uniform bearing.

In joining asbestos cement pipe, a thin coating of non-toxic and water soluble lubricant shall be applied to the entering level and back to the first machined shoulder of the pipe to be coupled. The rubber rings shall be set in the coupling grooves, and the couplings shall be placed between the pipe ends. The pipe shall be moved so that ends butt snugly against the rubber rings. A representative of the pipe manufacturer shall be present when the pipe laying commences in order to insure the proper installation of the pipe.

78-1.03A(5) Backfilling - Backfilling shall not be completed until the pipe has been properly installed to the satisfaction of the Engineer.

Backfill materials shall be placed on both sides of the pipe simultaneously to prevent any undue strain on the pipe.

Imported sand or an approved clean granular material free of all lumps and debris, passing 100% through the 3/4 inch sieve and having 5% to 20% passing the No. 200 sieve, with a minimum sand equivalent of 20 material shall be placed in the trench in six (6) inch layers to a depth of twelve (12) inches above the pipe and shall be hand tamped, or compacted to 85 percent relative compaction.

The balance of the trench shall be backfilled and compacted as shown by jetting or mechanical means on Standard Plans Nos. R-36, R-37, R-41, R-42, and R-43. This Standard shall be used as a minimum in all new construction unless otherwise noted in the Special Provisions.

Backfilling and bedding for P.V.C. pipe shall be performed in accordance with Section 71-1.04 Bedding of these Standard Specifications for P.V.C. pipe.

The Contractor shall do all excavating, loading, hauling, placing and compacting of the material in place.

All pipe damaged during construction operations shall be replaced by the Contractor at the Contractor's expense to the satisfaction of the Engineer.

78-1.03A(6) Trench Resurfacing - Trenches in existing streets, except streets which are to be closed or abandoned, shall be resurfaced with the type of thickness of bases, surfacing or pavement shown on the Standard Plans.

The Contractor shall proceed immediately to resurface any part of any excavation upon notice from the Engineer without waiting for completion of the full length of line.

78-1.03B(1) Testing - The test for hydrostatic pressure shall commence no sooner than seven (7) days after the last concrete thrust block has been cast with standard cement or at least after thirty-six (36) hours with high early strength cement, and after backfilling and compacting the trench to the plane upon which the asphalt concrete surfacing is to be placed. The Contractor shall take the necessary precautions to insure that the pipe fittings, couplings, valves, and other appurtenances are not displaced during the test. The pipe shall be filled with water at least twenty-four (24) hours prior to the time of the test. Each section of the completed pipe under test shall be subjected to a hydrostatic test pressure of one hundred twenty-five (125) pounds per square inch for two (2) hours. During this period of the test, all pipe shall be inspected for leaks, and any leaks failures, or imperfect construction revealed during the period of tests shall be corrected by the Contractor at the Contractor's own cost and expense.

After a satisfactory hydrostatic pressure test, the line shall be tested for leakage. The line shall be maintained at a sixty (60) pound per square inch pressure for seven (7) days. The leakage during this period shall not exceed 0.100 gallons for each inch of diameter for each joint for twelve (12) foot pipe lengths in the section under test in a twenty-four (24) hour period.

It shall be the Contractor's responsibility to locate and repair the points of line failure; fill, recompact the trench and retest the section of line in the event the line fails the leakage test.

78-1.03B(2) Interruption of Service - No valve or other control on an existing system shall be operated for any purpose by the Contractor. The City of Stockton will operate all valves, hydrants, blowoffs and curb stops.

78-1.03C Disinfecting Water Mains

78-1.03C(1) General –

1. The interior of all pipe, fittings, and other accessories shall be kept as free as possible from dirt, foreign material and bacteria at all times. During pipe laying operations, when bacterial contamination of interior pipe surfaces is obvious or suspected by the Engineer, the Engineer may order said surfaces to be swabbed with an approved bactericidal solution.

Disinfecting chemicals and additives shall comply with the requirements of Title 22, Division 4, Chapter 18 as Regulated by the State of California, Department of Health Services.

2. Disinfection of water mains shall be insured before permission for their connection to the City's water distribution system will be granted.

Chlorinated water may be disposed of in the sanitary sewer with prior approval from the Municipal Utilities Department (MUD). Without MUD approval, water must be dechlorinated and disposed of in the sanitary sewer. Chlorinated water or dechlorinated water shall not be disposed of in the storm drain system. Disinfecting water mains shall be performed after all water related appurtenances have been installed.

3. Bacteriological samples used to satisfy the disinfection requirement of section 78-1.03C shall be collected under the direction of a Public Works Department inspector, or the inspector's agent, by personnel trained in the proper techniques for obtaining bacteriological samples, and shall be analyzed by a laboratory certified by the California Department of Health Services. It is suggested that the project contractor to be present to insure that all parties agree to the appropriateness of the sample locations.
4. The Municipal Utilities Department Laboratory is certified to perform the required bacteriological analyses and can provide properly trained personnel to collect samples.
 - a. It is not required that the City laboratory perform these tasks. The inspector or contractor may choose to use the services of a commercial laboratory as long as all technical requirements are met.
 - b. The City laboratory may be called upon, at no additional cost to the contractor, to collect and analyze one set of samples, and if that test fails, one set of retest samples after reesterilization of the main as in section 78-1.03C4. Any sampling/analysis after the first retest will be billed to the contractor on a time and materials basis.

- c. The City laboratory requires that scheduling be done at least 48 hours in advance of the sampling event. Normally this is sufficient time to allow the person assigned to this task to schedule the field work and to insure sufficient facilities exist in the laboratory to complete the analysis.
 - d. The City laboratory provides these services to the Public Works Department, not the contractor. There will be no direct communication of analysis results to the contractor; the report of the results of analyses will be made only to the inspector, or the inspector's agent, who requested the test, and to the Deputy Municipal Utilities Department Director/Water & Collection System.
 - e. If the City laboratory cannot accommodate the requested time schedule, the inspector or contractor may choose to use a commercial laboratory for sample collection and/or analysis.
5. If a commercial laboratory is used, a copy of the analysis report will be forwarded to the Deputy Municipal Utilities Department Director/Water & Collection System.

78-1.03C(2) Isolation of New Mains - All new water lines shall be completely isolated from any existing main until they have been tested and disinfected to the satisfaction of the Engineer. New mains may be filled from existing mains only by temporary tap thereto and through a State Department of Health approved backflow prevention unit so as to provide positive backflow prevention provided by City of Stockton. When new main is properly disinfected and the isolation dam is removed from connection flange or other type connection is made, extreme care shall be exercised to prevent the entry of contamination. Connection fittings shall be thoroughly swabbed with an approved bactericide immediately prior to their installation.

Flush the mains thoroughly at the end of the contact period. The orthotolidine test shall show no more chlorine in the water leaving the main than in the water entering the main.

The Engineer will collect a sample for bacteriological examination in a sterile bottle provided by the laboratory. On the label, give date, address, and the estimate number for the job. Where possible the sample should be taken from a service located near the end of the chlorination section, otherwise, it may be taken through the same blowoff used for flushing the heavily chlorinated water out of the main so that the blowoff is sterilized.

If the bacteriological tests are unsatisfactory, the main shall be resterilized using Method No. 2, and the sterilization repeated, if necessary, until satisfactory results are obtained.

78-1.03C(3) Method No. 1 - H.T.H. Tablet Method - This method is preferred for short jobs and for small diameter pipe of any kind. It cannot be used where trench water has entered the main. The main cannot be flushed prior to sterilization, so the method requires that the pipe be kept clean during installation.

Using Permatex No. 1 as an adhesive, fasten the required number of tablets (see Table I) to the

inside top of each length of pipe. Tubes of Permatex may be purchased locally at any auto parts store. The tablets may be fastened to the pipe before it is placed in the trench providing the top of the pipe is marked to insure that the tablets are on the top of the pipe after installation.

When installing asbestos cement pipe, each butt end shall be treated by using a H.T.H. tablet as a piece of chalk. Fasten extra tablets to the beginning of the first length of pipe. To be sure that these tablets start to dissolve as the water enters the main, they should be placed in rows about half an inch above the bottom of the pipe. Use one tablet for each inch of diameter. For long runs, this should be repeated about every 500 feet.

When using dresser or similar couplings, an additional tablet shall be crushed and placed in the annular space between the coupling and the pipe. Fill the pipe very slowly and proceed as outlined under General Instructions.

78-1.03C(4) Method No. 2 - H.T.H. Solution with Hand Pump Method - This method is general in scope and shall be used when it is necessary to rechlorinate an existing main. When this method is used on a main coupled with dresser or similar couplings, a pinch of H.T.H. powder shall be placed in each coupling as the main is laid.

Equipment required includes an ordinary hand test pump, solution hose, and a five gallon can to contain the chlorine solution.

A compact and convenient assembly can be made by mounting the solution can and the pump on suitable board with a pipe connection from the tank on the suction side of the pump.

H.T.H. comes as a powder which shall be dissolved in water. Strong chlorine solutions should be handled with care since they are irritating to the skin and will damage shoes and clothes.

Make up chlorine solution according to Table II. The quantity required is estimated from Table II. An excess volume should be prepared so as not to empty the container before the job is complete.

Connect pump to main. Use a corporation cock for this purpose and make connection at or ahead of the inlet end of the new line.

After flushing the line thoroughly adjust flow by timing the period required to fill a five-gallon can.

Pump chlorine solution into the line at a rate of one gallon of solution in three minutes.

Continue pumping until orthotolidine tests on a sample taken from discharge end of line being treated shows a red color, or until the odor of chlorine is noticed.

After finishing application of chlorine, close valve or blow-off. Disconnect and flush pump thoroughly with fresh water.

Refer to instruction flushing and sampling.

If the above procedure has to be varied because of some unusual condition, it will be necessary only to regulate the pump, control the water flow, or adjust the strength of the chlorine solution to give a dose of at least 50 ppm.

TABLE I
NUMBER OF TABLETS REQUIRED FOR
MAIN STERILIZATION

Length of Section	Diameter of Pipe					
	2"	4"	6"	8"	10"	12"
13' or Less	1	1	2	2	3	5
18'	1	1	2	3	5	6
20'	1	1	2	3	5	7
30'	1	2	3	5	7	10
40'	1	2	4	6	9	14

TABLE II
CHLORINE SOLUTION STRENGTH
HAND PUMP METHOD OF MAIN CHLORINATION

Amount of Chemical in 5 Gallons of Solution

Discharge Rate GPM	H.T.H.
10	0.25 lbs.
20	0.50 lbs.
35	0.75 lbs.
50	1.00 lbs.
75	1.50 lbs.
100	2.00 lbs.

Choose a suitable discharge rate and determine the time required to apply the chlorine from Table III.

Compute the gallons of solution required by dividing this time by 3.

Use the above table to determine the strength of solution required. Example: If the estimate time from Table III is 35 minutes, 11-2/3 gallons will be required; and if the discharge rate is 50 GPM, the solution should contain one pound of H.T.H. in five gallons. Prepare fifteen gallons of solution so as

to be sure of having an adequate amount. Operate the hand pump at a rate of five gallons in fifteen minutes, or one gallon in three minutes.

TABLE III

Time in Minutes to Apply Chlorine to 100 Feet of Pipe

Discharge Rate GPM	2"	4"	6"	8"	10"	12"
10	2	7	15	26	41	59
20		3	7	13	20	29
35		2	4	8	12	17
50			3	5	8	12
75			2	4	6	8
100				3	4	6

The above table is used to estimate the time required to apply chlorine. For example: 700' of 8" main can be filled with chlorine solution in 35 minutes with a discharge rate of 50 GPM.

78-1.04 Measurement - The work to be performed under these Standard Specifications will be listed in the contract items by size, class type, or whatever information is necessary for identification.

The length of pipe to be paid for will be the slope length designated by the Engineer.

Pipe bends, wyes, tees, and other branches will be measured by the linear foot for the sizes of pipes involved.

78-1.05 Payment - Items of work, measured as provided in Section 70-1.04, "Measurement," will be paid for at the contract prices per linear foot for the various sizes and types of pipe; the contract unit prices per ton, cubic yard or square foot for the various types of surfacing required.

Full compensation for excavation, backfill, thrust blocks, testing, sterilizing and fittings will be considered included in the various contract items and no additional allowance will be made therefor.

78-1.06 Non-Potable Water Systems - Specifications and Plans for non-potable water systems shall be prepared in accordance with the Municipal Utilities Department's Non-Potable Water System Guidelines, and as approved by the Municipal Utilities Department

SECTION 79

STORM WATER BASINS

NOTE: THIS SECTION IS ADDED IN ITS ENTIRETY TO THE BLANK SECTION IN CALTRANS STANDARD SPECIFICATIONS DATED JULY 1992.

79-1.01 Definitions

“Detention Basin” – A facility which stores storm water for a relatively short time designed with type of metered outlet.

“Wet Detention Basin” – A lake having a metered outlet utilizing differential water levels for storm water detention purposes.

“Retention Basin” – A facility which stores storm water for an indefinite period of time not usually designed with a metered outlet.

79-1.02 Basin Notes

1. Storm water basins, shall only be allowed if downstream improvements are either not feasible or impractical from a cost standpoint at the time of development. Unless otherwise approved by the City Engineer, basins will not be considered a permanent means for handling peak storm runoff flows. A plan may be required outlining the proper abandonment of the basin in the future.
2. Basins shall be constructed such that the collection system drains into the basin by gravity. Basins designed with surface berms or levees may be subject to additional design criteria other than that stated below.
3. Basins constructed in the proximity of the airport may be subject to additional design criteria due to avigational concerns.

79-1.03 Detention Basin Design

79-1.03A Detention Basins With No Discharge Limitations

79-1.03A (1) Volume – One 10yr – 48hr event calculated by $V = \frac{CAR}{12}$. The rainfall value for a 10yr – 48hr event in Stockton shall be 3.12 inches.

where, C = Runoff Coefficient
 A = Area of Collection
 R = Rainfall Value = 3.12 inches
 V = Volume (acre-ft)

79-1.03A (2) Collection System – The starting point for hydraulic grade calculations in collection system design shall be the water surface in the pond generated by the volume of one 10yr – 48hr storm or the top of the inlet pipe, whichever is higher. Hydraulic grade shall be kept a minimum of 1 foot below the top of curb at any point in the subdivision.

79-1.03A (3) Water Surface – The maximum anticipated static water surface, determined by the volume criteria above. This water surface must remain at least 1 foot below the top of curb at the lowest point in the subdivision.

79-1.03B Detention Basins With Discharge Limitations – Design criteria shall be the same as that listed for detention basins without discharge limitations except for as follows:

79-1.03B (1) Volume – 150% of the 10yr – 48hr storm calculated by $V=1.5 \text{ CAR}/12$. The rainfall value for a 10yr – 48hr event in Stockton shall be 3.12 inches.

where, C = Runoff Coefficient

A = Area of Collection

R = Rainfall Value = 3.12 inches

V = Volume (acre-ft)

79-1.03B (2) Collection System – The starting point for hydraulic grade calculations in collection system design shall be the water surface in the pond generated by the volume of 1 10yr – 48hr storm or the top of the inlet pipe, whichever is higher. Hydraulic grade shall be kept a minimum of 1 foot below the top of curb at any point in the subdivision.

79-1.03B (3) Water Surface – The maximum anticipated static water surface, determined by the volume criteria above. This water surface must remain at least 1 foot below the top of curb at the lowest point in the subdivision.

79-1.03C Wet Detention Basins – Basins designed as lakes with the fluctuation of water levels allowing detention of storm water runoff may be allowed where feasible. These basins, however, may not be allowed in certain areas of the City due to avigational hazards posed by waterfowl. Volume, collection system, and water surface design requirements for these basins shall be the same as for all other detention basins and will depend on the specific discharge requirements at the given location. Inlet lines and structures shall direct all storm water flows into the basin.

79-1.03D Retention Basins – Retention basins shall not be allowed unless approved by the City Engineer.

SECTION 86

ELECTRICAL SYSTEMS

The following are to be added to the appropriate sections of Section 86 of the Cal Trans Standard Specifications:

86-1.06 Maintaining Existing and Temporary Electrical Systems – If any existing loop conductor, including the portion leading to the detector handhole or termination pull box, is damaged by the Contractor's operation (overlay, underground utility work, etc.), the Contractor shall re-install the loop conductor by installing a detector handhole(s) (where note exist) at the nearest appropriate lane line. All of the re-installed loop conductors shall be routed through the new detector handhole(s).

86-2.08E Signal Interconnect Cable (SIC) – Single mode fiber optic cable (minimum 12 strand) shall be installed from any new or modified traffic signal to the nearest available connection point on the City's fiber optic communication network. All electronic equipment necessary for the traffic signal to communicate with the City's central traffic control system shall be required.

2 ½" PVC (Schedule 80) interconnect conduit shall be installed between the new or modified traffic signal and the nearest available connection point on the City's fiber optic communication network. No. 6 pull boxes shall be installed at +/- 500 feet intervals over the length of interconnect conduit. All fiber strands shall be terminated in termination panels at either a traffic controller cabinet or fiber optic hub cabinet.

All fiber optic splicing necessary to provide Ethernet communication shall be included as part of new or modified traffic signals. All end electronic equipment necessary to provide Ethernet communication via the City's fiber optic network shall be included as part of new or modified traffic signals.

86-2.09B Installation - Traffic monitoring camera(s) shall be installed as part of new or modified traffic signals. Traffic monitoring camera(s) shall be either one pan-tilt-zoom (PTZ) camera or four fixed cameras per intersection. Fiber optic video/data modems (field and central) shall be installed to transmit the video images and data control (PTZ) between the traffic signal and the City's central traffic control system.

Emergency Vehicle Pre-emption detectors shall be installed on luminaire arms for each approach to a new or modified traffic signal. All accompanying electronic equipment necessary to send the pre-emption signal to the traffic signal controller shall be supplied and installed.

Only Traffic Rated Type B Detector Handholes (DH) (**triangular lid**) shall be used for loop installations. Home run conduit (Between DH and PB shall be a minimum of two inches (2") Rigid Metal Conduit or Schedule 80 PVC. The Detector Handholes shall be located at the lane line and about five feet (5') away from the corner of the loop. All loop wires shall have three feet (3') of slack in the pull box. All loop wires shall be routed through the Detector Handhole.

A maximum of eight loops (total of 16 loop wires) can be routed through one DH.

All loops shall be installed with Detector Handholes, unless site-specific exemption is provided by the City Traffic Engineer. In general, one DH is installed for left-turn lanes, and one for a set of four loops. One DH is installed for a set of advance loops.

SECTION 90

CONCRETE

The following is added to the appropriate sections of Section 90 of the Cal Trans Standard Specifications:

On reconstruction and removal projects which remove sidewalk, the sidewalk shall be replaced with a score pattern, either matching the existing pattern or meeting current sidewalk installation standards for new sidewalks, which most enhances the visual appearance of the whole sidewalk. The overall trend toward a specific pattern (new or existing) shall be considered in the decision. The Engineer shall make the final determination of the score pattern to be used.

The use of fly ash to improve the workability of concrete may be allowed subject to approval by the City Engineer. The amount of fly ash to be used shall be per an approved mix design. Substitution of fly ash or other mineral admixture in place of the required portland cement shall not be allowed.

Section 90-1.01C(3) Cementitious Materials - Additionally, for the purpose of these Specifications and Standard Plans, wherein referenced, in addition to the latest edition of the Cal Trans Standard Specifications the following shall apply for all reference to Class A or Class 2 concrete:

1. Structural Concrete – must contain at least 590 pounds of cementitious material per cubic yard.
2. Minor Concrete – Minor concrete must contain at least 505 pounds of cementitious material per cubic yard.

SECTION 100

STREET OPENING AND PAVEMENT RESTORATION REGULATIONS

NOTE: THIS SECTION IS ADDED IN ITS ENTIRETY TO THE BLANK SECTION IN CALTRANS STANDARD SPECIFICATIONS.

100-1.01 Excavation - Any trench cuts within the street right of way to access **or install** a utility line or any related facility in excess of four (4) square feet or four (4) feet long, whichever is smaller, shall be considered an excavation and requires an excavation permit, which will be issued as part of an encroachment permit.

100-1.011 Excavator – The applicant/permittee to whom an encroachment permit is issued for the purposes of excavation may be referred to, for purposes within this section, as the excavator for the project.

100-1.012 Excavation Permit – The Encroachment Permit that is issued for any work within the street right of way that meets the definition of an excavation as described in Section 100-1.01, above, shall be referred to as an excavation permit for purposes within this section.

100-1.013 Trench Cut Fee - All excavations as defined above are subject to the trench cut fee. The fee shall be collected as part of the encroachment permit fee for the project.

100-1.02 Moratorium

1. Newly constructed or resurfaced streets shall be termed moratorium streets within this section. Permission to excavate in newly constructed or resurfaced streets will not be granted for three (3) years after the completion of street overlays. An overlay consists of a ½ inch or thicker layer of asphalt. For those streets with chip seal, slurry seal coatings, or micro paving with less than ½ inch of new pavement, the moratorium shall be for three (3) years. Utilities shall plan well enough in advance to determine alternate methods of making necessary repairs to avoid excavating in newly resurfaced streets. Exceptions to the above policy are as follows:
 - A. Emergencies which endangers life or property.
 - B. Interruption of essential utility service.
 - C. Work that is mandated by City, State or Federal legislation.

- D. Service for buildings where no other reasonable means of providing service exists.
 - E. Other situations deemed by the City Engineer to be in the best interest of the general public.
2. To excavate in a moratorium street a waiver must be obtained.
- A. To request a waiver, the applicant must submit a written request to the City Engineer or his designee. The request must include:
 - 1) The location of the excavation.
 - 2) Description of the work to be performed.
 - 3) Why the work was not performed before the street was paved.
 - 4) Why the work can not be deferred until after the moratorium
 - 5) Why the work can not be performed at another location.
 - 6) Why is it justified to excavate a moratorium street.
 - B. Any excavation in the moratorium streets will be repaired with full lane paving on the street as follows: (See Drawing No. R-96, and refer to section 100-1.06 paving).
 - 1) Overlaid or reconstructed streets: All lanes that are affected shall be ground down 1.5 inches and repaved with 1.5 inches of asphalt concrete.
 - 2) Slurry sealed, chip sealed, or microsurfaced streets: All lanes that are affected shall be resurfaced per Section 100-1.06 paving.
 - 3) A minimum of one (1) ft. on either side of trench shall be resurfaced if the excavation is a lateral cut. For longitudinal trenches the entire length plus one (1) ft. on either end shall be resurfaced.
 - 4) Exception – Full lane width restoration shall not be required if the work is not considered an excavation as defined in section 100 – 1.01.

100-1.03 Permits - Any and all construction work within the city right of way shall be done by obtaining an encroachment permit. Anyone doing excavation work within the City of Stockton street right-of-way shall obtain an encroachment permit for the purposes of excavation in addition to any other permits required. This also applies to all City departments.

1. The permit application may be obtained at the City's Permit Center. A faxed copy may be obtained by calling 937-8900.
2. Except in an emergency, excavation permits shall be taken out in advance of excavation work. An emergency is considered to exist only when life or property is endangered or when an essential utility service is or may be interrupted during weekends, holidays, or between 5 p.m. and 8 a.m. of normal working days
3. The excavator shall notify the Permit Center and apply for an excavation permit for "emergency work" within four (4) hours after the Permit Center opens.
4. As a condition of the permit to excavate, the applicant shall have been provided an inquiry identification number by a regional notification center (Underground Service Alert, USA) pursuant to Section 4216, Chapter 1153, Assembly Bill #1606 of the California State Law.
5. Prior to applying for an excavation permit, the excavator must register with the Public Works Department. The owner or the contractor performing the work may apply for the permit. The owner of the facility shall determine who applies for the excavation permit. However, if the applicant is not the owner of the facility to be excavated, the applicant must provide documentation that the applicant is authorized to act on behalf of the owner.
 - A. The following must be provided to become registered to get an excavation permit:
 - 1) A Cash Deposit equal to 3% of the project cost with a minimum of \$1000 and a maximum of \$25,000. Companies working under a franchise agreement with the City are not required to post the cash deposit until they have violated the City standards or permit requirements.
 - 2) A current Business License.
 - 3) Current evidence of Insurance.
 - 4) 24 hr. Phone Number for emergencies.
 - 5) The name, telephone number, and mailing address (fax number, pager, and e-mail address if available) of the person who will receive all official correspondence from the Department.
 - B. If an account is past due or not in good standing, a permit cannot be issued until the account is brought into good standing. The account is past due if the fines are not paid and are deducted from the deposit. To bring the account to good standing, all fees and fines must be paid.

6. If an excavator damages other facilities during their excavation work:
 - A. They do not need another excavation permit if no additional excavation is required to repair the damaged facility. In this case the original permittee shall maintain the site and restore the pavement.
 - B. They need an additional excavation permit if additional excavation and trenches are needed to repair the damaged facility.

7. All applications shall include a plan indicating the following:
 - A. Name of the street to be excavated and the nearest cross streets.
 - B. Distance from the face of the curb.
 - C. Distance from the intersection.
 - D. The size of the excavation (length and width).
 - E. The location of any above ground facilities to be installed, showing:
 - 1) Distance from curb and any street facilities/furniture.
 - 2) Purpose of the facility.
 - 3) Size of the facility.
 - 4) Location of doors and door swing.
 - F. The location of any underground facilities to be installed showing:
 - 1) Conduits vaults, maintenance holes, pipes, etc.
 - 2) Structural detail and additional information for installation of the structures such as vaults and maintenance holes.
 - 3) The construction method of the structure to be installed.
 - 4) Construction detail, locations, size, design criteria and the purpose of the facility.

- G. Cross section of a typical trench indicating:
 - 1) The approximate depth of the facility to be installed.
 - 2) Trench backfill depth, compaction and layer depths.
 - 3) Pavement section detail (type and depths)
 - 4) Plans, structural details, and trench cross section must be signed and stamped by a licensed Civil Engineer, when legally required.
 - H. The plan may show the approximate location of the excavation provided that on an "as-built" plan, the exact location of the excavation is shown. This shall be submitted prior to the permit being finalized and filed.
8. Pre-Construction meeting:
- A. A pre-construction meeting shall be held for all projects that are scheduled to take longer than 15 working days to complete.
 - B. The owner, contractor, any other agency that is involved and the Public Works Department shall attend this meeting.
 - C. There will be a fine for projects that are supposed to be completed within 15 days, and are not completed within the allowed time, if a pre-construction meeting was not held.
 - D. A traffic control plan shall be provided with the submittal of the application, and approved prior to the pre-construction meeting.
9. Permit duration shall be indicated on the permit:
- A. All permits shall include estimated start and completion dates. A permit is valid from the construction start date specified on the approved permit until the specified completion date.
 - B. Excavation permits are not valid if other required permits are not obtained or required notifications are not given.
 - C. No disruption of traffic is allowed after 3:00 PM and before 9:00 AM unless specifically approved for these hours.
 - D. Some permits may be valid on specific dates. They may be approved with special conditions specifying the dates:

- 1) When work shall not be done.
 - 2) When work must be completed.
 - 3) Before which work shall not start.
- E. Permits expire and become void unless otherwise amended:
- 1) Thirty days after the start date, if no work has begun.
 - 2) If the work is not diligently prosecuted and there are long delays after the work has started.
 - 3) When the excavation, including the trench restoration is not completed within the duration specified on the permit or on the date specified on the permit as the expiration date.
- F. The work is determined to be proceeding diligently if:
- 1) Once a project begins, work continues on a daily basis, except for weekends, holidays, inclement weather, labor disputes or any other emergency.
 - 2) Once a project begins, the work continues uninterrupted until such work no longer affects public convenience, health or safety. If the project is a multi agency project, a one-week time will be allowed for one agency to move out and another to move in to complete their work.
 - 3) The permittee ensures that all necessary materials and supplies are on hand and ready for use so as not to delay the excavation and the prompt restoration of the public right-of-way.
10. A valid permit may be extended by:
- A. Requesting an extension prior to the expiration date by:
- 1) Specifying the dates that need to be changed
 - 2) Explaining why an extension is needed.
11. All the excavation permit fees are due at the time the permit application is submitted.
- A. Checks should be made out to the City of Stockton. The check shall include:

- 1) The permit number
 - 2) The type of fees being paid (Administration fee, Inspection, extension, reapplication, etc.)
 - 3) All the fees, fines and penalties, not collected with the application will be billed by the city and shall be paid within 30 days. If they are not paid within 30 days, then these fees, fines and penalties will be deducted from the deposit. Utility companies working under a franchise agreement have 90 days to pay. If a contractor working for a utility company does not pay, the owner/utility company will be responsible to pay these fees, fines, and/or penalties.
 - 4) If a violation occurs and the fines are deducted from the deposit, no other application will be processed until the deposit has been put in place with the city and all conditions are met. For companies without a deposit, if the fines are not paid on time, no other permit will be issued.
12. If an application has been withdrawn or an approved permit is cancelled prior to the start of work:
- A. Inspection fee and trench cut restoration fees will be refunded.
 - B. To request a refund a written request must be submitted to the City Engineer.
 - C. The request shall include:
 - 1) The reason for cancellation or withdrawal
 - 2) The application number
13. By accepting an excavation permit, the permittee and the owner of the facility(ies) for which the permit has been issued agree:
- A. To follow all rules, regulations, special conditions, and code requirements.
 - B. To assure that their employees, contractors, and subcontractors comply with all rules, regulations, permit conditions and code requirements.
 - C. To defend and indemnify the City as required by the contract.
14. The excavation permit must be available during work periods at the excavation

site, until the project is completed and signed off by the City. Permit must be shown to the city employees on request.

15. The City and various utility companies must coordinate their Capital Improvement Programs. This information shall be shared through the monthly utility coordination meeting.

The information about any planned work in the street right-of-way shall be shared at the earliest possible time.

Various utility owners are encouraged to coordinate their excavation of the streets so that all work is done simultaneously and that the street is not excavated frequently within the same year.

16. The excavator shall provide public notifications when excavating in the public right-of-way.

- A. Provide 11"x17" posters with 1-inch minimum letters at beginning and end of the project and every 300 feet in between. Notes must contain:

- 1) The names, address, and telephone number of the owner and the permittee.
- 2) The start and completion dates of the project.

- B. Major projects lasting 15 working days or longer, the excavator shall:

- 1) Mail notices to or notify, after the permit has been issued but no more than 30 days before the anticipated start date of work:
 - a) Property owners, residents, or occupants of the affected blocks.
 - b) Schools and churches in the area and the San Joaquin Regional Transit District.
 - c) Provide the City with a copy of the notice.
- 2) At least 5 days but not more than 15 calendar days prior to starting construction, post and maintain 11" X 17" notices at beginning and end of the project and every 300 feet in between and deliver a copy of same notice to each dwelling unit on the block. The notices must contain:

- a) The name, address, and telephone number of the owner and the permittee.
 - b) A description of the project.
 - c) The start and completion dates of the project.
 - d) The name, address and 24-hour telephone number of a contact person.
17. A project sign is required for all major projects to be installed at either end of the project. The location for the sign to be worked out by the excavator and the City.
- A. The sign shall be a minimum of 24" x 36" with 2" minimum letters. It shall be hung on 4" x 4" wooden posts or a standard metal sign posts and include:
- 1) Project name, description, and Permit number.
 - 2) Permittee's name, address and 24 hour phone.
 - 3) Owner's name.
 - 4) Start date and completion date of the project.

100-1.04 Excavation Material

1. Pavement shall be cut to a straight, neat, vertical line prior to excavation.
2. All excavated material not suitable for backfilling shall be removed from the job site within twenty-four (24) hours. Excavated material suitable for backfilling may be stored on the job site for a maximum of five (5) working days, provided it does not occupy any more street space than the permit allows and provided this material is completely prevented from blowing, washing, or being thrown about at all times. Material may be stored on the adjacent private property if a written approval from the property owner has been obtained.
3. No trench shall be opened on any street that is not backfilled or plated at the end of the same day. Fines will be charged if any trench is left open.

100-1.05 Backfill

1. Trenches shall be backfilled with sand or suitable site excavated material. Compaction of backfill shall be in accordance with Drawing No. R-36 or R-37.
2. When undermining occurs, remove existing pavement as required to compact the backfill and restore the pavement.

3. Each encroachment permit will specify the number of compaction tests required. Each compaction test shall be certified by an independent laboratory and submitted to the City Encroachment Permit Inspector. If the results of compaction test show generally poor or marginal compliance with City compaction requirements, the number of compaction tests may be increased by the Engineer to help insure that proper compaction is being achieved.
4. A CONTROL NUMBER SHALL BE OBTAINED by calling (209) 937-8900 one (1) day in advance of the start of work on any encroachment permit. A copy of the permit and control number shall be on site during the construction.

100-1.06 Paving

1. Trenches shall be paved as shown on Drawing No. R-36 or R-37. After the trench has been backfilled and immediately prior to placing asphalt concrete, the existing asphalt concrete shall be saw cut, or milled according to City Standards, to a vertical face. New AC paving shall be butt joined to the existing asphalt concrete vertical face. No feathering of new paving to existing paving is allowed. The vertical faces shall be tack coated. In moratorium streets, placement of the final one and one-half (1 ½) inches of AC wearing surface shall be done by a paving machine or spreader box. Asphalt concrete shall be delivered and compacted in accordance with the Standard Specifications and Plans

To allow for proper placement of the new pavement section, damaged pavement outside of the original trench cut lines shall be removed by cutting in lines perpendicular to or parallel to the original trench lines. No diagonal cuts are to be made. Undamaged pavement of three (3) feet or less between two damaged areas shall also be removed. (See Drawing No. R-38)

2. Pavement will be restored using the "T Section" shown on Drawing No. R-36.
3. For trenches in moratorium streets parallel to the centerline of the street, the entire lane shall be key-cut one and one-half (1 ½) inches, deep and repaved with asphalt concrete. For trenches in moratorium streets with chip seal or slurry seal coatings, the entire lane shall be resurfaced with these coatings.
4. Trenches in concrete streets shall be paved with concrete pavement. The thickness of the new pavement shall be equal to the thickness of the existing pavement with the minimum thickness to be six (6) inches in the roadway.
5. Trenches in arterial streets, with asphalt wearing surfaces, shall be paved with not less than eleven and one-half (11 ½) inches asphalt concrete topped with one and one-half (1 ½) inches of asphalt concrete wearing surface or match the existing pavement if it is more.

6. Trenches in local and collector streets shall be paved with not less than six and one-half (6 ½) inches asphalt concrete topped with one and one-half (1 ½) inches of asphalt concrete wearing surface or match the existing pavement if it is more.
7. Pavement shall be restored within fourteen (14) working days from the time the entire trench is backfilled. For minor excavations such as service installations, the pavement shall be restored within thirty (30) working days from the time the entire trench is backfilled. The asphalt concrete wearing surface shall be placed within five (5) working days after placement of asphalt concrete base, weather permitting.
8. Asphalt pavement shall be compacted to obtain a minimum of ninety-five percent (95%) of relative compaction. The asphalt concrete wearing surface shall have no irregularity greater than five-sixteenths of an inch (5/16") in ten feet (10') in any direction.
9. On collector and arterial streets steel plates shall be used when ordered by the permit inspector to facilitate traffic flow and to protect the excavation until finished pavement is restored. Steel plates used to bridge a street opening shall be ramped to the elevation of the adjacent pavement and secured against movement in any direction. Temporary ramps shall be constructed of asphalt and shall have a gradual slope. On all other streets, temporary asphalt cutback is permitted.
10. After trench paving, utility trenches shall be color-coded with the 4" stenciled initials of the company doing the trench. These initials will be prescribed by the City of Stockton as stated below and the color shall be as prescribed by the Underground Service Alert (USA). The initials shall be stenciled on the existing asphalt adjacent to the new trench. When paving is complete, the initials shall be painted, using Krylon (or an approved equal), at the beginning and end of each trench and at each intersection, if applicable. The use of colored identifying disks in place of painting is allowed.

<u>Company</u>	<u>Color</u>	<u>Initials</u>
PG&E - Electric	Red	PG&E
PG&E - Gas	Yellow	PG&E
Pacific Bell	Orange	PB
Cable TV	Orange	TV
Cal Water	Blue	CW
City of Stockton - Water	Blue	COS
City of Stockton - Electric	Red	COS
City of Stockton - Sewer	Green	COS

Any agency not listed above must contact Public Works to be assigned initials before performing any excavation or trenching activities in the City of Stockton.

USA Codes are:

Electric	Red
Gas-Oil	Yellow
Communication - CATV	Orange
Water	Blue
Sewer	Green
Temporary Survey Markings	Pink
Proposed Excavation	White

All painted USA markings shall be removed by the permittee after the work has been completed.

11. Wheelchair ramps shown on Drawing No. R-64 or R-65 shall be constructed where any portion of the curb, at a legal pedestrian crosswalk or any portion of the sidewalk in immediate contact with such curb is removed, except where there is an existing wheelchair ramp in the cross-walk or where there is a subsidewalk basement behind the crosswalk.
12. All damaged pavement markings and striping shall be replaced and restored by the excavator.

100-1.07 Defects

1. Depressed trench pavement shall be repaired as follows:
 - A. Wearing surface defects - remove and restore wearing surface.
 - B. Major defects - excavate, remove and restore surface and base.
 - C. The Permit Inspector will determine the severity of the defect.
2. Work not complying with the above requirements shall be rejected, removed, and redone to the satisfaction of the City Engineer.
3. The owner of the facility/utility company is responsible for the roadway defects appearing after the permittee restores the trench (area adjacent to the trench). The owner is responsible for maintenance, repair or reconstruction of the excavation site's affected area until the city reconstructs, repaves, or resurfaces the street.
4. If there is a trench related failure after the work by the city, the owner of the facility/utility company is responsible for its repair.

5. The owner of the facility/utility company is responsible to maintain the trenches and repair any defects that may appear. The City Engineer will determine who is responsible for a defect when one is detected and will notify the responsible party and direct them to repair the facility.

When the City determines that an excavation or a defect is hazardous or constitutes a public nuisance or other imminent threat to public health, safety, or welfare, the City Engineer may order the responsible party to remedy the condition immediately.

- A. If the responsible party refuses or fails to make the needed repairs immediately, the City will make the repairs and:
 - 1) The responsible party will be charged all the actual costs including administration, construction, consultant fees, equipment, inspection, notification, remediation made necessary by the action of the permittee, repair, and restoration.
 - 2) The repair or restoration by the City does not relieve the responsible party from liability for future pavement failures.
 - 3) If the responsible party fails or refuses to pay the restoration cost, the cost of the repair or restoration will be deducted from the responsible party's deposit.

6. If the owner/person responsible for the roadway defect does not make the required repairs, the City will make the repairs and the responsible party will be charged for all the actual cost of repair, including but not limited to administration, construction, consultant fees, equipment, inspection, notification, remediation made necessary by the action of the permittee, and restoration. Repairs or restoration by the City does not relieve the responsible party(s) from liability for future pavement failures. If the responsible party fails or refuses to pay the cost of the repair, the cost will be deducted from the responsible party's deposit.

100-1.08 Violations

100-1.08.1 Excavation Violations - Any violation of the above regulations may result in the revocation of the encroachment permit and/or be subject to a citation process and/or fine. The fines for various violations are as follows:

VIOLATIONS	PENALTY (Not to exceed amount shown)
1. Working without a Permit(s), control number not called in.	\$1,000 and Stop Work

VIOLATIONS	PENALTY (Not to exceed amount shown)
2. Excavation without providing Public Notice	\$1,000 and Stop Work
3. Beginning a "Major Project" without having a Pre-Construction Meeting	\$500 per occurrence, per day
4. Violation of Permit Conditions	\$500 per occurrence, per day
5. Improper Site Protection: Improper plating, path of travel, barricading, etc.	\$500 per occurrence, per day
6. No permit on site	\$250 per occurrence, per day
7. Improper Trimming of Trench	\$250 per Trench
8. Any trench left open after the allowed work hours that is not back filled and covered.	\$250 per day
9. Improper Public Notice: No Project Sign, wrong information on sign/notice	\$100 per block, per day
10. Non-compliance with Trench Restoration Requirements	\$250 per trench, per day
11. Improper Housekeeping: Failure to remove spoil, dirty site, no sweeping, etc.	\$100 per block, per day
12. Other Excavation Code Violations	\$100 per occurrence, per day
13. Call for Inspection but not ready to be inspected	\$250 per occurrence, per day

The above fines, when assessed, shall be deducted from the cash deposit required by 100-1.03 5A of this section or will be paid by the applicant if there is not a cash deposit.

To appeal any citations, fines, or other requirements, the Stockton Municipal Code procedure for appeal shall be followed. If there are any fines they must be paid and will be reimbursed if the

appeal is valid.

100-1.08.2 Other Violations - Any violation of the above regulations and/or Chapter 9 of the Stockton Municipal Code may result in the revocation of the encroachment permit and/or be subject to an administrative citation.

Violations include but are not limited to working without a permit, failure to obtain a control number before starting work, no permit on the work site, failure to comply with the permit's conditions, provisions and requirements, improper work area housekeeping, and work left open after allowed work hours that is not filled/covered.

DIVISION I GENERAL PROVISIONS

SECTION 1 - SPECIFICATIONS AND PLANS

1-1.01 Specifications

The work described herein shall be done in accordance with the current City of Stockton, Department of Public Works Standard Specifications and Plans, and the latest Editions of the State of California, Department of Transportation Standard Specifications and Standard Plans, California MUTCD, as referenced therein, and in accordance with the following Special Provisions. To the extent the California Department of Transportation Standard Specifications implement the STATE CONTRACT ACT, (or certain provisions of the Public Contracts code which are inapplicable to charter cities) they shall not be applicable.

In case of conflict or discrepancy between any of the Contract Documents, the order of documents listed below shall be the order of precedence, with the first item listed having the highest precedence.

1. Contract Change Order (changes last in time are first in precedence)
2. Addenda to Contract Agreement
3. Contract Agreement
4. Permits
5. Notice Inviting Bids and Instructions to Bidders
6. Addendums and Letters of Clarification
7. Special Provisions
8. Project Drawings
9. City of Stockton Standard Specifications
10. City of Stockton Standard Drawings
11. Caltrans Standard Specifications
12. Caltrans Standard Plans

Should it appear that the work to be done or any of the matters relative thereto are not sufficiently detailed or explained in these specifications, the special provisions, or the plans, the contractor shall apply to the Engineer in writing for such further explanations as may be necessary and shall conform to them as part of the contract. In the event of any doubt or question arising respecting the true meaning of these specifications, the special provisions or the plans, reference shall be made to the Engineer, whose decision thereon shall be final.

1-1.02 Plans

Attention is directed to the provisions in Section 1-1.03 "Definitions", of the Standard Specifications and Section 1-1.07 "Definitions", of the Caltrans Specifications.

1-1.03 Terms and Definitions

Wherever in the Standard Specifications, Special Provisions, Notice to Contractors, Proposal, Contract, or other contract documents the following terms are used, the intent and meaning shall be interpreted as follows:

SP3

City or Owner -	City of Stockton
Director -	Director of Public Works, City of Stockton
Standard Specifications -	Current City of Stockton, Standard Plans and Specifications, inclusive of all current revisions, and amendments, unless otherwise stated.
Caltrans Specifications -	State of California, Department of Transportation, Current Standard Plans and Specifications, inclusive of all current revisions, and amendments, unless otherwise stated.
Laboratory -	City of Stockton Department of Public Works Laboratory or consultant's laboratory
Department -	Department of Public Works, City of Stockton
Engineer -	City Engineer, City of Stockton, acting either directly or through properly authorized Engineer agents and consultants
California MUTCD	Latest edition of California Manual on Uniform Traffic Control Devices (MUTCD), and any amendments and revisions thereto.
Working Day	Defined as any eight-hour day, except as follows: Saturday, Sunday, and City recognized holidays.

SECTION 2 – Blank

SECTION 3 – Blank

SECTION 4 – SCOPE OF WORK

Attention is directed to the provisions in Section 4, “Scope of Work” of the Caltrans Specifications, Standard Specification, and these Special Provisions.

The Contractor shall follow the sequence of construction and progress of work as specified in Section 10-1.01, "Order of Work", of these Special Provisions.

The Contractor shall diligently prosecute all work items to completion.

Full compensation for any additional costs occasioned by compliance with the provisions in this section shall be considered as included in the prices paid for the various contract items of work, and no additional work compensation will be allowed therefore.

Bidders will be required to carefully examine these special provisions and attachments to judge for themselves as to the nature of the work to be done and the general conditions relative thereto and the submission of a proposal hereunder shall be considered prima-facie evidence that the bidder has made the necessary investigation and is satisfied with respect to the conditions to be encountered, the character, quantity and quality of the work performed. For work to be completed, contractors are advised to visit and review the job site prior to the submission of their bid.

Bidders must be thoroughly competent and capable of satisfactorily performing the work covered by the proposal, and when requested shall furnish such statements relative to previous experience on similar work, the plan or procedure proposed, and the organization and the equipment available for the contemplated work, and any other as may be deemed necessary by the City Engineer in determining such competence and capability.

It shall be understood that the Contractor shall be required to perform and complete the proposed work in a thorough and diligent manner, and to furnish and provide in connection therewith all necessary labor, tools, implements, equipment, materials and supplies. The Contractor is responsible to take all necessary precautions and use best practices in the industry to perform all work require completing the project.

4-1.01 Differing Site Conditions

Attention is directed to the provisions in Section 4-1.06, "Differing Site Conditions," of the Caltrans Specifications and the Standard Specifications. Contractor shall notify the Engineer if he/she finds physical conditions differing materially from contract documents.

SECTION 5 – CONTROL OF WORK

Attention is directed to the Instruction to Bidders, provisions in Section 5 "Control Work" of the Caltrans Specifications, Standard Specification and these special provisions.

5-1.01 Contract Components

Attention is directed to the provisions in Section 5-1.02,"Contract Components" of the Standard Specifications. If a discrepancy found or confusion arises, submit a Request for Information (RFI).

5-1.02 Subcontracting

Attention is directed to the provisions in Section 5-1.13A, "Subcontracting," of the Standard Specifications, and Caltrans Specifications.

5-1.04 Coordination With Other Entities

5-1.04A Permits

The Contractor shall procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work. The Environmental Quality Act (Public Resources Code, Sections 21000 to 21176, inclusive) may be applicable to permits, licenses and other authorizations which the Contractor must

obtain from local agencies in connection with performing the work of the contract. The Contractor shall comply with the provisions of those statutes in obtaining the permits, licenses and other authorizations and they shall be obtained in sufficient time to prevent delays to the work. In the event that the City has obtained permits, licenses or other authorizations, applicable to the work, in conformance with the requirements in the Environmental Quality Act, the Contractor shall comply with the provisions of those permits, licenses and other authorizations. The following is a non-inclusive list of the required permits and/or licenses:

- Contractor's License. At a minimum the Contractor shall possess at the time of bid and maintain throughout the duration of the contract, a valid California Class A or C-10 Contractor License.
- Business License. Contractor shall possess prior to the execution of the contract and maintain throughout the duration of the contract, a valid City of Stockton business license.
- City of Stockton and San Joaquin County Encroachment Permit
- Stockton Municipal Utilities Department Right-of-Entry Permit
- State's Water Resources Control Board Stormwater Construction General Permit
 - Storm Water Pollution Prevention Plan
 - Notice of Intent (NOI)
 - Notice of Termination (NOT)
 - County Encroachment Permit

5-1.05 Submittals

The following is a list of anticipated submittals for the project. The list is provided to aid the Contractor in determining the scope of work, but is not intended to be all inclusive and additional submittals may be required:

- 1) Baseline Progress Schedule (Critical Path Method)
- 2) Storm water Pollution Prevention Plan
- 3) Approved Notice of Intent from State Water Resources Control Board
- 4) Pre-construction survey
- 5) Temporary Traffic Control (includes Pedestrian Detour Plan)
- 6) Contractor Safety Plan
- 7) Portland Cement Concrete Mix Design
- 8) Staging Agreement with private property owners (if applicable)
- 9) City of Stockton and San Joaquin County Encroachment Permit
- 10) City's Construction and Demolition Debris Recycling Report
- 11) List of submittals
- 12) Product submittals
- 13) Lead Compliance Plan—if applicable
- 14) A Schedule of Values

The Contractor shall transmit each submittal to the Engineer for review and approval with

the submittal form approved by the Engineer. Submittals shall be sequentially numbered on the submittal form. Resubmittals shall be identified with the original number and a sequential resubmittal suffix letter. The original submittal shall be numbered X. The first resubmittal shall be numbered X-a and so on. Identify on the form the date of the submittal, Contractor, Subcontractor or supplier; pertinent drawing and detail number, and/or special provision number, as appropriate. The Contractor shall sign the form certifying that review, approval, verification of Products required, field dimensions, adjacent construction work, and coordination of information is in accordance with the requirements of the work and contract documents. Any incomplete submittals will be returned for resubmittal.

Schedule submittals to expedite the Project, and deliver to Engineer at the Engineer's office, see Section 10-1.01, "Order of Work," of these Special Provisions.

For each submittal for review, allow 15 calendar days excluding delivery time to and from the Contractor.

Identify variations from Contract Documents and Product or system limitations that may be detrimental to successful performance of the completed Work.

When revised for resubmission, identify all changes made since previous submission.

Distribute copies of reviewed submittals as appropriate. Instruct parties to promptly report any inability to comply with requirements.

Submittals not requested either in the Contract Documents or in writing from the Engineer will not be recognized or processed.

When required by the Engineer, the Contractor shall furnish to the Engineer for review, 1 set, plus one reproducible copy, of each shop drawing submittal. The term "Shop Drawings" as used herein shall be understood to include detail design calculations, shop drawings, fabrication and installation drawings, erection drawings, list, graphs, catalog sheets, data sheets, and similar items. Whenever the Contractor is required to submit design calculations as part of a submittal, such calculations shall bear the signature and seal of an engineer registered in the appropriate branch and in the state of California, unless otherwise directed.

Normally, a separate submittal form shall be used for each specific item or class of material or equipment for which a submittal is required. Transmittal of a submittal of various items using a single form will be permitted only when the items taken together constitute a manufacturer's "package" or are so functionally related that expediency indicates review of the group or package as a whole. A multi-page submittal shall be collated into sets, and each set shall be stapled or bound, as appropriate, prior to transmittal to the Engineer.

Except as may otherwise be indicated herein, the Engineer will return prints of each submittal to the Contractor with their comments noted on the submittal. The Contractor shall make complete and acceptable submittals to the Engineer by the second submission

of a submittal item.

If a submittal is returned to the Contractor marked "NO EXCEPTIONS TAKEN", formal revision and resubmission of said submittal will not be required.

If a submittal is returned to the Contractor marked "MAKE CORRECTIONS NOTED", formal revision and resubmission of said submittal will not be required.

5-1.06 Job Site Appearance

Attention is directed to Section 4-1.13 "Cleanup" of the Caltrans Specifications, Section 5-1.31 "Job Site Appearance" of the Standard Specifications, and these Special Provisions.

The Contractor shall maintain a neat appearance to the work.

Broken concrete and debris developed during clearing and grubbing shall be disposed of concurrently with its removal. Contractor shall pay to the City of Stockton the sum of Two Hundred Fifty Dollars (\$250) for every calendar day where debris has remained on the job site overnight.

Full compensation for conforming to the provisions in this section shall be considered as included in the prices paid for the various contract items of work involved, and no additional compensation will be allowed therefore.

5-1.07 Staging Area

Attention is directed to Section 5-1.36E, "Use of Private property," of the Standard Specification and these Special Provisions. The street right-of-way shall be used only for activities that are necessary to perform the required work. The Contractor shall not occupy the right-of-way or allow others to occupy the right-of-way for material storage or other purposes that are not necessary to perform the required work.

5-1.08 Construction Staking

Section 5-1.26, "Construction Surveys", of the Standard Specifications is deleted, and replaced with the following:

1. The Contractor shall be responsible for all construction survey stakes necessary to construct the project in accordance to the lines, grades, sections, stage construction/traffic handling, and traffic signalization, pavement delineation plan described in the plans and specifications.
2. Contractor shall be responsible referencing all existing monumentation within the limits of the project prior to removal of any existing monuments. Monument referencing shall be reviewed and approved by the engineer prior to commencing of the work.
3. The Contractor shall employ a Land Surveyor registered in the State of California or an appropriately registered Civil Engineer to perform such survey

work. All stakes and marks set by the Contractor's Land Surveyor or Civil Engineer shall be carefully preserved by the Contractor. In case such stakes and marks are destroyed or damaged, they will be promptly replaced, at the direction of the Engineer at no additional cost to the City. Copies of all field notes and cut sheets shall be provided to the City at no additional cost to the City.

Full compensation for conforming to the provisions in this section shall be considered as included in prices paid for the various contract items of work involved, and no additional compensation will be allowed therefore.

5-1.9 Increased or Decreased Quantities

The City reserves the right to make such alterations, deviations, additions to, or omissions from the plans and specifications, including the right to increase or decrease the quantity of any item or portion of the work or to omit any item or portion of the work, as may be deemed by the Engineer to be necessary or advisable and to require such extra work as may be determined by the Engineer to be required for the proper completion or construction of the whole work contemplated, without adjustment in the unit price as bid.

5-1.10 Blank

5-1.11 Rights in Land

All work, equipment parking, or any other activity associated with the project shall be confined to the project limits within the street rights-of-way. The Contractor's use of any other property exclusively in connection with this project shall be by a written agreement between the property owner and the Contractor. A certified copy of any such agreement shall be furnished to the Engineer prior to the use of such property by the Contractor.

5-1.12 As-Built/Record Drawings

The Contractor shall maintain a complete set of drawings on-site for the purpose of keeping up to date all field modifications. This plan set shall be available for review by the project Inspector and the Engineer. These plans shall be provided to the Inspector after the completion of construction at the Post-Construction Meeting and prior to the final payment. All revisions, modifications, and/or changes shall be marked clearly. Notes and dimensions shall be in red and be clear and legible. These plans will be used by the Engineer to mark up the original plan sheets with the revisions made during construction.

5-1.13 Property and Facility Preservation

Attention is directed to Section 5-1.36, "Property and Facility Preservation," of Caltrans Specifications and these Special Provisions. Due care shall be exercised to avoid injury to existing highway improvements or facilities, utility facilities, adjacent property, and roadside trees shrubs and other plants that are not to be removed. Roadside trees, shrubs and other plants that are not to be removed, and pole lines, fences, signs, markers and monuments, buildings and structures, conduits, pipelines under or above ground, sewer and water lines, all highway facilities and any other improvements or facilities within or adjacent to the highway shall be protected from injury or damage, and if ordered by the

Engineer, the Contractor shall provide and install suitable safeguards, approved by the Engineer, to protect the objects from injury or damage. If the objects are injured or damaged by reason of the Contractor's operations, the objects shall be replaced or restored at the Contractor's expense.

The facilities shall be replaced or restored to a condition as good as when the Contractor entered upon the work, or as good as required by the specifications accompanying the contract, if any of the objects are a part of the work being performed under the contract. The Engineer may make or cause to be made those temporary repairs that are necessary to restore to service any damaged highway facility. The cost of the repairs shall be borne by the Contractor and may be deducted from any moneys due or to become due to the Contractor under the contract. The fact that any underground facility is not shown upon the plans shall not relieve the Contractor of the responsibility under this Section of these Special Provisions. It shall be the Contractor's responsibility, pursuant thereto, to ascertain the location of those underground improvements or facilities which may be subject to damage by reason of the Contractor's operations.

Full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in protecting or repairing property as specified in this Section shall be considered as included in the prices paid for the various contract items of work and no additional compensation will be allowed therefor.

5-1.14 Pre-construction Survey

Attention is directed to Section 5-1.36D, "Survey Monuments" of the Caltrans Specifications and these Special Provisions. The Contractor shall perform a pre-construction survey of all existing structures, pavements, and other aboveground facilities within the project limits prior to beginning any work, noting their condition by means of photographs and video tapes supplemented by written documentation, where applicable.

Color photographs shall be taken with a digital camera at locations that are appropriate to show pre-existing conditions. Each photograph shall show the date and time the photograph was taken and clearly labeled showing the location, viewing direction, and any special features noted. Digital files of each photograph and a copy of videotapes shall be submitted to the Engineer.

Preserving and Perpetuating Survey Monuments

The contractor shall exercise due caution and shall carefully preserve bench marks, control points, reference points and all survey monuments, and shall bear all expenses for replacement and/or error caused by his/her unnecessary loss or disturbance. The contractor shall consult with a licensed land surveyor or civil engineer licensed to practice land surveying in California prior to beginning construction to ensure that any preconstruction corner records, as required by the State of California Professional Land Surveyor' ACT have been filed with the County Surveyor, pursuant to Section 8771(a-f) of the California Business and Profession Code.

Action by:	Action:
<i>Contractor's Land Surveyor</i>	<ol style="list-style-type: none"> 1. Identifies existing survey monuments. 2. Lists all existing survey monuments. 3. Ties out / performs construction staking of survey monuments. 4. Indicates survey monuments on construction plans. 5. Files all pre-construction Corner Records or Records of Survey with San Joaquin County. The Corner Records or Record of Survey will show monuments within the area of construction reasonably subject to removal or disturbance not shown on a recent record document (recent record document is a filed survey map or corner record document completed with acceptable modern survey methods that includes survey ties from monuments within the construction area to monuments outside of the construction area). 6. Submits copies of pre-construction Corner Records or Records of Survey filed with San Joaquin County to City Engineer/Project Manager
<i>Contractor</i>	<ol style="list-style-type: none"> 7. Preserves/perpetuates all survey monumentation during construction, including, but not limited to, those listed. 8. Restores survey monuments disturbed by construction.
<i>Contractor's Land Surveyor,</i>	<ol style="list-style-type: none"> 9. Files all post-construction Corner Records and Records of Survey with San Joaquin County for all monuments disturbed during construction 10. Submits copies of Corner Records or Records of Survey filed with San Joaquin County to City Engineer/Project Manager.

Monuments set shall be sufficient in number and durability and efficiently placed so as not to be readily disturbed, to assure, together with monuments already existing, the perpetuation or facile reestablishment of any point or line of the survey.

When monuments exist that control the location of subdivisions, tracts, boundaries, roads, streets, or highways, or provide horizontal or vertical survey control, the monuments shall be located and referenced by or under the direction of a licensed land surveyor or registered civil engineer prior to the time when any streets, highways, other rights-of-way, or easements are improved, constructed, reconstructed, maintained, resurfaced, or relocated, and a corner record or record of survey of the references shall be filed with the county surveyor. They shall be reset in the surface of the new construction, a suitable monument box placed thereon, or permanent witness monuments set to perpetuate their location if any monument could be destroyed, damaged, covered, or otherwise

obliterated, and a corner record or record of survey filed with the county surveyor prior to the recording of a certificate of completion for the project. Sufficient controlling monuments shall be retained or replaced in their original positions to enable property, right-of-way and easement lines, property corners, and subdivision and tract boundaries to be reestablished without devious surveys necessarily originating on monuments differing from those that currently control the area. It shall be the responsibility of the governmental agency or others performing construction work to provide for the monumentation required by this section. It shall be the duty of every land surveyor or civil engineer to cooperate with the governmental agency in matters of maps, field notes, and other pertinent records. Monuments set to mark the limiting lines of highways, roads, streets or right-of-way or easement lines shall not be deemed adequate for this purpose unless specifically noted on the corner record or record of survey of the improvement works with direct ties in bearing or azimuth and distance between these and other monuments of record.

The decision to file either the required corner record or a record of survey pursuant to subdivision shall be at the election of the licensed land surveyor or registered civil engineer submitting the document.

5-1.15 Cooperation

Should construction be under way by other forces or by other contractors within or adjacent to the limits of the work specified or should work of any other nature be under way by other forces within or adjacent to those limits, the Contractor shall cooperate with all the other contractors or other forces to the end that any delay or hindrance to their work will be avoided. The right is reserved to perform other or additional work at or near the site (including material sources) at any time, by the use of other forces. When 2 or more contractors are employed on related or adjacent work, or obtain materials from the same material source, as provided in Section 6, "Control of Materials" of the Caltrans Specifications, each shall conduct their operations in such a manner as not to cause any unnecessary delay or hindrance to the other. Each contractor shall be responsible to the other for all damage to work, to persons or property caused to the other by their operations, and for loss caused the other due to unnecessary delays or failure to finish the work within the time specified for completion.

The Contractor shall protect from damage any utility facilities that are to remain in place, be installed, relocated, adjusted, or otherwise rearranged.

The Contractor should note that the following utility companies and other agencies maintain facilities within the project area and may have forces in the project area or adjacent thereto:

- PG&E
- AT&T and other phone companies
- City of Stockton Municipal Utilities Department
- Comcast Cable Company
- California Water Service Company

The Contractor shall verify the horizontal and vertical locations of all existing utilities prior to start of construction. The Contractor shall be responsible for the repair and replacement of these or any other facilities damaged during construction. A minimum of forty-eight (48) hours or two (2) working days prior to beginning construction, the Contractor shall notify Underground Services Alert (USA), telephone (800) 227-2600, to have existing facilities marked in the field.

Installation and/or relocation of the aforementioned utilities and other agencies' facilities will require coordination with the Contractor's operations. The Contractor shall make necessary arrangements with the utility company and other agencies through the Engineer, and shall submit a schedule of work, verified by a representative of the utility company or other agency, to the Engineer. The Contractor shall notify the Engineer in writing one (1) month and again one (1) week prior to preparing the site for the utility relocation work or work to be done by other agencies.

The Contractor shall take care to avoid working in any area of the project, which may conflict with the work underway by the utility companies. The Contractor's construction schedule shall be prepared to avoid utility work.

The Contractor shall cooperate completely with all utility companies having facilities within the project area.

Attention is directed to the possible existence of underground facilities not known to the City or in a location different from that which is shown on the plans or in these Special Provisions. The Contractor shall take steps to ascertain the exact location of all underground facilities prior to doing work that may damage such facilities or interfere with their service.

Payment for complying with this Special Provision shall be included in the various items of work, and no additional compensation will be allowed therefore.

SECTION 6 – CONTROL OF MATERIALS

Attention is directed to the provisions in Section 6, "Control of Materials," of the Standard Specifications, and these Special Provisions.

6-1.01 Testing

Testing of materials and work shall conform to the provisions in Section 6, "Control of Materials" of the Caltrans Specifications and these special provisions. Whenever the provisions of Section 6 of the Caltrans Standard Specifications refer to tests or testing, it shall mean tests to assure the quality and to determine the acceptability of the materials and work.

6-1.02 Pre-qualified and Tested Signing and Delineation Material

The California Department of Transportation maintains the list of Prequalified and Tested signing and delineation materials and products. Approval of pre-qualified and tested products and materials shall not preclude the Engineer from sampling and testing any of

the signing and delineation materials or products at any time.

None of the listed signing and delineation materials and products shall be used in the work unless such material or product is listed on the California Department of Transportation's List of Approved Traffic Products. A Certificate of Compliance shall be furnished as specified in Section 6, "Control of Materials", of the Caltrans Specifications for signing and delineation materials and products. Said certificate shall also certify that the signing and delineation material or product conforms to the pre-qualified testing and approval of the California Department of Transportation, Division of Traffic Operations, and was manufactured in accordance with the approved quality control program.

For those categories of materials included on the list of Prequalified and Tested Signing and Delineation Materials, only those products shown within the listing may be used in the work. Other categories of products, not included on the list of Prequalified and Tested Signing and Delineation Materials, may be used in the work provided they conform to the requirements of the Standard Specifications. The list of approved pre-qualified and tested signing and delineation materials and products can be found at the California Department of Transportation Web Site:

<https://dot.ca.gov/-/media/dot-media/programs/engineering/documents/mets/signing-and-delineation-materials-a11y.pdf>

SECTION 7 – LEGAL RELATIONS AND RESPONSIBILITY TO THE PUBLIC

7-1.01 General

Attention is directed to Section 7 “Legal Relations and Responsibility to the Public” of the Caltrans Specifications, Standard Specifications, and these Special Provisions.

7-1.02 Maintaining Public Convenience and Safety

Attention is directed to Sections 7-1.03, "Public Convenience", 7-1.04, "Public Safety", and Section 12, "Temporary Traffic Control", of the Caltrans Specifications. Attention is also directed to Part 6 of the California MUTCD and Sections 7-1.03, "Public Convenience", 7-1.04, "Public Safety", of Standard Specifications, and Section 12-1.01, “Maintaining Traffic” of these Special Provisions. Nothing in these Special Provisions shall be construed as relieving the Contractor from his responsibility as provided in said sections and Part 6 of the California MUTCD.

7-1.03 Trench Safety

Attention is directed to Sections 7-1.02K(6)(b), "Excavation Safety” of the Standard Specifications and these Special Provisions.

If required, the Contractor shall furnish all labor, equipment, and materials required to design, construct, and remove all shoring, lagging, cribbing, piling, and/or other types of support for the wall of any open excavation required for the construction of this project.

In making excavations for the project, the Contractor shall be fully responsible for providing and installing adequate sheeting, shoring, and bracing, as may be necessary as a precaution against slides or cave-ins and to fully protect all existing improvements of any kind from damage.

The Contractor shall be solely responsible for any damages which may result from his failure to provide adequate shoring to support the excavations under any or all of the conditions of loading which may exist or which may arise during the construction project. Nothing herein shall be deemed to allow the use of shoring, sloping, or protective system less effective than that required by the Construction Safety Orders of the Division of Industrial Safety.

7-1.04 Public Convenience

Contractor's attention is directed to the Section 12-1.01 "Maintaining Traffic" of these Special Provisions, Section 7-1.03 "Public Convenience" of the Standard Specifications, and these Special Provisions.

The Contractor shall notify San Joaquin Regional Transit District (SJRTD) a minimum of five (5) working days prior to beginning work. The Contractor shall coordinate with SJRTD if any bus stops and bus routes are affected.

The Contractor shall inform the City Fire Department, City Police Department, Public Works Traffic Engineering, Municipal Utilities Department (MUD), and all affected utilities no later than three (3) working days before work is to begin.

The Contractor shall provide the City with the name and telephone number (business, home and mobile) of three (3) representatives available at all times during the duration of the contract. Said names and telephone numbers shall be provided to the City of Stockton Public Works, Fire, and Police Departments.

The Contractor shall circulate printed form letters, approved by the Engineer, explaining the project to be done and the length of time inconvenience will be caused by the project and deliver same to the residents and businesses to be affected at least three (3) working days before work is to commence on their street. In addition, the Contractor shall provide temporary "No Parking" signs posted three (3) working days in advance of the work. Such signs shall be placed no further than fifty (50) feet apart. The additional "No Parking" signs shall be removed upon completion of the work and the opening of the street to traffic. It shall be the Contractor's responsibility to remove any vehicles obstructing his operations.

7-1.05 Public Safety

Contractor's attention is directed to the Section 12-1.01 "Maintaining Traffic" of these Special Provisions, Section 7-1.04 "Public Safety" of the Standard Specifications, and these Special Provisions. Nothing in the specifications voids the contractor's public safety responsibilities.

All safety devices, their maintenance, and use shall conform to the latest requirements of

OSHA and shall conform to the applicable provisions of the Part 6 "Temporary Traffic Control", of the **California MUTCD**. It shall be the complete responsibility of the Contractor to protect persons from injury and to avoid property damage. Adequate barricades, construction signs, flashers, and other such safety devices, as required, shall be placed and maintained during the progress of the construction work, until the project is completed. Whenever required, flaggers shall be provided to control traffic.

The Contractor shall provide for the proper routing of vehicles and pedestrian traffic in a manner that will hold congestion and delay of such traffic to practicable minimum by furnishing, installing, and maintaining all necessary temporary signs, barricades, and other devices and facilities, as approved by the City Traffic Engineer. As the work progresses, the Contractor shall relocate, subject to the City Traffic Engineer's approval, such devices and facilities as necessary to maintain proper routing. The Contractor shall notify the City Traffic Engineer a minimum of three (3) working days prior to the relocation of any traffic control devices.

When work is not in progress on a trench or other excavation that requires closure of an adjacent lane, the traffic cones or portable delineators used for the lane closure shall be placed off of and adjacent to the edge of the traveled way. The spacing of the cones or delineators shall be not more than the spacing used for the lane closure.

7-1.06 Indemnification and Insurance

Attention is directed to Section 7-1.05 "Indemnification" and Section 7-1.06, "Insurance" of the Standard Specifications.

SECTION 8 – PROSECUTION AND PROGRESS

Attention is directed to the provisions in Section 8 of the Standard Specifications, and these Special Provisions.

8-1.01 Time of Completion

Attention is directed to the provisions in Sections 8-1.05A, "Time", and 8-1.07, "Delay" of the Standard Specifications, and these Special Provisions.

Submittals shall be delivered to the Engineer within thirty (30) calendar days of execution of contract. Contract shall not start any work on the job site until the Engineer approves the submittals. Refer to section 5-1.05, "Submittals" of these Special Provisions. The Contractor shall only enter the jobsite prior to approval of the above submittals for purposes of measuring field dimensions and locating utilities.

Prior to Notice to Proceed, the Contractor shall indicate in writing when all the traffic signal hardware and equipment, which makes the traffic signal and communication system operational, will be delivered to the project site.

SECTION 9 – PAYMENT

9-1.01 Description of Work

The work to be performed consists of furnishing all labor, materials, tools, transportation,
SP16

supplies, equipment, appurtenances, fuel, and power, unless specifically excepted, necessary, or required to install the traffic signal system, as further delineated on the plans and described in these Special Provisions.

The work shall include, but not be limited to, the following:

1. Mobilization
 - a. All costs connected with mobilization of Contractor's operations as and preparatory work.

2. Traffic Control System
 - a. Includes all labor, materials to provide in accordance with Section 12, "Temporary Traffic Control" of the Caltrans Specifications. Includes designing, furnishing, installing and maintaining traffic control as indicated on the plans and described in these Special Provisions. Also includes flagging costs, materials (including signs, cones, project information signs, portable delineators, portable changeable message signs, flashing arrows, and barricades and all other items shown on the traffic handling plans for which there is not a contract item in the estimate), tools, equipment, and incidentals (including overhead lighting, cellular phones and radios), and for doing all the work involved in placing, removing, storing, maintaining, moving to new locations, replacing and disposing of the components of the traffic control system shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer, including, but not limited to, temporary pavement markings (paint), temporary markers, temporary traffic striping (paint), and channelizers (surface mounted).

3. Traffic Signal and Electrical
 - a. Includes furnishing all labor, materials, tools, equipment and incidentals for all the work involved in, but not limited to, trenching and installing conduit, jacking and boring and installing conduit, installing conductors, controller cabinet equipment, signal standards, service equipment enclosure, pull boxes, detection loops, traffic signal poles, vehicular and pedestrian heads and framework, pedestrian push buttons, signs mounted on traffic signal poles, safety lighting, concrete controller pad, concrete foundations, emergency vehicle preemption system, closed circuit television camera, video detection, Ethernet switch, video and data field and central modems, encoder and ancillary video and data digital networking equipment, interconnect conduit, fiber optic cable, splice enclosures, testing fiber system, all fiber connections, modifying irrigation and landscaping to accommodate installation of traffic signal equipment, removing street lights, start-up and testing.

ITEM NO.	ITEM DESCRIPTION	UNITS	ESTIMATED QUANTITY
1	MOBILIZATION	LS	1
2	TRAFFIC CONTROL SYSTEM	LS	1
3	TRAFFIC SIGNAL AND ELECTRICAL	LS	1

DIVISION II GENERAL CONSTRUCTION

SECTION 10 – GENERAL CONSTRUCTION

10-1.01 Order of Work

Contractor's attention is directed to the Public Safety, Public Convenience, and Maintaining Traffic sections of these Special Provisions. Nothing in this section shall be construed as to relieve the Contractor of his/her responsibility to stage the work in a manner which complies with the requirements of these sections.

All permits and approvals as may be required for this project shall be secured by the Contractor.

The Contractor shall stage and sequence the work as follows:

1. The contractor orders all items required, after all submittals are approved by the Engineer, for this project which may have long lead times to assure that their acquisition is not the cause for any delays. These items may include, but are not limited to, traffic signal equipment, street lighting, and related appurtenances. The Contractor shall furnish the Engineer with statements from the vendors that the orders for said equipment has been received and accepted by said vendors. These statements shall be furnished within ten (10) working days of the Notice to Proceed date.
2. Obtain all necessary permits from City of Stockton and San Joaquin County.
3. Prior to the start of construction, the Contractor shall submit to the Engineer for approval a detailed "Traffic Control Plan" which also addresses pedestrian detours. The Traffic Control Plan shall be prepared in accordance with the provisions in Section 12-1.01," Maintaining Traffic" of these special provisions.
4. Traffic signal and lighting standards and other above ground electrical equipment shall not be installed until the Contractor has received delivery of all electrical materials.
5. Prior to the start of construction, the Contractor shall verify the location and

depth of all existing utilities and underground facilities within the project limits. The Contractor shall notify the Engineer of any discrepancies between the conditions in the field and the plans.

6. Street lighting, traffic signals, including fiber system shall be maintained at all times.
7. The Contractor shall develop and implement a Storm Water Pollution Prevention Plan (SWPPP), which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting storm water and with the intent of keeping all products of erosion from moving off site into receiving waters. The Contractor shall inspect and maintain all BMPs.
8. Portions of existing concrete curbs, gutters and sidewalks that are removed shall be replaced within 10 working days after removal.

At the end of each working day if a difference in excess of 2 inches exists between the elevation of the existing pavement and the elevation of excavations within 4 feet of the traveled way, material shall be placed and compacted against the vertical cuts adjacent to the traveled way. During excavation operations, native material may be used for this purpose; however, once placing of the topsoil commences, topsoil material shall be used. The material shall be placed to the level of the elevation of the top of existing pavement and tapered at a slope of 1:4 (vertical:horizontal) or flatter to the bottom of the excavation.

Minor deviations from these requirements may be allowed by the Engineer, if in the opinion of the Engineer, the prosecution of the contract will be better served and the work expedited. Any Contractor request for such deviations shall not be adopted without the Engineer's prior written approval.

10-1.02 Alternative Equipment

The City reserves the right to order discontinuance of any equipment in use. This will be determined at the discretion of the Engineer on the basis that the use of said equipment would prohibit obtaining the best possible end result.

Additional installation equipment may be requested by the Engineer for the above reason. Failure to comply with the Engineer's request concerning equipment use or removal will be deemed sufficient cause for shutting down all work until the requirements are met. Days lost for this type of shutdown will be charged as working days.

10-1.03 Inspections

All work under this contract shall be under the control and inspection of the City Engineer or his appointed representative. The Contractor shall notify of the Public Works Department, at (209) 937-8381, three (3) working days in advance of any construction.

10-1.04 Obstructions

Attention is directed to Section 5-1.36, "Property and Facility Preservation" of Caltrans

Specifications, Sections 7-1.05, "Indemnification" and Section 7-1.06, "Insurance", of the Standard Specifications and Section 15, "Existing Facilities", of the Caltrans Specifications and these Special Provisions.

The Contractor's attention is directed to the existence of certain underground facilities that may require special precautions be taken by the Contractor to protect the health, safety, and welfare of workers and of the public. Facilities requiring special precautions include, but are not limited to, conductors of petroleum products, oxygen, chlorine, and toxic or flammable gases, natural gas in pipelines six (6) inches or greater in diameter, or pipelines operating at pressures greater than 415 KPa (gage); underground electric supply system conductors or cables with potential to ground of more than 300 V, either directly buried or in duct or conduit, which do not have concentric grounded or other effectively grounded metal shields on sheaths.

The Contractor shall notify the Engineer and the appropriate regional notification center for operators of subsurface installations at least two (2) working days, but not more than fourteen (14) calendar days, prior to performing any excavation or other work close to any underground pipeline, conduit, duct, wire, or other structure. Regional notification centers include, but are not limited to, the following:

Notification Center	Telephone Number
Underground Service Alert – Northern California (USA)	(811) 227-2600 (800) 227-2600
South Shore Utility Coordinating Council (DICS)	(800)-541-3447

Relocations or repairs necessitated because of existing facilities, which are not shown on the plans or are shown at substantially different locations than existing, may be paid as extra work in accordance with Section 4-1.02, "Changes and Extra Work", of the these Special Provisions, but only if the Engineer rules that the Contractor exercised due diligence in his operation. Due diligence may be determined by the Engineer by reviewing surface and subsurface conditions that were existing prior to exposing the facility and determining the absence of any signs sufficient to warn a diligent Contractor of the possible existence of a facility in the area.

Immediately upon encountering unknown existing facilities, the Contractor shall notify the Engineer in writing of the situation, request coverage of the work as extra work, and aid the Engineer in determining due diligence. Failure to do so may result in forfeiture of any rights to receive extra work compensation under Section 8-1.07, "Delay", of the Standard Specifications. Should the Contractor stop work, no compensation will be made for any "down time" prior to written notifications being received by the Engineer or his representative.

Payment for complying with this Special Provision shall be included in the various items of work, and no additional compensation will be allowed therefore.

10-1.05 System Outage Request, City of Stockton Facilities

Modifications to existing facilities, the construction of new facilities, and the connection of new to existing facilities may require the temporary outage or bypass of treatment processes, equipment, utilities, or other facilities. In addition to the Construction Schedule required under these Special Provisions, the Contractor shall submit a System Outage Request (SOR) and a detailed outage plan and time schedule for all construction activities, which will make it necessary to remove a tank, pipeline, channel, electrical circuit, control circuit, equipment, structure, road, or other facilities from service.

The SOR and outage plan shall be submitted to the Engineer and other affected utilities for review and acceptance a minimum of two (2) weeks in advance of the time that such outage is needed. The outage plan shall be coordinated with the construction schedule specified in these Special Provisions and shall meet the restrictions and conditions specified in this section. The detailed plan shall describe the Contractor's method for preventing bypassing of other facilities; the length of time required to complete said operation; any necessary temporary power, controls, instrumentation, or alarms required to maintain control, monitoring, and alarms for the affected facilities; and the labor, plant, and equipment which the Contractor shall provide in order to ensure proper operation.

In addition, the outage plan shall describe the Contractor's contingency plan that shall be initiated in the event that his temporary facilities fail, or it becomes apparent that the time constraints described in the approved outage plan cannot be met. The contingency plan shall conform to all specified outage requirements. All costs for preparing and implementing both the outage and contingency plans shall be borne by the Contractor.

The Contractor shall provide, Monday through Friday, at least three (3) working days prior to the actual shutdown, written confirmation of the shutdown date and time, or written notification that the schedule for performing the work has changed, or revisions to the outage plan are required.

Operations of the City's facilities and utilities are critical to the public health and safety of the citizens of Stockton. Sufficient facilities to serve the needs and demands of the City shall remain in service at all times. The City and/or affected utility owner shall be the sole judge of its needs and the facilities that must remain in service to provide adequate service.

The Contractor shall coordinate and cooperate with the City and utilities to establish the Contractor's schedule for work at the entire project facilities. The approved project schedule shall be subject to change, as it pertains to site work and shutdowns, when required by the City/utilities to accommodate unforeseen or emergency situations in the operation of the affected facilities.

10-1.06 Directional Boring

Contractor's attention is directed to the provisions in Section 77-1.08, "Conduit" of these Special Provisions and Sections 86-1.02B, "Conduit and Accessories" and 87-1.03B, "Conduit Installation" of the Caltrans Specifications for the installation of signal and ITS conduits. Should the contractor desire to use other type(s) of conduit such as HDPE for

the ITS conduits then the Contractor should submit the material specifications for the proposed conduit to the Engineer for his review and approval. Contractor's attention is also directed to the provisions in Section 5-1.05 "Submittals" of these Special Provisions.

Directional Boring under railroad tracks shall be a minimum of 3'-6" below the railroad ties. No trenching will be allowed within the railroad right of way. The Contractor shall comply with all requirements set forth by the CPUC and other rail authority.

A. General

1. Quality Assurance

The requirements set forth in this document specify a wide range of procedural precautions necessary to ensure that the very basic, essential aspects of a proper directional bore installation are adequately controlled. Strict adherence shall be required under specifically covered conditions outlined in this specification. Adherence to the specifications contained herein, or the Engineer's approval of any aspect of any directional bore operation covered by this specification, shall in no way relieve the Contractor of their ultimate responsibility for the satisfactory completion of the work authorized under the Contract.

2. Submittals

a. **WORK PLAN:** Prior to beginning work, the Contractor must submit to the Engineer a general work plan outlining the procedure and schedule to be used to execute the project. Plan should document the thoughtful planning required to successfully complete the project.

b. **EQUIPMENT:** The Contractor shall submit specifications on directional boring equipment to be used to ensure that the equipment will be adequate to complete the project. Spares inventory shall be included.

c. **MATERIAL:** Specifications on material to be used shall be submitted to the Engineer. Material shall include the conduit, fittings and any other item which is to be an installed component of the project.

d. **PERSONNEL:** Documentation of training and relevant experience of personnel shall be submitted.

B. Equipment Requirements

1. General

The directional boring equipment shall consist of a directional boring rig of sufficient capacity to perform the bore and pullback the conduit, a boring fluid mixing and delivery system of sufficient capacity to successfully complete the boring, a guidance system to accurately guide boring operations and trained and competent personnel to operate the system. All equipment shall be in good, safe operating condition with sufficient supplies, materials and spare parts on hand to maintain the system in good working order for the duration of this project.

2. Boring System

a. BORING RIG: The directional boring machine shall consist of a hydraulically powered system to rotate, push and pull hollow drill conduit into the ground at a variable angle while delivering a pressurized fluid mixture to a guidable drill (bore) head. The machine shall be anchored to the ground to withstand the pulling, pushing and rotating pressure required to complete the directional boring. The hydraulic power system shall be self-contained with sufficient pressure and volume to power boring operations. The hydraulic system shall be free of leaks. The rig shall have a system to monitor and record maximum pull-back pressure during pull-back operations. The rig shall be grounded during boring and pull-back operations. Sufficient spares shall be kept on hand for any break-downs which can be reasonably anticipated.

b. BORE HEAD: The bore head shall be steerable by changing its rotation and shall provide the necessary cutting surfaces and boring fluid jets.

3. Guidance System

The Guidance System shall be of a proven type and shall be setup and operated by personnel trained and experienced with this system. The Operator shall be aware of any magnetic anomalies and shall consider such influences in the operation of the guidance system if using a magnetic system.

C. Operations

1. General

The Engineer must be notified 48 hours in advance of starting work. The Directional Bore shall not begin until the Inspector is present at the job site and agrees that proper preparations for the operation have been made. The Inspector's approval for beginning the installation shall in no way relieve the Contractor of the ultimate responsibility for the satisfactory completion of the work as authorized under the Contract. The conduit shall be installed below the minimum depth of 24" unless directed otherwise by the Engineer.

2. Boring Procedure

a. SITE PREPARATION: Prior to any alterations to the work site, the Contractor shall photograph or video tape the entire work area, including entry and exit points. One copy of which shall be given to the Engineer and one copy shall remain with the Contractor for a period of one year following the completion of the project.

The work site, as indicated on drawings, within right-of-way, shall be graded or filled to provide a level working area. No alterations beyond what is required for operations are to be made. The Contractor shall confine all activities to designated work areas.

b. BORE PATH SURVEY: The entire drill path shall be accurately surveyed with entry and exit stakes placed in the appropriate locations within the areas indicated on the drawings. If the Contractor is using a magnetic guidance system, the drill path shall be surveyed for any surface geo-magnetic variations or anomalies.

c. ENVIRONMENTAL PROTECTION: The Contractor shall protect all boring operation areas and any drainage or other area designated for such protection by contract documents and/or state, federal and local regulations. Additional environmental protection necessary to contain any hydraulic or boring fluid spills shall be put in place. The Contractor shall adhere to all applicable environmental regulations.

d. UTILITY LOCATES: the Contractor shall notify all companies with underground utilities in the work area via the state or local "one-call" to obtain utility locates. Once the utilities have been located the Contractor shall physically identify the exact location of the utilities by vacuum or hand excavation, when possible, in order to determine the actual location and path of any underground utilities which might be within 4 feet of the bore path. The Contractor shall not commence boring operations until the location of all underground utilities within the work area have been verified.

e. SAFETY: The Contractor shall adhere to all applicable state, federal and local safety regulations and all operations shall be conducted in a safe manner. Safety meetings shall be conducted at least weekly with a written record of attendance and topic submitted to the Engineer.

f. CONDUIT: Conduit shall be connected together in one length prior to pull-back operations, if space permits. The Contractor's attention is called to the fact that extreme care will be required when placing the conduit so as to permit the installation of the conduit to the alignment and depth, as shown on the Plans and these Special Provisions. Variations from theoretical grade of the conduit at the time of completion of boring shall not exceed one percent of the distance from the bore pit point.

g. PILOT HOLE: Pilot hole shall be drilled on bore path with no deviations greater than 5% of depth over a length of 100'.

h. BORE PIT: Where ground conditions at the face of the bore pit are such that sloughing or caving of ground is likely to occur at the face of the excavation upon commencement thereof, the face of the pit shall be made stable so that an excessive void is not carried with the face of the excavation for the length of the casing or conduit. This may be accomplished by solid sheathing at the portal of the bore pit, or excavating and backfilling the face of the bore pit with cohesive material.

i. REAMING: Upon successful completion of pilot hole, the Contractor shall ream bore hole to a minimum of 25% greater than outside diameter of conduit using the appropriate tools. The Contractor shall not attempt to ream at one time more than the boring equipment are designed to safely handle.

j. PULL-BACK: After successfully reaming the bore hole to the required diameter, the Contractor shall pull the conduit through the bore hole. In front of the conduit shall be a swivel. Once pull-back operations have commenced, operations must

continue without interruption until conduit is completely pulled into the bore hole. During pull-back operations the Contractor shall not apply more than the maximum safe conduit pull pressure at any time.

In the event that conduit becomes stuck, the Contractor shall cease pulling operations to allow any potential hydro-lock to subside and shall commence pulling operations. If conduit remains stuck, the Contractor shall notify the Engineer. The Engineer and the Contractor shall discuss options and then work shall proceed accordingly.

k. EXCAVATED MATERIAL: In general, excavated material shall be removed from the conduit as boring progresses and no accumulation of excavated material within the conduit will be permitted. Should appreciable loss of ground occur in installations where the face of the excavation is accessible, the voids shall be backpacked promptly to the extent practicable with an approved soil cement.

3. Site Restoration

Following boring operations, the Contractor shall de-mobilize equipment and restore the work site to its original condition. All excavations shall be backfilled and compacted according to the City of Stockton requirements.

4. Record Keeping, As-Builts

The Contractor shall maintain a daily project log of boring operations and a guidance system log with a copy given to the Engineer at the completion of the project. As-built drawings shall be certified as to accuracy by the Contractor.

10-1.07 Sheeting and Shoring

Attention is directed to the Section 10-1.02E, "Excavation" of the Caltrans Specifications. Excavations shall be adequately shored and braced so that the earth will not slide, move, or settle, and so that all existing improvements of any kind will be fully protected from damage.

Attention is called to Article 6 of "Construction Safety Orders" of the California Division of Industrial Safety, which applies to all open excavations made in the earth's surface, including trenches.

Trenches over five (5) feet in depth requires a permit from California Division of Industrial Safety and shall be evaluated for stability prior to personnel entering the trench. Where trenches are deeper than five (5) feet, the Contractor shall comply with the California Occupational Safety and Health Administration (CAL OSHA) requirements pertaining to trench safety.

The Contractor shall furnish, install, and maintain such sheet piling, timbering, lagging, and bracing as indicated on the standard drawings or any additional precautions not specifically set forth as necessary to support the sides of the trench. The protection of adjacent structures from movement of the ground and the elimination of the element of danger to life, property, or to existing improvements is the intent of this requirement.

Additional supports requested by the Engineer shall in no way relieve the Contractor of his responsibility for the sufficiency of his precautions.

All such piling, timbering, lagging, and bracing shall, unless otherwise required by the Engineer, be removed during backfilling in such a manner as to prevent any movement of the ground or damage to the piping or other structures.

10-1.08 Surface Restoration

Surface restoration shall consist of restoring all areas within the limits of work to their original existing condition prior to construction or to the condition shown on the plans or specified in the Specifications.

The Contractor shall restore all paved areas, such as driveways, curb and gutter, sidewalk, roadway surfaces, ditches, etc., landscaped areas, and all other improvements disturbed or damaged by his operations.

Payment for the restoration of damaged areas, for which specific bid items are not provided, shall be included in the prices paid for various items of work and no additional compensation will be allowed therefore.

SECTION 11 – BLANK

SECTION 12 – TEMPORARY TRAFFIC CONTROL

Attention is directed to Part 6 of the California MUTCD, and Sections 12, "Temporary Traffic Control", of the Caltrans Specifications, Standard Specifications, and these Special Provisions.

12-1.01 Maintaining Traffic

Attention is directed to Part 6 of the California MUTCD, Sections 7-1.03, "Public Convenience", 7-1.04, "Public Safety", Section 12-4 "Maintaining Traffic", of the Caltrans Specifications, and Section 10-1.01, "Order of Work", of these Special Provisions. Nothing in these Special Provisions shall be construed as relieving the Contractor from the responsibilities specified in these sections.

The Contractor shall furnish, and maintain in good working order, all barricades and flashers, and provide flaggers as necessary to protect pedestrians, bicyclists, and vehicular traffic. The Contractor shall furnish and maintain all barricades, flashers, and any detour signs twenty-four (24) hours a day, including covering or removing signs during non-construction hours.

The Contractor shall provide adequate and continuous ingress and egress for all adjacent properties; except for the limited period of time it is necessary to perform work at a specific property. The Contractor shall diligently prosecute all work directly impacting businesses to completion. The Contractor shall coordinate limited closures with tenants or owners, as required by these Special Provisions, and as directed by the Engineer. The Contractor

shall cover signal heads with traffic jackets, signs and other traffic control devices that may conflict with any detours.

The Contractor shall submit to the City Engineer a detailed "Traffic Control Plan" for review and approval. The "Traffic Control Plan" shall be submitted no later than ten (10) working days following the Notice to Proceed date and at least 3 working days prior to commencing any work which requires implementation of any component of the "Traffic Control Plan". The plan shall be approved by the Engineer prior to its implementation by the Contractor.

The "Traffic Control Plan" shall conform to the typical traffic control details included in the Caltrans Standard Plans, Part 6 of the California MUTCD, and the requirements of Section 12-1.02, "Traffic Control System for Lane Closure", of these Special Provisions. The Traffic Control Plan shall include, but not be limited to, detailed requirements for the following:

- ◆ Traffic control devices, including signs and markings.
- ◆ Construction routes, phasing and/or staging of both the roadway and sidewalk areas.
- ◆ Employee, Customer, and Business/Delivery access to adjacent property.
- ◆ Emergency vehicles access.
- ◆ Bus, refuse collection, and mail delivery access.
- ◆ Any parking zones to be removed on a temporary basis.
- ◆ Pedestrian and bicyclist access.

The Traffic Control Plan shall consider the impacts of changes in traffic volumes and capacities related to the construction activities, and their impact on vehicular and bicycle traffic and pedestrian operations, on roadway pavements, including provisions to restore construction-damaged pavements.

Traffic Lane and Sidewalk Closures

Lanes and sidewalks may be closed only as indicated in the Section 12, of these Special Provisions. Except for work required under Section 7-1.03 "Public Convenience" and Section 7-1.04, "Public Safety" of the Standard Specifications, work that interferes with public traffic shall be performed only as indicated. Traffic lane and sidewalk closures shall conform to the following requirements:

Lane closure, a maximum of one lane in each direction of travel, not less than twelve (12) feet wide, shall be permitted only between the hours of 9:00 a.m. and 3:30 p.m. Any lane closures other than specified shall be approved by the Engineer.

Standard working hours shall be 9:00 a.m. to 5:00 p.m. Any extended working hours require the approval of the Engineer.

Personal vehicles of the Contractor's employees shall not be parked on the traveled way or shoulders, including any section closed to public traffic.

Adequate ingress and egress shall be maintained throughout the project limits for fire, police, and other emergency vehicles. The Contractor shall provide adequate ingress and egress for residences, property owners, and abutting business owners to their respective properties except when performing work at their specific locations.

Also, the Contractor shall provide adequate signing, barricades and flashers or portable flashing beacons, flaggers, and other equipment and personnel necessary to adequately control and direct traffic in a safe manner. The Contractor shall maintain all barricades, flashers and detour signs twenty-four (24) hours a day, including covering signs during non-construction hours. The Contractor shall also provide the City with the names and telephone numbers of three (3) representatives available at all times.

Except as otherwise allowed by the Engineer, "long term" and temporary closures shall be removed and the full width of the traveled way shall be open for use by public traffic when construction operations are not actively in progress during the working period or successive working periods.

The contractor shall provide for pedestrian and wheelchair access to at least one (1) intersection corner within each block and the abutting sidewalk facilities along each block, at all times. Simultaneous closure of both intersection corners to pedestrian traffic within the same block is not allowed.

The contractor shall maintain at least one (1) north/south crosswalk and one (1) east/west crosswalk open to pedestrian and wheelchair access, where exists, at each intersection at all times.

Whenever Contractor's vehicles or equipment are parked within six (6) feet of a traffic lane, the area shall be closed with fluorescent traffic cones or portable delineators placed on a taper in advance of the parked vehicles or equipment and along the edge of the traffic lane at twenty-five (25) foot intervals to a point not less than twenty-five (25) feet past the last vehicle or piece of equipment. A minimum of nine (9) cones or portable delineators shall be used for the taper. A W20-1 (Road Work Ahead) sign shall be mounted on a portable sign stand with flags. The sign shall be placed where directed by the Engineer.

Temporary Pedestrian Access Routes

Attention is directed to Section 12-4.04, "Temporary Pedestrian Access Routes" of the updated Caltrans Specification and these Special Provisions.

When a pedestrian circulation path is temporarily closed by construction, alterations, maintenance operations, or other conditions, contractor shall submit a work plan for a temporary pedestrian access route complying with Caltrans Specification Section 12-4.04A(3) and sections 6D.01, 6D.02, and 6G.05 of the MUTCD, and State Standard plans T30, T31, T32, T33, and T34 shall be provided. The work plan must Be sealed and signed by an engineer who is registered as a civil engineer in the State

Whenever possible work should be done in a manner that does not create a need to detour pedestrians from existing pedestrian routes. Extra distance and additional

pedestrian street crossings add complexity to a trip and increase exposure of risk to accidents. The alternate pedestrian routes shall be accessible and detectable, including warning pedestrians who are blind or have low vision about sidewalk closures. Proximity-actuated audible signs are a preferred means to warn pedestrians who are blind or have low vision about sidewalk closures.

The surface shall be skid-resistant and free of irregularities. Pedestrian walkways shall be maintained in good condition, and shall be suitable for wheelchair use. Walkways shall be kept clear of obstructions.

The Contractor shall cause the least possible disruption to the affected properties and restore suitable pedestrian access immediately following completion of the active work in progress.

At least one (1) continuous walkway along one (1) side of the street shall be available at all times. At locations where work is actively in progress, the pedestrian walkway within a single block may be temporarily closed at one (1) end of the block along one (1) side of the street. Pedestrians shall be rerouted to the walkway on the opposite side of the street.

Minor deviations from the requirements of this section, which do not significantly change the cost of the work, may be permitted upon the written request of the Contractor if, in the opinion of the Engineer, public traffic will be better served and the work expedited. These deviations shall not be adopted by the Contractor until the Engineer has approved them in writing. All other modifications will be made by contract change order.

12-1.02 Traffic Control System for Lane Closure

A traffic control system shall consist of closing traffic lanes in accordance with the details shown on the plans, the provisions of Section 12, "Temporary Traffic Control", of the Caltrans Specifications, and Standard Specifications, and these Special Provisions.

The provisions in this section will not relieve the Contractor from the responsibility to provide additional devices or take the measures that may be necessary to comply with the provisions in Section 7-1.04, "Public Safety", of the Standard Specifications and these Special Provisions.

During traffic striping operations and pavement marker placement operations using bituminous adhesive, traffic shall be controlled, at the option of the Contractor, with either stationary or moving type lane closures. During all other operations, traffic shall be controlled with stationary type lane closures. The Contractor's attention is directed to the provisions in Sections 84-2.03, "Construction", of the Caltrans Specifications.

If any component in the traffic control system is displaced, or ceases to operate or function as specified, from any cause, during the progress of the work, the Contractor shall immediately repair the component to its original condition or replace the component, and shall restore the component to its original location.

When lane closures are made for work periods only, at the end of each work period, all components of the traffic control system, except portable delineators placed along open

trenches or excavation adjacent to the traveled way shall be removed from the traveled way and shoulder. If the Contractor so elects, the components may be stored at selected central locations, approved by the Engineer, within the limits of the highway right-of-way.

Each vehicle used to place, maintain, and remove components of a traffic control system shall be equipped with a Type II flashing arrow sign, which shall be in operation when the vehicle is being used for placing, maintaining, or removing the components. Vehicles equipped with Type II flashing arrow signs not involved in placing, maintaining, or removing the components when operated within a stationary type lane closure shall only display the caution display mode. The sign shall be controllable by the operator of the vehicle while the vehicle is in motion. The flashing arrow sign shown on the plans shall not be used on the vehicles which are doing the placing, maintaining, and removing of components of a traffic control system, and shall be in place before a lane closure requiring its use is completed.

The Contractor shall pay fully the cost of furnishing all flaggers, including transporting flaggers, to provide for passage of public traffic.

Attention is directed to Part 6 of the California MUTCD. Nothing in these Special Provisions shall be construed as relieving the Contractor from his responsibility as provided in Part 6 of California MUTCD.

12-1.03 Type K Temporary Railing

The Contractor shall install temporary railing (Type K) between a lane open to public traffic and an excavation, obstacle, or storage area when the following conditions exist:

- A. Excavations - the near edge of the excavation is twelve (12) feet or less from the edge of the lane, except:
 - 1. Excavations covered with sheet steel or concrete covers of adequate thickness to prevent accidental entry by traffic or the public.
 - 2. Excavations less than one (1) foot deep.
 - 3. Trenches less than one (1) foot wide for irrigation pipe or electrical conduit, or excavations less than one (1) foot in diameter.
 - 4. Excavations parallel to the lane for the purpose of pavement widening or reconstruction.
 - 5. Excavations in side slopes, where the slope is steeper than 1:4 (vertical:horizontal).
 - 6. Excavations protected by existing barrier or railing.

- B. Temporarily Unprotected Permanent Obstacles - the work includes the installation of a fixed obstacle together with a protective system, such as a sign structure together with protective railing, and the Contractor elects to install the obstacle prior to installing the protective system; or the Contractor, for the Contractor's convenience and with permission of the Engineer, removes a portion of an existing protective railing at an obstacle and does not replace such railing complete in place during the same day.

- C. Storage Areas - material or equipment is stored within twelve (12) feet of the lane and the storage is not otherwise prohibited by the provisions of the Standard Specifications and these Special Provisions.

The approach end of temporary railing, installed in conformance with the provisions in this section, "Public Safety", and in Section 7-1.04, "Public Safety", of the Caltrans Specification, shall be offset a minimum of fifteen (15) feet from the edge of an open traffic lane. The temporary railing shall be installed on a skew toward the edge of the traffic lane of not more than one (1) foot transversely to ten (10) feet longitudinally with respect to the edge of the traffic lane.

If the fifteen (15) feet minimum offset cannot be achieved, the temporary railing shall be installed on the 10 to 1 skew to obtain the maximum available offset between the approach end of the railing and the edge of the traffic lane, and an array of temporary crash cushion modules shall be installed at the approach end of the temporary railing.

Temporary Railing shall conform to the provisions in Section 12-3.20, "Type K Temporary Railing", of the Caltrans Specifications. Temporary Railing, conforming to the details shown on Caltrans Standard Plan T3A and T3B, may be used.

12-1.04 Temporary Pavement Delineation

Temporary pavement delineation shall be furnished, placed, maintained, and removed in conformance with the provisions in Section 12-6 "Temporary Pavement Delineation" of the Caltrans Specifications and these Special Provisions. Nothing in these Special Provisions shall be construed as reducing the minimum standards specified in the California MUTCD or as relieving the contractor from the responsibilities specified in Section 7-1.04, "Public Safety", of the Caltrans Specifications, Standard Specifications, and these Special Provisions. Whenever the work causes obliteration of existing pavement delineation, temporary or permanent pavement delineation shall be in place prior to opening the traveled way to public traffic. Lane line or centerline pavement delineation shall be provided at all times for traveled ways open to public traffic.

The Contractor shall perform the work necessary to establish the alignment of temporary pavement delineation, including required lines or marks. Surfaces to receive temporary pavement delineation shall be dry and free of dirt and loose material. Temporary pavement delineation shall not be applied over existing pavement delineation or other temporary pavement delineation. Temporary pavement delineation shall be maintained until superseded or replaced with a new pattern of temporary pavement delineation or permanent pavement delineation.

Temporary pavement markers, including underlying adhesive and removable traffic tapes which are applied to the final layer of surfacing or existing pavement to remain in place or which conflicts with a subsequent or new traffic pattern for the area, shall be removed when no longer required for the direction of public traffic, as determined by the Engineer.

12-1.05 Blank

12-1.06 Maintaining Existing and Temporary Electrical Systems

Maintaining existing electrical systems and communication systems shall conform to the provisions of Section 87, "Electrical Systems," of the Caltrans Specifications and these Special Provisions. Existing traffic signal systems and communication systems shall be kept in effective operation for the benefit of the traveling public during the progress of the work, except when shut down is permitted. The traffic signal shutdowns shall be limited to the hours of 9:00 a.m. to 3:30 p.m., and shall be permitted only during the switch over from existing to new controller operation, unless prior approval is obtained from the Engineer. Contractor required to obtain authorization at least three (3) working days before interrupting communication between an existing system and the traffic management center (TMC).

Temporary standards with signal equipment may be required during the construction of the new installation. The Contractor shall provide temporary equipment if deemed necessary by the Contractor or Engineer. The cost of the temporary systems shall be included in the lump sum price paid for the various contract items of work involved and no additional compensation shall be allowed therefor.

12-1.07 Barricades and Channelizers

Barricades shall be furnished, placed and maintained at the locations shown on the approved Traffic Control Plan (TCP), specified in Part 6 of the California MUTCD, in the Standard Specifications or in these Special Provisions or where designated by the Engineer. Barricades shall conform to the provisions in Section 12, "Temporary Traffic Control," of the Standard Specifications and these Special Provisions.

Attention is directed to Section 6-1.02 "Pre-qualified and Tested Signing and Delineation Material" of these special provisions regarding retroreflective sheeting for barricades.

Construction area sign and marker panels conforming to the provisions in Part 6 of the California MUTCD and Section 12, "Temporary Traffic Control," of the Caltrans Specifications, Standard Specifications, and these Special Provisions shall be installed on barricades in a manner determined by the Engineer at the locations shown on the plans and the TCP. Where provided, pedestrian barricades and channelizing devices shall comply with sections 6F.63, 6F.68, and 6F.71 of the MUTCD.

Channelizers shall conform to the provisions in Section 12, "Temporary Traffic Control," of the Caltrans Specifications, Standard Specifications, and these special provisions.

Channelizers shall conform to the provisions in Section 6-1.07 "Pre-qualified and Tested Signing and Delineation Material" of these Special Provisions.

At the time of completion of the project, certain channelizers shall be left in place as determined by the Engineer.

When no longer required for the work as determined by the Engineer, channelizers

(except channelizers to be left in place) and underlying adhesive used to cement the channelizer bases to the pavement shall be removed. Removed channelizers and adhesive shall become the property of the Contractor and shall be removed from the site of work.

SECTION 13 – WATER POLLUTION CONTROL

13-1.01 General

Attention is directed to Sections 13, "Water pollution Control", of the Caltrans Specifications, these Special Provisions, and as directed by the Engineer.

The Contractor shall develop and implement a Storm Water Pollution Prevention Plan (SWPPP), which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting storm water and with the intent of keeping all products of erosion from moving off site into receiving waters. The Contractor shall inspect and maintain all BMPs.

Full compensation for water pollution control shall be considered as included in the prices paid for various items of work, and no additional compensation will be allowed therefore.

SECTION 14 – ENVIRONMENTAL STEWARDSHIP

Attention is directed to Sections 14, "Environmental Stewardship", of the Caltrans Specifications, these Special Provisions, and as directed by the Engineer.

14-1.01 Construction Site Waste Materials Management

Removal of existing traffic stripes and marking shall be per Caltrans Specifications Section 84-9, "Existing Markings".

Where grinding or other methods approved by the Engineer are used to remove thermoplastic traffic stripes and pavement markings, the removed residue, including dust, shall be tested for lead and chromium content. If the thermoplastic grindings are found to be hazardous, the materials shall be disposed of at a Class 1 facility.

Residue from removing traffic stripes and pavement markings which contains lead from the paint or thermoplastic. The average lead concentrations are less than 1,000 mg/kg total lead and 5 mg/L soluble lead. This residue:

1. Is a nonhazardous waste
2. Does not contain heavy metals in concentrations that exceed thresholds established by the Health and Safety Code and 22 CA Code of Regs
3. Is not regulated under the Federal Resource Conservation and Recovery Act (RCRA), 42 USC § 6901 et seq.

Submit a lead compliance plan under section 7-1.02K(6)(j)(ii) "Lead Compliance Plan", of the Caltrans Specifications.

Earth Material Containing Lead

This section includes specifications for handling, removing, and disposing of earth material containing lead.

Submit a lead compliance plan.

If earth material is disposed of:

1. Disclose the lead concentration of the earth material to the receiving property owner when obtaining authorization for disposal on the property
2. Obtain the receiving property owner's acknowledgment of lead concentration disclosure in the written authorization for disposal
3. You are responsible for any additional sampling and analysis required by the receiving property owner

If you choose to dispose of earth material at a commercial landfill:

1. Transport it to a Class III or Class II landfill appropriately permitted to receive the material
2. You are responsible for identifying the appropriately permitted landfill to receive the earth material and for all associated trucking and disposal costs, including any additional sampling and analysis required by the receiving landfill

Soil Handling

Excess soils must be handled as potential hazardous waste, or the excess soils must be tested for concentrations of lead prior to disposal.

Contaminated Soil

Identify contaminated soil from spills or leaks by noticing discoloration, odors, or differences in soil properties. Soil with evidence of contamination must be sampled and tested by a laboratory certified by Environmental Laboratory Accreditation Program (ELAP).

If levels of contamination are found to be hazardous, handle and dispose of the soil as hazardous waste.

Prevent the flow of water, including ground water, from mixing with contaminated soil by using one or a combination of the following measures:

1. Berms
2. Cofferdams
3. Grout curtains
4. Freeze walls
5. Concrete seal course

If water mixes with contaminated soil and becomes contaminated, sample and test the water using a laboratory certified by ELAP. If levels of contamination are found to be hazardous, handle and dispose of the water as hazardous waste.

Upon completion of underground facilities and backfilling of the trenches in each portion of the work, the sub-grade shall be prepared by compacting to a relative compaction of not less than ninety-five (95) percent for a minimum depth of zero point five (0.5) feet below the grading plane (sub-grade plane) for a total width of the area to be paved.

All portland cement concrete flatwork shall be saw-cut a minimum of 3-1/2 inches deep prior to removal. All monolithic portland cement concrete shall be saw-cut a minimum of 8 inches deep prior to removal.

Existing asphalt concrete sections to be removed shall be neatly saw cut two and one-half (2-1/2) inches deep and excavated to a depth of fifteen (15) inches. The vertical edges of the pavement shall be neatly trimmed. All debris shall be removed. The top six inches of the sub-grade shall be compacted to 90% of the maximum density at near optimum moisture content.

14-1.02 Air Pollution Control

Attention is directed to Section 14-9.02 "Air Pollution Control" of the Caltrans Specifications.

Comply with air pollution control rules, regulations, ordinances, and statutes that apply to work performed under the contract, including air pollution control rules, regulations, ordinances, and statutes provided in government code 11017 (Pub Cont Code 10231).

Do not burn material to be disposed of.

14-1.03 Dust Control, Apply Water, Site Maintenance, and Cleanup

Dust control shall conform to any requirements set forth in the San Joaquin Valley Air Pollution Control District Construction Notification Form, the provisions in Section 14-9, "Air Quality" of the Caltrans Specifications, and these Special Provisions. Use of water except for recycled, reclaimed, or other non-potable water for the purpose of dust control or other construction uses unless for health or safety purposes is prohibited. All dust control operations shall be performed by the Contractor at the time, location and in the amount ordered by the Engineer. The application of either water or dust palliative shall be under the control of the Engineer at all times." Watering shall conform to the provisions of Section 13 "Water Pollution Control" of the Caltrans Specifications and these Special Provisions. Attention is also directed to Section 18 "Dust Palliatives" of the Caltrans Specifications and these Special Provisions.

During construction, the Contractor shall remove all rubbish and debris as it is generated. Upon completion of the work, the Contractor shall remove all equipment, debris, and shall leave the site in a neat, clean condition all to the satisfaction of the Engineer. A permit shall be obtained from the Municipal Utilities Department, or California Water Service, as applicable, for construction water obtained from City hydrants. This permit shall be approved by the City of Stockton Fire Department.

The Contractor shall conduct and cause all working forces at the site to maintain the site in a neat, orderly manner throughout the construction operations. The work shall be

conducted in a manner that will control the dust. When ordered to provide dust control, the Contractor shall use water to reduce the dusty conditions all to the satisfaction of the Engineer. During construction, the Contractor shall remove all rubbish and debris as it is generated. The Contractor shall pay to the City of Stockton the sum of Two Hundred Fifty Dollars (**\$250**) for every calendar day where debris has remained on the job site overnight. Upon completion of the work, the Contractor shall remove all equipment and debris, and shall leave the site in a neat, clean condition all to the satisfaction of the Engineer.

14-1.04 Sound Control Requirements

The Contractor's attention is directed to Section 14-8.02 "Noise Control" of the Caltrans Specifications and the project specific equipment noise control measures listed in Table 8.1 below. Nothing in the Caltrans Specifications or these Special Provisions voids the Contractor's public safety responsibilities or relieves the Contractor from the responsibility to comply with other ordinances regulating noise level.

The Contractor shall comply with all local sound control and noise level rules, regulations and ordinances which apply to any work performed pursuant to the contract. Each internal combustion engine, used for any purpose on the job or related to the job, shall be equipped with a muffler of a type recommended by the manufacturer. No internal combustion engine shall be operated on the project without the muffler.

To minimize the construction impacts to residents, the Contractor is encouraged to select the bore method (directional drilling) over conventional trenching to install new conduits.

The noise level requirement shall apply to the equipment on the job or related to the job, including, but not limited to, trucks, transit mixers, or transient equipment that may or may not be owned by the Contractor. All equipment shall have sound-control devices that are no less effective than those provided on the original equipment. The use of loud sound signals shall be avoided in favor of light warnings except those required by safety laws for the protection of personnel.

Project Specific Equipment Noise Control

Table 8-1 summarizes noise levels produced by construction equipment that is commonly used on roadway construction projects. Construction equipment is expected to generate noise levels ranging from 70 to 90 dB at a distance of 50 feet, and noise produced by construction equipment would be reduced over distance at a rate of about 6 dB per doubling of distance. The noise levels generated by the boring machine would be lower than any equipment listed in the table.

Table 8-1. Construction Equipment Noise

Equipment	Maximum Noise Level (dBA at 50 feet)
Scrapers	89
Bulldozers	85
Heavy Trucks	88

Backhoe	80
Pneumatic Tools	85
Concrete Pump	82

Source: Federal Transit Administration 1995.

Further, implementing the following measures would minimize the temporary noise impacts from construction:

All equipment shall have sound-control devices that are no less effective than those provided on the original equipment. No equipment shall have an unmuffled exhaust. As directed by the Engineer, the contractor shall implement appropriate additional noise mitigation measures as warranted. These could include, but are not specifically limited to, changing the location of stationary construction equipment, turning off idling equipment, rescheduling construction activity, notifying adjacent residents in advance of construction work, and installing acoustic barriers around stationary construction noise sources. Furthermore, construction activities shall be limited to the time period between 9:00 a.m. and 5:00 p.m.

SECTION 15 – EXISTING FACILITIES

15-1.01 Existing Facilities

Contractor attention is directed to requirements of Section 5-1.13, "Property and Facility Preservation" of these Special provisions, and 7-1.05, "Indemnification" and 7-1.06 "Insurance", of the Caltrans Specifications.

The work shall be performed in connection with various existing highway facilities (i.e., traffic signals and streetlights, storm drain pipe, catch basins, sidewalk drains, roadway pavement, roadside signs, utility boxes, trees, fences, etc.) shall conform to the provisions in Section 15, "Existing Facilities", of the Caltrans Specifications and these Special Provisions.

All traffic control signs shall be maintained. If relocation is necessary to facilitate the construction, the Contractor shall notify the Public Works Department, at (209) 937-8381, three (3) working days prior to said relocation, and request for approval as to where sign is to be temporarily relocated. Full compensation for performing such removal and reinstallation shall be considered as included in the various items of work and no additional compensation will be allowed therefore.

Fire hydrants, water valves, curb-stop boxes, and other utility facilities shall be unobstructed and accessible during the construction period.

Should the Contractor desire to have any alterations made in any utility or other improvement for Contractor's own convenience in order to facilitate Contractor's construction operations and for Contractor's sole benefit, Contractor shall make all necessary arrangements with the owners and bear all expense in connection therewith.

Removed highway facilities that are not to be salvaged shall become the property of the

Contractor and shall be disposed of according to these special provisions, Section 15 "Existing Facilities" of Caltrans specifications, and as indicated on the plans.

Items of work under this section, "Existing Highway Facilities", for which specific bid items are not provided, shall be considered as included in the prices paid for the various items of work of the bid schedule, and no additional compensation will be provided therefore.

Any contract adjustment that may be warranted due to differing site conditions will be made in accordance with the provisions of Section 4-1.02, "Changes and Extra Work", of these Special Provision.

Relocations or repairs necessitated because of existing facilities which are not shown on the plans, or are shown at substantially different locations than shown may be paid as extra work in accordance with Section 4-1.02, "Changes and Extra Work", of these Special Provisions, but only if the Engineer rules that the Contractor exercised due diligence in his operation. Due diligence may be determined by the Engineer by reviewing surface and subsurface conditions that were existing prior to exposing the facility, and determining the absence of any signs sufficient to warn a diligent Contractor of the possible existence of a facility in the area.

Utility Facilities

Attention is directed to the possible existence of underground utilities not known to the City or in a location different from that which is shown on the plans or in these Special Provisions. The Contractor shall take steps to ascertain the exact location of such facilities prior to doing any work that may damage such facilities or interfere with their service.

Remove Existing Concrete

Existing concrete sidewalk, gutter, curb and gutter, driveways, wheelchair ramps, and other concrete surfacing, where shown on the plans to be removed, shall be removed and disposed of. Concrete removal includes removal of any steel embedded in the concrete. Sawcut concrete ramps, walks, curbs, and gutters to be removed at the nearest joint or score-line, at the locations indicated on the plans, and as designated by the Engineer.

Remove Existing Pavement

Asphalt concrete pavement and aggregate base shall be removed by saw-cutting and excavation or cold planing to the lines, depths, and dimensions indicated on the plans and/or as directed by the Engineer.

Roadside Signs

Unless otherwise shown on the plans, the Contractor shall maintain existing roadside signs in place. The Contractor shall replace or repair all signs damaged by his operations and under this contract by using new material. Such material shall be a replacement of the original in regards to type of sign, posts, and construction. Relocation of the existing signs shall be done the same day the sign is removed from its original location.

At the Contractor's option, existing signs may be temporarily removed in order to facilitate the Contractor's construction of other improvements included under this contract. Any

sign which is removed or damaged by the Contractor's shall be reinstalled at its original location using new uni-strut posts in conformance with the Standard Specifications. Existing steel pipe sign posts shall be salvaged as directed by the Engineer. Each roadside sign shall be reinstalled on the same day that the sign is removed.

All new non-mast arm mounted signs shall have High Intensity Prismatic (HIP) reflective sheeting (reflectivity; ASTM type III) and covered with anti-graffiti film. The anti-graffiti film shall be transparent overlay for use on signs. The reflective sheeting and anti-graffiti film shall be from same manufacturer and guaranteed for the same number years.

SECTION 16 – BLANK

DIVISION III EARTHWORK AND LANDSCAPE

SECTION 17 – EARTHWORK AND LANDSCAPE

17-1.01 Clearing and Grubbing

Clearing and Grubbing shall conform to the requirements of Section 16, "Clearing and Grubbing", of the Standard Specifications, Section 17-2, "Clearing and Grubbing", of the Caltrans Specifications, and these Special Provisions.

All materials removed shall be off hauled and disposed of by the Contractor.

Attention is directed to Section 19-1.03D, "Buried Man-Made Objects", of the Caltrans Specifications.

Existing underground structures, trash, debris, loose fill, tree roots, tree remains, organic surficial soil, and other rubbish shall be removed or otherwise disposed of so as to leave the areas that have been disturbed with a neat and finished appearance, free from debris. Depressions left from any removals shall be properly filled and compacted in accordance with these Special Provisions, and as directed by the Engineer.

The methods for removal of subsurface irrigation and utility lines will depend on the depth and location of the line in relation to planned improvement. Unless otherwise specified, remove the pipe and compact the soil in the trench according to the applicable portions of these Special Provisions.

Where loose, uncompacted fill occurs at the surface of the site, the materials shall be excavated to expose firm natural ground or previously compacted fill. The exposed surface shall then be prepared to receive fill in accordance with the applicable portions of these Special Provisions.

Nothing herein shall be construed as relieving the Contractor of his responsibility for final cleanup of the highway as provided in Section 4-1.13, "Cleanup", of the Caltrans Specifications.

SECTION 18 – BLANK

SECTION 19 – EARTHWORK

19-1.01 Roadway Excavation

Roadway excavation shall conform to the requirements of Section 19, "Earthwork", of the Standard Specifications, Caltrans Specifications, and these Special Provisions. Wherever relative compaction is specified, it shall be determined by ASTM D1557.

Surplus excavated material shall become the property of the Contractor and shall be disposed of outside the highway right-of-way in accordance with the provisions in Section 19-2.03B, "Surplus Material", of the Caltrans Specifications. All excavated material shall be loaded for off-haul from the site as it is generated. Material will not be allowed to accumulate within the right-of-way. If excavation exceeds 15 feet, water sampling will be required.

19-1.02 Trench Excavation and Backfill

Trench excavation, pipe bedding, and backfill shall conform to the requirements of Section 71, "Sanitary Sewer and Storm Sewers", of the Standard Specifications and City of Stockton Standard Plan Nos. R36 through R43, and any amendment and revisions, these Special Provisions, and as specified on the plans. Controlled Density Fill (CDF) shall be mandatory for trenches 8" wide or less. Contractor shall grind 3" deep, 12" each side of trench, and repave. If excavation exceeds 15 feet in depth, water sampling will be required.

Water control shall conform to the provisions of Section 19-3.03B(5) "Water Control and Foundation Treatment" of the Caltrans Specifications and these Special Provisions. The Contractor shall construct and maintain all necessary ditches, cofferdams, channels, drains, sumps, and temporary protective works, and shall furnish, install, and maintain all necessary pumping and other equipment for controlling flows, including ground water in the pipe trenches and structure excavations, so that no foundation will contain any free water. Full compensation for water control shall be included in the contract prices paid for various items of work, and no additional compensation will be made therefore.

The Contractor shall do all excavation of whatever substance is encountered to the lines and grades shown on the plans. Where it becomes necessary to excavate beyond the limits of normal excavation lines in order to remove boulders or other interfering objects, the void remaining after the removal of the boulders shall be backfilled with suitable material and density, as approved by the Engineer. The Contractor shall do such grading as is necessary to prevent surface water from entering the excavation. The Contractor shall remove and dispose of all water entering the excavation. Disposal of water shall be done in a manner to prevent damage or nuisance to adjacent properties.

Due to width limitations, proximity of existing utilities, structures, and access requirements, the Contractor may be required to provide a vertical, open trench, shoring system for portions of this project. Shoring of all trench excavations shall conform to the

Sheeting and Shoring Section of these Special Provisions.

The amount of open trench or plated trench permitted at any one time shall not exceed fifty (50) feet or as allowed by the Engineer. Trench excavation shall be closed and all lanes shall be restored to traffic at the end of each workday. The Contractor shall furnish and install non-skid steel plates to span trench sections, which have not been backfilled. Non-skid trench plates shall have a manufactured surface with a coefficient of friction that equals or exceeds zero point thirty-five (0.35).

Approach and ending plates shall be attached to the roadway by a minimum of two (2) dowels predrilled into the corner of the plate and drilled a minimum of two (2) inches into the pavement. Interior plates are to be butted together. Fine graded asphalt concrete shall be compacted to form ramps with a maximum slope of eight and one-half percent (8.5%) with a minimum twelve- (12) inch taper to cover all exterior edges of the plates. When the plates are removed, the dowel holes in the pavement shall be backfilled with graded fines of asphalt concrete mix. A concrete slurry or equivalent slurry mix may be substituted with the approval of the Engineer.

All operations shall be carried out in an orderly fashion. Backfilling, compacting, and clean-up work shall be accomplished as the work is approved and traffic through the work shall be impeded or obstructed as little as possible.

The trench bottom shall be free of bumps or hollows and graded to provide uniform support along the length of pipe.

Excess excavated material shall become the property of the Contractor and shall be removed and disposed of away from the job site at the Contractor's expense. Full compensation for the removal and disposal of excess or unsuitable material shall be considered included in the contract unit prices paid for the various items of work and no additional compensation will be allowed therefore.

Pipe bedding and backfill shall be placed above and below the pipe to the lines and grades shown on the City of Stockton Standard Plans Nos. R36 through R43, as shown on the plans, and as specified in these Special Provisions.

Delete Section 19-3.03E, "Structure Backfill", of the Caltrans Specifications and substitute the following:

"Pipe bedding, envelope, and trench backfill material shall consist of imported material, free from vegetable matter and other deleterious substances and shall form a firm, stable base when compacted. The percentage composition weight by weight shall conform to the following grading:

<u>Sieve Size</u>	<u>Percentage</u>
	<u>Passing</u>
1"	100
¾"	90-100
No. 4	35-60
No. 30	10-30

The material shall conform to the following quality requirements:

	<u>Requirements</u>
Resistance (R-value)	78 min.
Sand equivalent	25 min.

In no case shall native excavated material be used as pipe bedding, envelope, and trench backfill.

Bedding material shall be placed to approximately the same elevation on both sides of pipe to prevent unequal loading and displacement of the pipe. The difference in elevation of the bedding backfill on either side of pipe shall not exceed six (6) inches at any time.

Trench backfill shall consist of the trench area from the top of the pipe bedding to the ground surface, or if within a roadway, to the bottom of the roadway subgrade.

Backfill shall be compacted by impact, vibration, or by a combination of these methods, as approved by the Engineer. However, impact type compactors shall not be used around or over PVC pipe until backfill over the top of the pipe will permit compaction of the backfill material without deflecting or damaging the pipe. Jetting will not be permitted.

All backfill shall be placed in maximum eight (8) inch uncompacted lifts.

Compaction shall be determined by ASTM D1557.

The Contractor shall place temporary surfacing promptly after backfilling and shall maintain such surfacing until permanent paving work can be installed.

Temporary paving shall consist of asphalt cutback rolled to provide a smoother surface. All edges shall be contoured to provide a smooth transition between the existing grade and the cutback surface. The Contractor shall maintain the surface free of depressions, bumps, loose pieces, and other defects at all times. During wet weather, the Contractor shall provide a solid, non-skid surface over temporary pavement to protect the surface from damage by traffic.

Temporary pavement shall be replaced with permanent pavement, as soon as is practical after the trench is backfilled and as allowed by the Engineer.

Until the permanent pavement is placed, the base rock and temporary asphalt plant mix at the surface of the trench shall be maintained at all times. Continuous inspection and maintenance of the trench area will be required.

Any excavation shall also conform to the provisions in Section 100, "Street Opening and Pavement Restoration Regulations" of the Standard Specifications.

19-1.03 Dewatering

Attention is directed to Section 19-3.03B, "Structure Excavation", of the Caltrans

Specifications and these Special Provisions.

If an NPDES (National Pollutant Discharge Elimination System) is required for disposal of water from construction dewatering activities, it shall be obtained by the contractor prior to any dewatering activities. Contractor shall comply with SWRCB requirements for discharging water from any dewatering operation, including obtaining all necessary permits, testing, and/or monitoring.

Dewater the excavation if ground water is encountered. Continue dewatering before and during subsequent excavation to prevent damage to the work. Foundation must be free of water when footing concrete or pipes are placed.

The contractor shall dispose of the water so as not to cause damage to the public or private property, or to cause a nuisance or menace to the public or violate the law. Dewatering shall be installed and operated so that the groundwater level outside the excavation is not reduced to the extent which would cause damage or endanger adjacent structures or property. The static water level shall be drawn down a minimum of 1 foot below the bottom to excavations to maintain the undisturbed state of natural soils and allow the placement of any fill to the specified density. The control of groundwater shall be such that softening of the bottom of excavations, or formation of "quick" conditions or "Boils", does not occur.

Full compensation for doing all the work involved in dewatering, water control and bedding and backfilling, and placement of temporary paving shall be considered as included in the contract prices paid for the various items of work requiring "Dewatering" and no additional compensation will be made therefore.

DIVISION VI STRUCTURES

SECTION 52 – REINFORCEMENT

52-1.01 Reinforcement

Reinforcing steel reinforcement shall conform to the provisions in Section 52, "Reinforcement", of the Caltrans Specifications. All rebar shall be Grade 60.

DIVISION VIII MISCELLANEOUS CONSTRUCTION

SECTION 77– ELECTRICAL SYSTEMS

77-1 Signal and Lighting Systems

Furnishing and installing traffic signals shall conform to Sections 86, "Electrical Work," and 87, "Electrical Systems," of the Caltrans Specifications, Section 86, "Electrical System" of the Standard Specifications, California MUTCD, and these Special Provisions.

77-1.01 Scope

- a. Work covered under this division shall include furnishing all labor, material, tools, equipment, and incidentals and doing all work involved which is required for the complete installation of the electrical work.
- b. Work or equipment not specified or shown on the Plans which is necessary for the proper operation of the work in this area shall be provided and installed at no additional cost.

77-1.02 Regulations and Code

Regulations and Code shall conform to Section 86-1.01D(1) of the Caltrans Specifications. Nothing in these plans or specifications shall be construed to permit work not conforming to the most stringent of applicable codes.

All individuals who perform work as electricians (to electrical connections 100 volt-amperes or more; Commercial and Industrial wiring, underground conduit installation, finish work and fixtures, and fire life safety), for contractors licensed as class A and C-10 electrical contractors, shall be certified according to Labor Code Sections 3099 and 3099.2. Additionally, the contractor's representative in charge on-site shall possess an IMSA certificate.

77-1.03 Certificate of Compliance, Warranties, Guarantees and Instruction Sheets

Certificate of Compliance, Warranties, guarantees and instruction sheets shall conform to Sections 86-1.01C(6), 86-1.01C(8), and 87-2.01C of the Caltrans Specifications and these Special Provisions.

All equipment furnished shall be guaranteed to the City by the manufacturers for a period of not less than one- (1) year following the date of acceptance of the project. If any part (or parts) is found to be defective in materials or workmanship within the one year period and it is determined by the Engineer or by an authorized manufacturer's representative that said part (or parts) cannot be repaired on the site, the manufacturer shall provide a replacement part (or parts) of equal kind and/or type during the repair period and shall be responsible for the removal, handling, repair or replacement, and reinstallation of the part (or parts) until such time as the traffic signal equipment is functioning as specified and as intended herein; the repair period shall in no event exceed seventy-two (72) hours, including acquisition of parts.

The one- (1) year guarantee on the repaired or replaced parts shall again commence with the date of acceptance of the project.

77-1.04 Description

Traffic signal work is to be performed at the locations shown on the Plans. Work or equipment not specified or shown on the Plans which is necessary for the proper operation of the work in this section shall be provided and installed at no additional cost.

Any Contractor-requested change, from approved Plans and Specifications, shall be made in writing to the City. No changes shall be made in the field without written approval of requested changes by the City.

The contractor is responsible to take all necessary precautions and use best practices in the industry to perform all work require to complete the project.

77-1.05 Materials General

The Contractor shall furnish and install all materials required to complete the work under this contract.

77-1.06 Equipment List and Drawings

Equipment list and drawings shall conform to the provisions in Section 86-1.01C(1) of the latest Caltrans Specifications, and these Special Provisions.

All equipment and materials that the Contractor proposes to install shall conform to these specifications and contract plans. A list of substitute equipment and/or materials along with a written descriptive summary, describing the functions of the components, which the Contractor proposes to install, shall be submitted along with his bid proposal. The list shall be complete as to the name of manufacturer, size and identifying number of each item. The list shall be supplemented by such other data as may be required. In all cases, the judgment of the Engineer shall be final as to whether substitute equipment and/or material recommended by the Contractor conform to the intent of these specifications.

THE CONTRACTOR SHALL FURNISH FINAL AS-BUILT DRAWINGS.

77-1.07 Foundations

Foundations shall conform to the provisions in Section 56-3 "Standards, Poles, Pedestals and Posts", Section 87-1.03E(3) "Concrete Pads, Foundations, and Pedestals" of the Caltrans Specifications and these Special Provisions.

Certification of the concrete shall be received from the vendor and delivered to the City Inspector at the time the concrete is poured. The foundation shall be cast monolithically up to the top 2 inches which shall be placed after the standards have been plumbed. Construction of Concrete foundations includes placement of reinforcement required per City standards.

Attention is directed to Section 51-1, "General," of the latest Caltrans Specifications regarding bonding, cold joints and construction preparations for same.

Dimensions of concrete footings for City of Stockton signal standards are shown on City of Stockton Standard Plans, Drawings R93 and R95. The 1-B pole foundation shall be installed in conformance with the City of Stockton Standard Drawings number R95.

77-1.08 Standards, Steel Pedestals and Posts

Standards, steel pedestals and posts shall conform to the provisions in Section 56.3 "Standards and Poles", and Section 87-1.03J "Standards, Poles, Pedestals, and Posts" of the Caltrans Specifications and these Special Provisions.

The Contractor shall have the Engineer locate the position of mast arm poles to determine if mast arms will be in conflict with existing overhead utilities. If relocation of utilities is required, immediate notification shall be given to the appropriate utility company.

Type 1-B shall have four (4)-bolt foundation, utilizing a cast iron pipe flange with eight (8) holes, with ornamental bolt cover. On Type 1-B poles, the ornamental cover shall rest on grouted surface. The 1-B pole shall be installed in conformance with the City of Stockton Standard Drawing number R95. The contractor shall furnish and install the ornamental cover.

All unused signal head tenons shall be capped.

The Type 15, Type 15 Duplex, and Type 15TS Lighting Standards shall be installed in conformance with the City of Stockton Standard Drawings number R88 through R92.

Grout height under poles shall be the height of the leveling nut plus a washer as a minimum and the height of the leveling nut, washer and one half inch as a maximum. This height will be measured from the highest point of grade under the pole.

All nuts used to attach standards to foundations and all bolts and nuts used to attach mast arms to standards shall be tightened with the correct size socket or box wrenches.

77-1.09 Conduit

Conduit shall conform to the provisions in Section 87-1.03B, "Conduit Installation," of the Caltrans Specifications and these Special Provisions.

All Conduits shall be Poly Vinyl Chloride (PVC), Schedule 80 with rigid steel sweeps. IMC conduit shall not be accepted. With the exception for bends to and from pull boxes and foundations the conduit shall run straight and true so that cable pulling forces are minimized. There shall be no more than 180 degree in bends. An intermediate pull box can be installed to relieve the need for additional bends at the Contractor's cost.

Insulated bonding bushings will be required on metal conduit. All nonmetallic conduits shall have a No.8 stranded (with green insulation) copper bounded/grounding wire. These bounding/grounding wires shall be connected in the pull box with cable connectors - Burndy-Servit No. KS -15 or an approved equal meeting Caltrans specifications.

Conduits into pull boxes and pole foundations shall be rigid metal and have 90-degree sweeps. Plastic pulling bells shall be installed on all conduit ends before conductors are pulled through the conduits.

After conductors have been installed, the ends of conduits terminating in pull boxes and/or controller cabinets will be sealed with an approved type of sealing compound. Refer to the City of Stockton Standard Drawing R87 for conduit/pull box details.

Refer to City of Stockton Standard Plan Drawing R37 for trench width and depth. All conduits shall be installed below the existing AC pavement regardless of the depth of the existing AC pavement.

All excavated areas in the street or sidewalk shall be completely backfilled or covered at the end of each working day and approved by the Engineer.

Where existing conduits are to be used, as directed by the Engineer, the existing conduit shall be cleaned and both old and new cables shall be pulled into the existing conduit as a unit per the Caltrans Specifications Section 87-1.03F, "Conductors and Cable Installations".

Fiber Optic Interconnect Conduits

The 2.5" rigid metal conduit between #6E pull box and the controller cabinet (for fiber optic interconnect) shall have 90-degree sweep and large radius bend. Conduit sweeps into No. 6E pull boxes on fiber optic interconnect runs shall enter, with rigid sweeps, at 45 degrees (in vertical plane). Sweeps shall be at least 24 inches below finished grade, unless approved by engineer. A pulling bell shall be installed at the end of each conduit. 3.0" PVC Schedule 80 conduit shall be installed between #6E pull boxes on fiber optic interconnect runs.

All fiber optic interconnect conduits with fiber cable shall include one 1250lbf detectable Muletape with 22 AWG wire. A detectable Muletape shall be installed after Fiber Optic cable installation for future detection.

77-1.10 Colored Controlled Density Fill (CDF)

The controlled density fill for the installations of all conduits shall be a red color to distinguish the concrete backfill from other concrete and soil. The concrete shall be pigmented by the addition of commercial quality cement pigment to the concrete mix.

The red concrete pigment shall be LM Scofield Company; Orange Chromix Colorant; or Davis Colors; or accepted equivalent. A minimum of 5 lbs. of red tint pigment shall be used per cubic yard of the CDF mix.

77-1.11 Pull Boxes

Pull boxes shall conform to the provisions in Sections 86-1.02C "Pull Boxes" and 87-1.03C "Installation of Pull Boxes" of the Caltrans Specifications, these Special Provisions, and in conformance with the City of Stockton Standard Drawings number R87.

When a pull box is subjected to vehicular traffic load, the cover shall be steel embossed with a non-skid pattern.

Pull boxes shall be placed at same elevation as adjacent standard base, service cabinet base or signal controller cabinet base if not an existing or future sidewalk area and elevation is not shown on plans. Pull boxes shall be five feet (5') from base or as shown on the plans. Pull boxes in existing or future sidewalk areas shall be placed at sidewalk elevation. The pull box elevation for pull boxes installed in median areas shall match the slope of the two adjacent curbs. The pull box elevation for pull boxes installed in planting areas adjacent to sidewalk or sidewalk area shall be at sidewalk grade. Pull boxes shall not be installed in part of wheelchair ramps, driveways or traveled way.

When pull boxes are placed in dirt and planting areas, a concrete collar shall be constructed around the pull box. The concrete collar shall be a minimum 12 inch concrete collar by 4 inch thick and at least 4 inches along the sides of the pull box to the bottom edge. The top of the pull box shall match slope of the adjacent top of curb. The surface elevation of the collar shall match the surface elevation of the pull box and slope away from the pull box at a rate of 1:50 (2%) slope.

The Contractor shall clean all existing pull boxes entered for installation of conduit or wire of all dirt and debris. All pull box lids damaged by Contractor operations shall be replaced at his/her expense. The wiring in these pull boxes shall be neatly bundled, recoiled and reinstalled in the box. Where existing pull boxes are removed and replaced with new larger boxes the existing conduits shall be cut back. When the conduits are cut, the existing conductors must either be removed or well protected. The ends of the cut conduits must have bushings placed on them.

Grout in bottom of pull boxes will not be required. Pull boxes shall be set on 6 inches of crushed rock for drainage. The conduits in the pull boxes shall be placed 2" above the crushed rock.

Recesses for suspension of ballasts will not be required.

All pull boxes shall be No. 5 unless otherwise noted on the plans.

All pull boxes shall have lids embossed with "TRAFFIC SIGNAL".

All pull boxes shall include copper grounding rods per City Standard Drawing No. R87.

All pull boxes on fiber optic interconnect runs shall be # 6 unless otherwise noted on the plans. All conduit sweeps into No. 6 pull boxes on fiber optic interconnect runs shall be 45 degrees. Contractor shall leave at least 20-foot fiber cable slack in each pull box run, between exiting conduit and entering conduit. The pull boxes shall have lids embossed with "INTERCONNECT".

A State Standard Number 6E pull box with extension (17" x 30" x variable depth (inside dimensions)) shall be installed adjacent to the traffic controller cabinet for fiber optic interconnect cable. The seam between pull box and extension shall be grouted. The optional base slab of the 6 (T) PB shall not be used. Contractor shall leave at least 50-foot fiber cable slack in pull box, between exiting conduit and entering conduit.

77-1.11.01 Street Lighting Pull Boxes

All street lighting pull boxes shall have security lids, and backfilled as indicated on City of Stockton Standard Drawing No. R87. All pull boxes shall have lids embossed with "STREET LIGHTING".

77-1.12 Conductors and Wiring

Conductors and wiring shall conform to the provisions in Sections 86-1.02F, 86-1.02I, 87-1.03F, 87-1.03H, 87-1.03I, and 87-1.03N of the Caltrans Specifications and these Special Provisions.

The Contractor shall install individual conductors type THW Polyvinyl Chloride (600 volt). Signal wires, Street Light wires, and White Neutral wires shall be 14 AWG, 10AWG, 12AWG, respectively. Signal cable shall not be used. Inert lubricant shall be used in placing conductors in the conduit.

All conductors that are to be spliced together shall be twisted a minimum of 5-turns and soldered. Then, the joint shall be held by mechanical means before insulating in accordance with Method "B."

When new conductors are to be added or existing conductors are to be removed from existing conduit, all conductors shall be removed; the conduit shall be cleaned as provided in Caltrans Specifications, Section 87-1.03F, "Conductors and Cable Installations"; and both old and new conductors as shown on the plans, shall be pulled into the conduit as a unit.

All field wiring terminating in the traffic signal controller cabinet or service cabinet shall be fastened to the termination panels with one piece copper solderless/crimpleless wire lugs. Solderless/crimpleless lug shall have offset shank and have a maximum wire size capacity of 6.

77-1.13 Fused Splice Connectors

Fused splice connectors as specified in Sections 86-1.02N "Fused Splice Connectors" and 87-1.03N "Fused Splice Connectors," of the Caltrans Specifications shall be required. Fused splice connectors shall be installed in the base of the poles, next to the inspection plate. No pigtail is allowed on the fuse holders.

77-1.14 Bonding and Grounding

Bonding and grounding shall conform to the provisions in Sections 86-1.02F(1)(c)(i), 86-1.02O, 87-1.03F(3)(c)(i), 87-1.03J, and 87-1.03O of the Caltrans Specification and these Special Provisions.

Grounding jumper shall be attached by a 3/16 inch or larger brass bolt in the signal standard or controller pedestal and shall be run to the conduit, ground rod or bonding wire in adjacent pull box. Grounding Rod shall be 5/8" in diameter and 8 foot in length.

In addition, because of past conflict monitor electronic problems associated with grounding, the Contractor shall be required to install a total of four (4) conductors between

the service pedestal and the controller cabinet. These conductors shall be installed as followed;

Green Conductor - No. 8 stranded conductor from Ground Bus #2 in controller cabinet to ground bus in service pedestal.

White Conductor - No. 8 stranded conductor from Ground Bus #1 terminal in the controller cabinet to the neutral bus in the service pedestal.

Black Conductor - No. 8 stranded conductor from the power terminal in the controller cabinet (312B) to service breaker.

Bare Copper Conductor - No. 10 solid conductor from Ground Bus #2 in controller cabinet to conduit grounding bushing in pull box.

Grounding jumper shall be visible after cap has been poured on foundation.

77-1.15 Service

Service shall conform to the provisions in Sections 86-1.02P, 87-1.03L, and 87-1.03P of the Caltrans Specifications and these Special Provisions. Each service shall be suitable for the short circuit current available at its supply terminal.

Refer to Type III AF wiring diagram on improvements plans.

If service equipment cabinet design deviates in any way from the details shown on the, details of such deviation shall be submitted to the Engineer for review before fabrication of the contract cabinets. If deemed necessary by the Engineer, one complete prototype cabinet shall be delivered to the Engineer for review at least 30 days before fabrication of the contract fixtures. The prototype cabinet will be returned to the Contractor and if permitted by the Engineer, the cabinet may be installed in the work.

The Contractor shall furnish and install Type III-AF single meter service equipment. Cabinets (See State of California Standard Plan ES-2C and ES-2D) conforming to City of Stockton Specifications shall be constructed with anodized aluminum and per the Caltrans Specifications Sections 86-1.02Q, 86-1.02P, and 87-1.03Q. A 40 amp, 120 volt, metered circuit shall be furnished to the controller cabinet for traffic signal operation. The Contractor shall confirm and provide all service requirements with Pacific Gas and Electric Company, and the City of Stockton. Refer to Attachment A (PG&E service confirmation letters). Note: 120/240 volt service houses a 4 jaw meter socket, 120/208 volt service houses a 5 jaw meter socket.

Service Cabinet Fabrication:

- Maximum width 12", Maximum height 63" with a minimum of 60" maximum depth 9". Minimum opening to control section 8.25" x 39.25".
- **Cabinet shall be fabricated with anodized aluminum.**
- Internal part shall be fabricated for 14-gauge cold steel.

- Cabinet shall be welded construction with welding materials specifically designed for material used.
- All fasteners, hinges, latches, and hardware shall be of stainless steel and hinges shall be continuous piano style.
- There shall be no exposed nuts, bolts, screws, rivets, or other fasteners on the exterior.
- Cabinet shall have enclosed swept pull section with removable step.
- Cabinet shall have fully framed ride hinged outer door with swaged close tolerance sides for flush fit with top drip lip and closed cell neoprene flange compressed gaskets.
- Cabinet door shall have 2,000 LB stress rated stainless hasp, welded to cabinet door.
- Base mounting detail shall be identical to existing cabinets for emergency Dead-front Safety Door.
- Distribution and control panel shall have separate hinged dead-front panels with 1/4 turn latch and knotted knobs.
- Breaker compartment shall be safety barriered from the control compartment.
- Dead front shall be hinged on the same side as the front door and shall open a minimum of 120 degrees.
- Removable back-pan shall be mounted on 4 welded 1/4" studs.
- The cabinet shall have a type II lock.

Power Distribution Panel:

- Main breakers shall be available as 1 pole, 2 pole, 3 pole, or 4 pole.
- Provide separate metered main, lighting main and disconnects as required.
- All circuit breakers shall be installed in a vertical position, handle up for "On," handle down for "Off".
- Circuit breaker shall be industrial grade, Westinghouse Quicklag C or equal to match existing.
- There shall be no plug-in circuit breakers.
- All bushing shall be UL approved copper THHN cable bussing, fully rated 125 Amps.

Control Compartment:

- There shall be a minimum 25" from base to circuit breakers.
- All components shall match existing components in use for maintenance of spare parts and known reliability.
- Contactors shall be Westinghouse Class A202 or other to match existing.
- The cabinet shall be wired to include a spare contactor for street lighting (See the wiring diagram detail).
- The cabinet shall be completely pre-wired in the factory.
- Wiring will be to NEMA IIB standards showing external connections and external equipment.
- All control wiring shall be 19 strand #14 AWG THHN.

- All control wires shall be permanently labeled with matching engraved clip-sleeve nylon markers.
- All terminals shall be permanently labeled.

Nameplates and Drawings:

- The function of all circuit breakers, switches and other components as required shall be identified by laminated engraved plastic nameplates with minimum 1/4 " letters fastened with minimum of two 1/4", #4-40 machine screws.
- Wiring schematics shall be Computer Aided Drafted and include all external equipment and connections per NEMA IIB.
- As built factory drawings shall be enclosed in clear plastic and held inside the outer door by weld hooks.

Certification:

- Manufacturers will be required to furnish independent laboratory certification of material preparation and finish and to confirm that the overall product meets these specifications. If this agency wishes to witness this testing, all costs to be paid by the Contractor.

Photoelectric Control:

- Photoelectric control shall be NEMA Type V, three-prong, twist-lock, and housed inside the service cabinet. Photoelectric control shall have an instant on/delay (5 second) off incorporated as per State Standards, to prevent cycling if struck by vehicle headlights. The photoelectric cell shall be solid-state unit and the photocell sensitivity shall be in compliance with PG&E LS rate requirements. Photocell socket must be made of metal and not plastic. The service cabinet shall be install such that the photoelectric control faces north.

A secondary photoelectric control system shall be wired from the mast arm street light to the service cabinet. After testing the secondary, the wire will be disconnected, coiled, and secured in the service cabinet until needed at a future date. The mast arm PEU shall have a north orientation. The photoelectric unit shall be a multi-voltage, instant on/ delay (5 sec) off, and three-prong twist-locking type unit. The photocells sensitivity shall be in compliance with PG&E LS rate requirements.

77-1.16 Signal Faces and Signal Heads

Signal faces, signal heads and auxiliary equipment as shown on the plans, and the installation thereof, shall conform to the provisions in Section 86-1.02R(4), "Signal Heads"; 86-1.02R(3), "Backplates"; 86-1.02R(2), "Signal Mounting Assemblies"; and 86-1.02R(1), "General", of the Caltrans Specifications and these Special Provisions.

In addition to Section 86-1.02R(2), "Signal Mounting Assemblies," of the Caltrans Specifications, the mounting bolt spacing, cable guide location and dimensions and terminal compartment shall conform to Caltrans Standard plan, ES-4D. Terminal compartments with hinged doors will not be accepted.

Backplate shall be fastened with stainless steel self-tapping screws.

All backplates shall be vented, colored satin black, and one piece.

Visors on mast arm hung signals shall be "tunnel" type and colored satin black with open slot at bottom.

Visors on side-mount and 1B-pole signals shall be "full circle" type and colored satin black.

All signal face indications shall have 12-inch sections (unless specifically noted on plans).

Polycarbonate traffic signal heads will not be accepted.

Lens doors shall be a type with a single wing nut/fastening bolt assembly, colored satin black, and made of stainless steel.

The framework for vehicle heads shall be colored traffic signal green.

TV-1 mountings on Type 1-B standards shall not be accepted.

77-1.17 Light Emitting Diode (LED) Vehicle Signal Lenses

All traffic signal heads shall be State approved LED modules. All the LED sections shall have internal fuses (Fusistors are not allowed). The external lens shall be smooth on the outside to prevent excessive dirt/dust buildup. The LED signal module lens shall be UV stabilized. The external lens shall be specifically designed with a sloped front face to reduce sun reflections (Sun Phantom). The LED module shall be supplied with an installed gasket. The red, yellow, and green ball modules shall have a visual appearance similar to that of an incandescent lamp (i.e. Smooth and non-pixelated). The optical assembly shall diffuse the light output and provide uniform illumination across the entire surface of circular lenses. Individual LED's shall not be visible to the observer of indications displayed by traffic signal modules, providing an incandescent type appearance. The LED arrow modules shall have a full, filled profile, reflecting a light distribution look and appearance similar to that of an incandescent lamp, without the individual LED's being visible. The arrows shall meet all applicable Caltrans specifications on light intensity.

The unit shall be repaired or replaced by the contractor if it exhibits a failure due to workmanship or material defect within the first 60 months of delivery. The unit shall be repaired or replaced if the intensity level falls below 50% of the original values within 60 months of delivery.

77-1.18 Pedestrian Signals - Light Emitting Diode (LED) Pedestrian and Countdown Signal Module

Pedestrian signals shall be State approved and conform to the following provisions:

GENERAL

Pedestrian and countdown LED traffic signals shall be 16" X 18" Type – Full Hand/Full

Man Overlay + countdown.

The framework for pedestrian signal indications shall be colored traffic signal green.

Pedestrian and countdown LED traffic signal modules shall be designed as a retrofit replacement for the message bearing surface of a nominal 16" × 18" pedestrian and countdown traffic signal housing built to the PTCSI Standard. **The message-bearing surface of the module shall be supplied with an overlapping, full "HAND" and "MAN" symbol,** that comply with PTCSI standard for these symbols for a message-bearing surface of the size specified. **The numbers 00 to 99 on the numerical display shall have 2 rows of LEDs and a minimum height of 9 inches.**

1-A INSTALLATION

- a. LED pedestrian and countdown signal modules shall not require special tools for installation.
- b. LED pedestrian and countdown signal modules shall fit into the traffic housings built to the VTCSH Standard without any modification to the housing.
- c. LED pedestrian and countdown signal modules shall be weather tight, fit securely in the housing and shall connect directly to electrical wiring.

1-B SIGNAL LENS

The lens of the LED pedestrian and countdown signal modules shall be polycarbonate UV stabilized and a minimum of ¼" thick.

The exterior of the lens of the LED pedestrian and countdown signal module shall be uniform and frosted to reduce sun phantom effect.

1-C LED PEDESTRIAN AND COUNTDOWN SIGNAL MODULE CONSTRUCTION

- a. The LED pedestrian and countdown signal module shall be a single, self-contained device, not requiring on-site assembly for installation into the existing traffic signal housing and include an installed gasket.
- b. All Portland Orange LEDs shall be "AlInGaP" technology or equal, and rated for 100,000 hours or more at 25°C and 20 mA. White LEDs must be InGaN technology.
- c. All internal LED and electronic components shall be adequately supported to withstand mechanical shock and vibration from high winds and other sources.
- d. The signal module shall be made of UL94VO flame-retardant materials. The lens is excluded from this requirement.
- e. Each individual LED traffic module shall be identified for warranty purposes with the manufacturer's trade name, serial number and operating characteristics, i.e., rated voltage, power consumption, and volt-ampere.

1-D ENVIRONMENTAL REQUIREMENTS

- a. The LED pedestrian and countdown signal modules shall be rated for use in the ambient operating temperature range of -40°C to +60°C (-40°F to +140°F).
- b. The LED pedestrian and countdown signal modules, when properly installed with gasket, shall be protected against dust and moisture intrusion per requirements of NEMA Standard 250-1991, sections 4.7.2.1 and 4.7.3.2, for

type 4 enclosures to protect all internal LED, electronic, and electrical components.

1-E LUMINOUS INTENSITY

- a. Pedestrian and countdown LED signal modules shall be designed to operate over the specified ambient temperature and voltage range, attract the attention of, and be readable by, a viewer (both day and night) at all distances from 3 m to the full width of the area to be crossed.
- b. The luminous intensity of the LED pedestrian and countdown signal module shall not vary more than $\pm 10\%$ for voltage range of 80 VAC to 135 VAC.

1-F CHROMATICITY

The measured chromaticity coordinates of the LED signal modules shall conform to the chromaticity requirements as follows:

“Hand” shall be Portland Orange.
not greater than 0.390, nor less than 0.331, nor less than $0.997 - x$.

Walking person shall be lunar white.
x: not less than 0.290, nor greater than 0.330
y: not less than $1.5x - 0.175$, nor greater than $1.5x - 0.130$

1-G ELECTRICAL

- a. The secured, color coded, 914 mm (36 in) long, 600V, 20 AWG minimum, jacketed wires, conforming to the National Electrical Code, rated for service at $+105^{\circ}\text{C}$, are to be provided for electrical connection.
- b. The LED pedestrian and countdown signal module shall operate from a 60 ± 3 Hz AC line over a voltage range of 80 VAC to 135 VAC. Rated voltage for all measurements shall be 120 ± 3 volts rms.
- c. The LED circuitry shall prevent perceptible flicker over the voltage range specified above.
- d. The LED pedestrian and countdown signal module circuitry shall include voltage surge protection against high-repetition noise transients and low-repetition noise transients as stated in Section 2.1.6, NEMA Standard TS-2, 1992.
- e. Catastrophic failure of one LED light source shall not result in the loss of more than the light from that one LED.
- f. The LED pedestrian and countdown module shall be operationally compatible with the currently used controller assemblies. The LED pedestrian and countdown module shall be operationally compatible with conflict monitors.
- g. The LED pedestrian and countdown module including its circuitry must meet Federal Communications Commission (FCC) Title 47, Subpart B, Section 15 regulations concerning the emission of noise.
- h. The LED pedestrian and countdown module shall provide a power factor of .90 or greater over the operating voltage range and temperature range specified above for modules with 6 watts or more.

- i. Total harmonic distortion (current and voltage) induced into an AC power line by an LED pedestrian and countdown module shall not exceed 20% over the operating voltage range and temperature range specified above.

1-H FUNCTIONS

a. Basic operation

The control and regulation module shall be of the “smart” type in order for the countdown displays to be automatically adjusted with the programmed intervals of the traffic controller.

b. Operating Modes

The module shall operate in two different modes:

- i. Full Cycle Countdown Mode – The module will start counting when the walk signal is energized. It will countdown the full walk and flashing clearance signal to reach “0” and turn off when the steady “Don’t Walk” signal turns on.
- ii. Clearance Cycle Countdown Mode – The module will start counting when the flashing clearance signal turns on and will countdown to “0” and turn off when the steady “Don’t Walk” signal turns on.

Note: The units shall be set on the Clearance Cycle Countdown Mode at the factory. The units shall be easily changed to either mode by a “jumper wire” on the back of the unit.

c. Power failure

The equipment must maintain a consistent countdown during short power failures (<1 second). A longer failure or an absence of signal superior to one (1) second must turn off display and trigger a restart system remembering the last sequence, as it is done for the NEMA traffic controller.

d. Quality Assurance

LED pedestrian and countdown modules shall be manufactured in accordance with a Vendor quality assurance (QA) program including both design and production quality assurance. All QA process and test result documentation shall be kept on file for a minimum of seven years.

e. Warranty

- i. The unit shall be repaired or replaced by the contractor if it exhibits a failure due to workmanship or material defect within the first 60 months of delivery.
- ii. The unit shall be repaired or replaced if the intensity level falls below 50% of the original values within 60 months of delivery.

77-1.19 Accessible Pedestrian Signal (APS) System

Accessible Pedestrian Push Buttons system must comply with the California MUTCD, chapter 4E. No part of the audible signal must be installed inside the controller cabinet and it shall be compatible with existing City’s system. PBS system shall consist of all electronic control equipment, mounting hardware, push buttons and signs. The PBS must have an access port for a laptop for controlling and programming the volume level and messaging. Power for the PBS must be from the pedestrian signal housing terminal

block. The system shall comply with the following requirements;

- NEMA, 250-Type 4X protection (Enclosure).
- TS4 (Electrical Reliability in section 8).
- IEC 61000-4-4 and IEC 61000-4-5 (Transient Suppression).
- FCC Title 47, Part 15, Class A (Electronic Noise).
- NEMA TS2 Section 2.1.
- Weigh less than 5 lb.
- The Control unit shall measure 7.3 by 3.6 by 1.3 inches.
- Have an internal weatherproof speaker and microphone that senses the ambient sound level.
- Adjustable operating force between 1lb and 3 lb.
- Minimum 2-inch diameter actuator.

A. The housing for the unit shall be 9”X12” (green) and made of 356 Aluminum heat-treated to meet Specification T-6. It shall be of a telescoping, vandal-proof design. The color shall be Olive Green. Adaptors may be required to install the APS pushbutton housing and the sign plate. An adaptor or a /Spacer may be required to install two 9”X12” housings side by side. The PPB shall be installed right side up to avoid water penetration.

B. The PBS must detect WALK and DON’T WALK from one Control Unit (CU) data input wire. The CU shall be mounted inside the pedestrian signal indications housing powered by 120 VAC WALK/DON’T WALK pedestrian head lamp indications, an interface panel. Each PBS shall connect to a control unit located inside its associated pedestrian signal housing. The PBS shall provide information and cues via both a vibrating arrow button and audible message indicating the” WALK SIGN IS ON”, during WALK interval. All sounds grill must be located on the back of the unit. The weather-proof speaker shall be protected by a vandal resistant screen. A sunlight visible red LED latches “ON” to confirm the button has been pushed. PBS shall include frame, sign, ADA compliant push button, and mounting hardware.

By interfacing with the Control Unit that is installed in the pedestrian signal indication housing, the PBS shall provide the following standard features:

- The system shall only have 3-wires to the PBS (power, data, ground)
- The system shall have button to button wireless synchronization capabilities via a phase partner PBS.
- The user shall be able to configure and activate the system by setting at least four different times of day on a daily, weekly, or holiday basis.
- The user shall be able to retrieve the event log by using vendor’s client application.
- The user shall be able to record and upload cumulative pedestrian count and call data.
- The user shall be able to upload voice messages, setting all volumes and features through the Bluetooth interface and using the PBS firmware.

- Confirmation of button push via latching LED, sound, and vibrotactile bounce.
- Direction of travel (with extended button push).
- Standard locating tone during Don't Walk (and clearance if desired).
- Standard voice messaging during Walk.
- Vibrating button during Walk.
- Standard locating tone or verbal countdown during clearance.
- All sounds automatically adjust to ambient over 60dB range.
- All sounds shall be synchronized.
- Extended button push shall turn on, boost volumes, and/or mute all sounds except those on activated crosswalk.
- The System shall have at the minimum seven pedestrian clearance sound options, including audible countdown.
- The system shall provide two language options.
- The system shall have at least 10 selectable WALK sound choices, including cuckoo, a chirp, a MUTCD rapid tick or custom message.

C. Mounting Height and Location. PPB's Controls shall be located no more than 5 feet offset from the extended crosswalk line, at a height of 42 inches above the finished surface, and at least 10 feet apart. The PPB's shall also be located adjacent to a paved flat area and there shall be 10 to 24-inch sides reach from the flat area to the PPB. A Push Button Frame Extender (PBFE) may be required.

D. Pedestrian Pushbutton front cover plates shall be international symbol (R10-3e MUTCD sign) and installed with security screws. The security screws shall be stainless steel, button head socket cap screws #8 diameter, 3/8 inch in length and 32 threads per inch. The socket shall be 3/32 inch Allen.

E. The Contractor shall verify with the City Traffic Engineering the types of verbal message to be programmed in each pedestrian push button.

77-1.20 Detection

77-1.20.1 Loop Detection

Detectors shall conform to the provisions in Sections 86-1.02F(1)(c)(iii), 86-1.02F(2)(d)(iii), 86-1.02W, 86-1.02U, 87-1.03U and 87-1.03V of the Caltrans Specifications and these Special Provisions.

Sensor units shall be rack mounted.

Loop detector lead-in cable, from the pull box for the detector handhole adjacent to the loop to the field terminals in the controller cabinet, shall conform to the following:

Lead-in cable shall be City approved detector loop lead-in cable and consist of 4 number 18 stranded copper conductors (Micro Loop Cable) with each conductor insulated with polyethylene. The conductors shall be twisted together with a minimum of 5 turns per

foot and the twisted pair shall be protected with a shield of aluminum polyester jacket with a thickness of 27 mils, minimum, at any point, and shall be UL listed, Style 2106. The diameter of the cable shall be 0.25-inch maximum. The diagonal pairs shall conform the following color-coding: White/Black and Red/Green.

Inductive Loop Detector Installation Details: Section 87-1.03V, "Detectors", of the Caltrans Specifications, shall be deleted and the following shall be substituted:

Loop lead-ins shall be individually identified as shown on the plans. Identification shall be by means of bands placed on the lead-in near the first splice.

The loops shall be installed in conformance with City of Stockton Standard Drawing numbers R96 through R98. All loops shall be wrapped in the slots in the same clockwise direction. The loop wire ends MUST be marked START and FINISH with loop lane/phase identification number. Splices between the loop conductors and the lead-in cable shall be made in the pull box adjacent to the loops. The loops shall be joined in the pull box in series but alternating the wire ends of adjacent loops to alternate polarity to achieve optimum sensitivity at the sensor unit. Series loops shall be marked and connected as follows. First loop - "start" end to lead-in cable. "Finish" end to "finish" wire of second loop. "Start" wire of second loop to "start" end of third loop. The alternating sequence will continue for any series of loops.

For dual left or where there are multiple lanes with presence loops adjacent to each other and the lanes are 11 feet wide and narrower, inductive loops shall be 5 feet square/diameter. For lanes wider than 11 feet, inductive loops shall be 6 feet square/diameter. All advance loops and sampler loops shall be 6 feet square/diameter, regardless of lane width.

Detector Handholes shall be Type A or B Traffic Rated, as shown on City of Stockton Standard Drawing R98. Metal triangular lids with metal rings shall be used. The point of the triangle shall face the direction of travel. Conduit from detector handhole to nearest pull box shall be 2" diameter or as shown on plans. If the handhole is located at the lip of the gutter, four (4" deep) concrete is required around the handhole.

Slots cut in the pavement shall be immediately cleaned by washing with water to remove all sawing residue and blown out and dried before installation of conductors.

After conductors are installed in the slots, the slots shall be filled with sealant. The sealant shall be at least one inch thick above the top conductor in the saw cut. Each loop shall be checked and filled with sealant after a minimum elapsed time of one hour. This is due to trapped air pockets and/or settling of the sealant.

All inductive loops and lead-in shown in areas paved with "Open Graded Asphalt Concrete" shall be installed a minimum of 2 inch deeper, as measured from the pavement surface, than shown on the drawings.

Loop detector sealant will be furnished by the Contractor. Sealant shall be Asphaltic Emulsion Induction Loop Sealant, State Spec. No. 8040-41A-15.

Loop detector sealant must be used at air temperatures above 40 degrees Fahrenheit. Sealant shall be placed 1/8 inch below pavement surface. At no time shall the sealant be installed if the ground is wet.

One-inch (1") minimum diameter holes shall be core drilled at the loop corner before slots are saw cut. Diagonal corner cuts shall not be permitted. Homerun cut must be at a 45-degree angle from any corner of the loop. If round loops are used, homerun shall be cut perpendicular to the loop slot. This prohibits the loop wire from being bent more than 90 degrees.

Conductors of all loops to be operated by each sensor unit shall be run continuous to the nearest detector handhole up to the nearest pull box. All loop wires shall have five (5) feet of slack in the pull box.

Detector loop conductors shall be Type 2 loop conductors.

Splices between loops and lead-in cable shall not be made until the operation of the loops under actual traffic conditions is approved by the Engineer. If there is more than a 24 hour lag time between the time the loops are installed and connected to the lead-in cable, both the loop conductors and the lead-in cable ends shall be water proofed until the actual splice is made (to prevent capillary action of water into the conductor insulation). The conductors and lead-in cable ends shall be waterproofed as follows:

Completely cover the conductor and lead-in cable ends with an electrical insulating coating and allowed to dry. Apply one layer of high voltage tape half-lapped then apply one layer of PVC tape half-lapped. Apply electrical insulating coating over PVC tape and at least 4 inches of conductor insulation above the cut ends.

All loops shall be marked with phase tape in the pull box as well as in the controller cabinet.

Lead-in cable for traffic signal and traffic counting installations shall be identified and banded by lane in the detector handhole and near the termination of the conduit in the controller or traffic count station cabinet. Bands shall conform to the provisions in Section 87-1.03F, "Conductors and Cable Installations," of the Caltrans Specifications.

The Contractor shall test the detectors with a motor-driven cycle, as defined in the California Vehicle Code, which is licensed for street use by the Department of Motor Vehicles of the State of California. The anodyne weight of the vehicle shall not exceed 220 pounds and engine displacement shall not exceed 100 cubic centimeters. Special features, components or vehicles designed to activate the detector will not be permitted. The Contractor shall provide an operator who shall drive the motor-driven cycle through the response or detection area of the detector at not less than 3 miles per hour or more than 7 miles per hour. The detector shall provide an indication in response to this test.

77.1.20.2 Multi Sensor Video Detection System (MSVDS)

General

The Multi Sensor Video Detection System (MSVDS) shall consist of two different technologies, video imaging and radar. The system shall detect and track vehicles at distances over 500 feet. In a low-visibility condition, the system shall be capable to switch automatically to either radar detection mode or constant call mode. The MSVDS shall fuse vehicle information from the two sensors to provide highly accurate and precise detection for simultaneous stop bar presence detection, advanced detection, and special or advanced applications. All equipment, cables, and hardware must be from the same manufacturer. The MSVDS shall match City's existing system and be compatible with City's existing cloud data collection software. No rewiring to the City of Stockton standard P controller cabinet is allowed.

System Hardware

The MSVDS shall consist of up to two hybrid video camera/radar sensors for main streets, two standard video cameras for side streets, a shelf mounted form factor Central Control Unit (CCU) with up to four detection processors capable of processing from up to four sensors, video surge suppressors, a 7-inch monitor, a keyboard, system software, and a pointing device. At locations where there is a TS1 traffic signal cabinet a SDLC Hub is required.

With use of software the system shall discriminately detects the presence of individual vehicles and bicycles in a single or multiple lanes using only the video image and sends vehicle and bicycles calls out to the controller via separate outputs. The system software shall also utilize artificial intelligence and deep learning to automatically count and detect pedestrian movement in the crosswalk, count turning movement counts and learn the back ground to count and distinguish left, through and right turn movements. The system software shall be able to work simultaneously with City's existing cloud based ATSPM and the City's cloud based DATA fusion live System. A minimum of 32 video detection zones and 32 radar detection zones per sensor shall be available.

In addition to creating vehicle and bicycle zones, the system shall provide a tracking mechanism that counts pedestrian volume moving within the crossing area, and determine the average, maximum, and minimum speed of pedestrians moving within the crossing zone. The system shall also provide discrete outputs when pedestrians are in the crosswalk during normal crossing phases (one for each direction of travel) and when a red phase input has been detected. The system shall also provide a visual indication on the video image that a pedestrian is in the crosswalk.

MSVDS Hardware

Central Control Unit (CCU)

The CCU shall be a single-rack detector card width, and provide provision for up to four sensors/cameras. The Detection Processor shall be embedded in the CCU to provide one single cabinet interface. Each sensor/camera shall be connected to the CCU via Ethernet cable. The interface connectors shall be RJ-45 type. The CCU shall have four detection status LEDs on the front panel. The CCU shall enable the loading of modified or enhanced software through either the Ethernet or front-panel USB port (using a USB thumb drive). The shelf-mount format CCU shall be powered from a 48V DC power supply. CCU power consumption shall not exceed 150 Watts. The CCU shall have logic inputs for future use.

The CCU shall incorporate surge suppression for each sensor input. The CCU shall incorporate power surge suppression both on the input power and on the power supplied to the sensors. The CCU shall incorporate power management for the various parts of the MSVDS such that if fault conditions are detected the power supply will safely shut down the power to that peripheral.

The CCU shall provide 2 USB 'A' ports on the front panel. These ports can be utilized for various functions. The USB ports shall be used as part of system setup and configuration. The CCU shall provide an output to a monitor. The port shall be HDMI. The native resolution of the monitor port shall be 1024 x 768.

An Ethernet communications port shall be provided on the front panel. The Ethernet port shall be compliant with IEEE 802.3 and shall use a RJ-45 type connector mounted on the front panel of the CCU. The Ethernet communications interface shall allow the user to remotely configure the system and/or to extract calculated vehicle/roadway information. The interface protocol shall be documented or interface software shall be provided. Each MSVDS shall have the capability to be IP addressable. The CCU shall support data rates of up to 100Mbps.

The CCU shall provide an SDLC connection to the traffic controller. The connector shall be a 'D-15' type, in compliance with NEMA TS-2 specifications. The CCU shall provide a Wi-Fi connection. The connection shall be over a standard 2.4GHz connection. The Wi-Fi connection shall be enabled and disabled by a switch on the CCU. The CCU shall provide an indicator when the Wi-Fi connection is active. The CCU shall provide a connection for a removable antenna. The antenna connection shall be a SMA Male type.

MSVDS Sensor/Camera

The MSVDS sensor shall have two components; a camera sensor and a radar sensor. The MSVDS sensor shall utilize a single shielded CAT5E or CAT6 cable for power, communications and video. Cable termination at the camera shall not require crimping or special tools. An optional RJ45 direct connector shall be made available.

The MSDS shall detect vehicles and bicycles and pedestrians in real time as they travel across each camera detection zone. Vehicles, bikes, and pedestrians' detection outputs shall be on separate channels within the same field of view. The MSVDS shall default to a safe condition, such as a constant call on each active detection channel, in the event of unacceptable interference or loss of the video and/or radar signal.

A user-selected alarm output shall be available to be used during the low-visibility condition that can modify the controller operation if connected to the appropriate controller input modifiers (Max1 or Max2). The system shall automatically revert to normal detection mode when the low-visibility condition no longer exists. An On-Screen Icon shall be displayed while the system is in this mode. Detection shall be at least 98% accurate in good weather conditions, with slight degradation possible under adverse weather conditions (e.g. rain, snow, or fog) which reduce visibility. Detection accuracy is dependent upon site geometry, sensor placement, camera image quality and detection zone location, and these accuracy levels do not include allowances for occlusion or poor video due to sensor location or quality. Detection zone setup shall not require site specific information such as latitude and longitude to be entered into the system.

In addition to the count type zone, the MSVDS shall be able to calculate average speed and lane occupancy for all the video detection zones independently. These values shall be stored in non-volatile memory for later retrieval.

The MSDS shall have the capability to change the characteristics of a detection zone based on external inputs such as signal phase. Each detection zone shall be able to switch from one zone type (i.e. presence, extension, pulse, etc.) to another zone type based on the signal state.

The On-Screen Display shall include an Automatic Traffic Volume graph. This graph will display estimated Vehicles Per Hour (VPH) per movement for each camera view. The graph will display a rolling 24-hour period of VPH. The On-Screen Display shall include an Occupancy Graph. This graph will display estimated approach occupancy for each camera view. The graph will display a rolling 24-hour period of Occupancy. The On-Screen Display shall include a Speed Graph. This graph will display average speed of vehicles through each sensor view for the last Bin Interval. The graph will display a rolling 24-hour period of Speed.

Installation

The CCU shall be appropriately grounded to the cabinet ground rod using 14 AWG (2.5mm²) minimum. The cable to be used between the MSVDS sensor/Camera and the CCU in the traffic cabinet shall be Cat-5e, shielded, direct burial. This cable shall be suitable for installation in conduit or overhead with appropriate span wire. Shielded RJ-45 connectors shall be used where applicable. The MSVDS system shall be installed by factory-certified installers as recommended by the supplier and documented in installation materials provided by the supplier. Proof of factory certification shall be provided. Each cable shall be tagged in cabinet as well as in the pull box near each associated traffic signal pole. The following configuration shall be used for Cat5e/Cat6 cable installation.

Cable Color	Phases	CCU Port
Red	2 & 5	1
Green	4 & 7	2
Blue	6 & 1	3
Yellow	8 & 3	4

Warranty

Furnish minimum of 3-year replacement warranty from the manufacturer against defects in material and workmanship or failures. The effective date of the warranty is the date of acceptance of the project. Submit all warranty documentation before installation. Replacement parts must be furnished within 10 days of receipt of a fail unit. The City does not pay for replacement. During the warranty period, updates to DP software shall be available from the supplier without charge.

Maintenance and Support

The supplier shall maintain an adequate inventory of parts to support maintenance and repair of the video detection system. These parts shall be available for delivery within 30 days of placement of an acceptable order at the supplier's then current pricing and terms of sale for said parts.

The supplier shall maintain an ongoing program of technical support for the video detection system. This technical support shall be available via telephone, or via personnel sent to the installation site upon placement of an acceptable order at the supplier's then current pricing and terms of sale for on-site technical support services. Installation or training support shall be provided by a factory-authorized representative and shall be a minimum IMSA-Level II Traffic Signal Technician certified.

77-1.21 Solid State Traffic Actuated Controllers

Solid-state traffic actuated controller units, cabinets, and auxiliary equipment shall conform to these Special Provisions.

Installation: NEMA TS 2 Type 2 Traffic Signal Controller.

NEMA TS 2 Type 2 controller, with auxiliary equipment and cabinet shall be furnished and installed by the contractor. The controller shall be in a 16-phase frame assembly with auxiliary equipment housed in a City of Stockton Standard Type P cabinet, TS 2 Type 2, as specified below. Solid-state switching devices shall conform to the provisions in Section "Solid-State Switching Devices," of these Special Provisions, and the following:

The controller shall meet the most current Caltrans Transportation Electrical Equipment Specifications (TEES) and fully field tested and accepted by the City (prior to the bid date of this special provision). Controller shall have Linux operating system. The controller shall be supplied with D4 V1.5L40(1C)9571D firmware and communicating with the City's existing KITS and TransSuite central traffic control servers. The controller shall be provided with the following items:

- 1) Quality Control (QC) test sheet
- 2) Vendor's test report
- 3) All the accessories, including 1B, and ATC communication modules

- 4) One copy of the latest D4 user manual
- 5) 4 GB USB flash drive

77-1-21.1 Solid-State Switching Devices

Signal light circuits shall be controlled externally to each controller unit by 3-circuit solid-states switching devices, which shall be plug-in mounted to a base. Each circuit shall have a minimum rating of 1,000 watts for tungsten lamp or gas tubing transformer load at 120 volts, AC. Solid-state switching devices shall be unaffected by transient voltages when tested in accordance with California Test 667. The switching devices shall meet the requirements of Section 5, "Solid-State Load Switches" of NEMA Standards Publication No.TS1.

Solid-state switching devices shall be provided with an indicator light for each lamp circuit input. The light shall be visible when viewing the installed switching device. No other equipment within the controller cabinet shall use a socket, which will accept a switching device.

77-1-21.2 NEMA TS 2 Type 2 Controllers

TS 2, Type 2 NEMA controller with auxiliary equipment will be furnished and installed by the contractor. The controller shall be in a 16-phase frame assembly with auxiliary equipment housed in a cabinet. Solid-state switching devices shall conform to the provisions in Section 77-1.21.1, "Solid-State Switching Devices," of these Special Provisions, and the following:

The controller unit shall meet the most current Caltrans Transportation Electrical Equipment Specifications (TEES) (prior to the bid date of this special provision).

The controller unit shall meet the requirements of NEMA TS-2 2003 V2.06 Actuated Controller Unit Standards. It shall also meet TS 2 Type 2, ATC 5.2b, and NTCIP 1201 and 1202 requirements. The controller shall satisfy the following minimum hardware and feature requirements:

Central Processor Unit (CPU)

- Open architecture platform with standard Linux operating system
- MPC8306 266MHz 16-bit processor
- 256MB FLASH, 256MB DRAM, and 2MB Non-volatile SRAM
- Real-time clock
- Power supply will power the SRAM during power failures

Keyboard and Display

- LCD Display with 16 lines of 40 characters
- 7x4 keypad

Communications

- 2x SDLC ports
- 2x ENET 1 100 Base-T Ethernet ports
- ENET 2 100 Base-T Ethernet port

- 2 USB 2.0 Ports
- 3x Serial connection port
- Unique MAC address assigned by the Institute of Electrical and Electronic Engineers (IEEE)

Controller Housing

- 1 expansion slot for 2070 form factor communication module
- All-metal housing
- NEMA base with NEMA TS 2 Type 2 “A”, “B”, “C”, and Caltrans standard “D” connectors
- NEMA TS 1 small “A” connector
- Controller shall not have VME chassis

Other Hardware

- Controller shall have physical power on/off switch
- The dimensions of the controller shall not exceed 10” H x 11” W x 11” D
- Controller shall be equipped with a minimum 2-amp, 65W triple output switching power supply with minimum MTBF of 270,000 hours

Software

- Controller shall be capable of remote software upgrades without putting the signal in flash
- Controller shall be capable of running multiple different local traffic signal control softwares

77-1-21.3 BLANK

77-1.22 Traffic Signal Controller P Cabinet Specifications

City of Stockton traffic signal cabinet specification shall supersede any applicable parts of the State of California, Department of Transportation Standard Specifications and Standard Plans. This specification shall apply to all controller cabinet types with noted exceptions.

All specifications not covered by these specifications shall conform to the latest Caltrans Standard Specifications and Standard Plans. Traffic signal cabinet shall also comply with NEMA specifications where applicable.

The controller cabinet shall be furnished and installed by the contractor. The controller cabinet shall be equipped with all auxiliary equipment and plug-ins which are capable of operating 8 vehicle phases and 4 pedestrian phases (NEMA TS-2, Type 2). Solid-state switching devices shall conform to the provisions in Section Solid-State Switching Devices," of these Special Provisions and the following:

The cabinet manufacturer shall have pre-approval by the City of Stockton on any cabinet that they propose to provide to the City. Said pre-approval shall have been obtained no less than 30 days prior to the closing date of the bid. The cabinet shall be

completely wired and tested to the 2003 NEMA Traffic Controller Assemblies specification with NTCIP Requirements Version 02.06 (as amended here in). In addition, and at a minimum, the following requirements shall be met:

The cabinet shall be wired for up to a minimum of (32) channels of detection and (4) channels of EVP preemption.

The use of PC boards shall not be allowed except in detector racks & SDLC interface panels.

The use of plug and play modules shall not be allowed, with the exception of detector rack(s).

All cabinet 120VAC wires shall be 18AWG or greater, including controller "A" and MMU "A & B" cables.

The complete cabinet assembly with electronics shall undergo complete input/output function testing by the manufacturer before being released to the City of Stockton.

Cabinet Enclosure

At a minimum the cabinets shall meet the following criteria:

1. It shall have nominal dimensions of 56" high x 44" width x 25.5" depth and meet the footprint dimensions as specified in Section 7.3, Table 7-1 of NEMA TS2 standards for a Type P cabinet. The cabinet base shall have continuously welded interior mounting reinforcement plates with the same anchor bolt hole pattern as the footprint dimensions.
2. Shall be fabricated from 5052-H32 0.125-inch thick aluminum.
3. The cabinet shall be double-flanged where it meets the cabinet door.
4. The top of the cabinet shall be sloped 1" towards the rear to facilitate water runoff. And shall bend at a 90° angle at the front of the cabinet. Lesser slope angles are not allowed.
5. The inside of the cabinet shall utilize C channel rails. (2) Welded on the back wall on 34" center and (4) welded on each side wall on 08" center with 04" between sets. The C channel rails on the back wall shall be 35" in length and start 5" from the bottom of the cabinet interior. The C channel rails on the side walls shall be 48" in length and start 5" from the bottom of the cabinet interior. Adjustable rails are not allowed.
6. The Cabinet shall be supplied with an anodized finish as per the most current California Standard Specification, Sections 86-1.02P, "Enclosures," and 87-1.03Q, "Cabinets" (prior to the bid date of this special provision). Submit alternative design details for review and approval before manufacturing a cabinet.
7. All external fasteners shall be stainless steel. Pop rivets shall not be allowed on any external surface.

8. The door handle shall be ¾" round stock stainless steel bar.
9. The main door shall contain a police door with a conventional police lock. A key shall be provided for both the cabinet lock and the police door lock. The police door shall be recessed into the main door so that the police door is flush with the main door. A closed-cell, neoprene gasket seal shall be bonded to the enclosure doors. A stiffener plate shall be welded across the width of the inside of the main door to prevent flexing. A main door bar stop shall be a two-position, three-point stop that accommodates open-angles at 90, 125, and 150 degrees. A louvered air entrance located at the bottom of the main door shall satisfy NEMA rod entry test requirements for 3R ventilated enclosures. Bearing rollers shall be applied to ends of door latches to discourage metal-on-metal surfaces from rubbing. The lock assembly shall be positioned so handle does not cause interference with key when opening the door.
10. The cabinet shall be equipped with a universal lock bracket capable of accepting a Best™ style lock and a Corbin #2 tumbler series lock. The cabinet shall come equipped with a Corbin #2 lock.
11. The cabinet shall be supplied with three door switches which control the door open status, the cabinet interior lighting circuits and the MMU override circuit.
12. All exterior seams shall be manufactured with a neatly formed continuously weld construction. The weld for the police box door shall be done on the inside of the cabinet door. All welds shall be free from burrs, cracks, blowholes or other irregularities.
13. The fan baffle panel seams shall be sealed with RTV sealant or equivalent material on the interior of the cabinet.
14. The cabinet shall be UL listed.
15. The cabinet shall come with lifting ears affixed to the upper exterior of the cabinet. These ears shall utilize only one bolt for easy reorientation.
16. The cabinet shall come with one (1) dual-ply Dustlock™ Media polyester, disposable air filter; and the filter performance shall conform to listed UL 900 Class 2 and conform to MERV-8 & ASHRAE Standard 52.2-1999. The filter element shall be secured to louvered entrance on the main door with Velcro type mounting on all four edges. The Velcro adhesive shall be rated for high temperatures.
17. The door shall be mounted with a single continuous stainless steel piano hinge that runs the length of the door. The hinge shall be attached via stainless steel tamper resistant bolts.
18. The wired cabinet facility shall use the latest technology applicable and shall be 100% compliant with Section 1605 of the American Recovery and Reinvestment Act of 2009, requiring the use of American iron, steel and manufactured goods. The contract shall provide a "Buy America" certificate.

19. Fire Pre-empt: When a fire pre-empt is specified, either by special provisions or noted on plan with requirement of hardwired interconnect to firehouse, a pre-empt isolation relay panel shall be installed. This panel shall be easily installed without extensive modification to cabinet. If the cabinet is replaced, the modular pre-empt panel shall be easily transferred to a standard City of Stockton cabinet.
20. Vehicle Pre-empt: The vehicle pre-empt shall comply with the Section 77-1.30 “Priority Control System” of this special provisions. The Optical discriminator card shall include the ability to directly sense the green signal indications from traffic signal controller through the use of dedicated sensing circuits and wires connected directly to the field wire termination points in the traffic signal controller cabinet. The discriminator card shall be a plug-in, four (4)-channel, multiple-priority device intended to be installed directly into a card rack, without any modifications to the card rack, located within the traffic signal controller cabinet. The discriminator card shall be able to detect encoded infrared as well as other signals and provide coordinated inputs to the traffic signal controller. The cable, which connects the discriminator card to the auxiliary panel and the harness wires, shall be installed in the traffic signal cabinet prior to shipping the cabinet to the City’s Corporation Yard for testing. Two directions with the same phasing (like; 2-6 and 4-8) shall have separate wiring from traffic signal cabinet to the proper signal poles. The traffic signal cabinet shall be wired such that the two phases do not turn green, at the same time, during vehicle pre-emption in only one direction. The following configuration shall be used for detection.

Channel	Phases	Controller
A	2 & 5	3
B	4 & 7	4
C	6 & 1	5
D	8 & 3	6

A 6-foot Cat5e (Red Color) cable and a SFP-1 Copper 10/100/1000 Mbps RJ45 Small Form-Factor Pluggable module shall be furnished to enable the phase selector to communicate through the Ethernet switch with EVP central software.

21. Railroad Pre-empt: For railroad pre-empt, please refer to plans. The City does not have a standard configuration for railroad pre-empt. Cabinet design engineer shall submit to the City a written schematic of the proposed railroad pre-empt configuration. This schematic design shall be approved by the City prior to the construction of the traffic signal cabinet. If illuminated directional signs required to be installed to restrict turns during railroad pre-emption, sign relay panel shall also be installed as well as pre-empt isolation relay panel in the traffic signal cabinet.

Labels

A permanent printed thermo vinyl, engraved or silk screened label shall be provided for all terminals and sockets. Labels shall be legible and shall not be obstructed by cabinet wiring, panels or cables. All labels shall conform to the designations on the cabinet wiring prints. Labels for all shelf-mounted electronics and equipment shall be on the face of the shelf directly below their placement in the cabinet.

Shelves

Shall come with two (2) double beveled shelves 10" deep that are reinforced welded with V channel, fabricated from 5052-H32 0.125-inch thick aluminum with double flanged edges rolled front to back. Slotted hole shall be inserted every 7" for the purpose of tying off wire bundles.

Cabinet Layout

The shelves shall be populated as follows. The power supply and (2) detector racks shall be placed on the top shelf. The controller and monitor shall be placed on the bottom shelf.

The roll out drawer and LED light shall be mounted under the bottom shelf just left of center.

The display panel shall be mounted on the door.

Load bay shall be mounted on the back wall with 7" of clearance to the bottom of the cabinet.

The detector panel for all field inputs shall be mounted on the lower left wall.

The "D" panel shall be mounted on the left wall just above the detector panel.

The SDLC and power supply interface panels shall be mounted on the left wall between the shelves.

The auxiliary panel for vehicle pre-emption shall be mounted on the left wall under the bottom shelf.

The load resistor panel shall be mounted on the left wall under the 768 panel.

The power panel shall be mounted on the lower right wall.

The 120VAC video power panel shall be mounted above the power panel.

The 120VAC six position power strip shall be mounted on the right wall, between the shelves just under the top shelf.

One 12" x 12" blank panels shall be located on the upper right wall, at the top of the "C" channel.

Ventilating Fans

The cabinet shall be provided with two (2) finger safe fan mounted on the right and left sides of the cabinet plenum, and shall be thermostatically controlled (adjustable between 4-176° Fahrenheit). The safe touch thermostat and power terminal block(s) shall be din rail mounted on right side of cabinet plenum.

Computer Shelf

A slide-out computer shelf 16" length by 12" width by 2" depth shall be installed below the bottom shelf underneath the controller. The shelf shall be mounted just left of center

so that controller cables will not interfere with the operation of the shelf when equipment is installed. The shelf shall have a hinged cover that opens from the front and shall be powder-coated black. It shall be a General Devices Part # VC4080-99-1168. The drawer when fully extended shall hold up to 50lbs.

Main Panel Configuration (Load-Bay)

The design of the panel shall conform to NEMA TS2 Section 5, Terminals and Facilities, unless modified herein. This panel shall be the termination point for the controller unit (CU) MSA, MSB, MSC, (MMU) MSA, MSB cables and field terminal facilities. The terminal and facilities layout shall be arranged in a manner that allows all equipment in the cabinet and all screw terminals to be readily accessible by maintenance personnel.

The load-bay shall be fully wired and meet the following requirements:

- The load-bay shall have the following dimensions; constructed from aluminum with a nominal thickness of 0.125 inches, a maximum height of 19" and a maximum width of 38 inches including attached wiring bundles.
- The entire assembly shall roll down and provide access to all of the back of panel wiring. All solder terminals shall be accessible when the load-bay is rolled down. The assembly shall be able to roll down without requiring other components, cables or switches to be removed.
- The load-bay shall be designed so that all other cabinet screw terminals are accessible without removing cabinet electronics.
- All the controller (CU) and malfunction management (MMU) cables shall be routed through the back of the load-bay so that they will not be subject to damage during load-bay roll down.
- The top of the load-bay panel shall attach directly to Unistrut™ spring nuts without the use of standoffs and spacers.
- The load-bay shall be balanced such that it will not roll down when the Unistrut™ spring nuts are removed, even when fully loaded with BIUs load switches, flasher and flash transfer relays.
- The load-bay facility shall be wired for 16 channels. Load switch(s) 1-8 shall be vehicle phases 1-8; load switch(s) 9-12 shall be pedestrian phases 2, 4, 6 & 8; load switches 13-16 shall be overlaps A, B, C & D. All load switches shall be routed through a flash transfer relay.
- (16) Load sockets spaced on 2" center per NEMA TS2 section 5.3.1.2, Figure 5-2.
- (8) Flash transfer relay sockets.
- (1) Flasher socket.
- All load switches and flasher shall be supported by a bracket extending at least ½ the length of the load switch.
- Wiring for controller A, B & C connectors. All CU wiring shall be soldered to backside of a load bay screw terminal. The screw terminals provide access to all functions of CU cables.
- Wiring for one Type-16 MMU. All MMU wiring shall be soldered to backside of a screw terminal. The screw terminals provide access to all functions of the MMU.
- All 24 VDC relays shall have the same base socket, but it shall be different from the 115VAC relays.

- All 115VAC relays shall have the same base socket, but it shall be different from the 24VDC relays. (not applicable to flash transfer relays)
- Shall have a relay that drops +24VDC to load switches when the cabinet is in flash. Relay shall have a test switch for troubleshooting.
- There shall be a wire between the pedestrian yellow field terminals and another terminal on the load bay. The MMU channel 9-12 yellows shall terminate next to said pedestrian yellows terminal.
- The load-bay shall be silkscreened on both sides. Silkscreen shall be numbers and functions on the front side, and numbers only on the back side.
- Field wiring terminations shall be per channel across the bottom of the load-bay. Each channel shall have 3 terminations corresponding to the appropriate vehicle phase Red, Yellow and Green. Default wiring shall be left to right vehicle phases 1-8, pedestrian phases 2, 4, 6 & 8 and overlap channels A, B, C & D following the order of the load switches. Field terminals shall be #10 screw terminal and be rated for 600V.
- All load bay field terminals shall have a copper wire lug, Blackburn part # L35.
- All cable wires shall be terminated. No tie-off of unused terminals will be allowed.
- Shall be 100% manufactured in the United States of America

All wiring shall conform to NEMA TS2 Section 5.2.5 and table 5-1. Conductors shall conform to military specification MIL-W-16878D, Electrical insulated high heat wire, type B. Conductors #14 or larger shall be permitted to be UL type THHN. Main panel wiring shall conform to the following colors and minimum wire sizes:

Vehicle green load switch output	14 gauge brown
Vehicle yellow load switch output	14 gauge yellow
Vehicle red load switch output	14 gauge red
Pedestrian Don't Walk switch	14 gauge orange
Pedestrian Walk switch	14 gauge blue
Pedestrian Clearance load switch	14 gauge yellow
Vehicle green load switch input	22 gauge brown
Vehicle yellow load switch input	22 gauge yellow
Vehicle red load switch input	22 gauge red
Pedestrian Don't Walk input	22 gauge orange
Pedestrian Walk input	22 gauge blue
Pedestrian Clearance input	22 gauge yellow
Logic Ground	18 gauge white with red tracer
+24V DC	18 gauge red with white tracer
+12V DC	18 gauge pink
AC+ Line	14 gauge black
AC- Line	14 gauge white
Earth Ground	16 gauge green
AC line (load bay)	12/14 gauge black
AC neutral (load bay)	12/14 gauge white

Controller A cables	22gauge blue <i>with the exception of power wires (AC+ Black, AC- White & Earth Ground Green) These wires shall be 18AWG</i>
MMU A & B cables	22 gauge orange <i>with the exception of power wires (AC+ Black, AC- White & Earth Ground Green Start Delay Relay Common Black, Normally open Black & Normally Closed Black) These wires shall be 18AWG</i>

Four conductors will supply alternating current (AC) power to the load switch sockets. The load switch sockets shall be supplied 1-4, 5-8, 9-12 & 13-16 by each conductor.

The field terminal blocks shall have a screw Type No. 10 post capable of accepting no less than 3 No. 12 AWG wires fitted with spade connectors. Four (4) 12-position terminal blocks shall be provided in a single row across the bottom of the main panel. Spade lugs from internal cabinet wiring are not allowed on field terminal screws. There shall be a second row of four (4) 12-position terminal blocks with screw type #10 above the field terminal blocks. These blocks shall operate the flash program. It shall be changeable from the front of the load-bay.

The power terminal blocks shall have a screw Type No. 10 post capable of accepting no less than 3 No. 12 AWG wires fitted with spade connectors. One (1) 12-position terminal blocks shall be provided vertically on the right side of the load bay. The placement of the power terminal block on any other panel shall not be allowed.

All load switches, flasher, and flash transfer relay sockets shall be marked and mounted with screws. Rivets and clip-mounting is unacceptable.

Wire size 16 AWG or smaller at solder joints shall be hooked or looped around the eyelet or terminal block post prior to soldering to ensure circuit integrity. All wires shall have lugs or terminal fittings when not soldered. Lap joint/tack on soldering is not acceptable. All soldered connections shall be made with 60/40 solder and non-corrosive, non-conductive flux. All wiring shall be run neatly and shall use mechanical clamps and conductors shall not be spliced between terminations. Cables shall be sleeved in braided nylon mesh and wires shall not be exposed.

All field wiring terminating in the traffic signal controller cabinet shall be fastened to the termination panels with one piece copper solderless/crimless wire lugs. Solderless/crimless lug shall have a maximum wire size capacity of 6.

Load-Bay and Panel Wire Termination

All wires terminated behind the main panel or on the back side of other panels shall be **SOLDERED**. No pressure or solder-less connectors shall be used. Printed circuit boards shall not be allowed on the load bay.

Cabinet Light Assembly

The cabinet shall have an LED lighting fixture with 15 high power LEDs using a cool white color emitting 300lm min @ 12VDC/750mA. The LED shall be a Rodeo Electronics TS-LED-05M02. The LED fixture shall be powered by a Mean Well class 2 power supply LPV-20-12 that shall be mounted on the inside top of the cabinet near the front edge. The cabinet light circuit shall be designed so a second LED fixture will be installed in the cabinet without the need a of a second power supply. It shall be attached under the cabinet drawer so that it remains stationary when drawer is extended. An on/off switch that is turned on when the cabinet door is opened and off when it is closed shall activate the lighting fixture(s) power supply.

Convenience Outlet

The cabinet shall be wired with one (1) convenience outlet with a ground fault interrupter (GFI) and one (1) six position power strip outlet without ground fault interrupters. The ground fault outlet (GFI) shall be mounted on the right side of the cabinet on or near the power panel. The power strip outlet shall be mounted on the right side, between the shelves just below the top shelf. No outlets shall be mounted on the door. The GFI power shall be fed through the auxiliary breaker (CB2). The power strip outlet shall be fed through the ACO breaker (CB3).

Auxiliary Panel

The cabinet shall include an auxiliary switch panel mounted to the interior side of the police panel compartment on the cabinet door. The panel shall be secured to the police panel compartment by (2) screws and shall be hinged at the bottom to allow access to the soldered side of the switches with the use of only a Phillips screwdriver. Both sides of the panel shall be silkscreened. Silk-screening on the backside of the switch panel shall be upside down so that when the panel is opened for maintenance the silk-screening will be right side up.

At a minimum the following switches shall be included;

Controller ON/OFF Switch: There shall be a switch that renders the controller and load-switching devices electrically dead while maintaining flashing operations for purpose of changing the controller or load-switching devices. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Signals ON/OFF Switch: There shall be a switch that renders the field signal displays electrically dead while maintaining controller operation for purpose of monitoring controller operations. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Stop Time Switch: There shall be a 3-position switch labeled “Normal” (up), “Off” (center), and “On” (down). With the switch in the “Normal” position, a stop timing command shall be applied to the controller by the police flash switch or the MMU (Malfunction Management Unit). When the switch is in its “Off” position, stop timing commands shall be removed from the controller. The “On” position

shall cause the controller to stop time. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

MMU Override Switches: There shall be a switch that will allow the MMU to be removed without causing the intersection to go into flashing operation provided the cabinet door is opened. The switch shall be normally off and shall have a flip-up switch cover. This switch cover shall force the switch to the off position when closed. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Technician Flash Switch: There shall be a switch that places the field signal displays in flashing operation while the controller continues to operate. This flash shall have no effect on the operation of the controller or MMU. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Preemption Test Switches: Six (6) preempt inputs shall have momentary pushbutton test switches with red caps. These switches shall be labeled 1, 2, 3, 4, 5 & 6.

Police Panel

Behind the police panel door there shall be switches for use by emergency personnel. The wiring for these switches shall be accessible when the auxiliary panel is open. The following switches shall be included;

Flash Switch: There shall be a switch for the police that puts the cabinet into flashing operations. The switch shall have two positions, "Auto" (up) and "Flash" (down). The "Auto" position shall allow normal signal operation. The "Flash" position shall immediately cause all signal displays to flash as programmed for emergency flash and apply stop time to the controller. When the police flash switch is returned to "Auto", the controller shall restart except when the MMU has commanded flash operation. The effect shall be to disable the police panel switch when the MMU has detected a malfunction and all controller and MMU indications shall be available to the technician regardless of the position of the police flash switch. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Signals ON/OFF Switch: There shall be a switch that renders the field signal displays electrically dead while maintaining controller operation for purpose of monitoring controller operations. The switch shall be a general-purpose bat style toggle switch with .688-inch long bat.

Cables

All wire cable bundles shall be encased in flex or expandable braided sleeving along their entire free length.

All SDLC cables shall be terminated on both ends, securely terminated to the SDLC interface panel with screw type connection and professionally routed in the cabinet interior to easily reach the load bay, controller, malfunction management unit and detector racks. All SDLC connectors shall be fully populated with 15 pins each.

Flashing Operation

All cabinets shall be wired to flash for all vehicle channels. Flashing operation shall alternate between the used vehicle phases 1,4,5,8, pedestrian phases 2, 8, OLA & OLD and 2,3,6,7, pedestrian phases 4, 6, OLB & OLC. Flash programming shall be either red, yellow or no flash simply by changing wires on the front of the load-bay. Cabinet shall be supplied with vehicle and overlap phases programmed to red flash and pedestrian phases to no flash.

Detector Racks

At a minimum, the cabinet shall be wired to accommodate (32) channels of detection. One detector rack shall support (16) channels of loop detection, (1) Buss Interface Unit (BIU) and (4) channel of Emergency Vehicle Pre-emption (EVP) Detection. One detector rack shall support (16) channels of loop detection and one (1) Buss Interface Unit (BIU). Racks shall be capable of using both two channel or four channel detection devices or discriminator cards. The loop cabling shall be connected via a 37 pin DB connector using spring clips. The EVP cable shall be connected via a 24 pin connector using locking latches. The power cable shall be a 6 pin connector. All power wires shall be 18AWG. The addressing of detector racks shall be accomplished via dipswitches mounted to the Printed Circuit Board (PCB). There shall be the capability to turn off the TS2 status to the BIU for the uses of TS1 detector equipment via dipswitches mounted to the PCB. There shall be a 34 pin connector using locking latches that breaks the output from the detector to the input of the BIU, there shall also be +24VDC and logic ground on this connector. All racks shall have space at the bottom front for labeling. All racks shall be designed for horizontal stacking. Separate racks for detection and preemption are not allowed.

Vehicle Pre-emption Auxiliary Interface Panel (AIP)

There shall be an AIP installed in the cabinet. At a minimum it shall be soldered to the load switch green outputs phases 1-8. This panel shall have a protective plastic cover. The panel shall be mounted directly under bottom shelf.

Detection Panel

The detection panel shall support (32) channels of vehicle detection, (4) channels of emergency vehicle preemption detection, (8) channels or pedestrian detection and (8) pedestrian returns on a single panel. The loop wires shall be a 22AWG twisted pair, color coded as follows. Channel one brown, channel two red, channel three orange and channel four yellow. One of the twisted pair wires of all colors shall have a white tracer and land on the second position terminal of each loop. The emergency preempt wires shall be color coded as follows. +24VDC orange, preempt inputs yellow and ground blue. This panel will be mounted on the lower left side of the cabinet.

Controller "D" Panel

The “D” panel shall be a raised panel with all EPAC M type “D” and 2070N type “D” cables. The “D” cable shall be soldered to the backside of the panel. All other wires shall be mounted to the front side. This panel shall be mounted on the left wall of the cabinet above the detector panel.

Power Supply Interface Panel

The power supply interface panel shall include terminations for all the cabinet power supply inputs and outputs. It shall have a protective plastic cover. This panel shall be mounted on the left wall of the cabinet between the shelves.

SDLC Panel

The SDLC panel shall have six 15 socket DB connectors mounted to a PCB. The PCB shall be mounted to an “L” bracket for attaching to cabinet “C” channel. All SDLC cables shall attach with screw type retainers. There shall be one position with latching blocks to mate with latching spring blocks. This panel shall be mounted on the left wall of the cabinet between the shelves.

Video Power Panel

The video power panel shall have five (5) din rail mounted terminal blocks, capable of accommodating 4 size #14 wires in each hole. There shall be two (2) for 120 AC+, two (2) for 120 AC- and one (1) for ground. They shall be labeled respectively. This panel shall be mounted on the right wall of the cabinet above the power panel.

Spare Panels

A sheet metal panel 12” x 12” shall be installed on the upper right wall of the cabinet at the top of the “C” channel.

Supplemental Loads

There shall be a supplemental load panel with (4) 2.5K-ohm, 10-watt panel mount resistor. One side terminated to a (4) position terminal block tied to neutral. The other side terminated to another (4) position terminal block. This block shall be left open for future loading in the cabinet. This panel shall be mounted on the left side of the cabinet below the AIP panel.

Service Surge Suppression

The cabinet shall be equipped with an EDCO model SHP300-10 or approved equivalent surge arrestor mounted on the power panel. Power to all cabinet electronics equipment shall come through this surge suppression circuit.

The power panel shall handle all the power distribution and protection for the cabinet and shall be mounted on the lower right wall of the cabinet. All equipment shall be mounted on a 12” x 17” silkscreened aluminum panel and include at a minimum the following equipment:

- A 30-amp main breaker shall be supplied. This breaker shall supply power to the load bay, load switches and auxiliary panel. It shall also power via the EDCO SHP300-10, the controller, MMU, power supply & detector racks.
- A 15-amp auxiliary breaker shall supply power to the fans, lights and GFI.

- A 15-amp equipment breaker shall supply power to the video power panel and power strip outlet.
- A 60-amp, 125 VAC radio interference line filter.
- A normally open, 50-amp, solid-state relay. The relay shall have a green LED light that is on when energized. (No Mercury Contactors shall be allowed)
- One see-through Plexiglas cover on stand-offs to protect maintenance personnel from AC line voltages. This shall be removable by loosening screws but without removing screws.
- Two (19) position solid aluminum, tin plated neutral buss bar with raised slotted & torque style screw heads.
- One (19) position solid aluminum, tin plated ground buss bar with raised slotted & torque style screw heads.
- Two MOVs shall be terminated on the 120AC in field terminal. One tied between line and ground, the other between neutral and ground.

Display Panel

The display panel shall match the intersection geometrics and traffic signal design phasing. The display panel shall have LED indicator lights, with appropriate colors for each indication represented. The indicators shall be arranged to reflect a typical 8 phase intersection. The panel shall have 3-position detector switches oriented with each vehicle and pedestrian phase indicator light. The switches shall operate as follows; locking call (up), normal operations (middle), momentary call (down). They shall be labeled for each phase. There shall be a door switch to turn on power to the display when the door is open. When the door is closed the switch will remove all power to the indicators. The display LEDs shall be powered by the input side of the load switches. North orientation shall always be in the up direction. All vehicle and pedestrian phases' indicator **lights shall match the intersection layout**. The test switches shall be programmable by connectors on the backside of display panel.

Manuals & Documentation

The cabinet shall be furnished with (3) complete sets of cabinet prints. All cabinet wiring, and layout shall come on (1) E1 size sheet, multiple pages shall not be allowed. Upon request (1) CDROM with AutoCAD v2018 cabinet drawing for the cabinet wiring.

The following auxiliary equipment and plug-ins shall be included in the cabinet unless otherwise is noted.

Malfunction Management Unit (MMU)

The cabinet shall come with a (MMU) Reno A & E 1600 GE or approved equivalent.

Load Switch

The cabinet shall come with (12) load switches. All load switches shall be discrete type and have LED indications for both the input and output side of the load. The load switches shall be Reno LS-200.

Unused Red Jumpers

The cabinet shall be supplied with (16) unused red jumpers. They shall be made out of .063 inches thick aluminum, 2" x 11/16". The U-shaped cut-out shall be exposed aluminum with the rest of the jumper covered with red, heat-shrink tubing insulation.

Flasher

The cabinet shall come with (1) flasher. The flasher shall be discrete type and have LED indications. The flasher shall be Reno FL-200.

Flasher Transfer Relay

The cabinet shall come with (4) heavy duty flash transfer relays. The relays shall be Reno model FR-200.

Bus Interface Unit (BIU)

The cabinet shall come with (2) bus interface units (BIU). These shall meet all the requirements of NEMA TS-2 1988 standards. In addition, all BIUs shall provide separate front panel indicator LED's for DC power status and SDLC Port 1 transmit and receive status. The (BIU)'s shall be Eberle Design, Inc. model BIU700 or approved equivalent.

Power Supply (PS)

The cabinet shall come with a shelf mounted cabinet power supply meeting at minimum TS 2-2003 standards. It shall be a heavy duty device that provides +12VDC at 5 Amps / +24VDC at 2 Amps / 12VAC at .25 Amp, and line frequency reference at 50 mA. The power supply shall provide a separate front panel indicator LED for each of the four outputs. Front panel banana jack test points for 24VDC and logic ground shall also be provided. The power supply shall provide 5A of power and be able to cover the load of four (4) complete detector racks. The (PS) shall be Eberle Design, Inc. (EDI) model PS250 or approved equivalent.

Loop Amplifiers

The cabinet shall come with (8) 4-channel detector amps (Reno ½ width) WS Part # 5620040065 RENO A&E, 4-channel, TS2, 1.12 Wide Faceplate, E/2-1200-SS.

STANDARDS FOR PRE-QUALIFYING TRAFFIC SIGNAL CONTROLLERS

All local controller equipment shall be submitted to City of Stockton Signal Shop for visual inspection and field-testing (field-testing may take up to 3 weeks) prior to bidding. Only those cabinets, controllers, and modules pre-qualified will be allowed to bid.

Prequalification will be based, in part, upon quality of construction, materials used, track density of boards, ability to easily repair boards, overall physical size of controllers, ease of programming, and changes thereto of the total controller for all functions including preemption at each intersection.

CONTROLLER CABINET FOUNDATION

Type P traffic signal controller foundations shall be 18" above finished grade. All edges and corners of foundations shall be rounded or chamfered 1.5 inches radii to prevent chipping. Top surface of foundation shall have smooth or polished surface. No broom finish allowed. This is to facilitate cleaning in the future.

Anchor bolts for the controller cabinet shall extend 1-1/2 inches (plus or minus 1/8 inch) above the top of the foundation. When installing cabinet foundation bolts, install bottom set of nut and washer threaded on the foundation bolts so the nut is embedded in the concrete foundation. The bottom washer shall rest on the top of the concrete foundation. The cabinet then is placed on the washer to prevent direct contact on the concrete foundation. Mastix or plumber's tape shall be all along the base of the cabinet between the washers. After the cabinet is installed on the foundation, silicon sealant shall be used along the outside and inside of the cabinet base to ensure waterproofing. The one inch foundation drain pipe in the back of the cabinet shall be fitted with a union fitting, with the union fitting set just below the top of the foundation grade. A 4" piece of 1" pipe shall be placed in the fitting until the concrete is cured. Then the 1" pipe is removed to ensure the drain is the lowest point of the foundation and will drain properly if it becomes necessary. The foundation shall be located on Minor Street nearest approach unless indicated differently.

WORKMANSHIP - FIELD CONDUCTOR PLACEMENT

Six to eight feet of field wiring, in two to three coils shall be placed in the bottom of the cabinet. These coils shall be neatly bound using tie wraps. Each set of vehicle, pedestrian, pedestrian push button, DLC, common, camera wiring shall be incrementally brought out the coiled bundle depending on its connection point in the cabinet. All conductors or groups of conductors shall be labeled appropriately and only long enough to neatly connect to the load bay or terminal inside the cabinet. The fiber optic cable shall be securely attached to the right side of the cabinet. The connecting ends shall be long enough to be neatly placed along the back, right corner of the cabinet and brought up to the camera modem or Ethernet switch. Labeling of field conductors shall use plastic labeling tie wrap, using permanent black marker compatible with nylon or plastic ty-wrap style.

Full compensation for conforming to the provisions in this section shall be considered as included in the contract price paid for "Traffic Signal and Electrical" and no additional compensation will be allowed therefor.

77-1.23 Luminaires and Numbering Street Lighting poles and traffic signal poles

The Contractor shall furnish and install luminaires with accordance to City of Stockton Standard Drawing R88 through R93 with the exception of the LED luminaires at signalized intersections, which shall be able to deliver 4000K(NW) color and 13,270 lumens at 107 watts.

77-1.23.1 Copper and Wire for Street Lighting

The work shall consist of furnishing and installing street light conductor in conformance with the plans, these Specifications, and as directed by the Engineer.

Copper wire shall be UL approved A.W.G. No. 8 Minimum, 7-strand soft copper, type THWN or THHN with minimum of 3/64 in. polyvinyl chloride insulation, unless otherwise noted. No. 10 in pole may be used.

Full compensation for furnishing all labor, materials, equipment, tools and incidentals

necessary to complete the installation of copper wire as indicated on the plans, in these Special Provisions, and as directed by the Engineer shall be included in the lump sum price paid for "Traffic Signals and Electrical" and no additional compensation shall be allowed therefor.

77-1.24 Fiber Optic Cabling (Existing locations)

General

~~For relocation of controller cabinets, the contractor shall be responsible to perform the relocation and connection of the existing fiber optic cable. It is necessary to maintain communications and protect cabling during construction.~~

~~If the fiber and its associated connectors are damaged due to the contractor's activities, the contractor shall be fully responsible to replace the existing fiber with new. The contractor shall contact AT&T and hire AT&T as sub-contractor to install and test a new fiber cable from the original splice point or termination to an original splice point or termination. Replacement, testing and verification of the new fiber optic cabling shall be done by AT&T. As a subcontractor, all costs incurred by AT&T shall be the responsibility of the contractor.~~

~~The fiber optic cable shall be spliced at the splice vaults if available. The amount of new fiber optic cable slack in splice vaults and the number of new fiber optic cable splices shall be equivalent to the amount of slack and number of splices existing before the damage or as directed by the Engineer.~~

~~The Contractor shall demonstrate that repaired or replaced elements operate in a manner equal to or better than the replaced equipment or as directed by the Engineer. If the Contractor fails to perform required repairs or replacement work, as determined by the Engineer, the City may perform the repair or replacement work and the cost will be deducted from monies due to the Contractor.~~

~~The contractor shall remove all wires first, before removing fiber optic cable from the existing signal cabinet. The connectorized fiber optic cable shall be protected such that none of the pigtailed can be damaged during the pulling through any conduit. The fiber optic cable shall be protected in place in the nearest pull box, in the fiber run, next to the signal cabinet.~~

~~Before any other wires are installed, the existing fiber optic cable shall be re-installed, from nearest pull box, through conduits into the new signal cabinet and re-start communications. The fiber optic cable shall be re-installed in a timely manner in order to minimize the time that the communications are out of service.~~

~~The fiber optic cable shall be secured in the new traffic signal cabinet with Velcro type wrapping. Plastic type wrappings are acceptable.~~

~~The Contractor shall be fully responsible for assembling, installing, testing, and troubleshooting the fiber optic cable system.~~

Testing and Documentation

~~***Fiber optic testing shall only be conducted if an existing fiber optic cable is to be replaced with a new fiber optic cable due to damage done by the contractor.***~~

~~**The contractor shall retain AT&T to conduct, verify and certify all fiber tests and connections. Documentation of all test results (factory and field tests) and fiber run as-builts shall be submitted to the Engineer within two (2) working days after completing the tests.**~~

Testing shall include the tests on elements of the passive fiber optic components:

(1) At the factory:

~~The Manufacturer with the appropriate documentation shall supply verification of the fiber specifications as listed in the Fiber Characteristics Table. After cabling, before shipment but while on the shipping reel, one hundred (100%) percent of all fibers shall be tested for attenuation. Copies of the results shall be (1) maintained on file at the Contractor's, Manufacturer's and Owner's place of business with a file identification number for a minimum of ten (10) years, (2) attached to the cable reel in a waterproof pouch, and (3) submitted to the Contractor and to the Engineer prior to the delivery of the cable to the jobsite.~~

(2) After delivery to the project site but prior to installation:

~~The Cable and reel shall be physically inspected by the Contractor on delivery and one hundred (100%) percent of the fibers shall be tested with the Optical Time Domain reflectometer (OTDR) for attenuation to confirm that the cable meets requirements.~~

~~OTDR testing shall be done at the following points in the system construction:~~

- ~~• At cable delivery (reel test).~~
- ~~• Following cable installation prior to connectorization, termination or splicing.~~
- ~~• End to End following installation of all pigtails, connectors, and termination devices.~~

~~In addition, the final test (post-connectorization test) shall be completed with an optical power meter and light source.~~

~~Test results shall be recorded, dated, compared with the manufacturer factory test results and filed with the factory manufacturer test results accompanying the shipping reel in a weatherproof envelope. Attenuation deviations from the shipping records greater than five (5%) percent shall be brought to the attention of the Engineer in writing. The cable shall not be installed until completion of this test sequence and written approval by the Engineer is received. Copies of traces and test results shall be submitted to the Engineer. If the OTDR test results are unsatisfactory, the reel of fiber optic cable shall be considered unacceptable and all records corresponding to that reel of cable shall be marked accordingly. The unsatisfactory reels of cable shall be replaced with new reels of cable at the Contractor expense. The new reels of cable shall then be tested to demonstrate acceptability. Copies of the test results shall be submitted to the Engineer for approval.~~

(3) After installation but prior to connection to any other portion of the system:

~~After the fiber optic cable has been pulled but before breakout and termination one hundred (100%) percent of all the fibers shall be tested with the OTDR for attenuation. Test results shall be recorded, dated, compared, and filed with the previous copies of the tests. Copies of traces and test results shall be submitted to the Engineer for approval. If the OTDR test results are unsatisfactory, the fiber optic cable segment will be unacceptable. The unsatisfactory segment of cable shall be replaced with a new segment, without additional splices, at the Contractor's expense. The new segment of cable shall then be tested to demonstrate acceptability. The contractor shall also perform end to end attenuation test, utilizing a power meter in field, after installing the cable to establish the integrity and performance of the system and its components. The end-to-end attenuation shall not exceed the sum of the maximum allowable attenuation for the component cable segments, splices, and typical loss for connectors. Nor shall the attenuation from an individual connector exceed the maximum allowable losses. If the fibers in the cable exceed the allowable loss, the Contractor shall take corrective measures to bring the cable's total attenuation below the allowable limit, including replacement of the cable at the Contractor's expense.~~

~~The contractor shall perform all OTDR testing in the presence of the Engineer. The Engineer shall attach their written mark to all test I documentation made by the Contractor at the time of the test. Testing performed by the Contractor and not witnessed by the Engineer shall not be accepted, re-testing will be required.~~

~~The contractor shall verify that the attenuation and optical continuity of each active and spare optical fiber in the cable plant satisfies the specified requirements.~~

~~Attenuation and continuity shall be measured at the operational wavelength of the equipment being used on the link. If the operational wavelength is unknown, the attenuation shall be measured at both 1310nm and 1550nm.~~

~~Testing of fiber links shall be completed in such way, to show the loss of each connector, in the OTDR trace. The tests shall be conducted in both directions. The test shall be performed at both wavelengths (1310 and 1550 nm). The cable shall be tested in accordance with EIA-455-3A (FOTP-3), "Procedure to Measure Temperature Cycling Effect on Optical Fiber, Optical Cable, and Passive Fiber Optic Components". Copies of the test results shall be submitted to the Engineer for approval.~~

~~(4) During the final system testing:~~

~~The active components shall be tested after installation. The Contractor shall provide all personnel, equipment, instrumentation and materials necessary to perform all testing. The Engineer shall be notified in writing a minimum of two (2) working days prior to all field tests. The notification shall include the exact location of the system to be tested.~~

~~The fiber optic shall be in one continuous length without factory splices in the fiber. Installation procedures and technical support information shall be furnished at the time of delivery. The change in attenuation at extreme operational temperature for single mode fiber shall not be greater than 0.20dB/km, with 80% percent of the measured values no greater than 0.10dB/km. The single mode fiber measurement is made at 1550nm.~~

The contractor shall also follow the following guidelines for efficient and accurate test results:

- Ensure that the test jumpers (end-to-end attenuation) or test fiber box (OTDR) are of the same fiber core size and connector type as the cable system, e.g., 50/125 μm core test jumpers should be used for testing a 50/125 μm multimode cable.
- Ensure that optical sources are stabilized and have center wavelengths within ± 20 nm of the 850/1300 nm multimode and 1310/1550 nm single-mode nominal wavelengths. In accordance with TIA/EIA-526-14-A, multimode LED sources should have spectral widths from 30-60 nm at 850 nm and 100-140 nm at 1300 nm.
- Ensure that the power meter is calibrated at each of the nominal test wavelengths and traceable to the National Institute of Standards and Technology (NIST) calibration standard.
- Ensure that the power meter and the light source are set to the same wavelength.
- Ensure that all system connectors, adapters, and jumpers are properly cleaned prior to and during measurement.

Full compensation for conforming to the provisions in this section shall be considered as included in the contract price paid for relocation of traffic signal controllers and no additional compensation will be allowed thereof.

77-1.25 Single Mode Fiber Optic Cabling (New Locations)

General

At new locations, certified experienced personnel, with at least 5 years' experience, shall do the installation and connection of any fiber optic cable. The personnel shall be certified by the Fiber Optic Material Personnel. The contractor shall submit the manufacturer's recommended procedure for pulling fiber optic cable at least 20 working days prior to installing cable. Documentation of compliance to this specification shall be provided to the City Traffic Engineering Section of Public Works Department prior to ordering the material. All fiber optic cables shall be tested according to manufacturer's recommended testing procedures and verified by the City prior to final acceptance. The cable shall be new, unused, and of current design and manufacturer. The maximum allowable pulling tension for the cable installation by the contractor shall not exceed 70 percent of the manufacturer's maximum pulling tension.

The fiber cable shall be all-Dielectric, Gel-Free, with stranded loose-tube design with dry water blocking for outdoor duct and aerial installations. The cable shall be comprised of water-swallowable yarns and/or tapes, dielectric strength members, ripcord and a medium

density polyethylene (MDPE) jacket containing carbon black to provide ultraviolet light protection while inhibiting the growth of fungus. The cable shall be fully water blocked using craft-friendly water-swellaable yarns and tapes, making cable access simple and requiring no clean up. **Cables shall contain at least 24 single-mode, or as indicated on the plans, (SM) dual operating window (1310nm and 1550nm) fibers.**

Each fiber shall be distinguishable by means of color-coding in accordance with TIA/EIA-598-A, "Optical Fiber Cable Color Coding." The fiber shall be colored with ultraviolet (UV) curable inks. The contractor shall provide manufacturer's certification that the cable is meeting the functional requirement of Rural Utilities Service (RUS) 7 CFR 1755.900 to 1755.902 and fully comply with ANSI/ICEA S-87-640, *Standard for Optical Fiber Outside Plant (OSP) Communications Cable*. Manufacturer shall be ISO9001 and TL9000 registered. Cable shall have storage temperature range of -40° to 70°C, an installation temperature range of -30° to 70°C and an operating temperature range of -40° to 70°C. The Cable shall have a short-term tensile rating of 2700N. Cable and fiber manufacturer shall be the same company with minimum of 20 years in manufacturing optical fiber cable to demonstrate cable long-term reliable field performance and to ensure the availability of fully integrated technical support.

The fiber cable installed in the traffic signal cabinet, shall be composed of factory pre-connectorized fiber optic SC pig tails and shall be terminated in the LIU wall mount box with either a twelve-(12) port coupler (Simplex) panel or single panel with 2-12 port coupler (Simplex) panels, SC compatible connector. The SC pig tail connectors shall be composed of the same optical fiber glass as used in the optical fiber cable. Contractor shall leave at least 20-foot fiber cable slack in each pull box run, between exiting conduit and entering conduit. The contractor shall also coil 50 lineal feet of fiber cable slack cable in the No. 6 pull box at traffic signal cabinet location, and label the cable. Contractor shall complete the installation of the cable into the controller cabinet and terminate the cable in the LIU.

The fiber optic cable shall consist of, but not limited to, the following components:

- Dielectric central member
- Water-swellaable yarn
- Fiber and water-swellaable yarns (at least 12 fiber per tube)
- Water-swellaable tape
- Dielectric strength members
- Ripcord
- Outer jacket

The buffer tube shall be gel free. The optical fibers shall be contained within loose buffer tubes. The loose buffer tubes shall be stranded around a dielectric central member using the reverse oscillation stranding process. The buffer tubes shall be made of polyethylene (PE). Each buffer tube shall contain a water swellaable yarn for water blocking protection. The buffer tube shall be manufactured to a standard 3.0 mm in size, regardless of fiber count, to reduce the number of required installation and termination tools. Each buffer tubes shall be distinguishable from other buffer tubes in the cable by means of color-coding in accordance with TIA/EIA-598-B, "Optical Fiber Cable Color Coding."

- Dielectric Central Member

The central member which functions as an anti-buckling element to resist temperature and induced stresses, shall be a glass reinforced plastic rod with similar expansion and contraction characteristics as the optical fiber and buffer tubes. The loose buffer tubes shall be stranded around a dielectric central member using the reverse oscillation stranding process.

- Water-Swellable Yarn and Tapes

The water-swellable yarn shall be non-nutritive to fungus, electrically non-conductive, and homogeneous. It shall also be free from dirt or foreign matters. Water swellable yarn(s) shall be applied longitudinally along the central member during stranding. The water swellable tape shall be applied longitudinally over both the inner and outer layer. The tape shall be non-nutritive to fungus, electrically non-conductive, and homogenous. It shall also be free from dirt and foreign matters. Two (2) polyester yarn binders shall be applied contra-helicly with sufficient tension to secure each buffer tube layer to the dielectric central member without crushing the buffer tubes.

- Dielectric Strength Member

Tensile strength shall be provided by high tensile strength yarns and/or fiberglass which shall be helically stranded evenly around the cable core and shall not adhere to other cable components.

- Ripcord

The cable shall contain at least one ripcord under the jacket for easy sheath removal.

- Outer Jacket

The Cable jacket shall be marked with the manufacturer's name, the number of fiber "SM", month and year of manufacture, sequential meter or foot markings, a telecommunication handset symbol as required by Section 350G of the National Electrical Safety Code (NESC), fiber count, and fiber type. The print color shall be in a contrasting color to the cable jacket. The height of the marking shall be approximately 2.5mm. The cable jacket shall be medium density polyethylene (MDPE) jacket containing carbon black to provide ultraviolet light protection while inhibiting the growth of fungus.

77-1.25.1 Rack Mount Enclosure:

The Rack Mountable Connector Housings shall be mountable in an EIA-310 compatible 465 or 592 mm rack. Housings shall be available in several sizes, including 1U, 2U, 3U and 4U. One EIA rack space or panel height (denoted as 1U) is defined as being 44.45 mm in height. The unit shall meet the design requirements of ANSI/TIA/EIA-568 and the polymer compounds flammability requirements of UL 94 V-0. Manufacturer shall be ISO 9001 and TL 9000 registered. The unit shall be available in different sizes to accommodate different port count requirements. Housings shall be manufactured using

16-gauge aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Installation fasteners shall be included and shall be black in color.

77-1.25.2 Splice Tray Fiber:

Splice Tray shall be from same manufacturer as the splice closure. Splice only 12 fibers per splice tray and label each tray with a permanent label. The splice tray shall be Wide-Style Splice Tray. Splice Tray shall securely organize and provide physical protection without stress on the fibers for both single-mode and ribbonized fiber splices. Splice Trays shall not induce attenuation of signal at operational wavelengths up to 1550 nm. The splice tray shall be hinged for access to any splices without disturbing other trays.

77-1.25.3 Advanced Splice Closure (ASC):

The closures shall be butt style splice closures with gel sealing technologies for cable termination and hinging splice trays. The closure shall be made with thermoplastic outer materials that withstand temperature and contaminate extremes. The closure shall be designed for use with any cable construction in any environment and for numerous splice applications.

The closure shall accommodate at least 24 SC/UPC connections with 12 SC/UPC connections per tray. The closure shall have at least one oval cable port to terminate at least two cables. The splice closure shall have; easy-to-use dome-to-base clamping with O ring system, and single ended design. The splicing shall be done in accordance to the approved manufacturer's methods, procedures and instructions to ensure warranty compliance.

The splice closure shall have at least six round cable entry ports with multi-cable capacity. This block can be opened and closed repeatedly without the need to remove or replace the gel. With the use of special kits, multiple cables per port shall be installed. The splice trays shall be hinged for access to any splice without disturbing other trays.

The closure shall be pre-assembled case with wide-style splice trays suitable for fiber capacity. To seal the cables entering the enclosure; gel sealing process or wrap around style cable seal shall be used. The closure shall have at least one storage slack tray basket for storing slack fiber. To increase splice capacity the closure can be upgraded by just adding an upgrade kit.

The fiber cable shall be labeled within six inches of the splice closure and 6" from all conducts and sleeves. Laminated labels shall be installed on the external surface of the outside closures. All optical fiber shall be neatly and efficiently dressed into splice tray management and the contractor is to ensure that splices are accessible without damage to the optical fibers or splices. *Contractor shall leave at least 30-foot slack cable on each end of the splice enclosure.* The slack shall be along enough to enable maintenance personnel to perform splicing of the cable in a vehicle located near the controller cabinet. Contractor shall prepare and submit Record Drawings of each splice closure installed, showing each fiber enclosed, fiber color, splices, and unconnected fibers. Record drawings shall be labeled to indicate the splice closure location.

77-1.25.4 Small Lightguide Interconnect Units (LIU) Wall Mount Box

Contractor to install one small Lightguide Interconnect Units (LIU) Wall Mount Box in the traffic signal cabinet at each location shown on the plans.

The Single Panel housings shall be available for cross-connecting or interconnecting purposes. Two (2) single panel units shall be provided. The units shall provide the means for direct connections for up to 2-12 fibers or as indicated on the plans. The units also shall provide means for pigtail splicing within the housing for at least 12 fibers or as indicated on the plans. The Single Panel housings shall accommodate a single Solutions panel. The housings shall have a small footprint and low profile to minimize the amount of occupied space. The dimensions shall not exceed the 6.3" (height) 5.5" (width), and 2" (depth). Manufacturer shall be ISO 9001 and TL 9000 registered.

Housings shall be manufactured using 16-gauge aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Assembly hardware and equipment-attaching-machine screws shall be included and shall be black in color. Housing shall include a 0.4" splice holder, which will support up to 12 heat shrink splices. Top and bottom removable cable entry grommets shall be provided to allow for mid-span access and environmental sealing. The housings shall be supplied with pre-drilled holes for surface mounting on the plate in the traffic signal cabinet, but shall have an optional ledge mount bracket available. Each CCH housing should be labeled with Machine labels identifying to/ from destinations and fiber counts. The units shall be installed on a mounting plate in each signal cabinet.

It is acceptable to use a single wall mountable closet housing (WMC) to fit all 24- strand fiber, where the 2 panels cannot be installed.

Laminated labels shall be installed on the external surface of the outside panels.

77-1.25.5 Port Coupler Panels:

The Closet Connector Housing (Simplex) Panels shall be in 12-fiber versions for use. The panels shall be able to be used with field-installable connectors or in applications where the pre-terminated cables are routed directly from the equipment to the interconnect hardware. The 12-fiber versions shall include in-line SC-SC Compatible Connector.

The Closet Connector Housing Panels shall be designed to accommodate applications requiring specified labeling and connector identification. Each CCH housing should be labeled with Machine labels identifying to/ from destinations and fiber counts.

The panel shall be attached with two push-pull latches to allow quick installation and removal. Blank connector panels shall be available to fill unused space within the housings. The blank connector panel shall be attached with at least two push-pull latches to allow quick installation and removal. The blank panels shall be manufactured from injection-molded polycarbonate. Panels shall be manufactured from 16-gauge cold rolled steel or injection-molded polycarbonate for structural integrity.

77-1.25.6 Single Mode Fiber Patch Cables SC-SC, ST-SC:

Patch Cord connectors shall be measured for insertion loss with the following values for each connector: typical of 0.1 dB and maximum of 0.5 dB and guaranteed reflectance of = -55 dB for UPC. Manufacturer shall be ISO 9001 and TL 9000 registered. Available connectors shall be single-mode SC, ST® Compatible Connector. Patch Cord shall contain standard single-mode fiber and shall comply with TIA/EIA-568-B.3 and applicable TIA/EIA-604 document. Patch Cord jacket color shall be yellow. Patch Cord shall be available in different lengths. The manufacturer shall have an in-depth knowledge, and more than 10-year history, of manufacturing optical fiber patch cords. Manufacturer shall manufacture both cable, fiber, and the connectors.

At the signalized intersection, in the Traffic Signal Cabinet

- Provide two (2) 1m patch cables SC-SC (Duplex) jumpers to connect from fiber housing to the switch.
- Provide two (2) 1m patch cable ST-SC (Duplex) jumpers for video connections to the video/data modem.

At Fiber Hub locations/City Hall (TMC)

- Provide as many 2m/10m patch cable SC-SC (Duplex) jumpers as fiber strands going in the Fiber Hub/City Hall (TMC).

Notes: Connector codes available must be inserted into the first four digits and are the following:

72 = SC Duplex, 61 = ST Compatible Ultra PC.

77-1.25.7 Fiber Optic Conduits

Conduit shall conform to the provisions in Sections 86-1.02B, "Conduit and Accessories" and 87-1.03B, "Conduit Installation" of the Caltrans Specifications and these Special Provisions.

All Fiber Optic Conduits shall be 2 ½" Poly Vinyl Chloride (PVC) or HDPE (Orange color), Schedule 80 with rigid steel sweeps. The HDPE conduit shall be capable of being coiled on reels in continuous lengths and uncoiled for installation without affecting its properties or performance. With the exception for bends to and from pull boxes and foundations, the conduit shall run straight and true so that cable pulling forces are minimized. The conduit shall have smooth outer wall and smooth inner wall. Intermediate pull boxes shall be installed every 500 feet.

Conduit sweeps into No. 6 pull boxes on fiber optic interconnect runs shall enter/exit, with rigid sweeps, at 45 degrees (in vertical plane). Plastic pulling bells shall be installed on all conduit ends before conductors are pulled through the conduits.

After fiber has been installed, the ends of conduits terminating in pull boxes and/or controller cabinets will be sealed with an approved type of sealing compound. Refer to the City of Stockton Standard Drawing No.R87 for conduit/pull box details.

Refer to City of Stockton Standard Plan Drawing No. R37 for trench width and depth. All conduits shall be installed below the existing AC pavement regardless of the depth of the existing AC pavement. All conduits shall be installed at a minimum depth of thirty (30) inches (top of conduit to the finish grade).

All excavated areas in the street or sidewalk shall be completely backfilled or covered at the end of each working day and approved by the Engineer.

Where existing conduits to be used, as directed by the Engineer, the existing conduit shall be cleaned and both old and new cables shall be pulled into the existing conduit as a unit per the Caltrans Specifications in Section 87-1.03F, "Conductors and Cable Installations".

The 2.0" rigid metal conduit between #6E pull box and the controller cabinet shall have 90-degree sweep and large radius bend. Sweeps shall be at least 24 inches below finished grade, unless approved by engineer. A pulling bell shall be installed at the end of each conduit.

All fiber optic interconnect conduits with fiber cable shall include one 1250lbf detectable Muletape with 22 AWG wire. A detectable Muletape shall be installed after Fiber Optic cable installation for future detection.

77-1.25.8 Colored Controlled Density Fill (CDF)

The controlled density fill for the installations of fiber optic conduits shall be a red color to distinguish the concrete backfill from other concrete and soil. The concrete shall be pigmented by the addition of commercial quality cement pigment to the concrete mix.

The red concrete pigment shall be LM Scofield Company; Orange Chromix Colorant; or Davis Colors; or accepted equivalent. A minimum of 5 lbs. of red tint pigment shall be used per cubic yard of the CDF mix.

77-1.25.9 Fiber Optic Pull Boxes

Pull boxes shall conform to the provisions in Sections 86-1.02C "Pull Boxes" and 87-1.03C "Installation of Pull Boxes" of the Caltrans Specifications and these Special Provisions.

When a pull box is subjected to vehicular traffic load, the cover shall be steel embossed with a non-skid pattern.

Pull boxes shall be placed at same elevation as adjacent standard base, service cabinet base or signal controller cabinet base if not an existing or future sidewalk area and elevation is not shown on plans. Pull boxes shall be five feet (5') from base or as shown on the plans. Pull boxes in existing or future sidewalk areas shall be placed at sidewalk elevation. The pull box elevation for pull boxes installed in median areas shall match the slope of the two adjacent curbs. The pull box elevation for pull boxes installed in planting areas adjacent to sidewalk or sidewalk area shall be at sidewalk grade. Pull boxes shall not be located within the limits of wheelchair ramps.

When pull boxes are placed in dirt and planting areas, a concrete collar shall be constructed around the pull box. The concrete collar shall be a minimum 12 inch concrete collar by 4 inch thick and at least 4 inches along the sides of the pull box to the bottom edge. The top of the pull box shall match slope of the adjacent top of curb. The surface elevation of the collar shall match the surface elevation of the pull box and slope away from the pull box at a rate of 1:50 (2%) slope.

The Contractor shall clean all existing pull boxes entered for installation of conduit of all dirt and debris. All pull box lids damaged by Contractor operations shall be replaced at his/her expense. The wiring in these pull boxes shall be neatly bundled, recoiled and reinstalled in the box. Where existing pull boxes are removed and replaced with new larger boxes the existing conduits shall be cut back. When the conduits are cut, the existing conductors must either be removed or well protected. The ends of the cut conduits must have bushings placed on them.

Grout in bottom of pull boxes will not be required. Pull boxes shall be set on 6 inches of crushed rock for drainage. The conduits in the pull boxes shall be placed 2" above the crushed rock.

All pull boxes on fiber optic interconnect runs shall be # 6 unless otherwise noted on the plans. All conduit sweeps into No. 6 pull boxes on fiber optic interconnect runs shall be 45 degrees. Contractor shall leave at least 20-foot fiber cable slack in each pull box run, between exiting conduit and entering conduit. All pull boxes shall have lids embossed with "INTERCONNECT".

A State Standard Number 6E pull box with extension (17" x 30" x variable depth (inside dimensions)) shall be installed adjacent to the traffic controller cabinet for fiber optic interconnect cable. The seam between pull box and extension shall be grouted. Contractor shall leave at least 50-foot fiber cable slack in pull box, between exiting conduit and entering conduit.

77-1.25.10 Testing and Documentation:

The contractor shall retain AT&T or approved fiber optic contractor to verify and certify all fiber tests and connections. Documentation of all test's results (factory and field tests) and fiber run as-builts shall be submitted to the Engineer within two (2) working days after completing the tests.

Testing shall include the tests on elements of the passive fiber optic components:

(1) The factory:

The Manufacturer with the appropriate documentation shall supply verification of the fiber specifications as listed in the Fiber Characteristics Table. After cabling, before shipment but while on the shipping reel, one hundred (100%) percent of all fibers shall be tested for attenuation. Copies of the results shall be (1) maintained on file at the Contractor's, Manufacturer's and Owner's place of business with a file identification number for a minimum of ten (10) years, (2) attached to the cable

reel in a waterproof pouch, and (3) submitted to the Contractor and to the Engineer prior to the delivery of the cable to the jobsite.

(2) After delivery to the project site but prior to installation:

The Cable and reel shall be physically inspected by the Contractor on delivery and one hundred (100%) percent of the fibers shall be tested with the Optical Time Domain reflectometer (OTDR) for attenuation to confirm that the cable meets requirements.

OTDR testing shall be done at the following points in the system construction:

- At cable delivery (reel test).
- Following cable installation prior to connectorization, termination or splicing.
- End to End following installation of all pigtails, connectors, and termination devices.

In addition, the final test (post-connectorization test) shall be completed with an optical power meter and light source.

Test results shall be recorded, dated, compared with the manufacturer factory test results and filed with the factory manufacturer test results accompanying the shipping reel in a weatherproof envelope. Attenuation deviations from the shipping records greater than five (5%) percent shall be brought to the attention of the Engineer in writing. The cable shall not be installed until completion of this test sequence and written approval by the Engineer is received. Copies of traces and test results shall be submitted to the Engineer. If the OTDR test results are unsatisfactory, the reel of fiber optic cable shall be considered unacceptable and all records corresponding to that reel of cable shall be marked accordingly. The unsatisfactory reels of cable shall be replaced with new reels of cable at the Contractor expense. The new reels of cable shall then be tested to demonstrate acceptability. Copies of the test results shall be submitted to the Engineer for approval.

(3) After installation but prior to connection to any other portion of the system:

After the fiber optic cable has been pulled but before breakout and termination one hundred (100%) percent of all the fibers shall be tested with the OTDR for attenuation. Test results shall be recorded, dated, compared, and filed with the previous copies of the tests. Copies of traces and test results shall be submitted to the Engineer for approval. If the OTDR test results are unsatisfactory, the fiber optic cable segment will be unacceptable. The unsatisfactory segment of cable shall be replaced with a new segment, without additional splices, at the Contractor's expense. The new segment of cable shall then be tested to demonstrate acceptability. The contractor shall also perform end to end attenuation test, utilizing a power meter in field, after installing the cable to establish the integrity and performance of the system and its components. The end-to-end attenuation shall not exceed the sum of the maximum allowable attenuation for the component cable segments, splices, and typical loss for

connectors. Nor shall the attenuation from an individual connector exceed the maximum allowable losses. If the fibers in the cable exceed the allowable loss, the Contractor shall take corrective measures to bring the cable's total attenuation below the allowable limit, including replacement of the cable at the Contractor's expense.

The Contractor shall perform all OTDR testing in the presence of the Engineer. The Engineer shall attach their written mark to all test I documentation made by the Contractor at the time of the test. Testing performed by the Contractor and not witnessed by the Engineer shall not be accepted, re-testing will be required.

The Contractor shall verify that the attenuation and optical continuity of each active and spare optical fiber in the cable plant satisfies the specified requirements.

Attenuation and continuity shall be measured at the operational wavelength of the equipment being used on the link. If the operational wavelength is unknown, the attenuation shall be measured at both 1310nm and 1550nm.

Testing of fiber links shall be completed in such way, to show the loss of each connector, in the OTDR trace. The tests shall be conducted in both directions. The test shall be performed at both wavelengths (1310 and 1550 nm). The cable shall be tested in accordance with EIA-455-3A (FOTP-3), "Procedure to Measure Temperature Cycling Effect on Optical Fiber, Optical Cable, and Passive Fiber Optic Components". Copies of the test results shall be submitted to the Engineer for approval.

(4) During the final system testing:

The active components shall be tested after installation. The Contractor shall provide all personnel, equipment, instrumentation and materials necessary to perform all testing. The Engineer shall be notified in writing a minimum of two (2) working days prior to all field tests. The notification shall include the exact location of the system to be tested.

The fiber optic shall be in one continuous length without factory splices in the fiber. Installation procedures and technical support information shall be furnished at the time of delivery. The change in attenuation at extreme operational temperature for singlemode fiber shall not be greater than 0.20dB/km, with 80% percent of the measured values no greater than 0.10dB/km. The singlemode fiber measurement is made at 1550nm.

The contractor shall also follow the following guidelines for efficient and accurate test results:

- Ensure that the test jumpers (end-to-end attenuation) or test fiber box (OTDR) are of the same fiber core size and connector type as the cable system, e.g., 50/125 μm core test jumpers should be used for testing a 50/125 μm multimode cable.

- Ensure that optical sources are stabilized and have center wavelengths within ± 20 nm of the 850/1300 nm multimode and 1310/1550 nm single-mode nominal wavelengths. In accordance with TIA/EIA-526-14-A, multimode LED sources should have spectral widths from 30-60 nm at 850 nm and 100-140 nm at 1300 nm.
- Ensure that the power meter is calibrated at each of the nominal test wavelengths and traceable to the National Institute of Standards and Technology (NIST) calibration standard.
- Ensure that the power meter and the light source are set to the same wavelength.
- Ensure that all system connectors, adapters, and jumpers are properly cleaned prior to and during measurement.

77-1.25.11 Warning Tape:

Warning tape shall be provided and placed in the trench over conduits containing fiber optic cable as shown on the plans. The warning tape shall be four (4") inches wide with bold printed black letters of approximately seventy-five (75") inches on bright orange color background, and contain the printed warning "CAUTION BURIED FIBER OPTIC CABLE" repeated at approximately thirty (30") inches intervals.

The printed warning shall be non-erasable and shall be rated to last with the tape for a minimum of forty (40) years.

The construction of the warning tape shall be such that it will not delaminate when it is wet. It shall be resistant to insects, acid, alkaline and other corrosive elements in the soil. It shall have a minimum of 120 lb tensile strength per four (4") wide strip and shall have a minimum of seven hundred (700%) percent elongation before breakage. The warning tape shall be the detectable type with a contiguous conductor in the form of a copper wire or aluminized foil, encased in a protective plastic jacket. The aluminized foil shall be approximately 0.01" (inch) thick. Separate rolls of the warning tape shall be electrically connected by corrosion resistant clips or soldering. The ends of warning tape shall extend into pull boxes and splice vaults a minimum of twenty-four (24") inches for future connection to a warning signal device. The continuity and detectability of the warning tape, for the entire conduit run, shall be demonstrated prior to and again after backfilling each trench to the satisfaction of the Engineer.

77-1.26 Street Name Signs

The Contractor shall provide and install street name signs as shown on the plans and in accordance with these Special Provisions. Contractor shall supply sign brackets and all necessary hardware to install signs. Payment of furnishing brackets, hardware, and installing street name signs shall be included in the lump sum bid item for "Traffic Signal and Electrical".

The contractor shall submit a street name sign design as part of the submittals to be approved for conformance prior to ordering the street name signs. Street name sign block numbers shall be installed on the lower right hand side of each street name sign. The street name sign shall be installed in conformance with the City of Stockton Standard Drawings number R94. The street name sign shall be type, at least, HIP series 3900 sheeting. The street name sign bracket shall be double banded on mast arm.

R3-4 (No U-Turn) mast arm sign shall be 36"x36".

R73-2 (Left-Turn & U-Turn) mast arm sign shall be 36"x36".

77-1.27 Traffic Signal Controller Communications and CCTV System:

77-1.27.1 Fiber Optic Ethernet Switches

The contractor shall supply and install the following devices one in the field controller cabinets and one in the City's Traffic Management Center (TMC) to establish communication between devices such as the traffic signal controller, IP based camera, and their associated central servers in TMC. Each Fiber Optic Ethernet Switch shall consist of the following:

GENERAL SPECIFICATIONS

The Ethernet data switch shall be environmentally hardened Ethernet 12-port managed switch, supports 10/100/1000Mbps (one for field and one for central control center installation), with manufacturer provided lifetime warranty.

The module shall support transmission utilizing Category 5 cable or better, multimode, or single-mode fiber. The module shall support the Ethernet data IEEE 802.3 protocol using Auto-negotiating and Auto-MDI/MDI-X features. The module shall feature 8 (eight) 10/100/1000BASE-T(X) RJ-45 ports, each capable of 30 Watt PoE, and 4 (four) 100/1000BASE-X Small Form-factor Pluggable (SFP) ports. The SFP module shall require no in-field electrical or optical adjustments or in-line attenuators to ease installation. The module shall provide power, link speed, and fiber port status indicating LED's for monitoring proper system operation. The modules shall provide automatic re-settable solid-state current limiters on each module to reduce the chance of a single point failure of the system. The module shall have dual redundant power supply connections to minimize single point failure. The module shall provide a serial connection for local management of the device. The module shall have a lifetime warranty to reduce system life cycle cost in an event of a module failure.

1. DATA SPECIFICATIONS

- a) Data Interface: Ethernet IEEE802.3
- b) Data Rate: 10/100/1000 Mbps
- c) Data Inputs/Outputs: 12
- d) Operation Mode: Half or Full Duplex
- e) Max VLANs: 256
- f) 24 Gbps switching bandwidth
- g) MAC table capable of storing 8000 MAC addresses

h) 16 Mb packet buffer

2. OPTICAL SPECIFICATIONS

- a) Number of Optical ports: 4 SFP-dependent
- b) Number of Fibers Required: 1 or 2, SFP-dependent
- c) Optical Wavelength: 850, 1310 or 1550 nm, SFP-dependent
- d) Optical Power Budget: SFP-dependent
- e) Maximum Distance: up to 120 km (70 mi) single mode, SFP-dependent

3. STATUS INDICATORS

- a) Power
- b) Per Port: Link/Activity
- c) Per Port: PoE Status
- d) Ring Status

4. CONNECTORS

- a) Optical: LC or SC, SFP-dependent
- b) Data: RJ-45
- c) Console: RJ-45

5. ELECTRICAL SPECIFICATIONS

- a) Power: 12 VDC
- b) Reverse polarity protected
- c) Overload current protected
- d) Circuit Board: UL 94 flame rated and meets all IPC standards.
- e) PoE: 30 W per port, 240 W budget

6. ENVIRONMENTAL SPECIFICATIONS

- a) MTBF: >100,000 Hours
- b) Operating Temp: -40° C to +75° C
- c) Storage Temp: -40° C to +85° C
- d) Relative Humidity: 5% to 97% (non-condensing).

7. MOUNTING SPECIFICATIONS

Shall be mountable on wall, shelf, DIN rail

8. REGULATORY AGENCIES/APPROVALS AND LISTINGS

- a) Underwriters Laboratory (UL) Listing
- b) Federal Communication Commission (FCC) Part 15 compliant
- c) NEMA TS1/TS2 Certified
- d) CE marked
- e) Restriction of Hazardous Substances (RoHS) compliant
- f) IP30 rating
- g) "Buy America" Compliant

9. SMALL FORM-FACTOR PLUGGABLE (SFP) MODULE

- a) All SFPs should come with manufacturer provided lifetime warranty.

- b) Temperature Requirements: Products shall operate in an environment with an ambient temperature range of 0° F to +150° F without the assistance of fan-forced cooling. The modules shall have an MTBF (Mean time between failures) of >100,000 hours.
- c) Provide MSA Compliant one fiber SC Small Form-Factor Pluggable (SFP) Optical Device. The devices shall utilize 1000fx, 1310/1550 nm optics capable of simultaneous bi-directional signal transmission on one single mode optical fiber. The SFPs shall have the same transmitting sensitivities with the matching SFPs upstream or downstream. The SFP modules shall have different wavelengths and optical power to offer distances from 300 meters to 120 kilometers. The module shall require no in-field electrical or optical adjustments or in-line attenuators to ease installation. The module shall be UL listed. The circuit board shall be UL 94 flame rated and meet all IPC standards. Housing shall be of all metal construction. All LED indicators and both electrical and mechanical connections shall be identified with silk-screened labels. The Contractor shall install one 1000fx, 1550nm, single-mode SC fiber SFP and one 1000fx, 1310nm, single-mode SC fiber SFP into the 12-port Ethernet switch for field installation and deliver one each of the 1550nm and 1310nm SFPs to the City for central installation.
- d) Copper 10/100/1000 Mbps RJ45 SFP module. The module shall require no in-field electrical or optical adjustments or in-line attenuators to ease installation. The module shall be UL listed. The circuit board shall be UL 94 flame rated and meet all IPC standards. Housing shall be of all metal construction. All LED indicators and both electrical and mechanical connections shall be identified with silk-screened labels. Housing shall be of all metal construction. The Contractor shall deliver all copper SFPs to the City.

ACCESSORIES

- a) 6-foot Cat5e cable (with yellow skin) to connect the traffic signal controller to the 12-port Ethernet switch.
- b) 6-foot Cat5e cable (with red skin) to connect the EVP phase selector to the 12-port Ethernet switch.
- c) 6-foot Cat5e cable (with gray skin) to connect the video detection CCU to the 12-port Ethernet switch
- d) 6-foot Cat5e cable (with blue skin) to connect an additional IP device to the 12-port Ethernet switch
- e) Associated switch mounting hardware
- f) 240 Watt @ 48 Volt DIN rail mounted power supply for PoE
- g) Other accessories as required by the manufacturer.

After submitting the Ethernet switch and SFP submittals, under the direction of the Engineer, the Contractor may be required to demonstrate that the proposed switch and SFPs adhere to the requirements of these technical specifications. The demonstration shall take place at a City signalized intersection and at City Hall. The demonstration shall show that the proposed switch and SFPs can transmit and receive data between testing traffic signal controller and City's existing centralized traffic signal servers, and between other traffic signal controllers in the same communication channel and network. The switch and SFP modules used in the demonstration shall be the exact make and model of the modules that Contractor proposes to install in the field. Satisfactory demonstration of the switch and modules functionality shall be determined by the Engineer. The Contractor shall be responsible arranging the demonstration at no additional charge to the City nor to the project.

77-1.27.2 Monitoring Camera Cabling (General)

CAT5e RJ45 10/100/1000Base-TX Ethernet (High Power-over-Ethernet) or PoE+ (IEEE 802.3at, class 4 standard) 21-30 VAC, 50/60 Hz, outdoor, shielded cable with integrated ESD drain wire and anti-crosstalk divider and secondary shielding. RJ45 connectors shall provide protections against ESD attacks and Ethernet hardware damages,

Power cable shall be A11403-BWG (water and sun resistant, 3 #14 AWG, white/green/black, UL Type TC 600V, NEC Type TFN Conductors, IEEE 1202/CSA FT4, IEEE 383, UL Subject 1277, and OSHA acceptable) or accepted equivalent.

77-1.27.3 Traffic Monitoring Camera Conductors Field Installation (General)

The installation of the wiring will require that a hole be drilled into the camera supporting structure for all the camera installations. Prior to drilling this hole the existing wiring inside the pole or mast arm shall be removed or protected such that it is not damage by the drilling operation. The edges of the drilled hole shall be smoothed. The Contractor shall install a watertight gland nut (or grommet) in this hole that securely holds the wiring. All cables shall be:

- Installed without damaging the conductors or insulation
- Installed without kinks
- Handled in accordance with manufacturers specifications and recommended bending radius
- Run continuously between terminations without splices
- Installed with sufficient slack for equipment movement
- Neatly tagged at the cabinet to indicate which camera it serves
- Rated for outdoor use and resistant to water and UV radiation
- Have a watertight, strain relieved plug type connection to the camera housing

The Contractor shall make all connections of this wiring to the camera assembly, the video transmission device, and power.

77-1.27.4 High Speed Dome Pan/Tilt/Zoom Traffic Monitoring Camera

The high speed camera unit shall be 1080p HD Outdoor Day/Night Network PTZ Dome Camera that delivers 1920 x 1080 resolution video with up to 30x optical zoom and

providing a 360 degree viewing field. It comes equipped with an outdoor pendant housing. It features complete network-based control of all dome functionality, including pan/tilt/zoom operation, presets, tours, and alarms, as well as web-based configuration of all dome settings. It also provides direct network video streaming using H.264 compression and bandwidth throttling to efficiently manage bandwidth and storage requirements. Equipment shall include all mounting adaptor (pole mount, and/or luminaire arm mount), pendant arm and power supply, camera unit, data cable, power cable, to make the installation complete and operational with the existing City traffic management's video system.

The camera shall be fully compatible and shall communicate with the City's existing Bosch' Allegiant Microprocessor Based Switcher/Control System LTC 8903/60, without requiring modification or re-configuration after being decoded. After submitting the camera submittal, under the direction of the Engineer, the Contractor may be required to demonstrate that the proposed camera adheres to the requirements of these technical specifications. The demonstration shall take place at a City facility and show that the camera is compatible with the existing camera switch, and that the camera can be controlled from the City's central camera control location. The camera used in the demonstration shall be the exact make and model, using the exact software, of the camera that Contractor proposes to install in the field. Satisfactory demonstration of camera functionality shall be determined by the Engineer. The Contractor shall be responsible arranging the demonstration at no additional charge to the City nor to the project.

The proposed camera shall have features and functionality that meet or exceed the following specifications:

1. The mounting hardware shall include a mast mount option to be installed on traffic signal poles, as well as a pipe mount option to be installed on luminaire arms.
2. If it is mast mounted, the arm mount assembly shall provide minimum 14" clearance between the edge of the pole and the center of the camera.
3. The camera and its housing's weight shall not exceed 7 lbs.
4. Camera shall have a minimum of 50 preset scenes, which shall be presentable in a preset tour.
5. Camera assembly shall be housed in an IP66 enclosure.
6. Shall have at a 30x Zoom, and 12x Digital Zoom. The 12x digital zoom shall not cause the image to become unrecognizable.
7. The effective pixel shall be 1900x1040(2.0 MP).
8. Shall have internal heater that is powered through RJ45 10/100Base-TX Ethernet (High Power-over-Ethernet) 21-30 VAC, 50/60 Hz.
9. The camera shall have a wide dynamic range of 120 dB and signal-to noise ratio greater than 50dB.
10. The camera shall be capable of the following preset speeds:
 - a. Pan – 360 degrees per second
 - b. Tilt – 250 degrees per second
11. The camera shall be capable of automatically pivoting the sensor to follow a target that moves underneath the camera.
12. Record and play back minimum two 30-minutes tours.

13. The lens shall return to a preset scene after a user defined idling time.
14. The pan, tilt, and zoom shall be able to function simultaneously for manually tracking speeding objects.
15. The camera shall be able to be configured remotely without needing to access any part of the camera equipment locally.

The camera shall meet or exceed the following technical specifications:

Construction

Housing:	Aluminum
Bubble:	Acrylic (high-resolution), clear
Installation Environment:	IP66, NEMA 4X
Operating Temperature:	Maximum 130 F Minimum 15 F

Electrical

Input Voltage:	21 to 30 VAC, 50/60 Hz
Power Consumption:	60W (max)
Control Data:	RJ45 10/100Base-TX Ethernet
Video:	H.264 (ISO/IEC 14496-10), MJPEG, JPEG
Audio:	Available

Testing and Final Acceptance

Make proper adjustments to video system devices to for correct operation in accordance with manufacturer’s instructions.

Make any adjustment of camera settings that are required in order to meet the operations needs of the City.

Demonstrate upon final inspection that the video management system and devices function properly when controlled from Central.

The Contractor shall be fully responsible for purchasing, assembling, installing, testing, and troubleshooting the camera system and all the corresponding camera mounting hardware at each installation location.

77-1.27.5 High Speed Dome Pan/Tilt/Zoom Camera Installation

The Contractor shall obtain an IP address from the City and configure the camera. The Contractor shall install and fully adjust the camera with the associated lens, communication addressing, power supplies, housings, and all-necessary cabling, etc., to make the assembly operational. The Contractor shall firmly attach the dome system to the assigned poles as shown on the Plans. The Contractor shall exercise care to tighten

the camera mount within the torque limits specified by the camera manufacturer.

The Contractor shall properly terminate all of the electrical cables to the camera and firmly attach them. The Contractor shall dress and secure the electrical cables inside the dome enclosure and traffic signal cabinet so that they do not interfere with the closing of the cabinet, with the fan, or with any other moving part.

Cameras and other video sources where possible, shall use the electrical power supply 60 Hz signal for synchronization. When cameras are initially installed, the camera shall be in a position where its view of the roadway will not be obstructed by the pole it is mounted on. At a 4-leg intersection, the camera shall be capable of seeing all four legs without its view being blocked by the signal pole.

After all cameras are installed and central equipment is operational, the Contractor shall arrange an interactive session with the Engineer to fine-tune any adjustments to the camera that require a technician in the field. This session shall enable the Engineer to observe the image at the control room while being in verbal communication with the Contractor at the camera. The Contractor shall provide a camera license from Verint to the City.

77-1.28 Payment

Payment for furnishing and installing traffic signals, street lighting, and interconnect shall conform to the provisions in Section 9, "Payment," of the Caltrans Specifications and these Special Provisions.

Full compensation for furnishing the labor, materials, tools, equipment, including installing PTZ cameras, video and data modems, hardware, conduits, and wiring, complete in place as shown on the plans and as specified in the Standard Specifications, these Special Provisions, and as directed by the Engineer, shall be considered as included in the contract lump sum price paid for "Traffic Signal and Electrical" and no additional compensation will be allowed therefor.

Hauling and stockpiling of salvaged material off the right-of-way and delivered to the City Corporation Yard, 1465 South Lincoln Street, will be considered as included in the contract prices paid for the various items of work, and no additional payment will be allowed therefor.

77-1.29 Removing, Reinstalling or Salvaging Electrical Equipment

Removing, reinstalling or salvaging electrical equipment shall conform to the provisions in 87-21.03A "General" and 87-21.03D "Removing Existing Electrical Systems" of the Caltrans Specifications and these Special Provisions.

Existing facilities that are removed (i.e., streetlights, electroliers, frames, grates, covers, roadside signs, etc.) shall be salvageable wherever shown on the plans and as determined by the Engineer. Equipment shall be tagged with intersection name from which it was removed.

All equipment to be salvaged shall be handled as follows: All signal equipment (signal heads, pedestrian heads, push buttons, etc.) shall be removed from the poles and stacked on pallets. This includes signal hardware, conductors, and terminal compartments. The equipment shall be secured on the pallets and delivered to Corporation Yard. All poles shall be salvaged to the storage yard on Daggett Road. Contact the City's Operation and Maintenance at (209) -937-8341, giving 3 days advanced notice prior to delivery. Staff will direct contractor to Daggett Road yard and where to leave signal equipment in the Corp Yard.

All conductors shall be removed from abandoned conduits. Otherwise, removed items shall become the property of the Contractor and shall be disposed of as provided in Section 14 and Section 5-1.20B(4) of the Caltrans Specifications and these Special provisions.

The following material shall be salvage to the contractor;

- 8" traffic signal heads
- Mast arm signal poles
- HP luminaire fixtures
- Traffic signal wires

The following materials shall be salvage to the City;

- Pedestrian signal indications
- Pedestrian push buttons
- 12" traffic signal heads
- Luminaire mast arm and the LED fixture
- 1-B traffic signal poles with ornamental flange cover

77-1.30 Priority Control System

The contractor shall be fully responsible for purchasing, assembling, installing, testing, and troubleshooting the vehicle pre-emption system. The priority system shall receive and store all information in a processor at each traffic signal controller cabinet. The priority control system shall match the existing system at other traffic signals.

The priority control system shall be fully compatible with and supported by the existing City's traffic signal priority Central Management Software (CMS).

I. SYSTEM DESCRIPTION

A priority control system shall operate in a manner that allows infrared as well as other signal control technologies to interoperate and activate one another in a consistent manner. The priority control system shall consist of a matched system of vehicle equipment and intersection equipment capable of employing both data-encoded radio communications to identify the presence of designated priority vehicles, as well as data-encoded infrared signaling communications. In preemption mode, the data-encoded communication shall request the traffic signal controller to advance to and/or hold a desired traffic signal display selected from phases normally available. A record of system usage by agency identification number, vehicle classification and vehicle identification number shall be created. The system software shall support call history analysis and reporting across any subset of intersections and/or vehicles independent of activation

method. System software shall also support both onsite and remote programming and monitoring of the priority control system.

Intersection detection equipment will consist of an infrared detector at or near the intersection that is connected to a phase selector located in the intersection controller cabinet. The infrared detector, mounted on signal pole mast arms or vehicle signal head, receives the data-encoded infrared signal from the infrared equipped vehicle and transmits information through detector cable designed to convert infrared light energy at the proper wavelength into analog voltage signals that can be evaluated and decoded by the phase selector.

The phase selector shall be capable of receiving data encoded signals from infrared and other signals and combine the detection signals into a single set of tracked vehicles requesting priority activation. The phase selector will process the vehicle information to ensure that the vehicle is (1) in a predefined approach corridor, (2) heading toward the intersection, (3) requesting priority, and (4) within user-settable range. The phase selector shall treat the combined, single set of tracked calls with first come first served priority methodology within a given priority level. Arbitration between infrared signal intensity and other signal distance/ETA shall be first come first served methodology based on time of detection as each equipped vehicle reaches its programmed threshold.

When these conditions are met, the phase selector shall generate a priority control request to the traffic controller for the approaching priority vehicle. The system shall offer compatibility with most signal controllers, e.g. NEMA (National Electrical Manufacturers Association) 170/2070 controllers. The system can be interfaced with most globally available controllers using the controller's preemption inputs. RS-232, USB and Ethernet interfaces shall be provided to allow management by on-site interface software and central software. The required priority control system shall be vehicle ID compatible with neighboring jurisdictions using optical emergency vehicle preemption. This will allow neighboring jurisdictions with mutual aid agreements with the City of Stockton to use the preemption system in Stockton and vice versa.

The system shall allow for relative priority for each emitter classes. The system shall allow for evacuation mode.

II. MATCHED SYSTEM COMPONENTS

The required priority control, data-encoded, infrared communications system shall be comprised of five basic matched components: data-encoded emitter, infrared detector, detector cable, Auxiliary Interface Panel (AIP), and phase selector. This system shall be installed, with all five basic components, at each signalized location. In addition, a card rack (Model # 760) and an electromechanical interface card shall be available if required. To ensure system integrity, operation and compatibility, all components shall be from the same manufacturer. The system shall offer compatibility with most signal controllers, e.g., electromechanical, NEMA (National Electrical Manufacturers Association), 170. Interfacing to an electromechanical controller may require the use of an interface card. The priority system shall be fully compatible with and supported by the existing City's traffic signal priority Central Management Software (CMS).

- A. Infrared Detector (GTT model # 721). The detector shall change the infrared signal to an electrical signal. It shall be located at or near the intersection. It shall send the electrical signal, via the detector cable, to the phase selector.
- B. Detector Cable (GTT model # 138). The detector cable shall carry the electrical signal from the detector to the phase selector. The cable shall be made by the same manufacturer as the rest of the priority control system.
- C. Auxiliary Interface Panel (AIP), **required only if indicated on the plans**. An AIP shall be installed in the traffic signal cabinet where a new cabinet is not installed. The auxiliary panel shall provide additional preemption outputs if needed. It shall also provide a connection point for the phase selector to monitor the status of the intersection's green lights (green sense). Additional RS-232 communication ports may also be accessed via this panel. If additional outputs are not required, an auxiliary harness shall be used to monitor the status of the intersection's green lights.
- D. Phase Selector (GTT model # 764). The phase selector shall recognize inputs from both infrared and other signal activation methods at the intersection and supply coordinated inputs to the controller. The phase selector shall process the data in order to validate that all parameters required for granting a priority request are met. It shall be located within the controller cabinet at the intersection. It shall request the controller to provide priority to a valid priority vehicle by connecting its outputs to the traffic controller's preemption inputs.
- E. A 6-foot Cat5e (Red Color) cable and a SFP-1 Copper 10/100/1000 Mbps RJ45 Small Form-Factor Pluggable module shall be furnished to enable the phase selector to communicate through the Ethernet switch with Opticom central software.

RELIABILITY

- A. All equipment supplied as part of the infrared priority control system intended for use in the controller cabinet shall meet the following electrical and environmental specifications spelled out in the NEMA Standards Publication TS2 1992, Part 2:
 - 1. Line voltage variations per NEMA TS2 1992, Paragraph 2.1.2.
 - 2. Power source frequency per NEMA TS2 1992, Paragraph 2.1.3.
 - 3. Power source noise transients per NEMA TS2 1992, Paragraph 2.1.6.1.
 - 4. Temperature range per NEMA TS2 1992, Paragraph 2.1.5.1.
 - 5. Humidity per NEMA TS2 1992, Paragraph 2.1.5.2.
 - 6. Shock test per NEMA TS2 1992, Paragraph 3.13.9.
 - 7. Vibration per NEMA TS2 1992, Paragraph 3.13.8.
- B. Each piece of equipment supplied as part of the priority control system intended for use in or on priority vehicles shall operate properly across the entire spectrum of combinations of environmental conditions (temperature range, relative humidity, vehicle battery voltage) per the individual component specifications.

RESPONSIBILITIES

- A. The manufacturer of the required infrared priority control system and/or the manufacturer's representative shall provide responsive service before, during and after installation of the priority control system. The manufacturer and/or the manufacturer's representative, as consultants to the installer, shall provide certified, trained technicians having traffic systems industry experience and operational knowledge of priority control systems.
- B. The lowest fully responsive bidder shall be required to supply working production components specified in this Specification within 14 calendar days from the bid opening date. Failure to do so shall render the bid non-responsive.
- C. Paragraph B. shall not be required if, prior to the bid opening, the bidder demonstrated to the city that the equipment bid meets these specifications.

SUBSTANTIATED WARRANTY

- A. The manufacturer of the required infrared priority control system shall warrant that, provided the priority control system has been properly installed, operated and maintained, component parts of a matched component system (see Section II) that prove to be defective in workmanship and/or material during the first five (5) years from the date of shipment from the manufacturer shall be covered in a documented system-protection plan, plus provide an added five-year maintenance coverage for repair or replacement at a fixed deductible charge for a total of ten (10) years of product coverage.
The manufacturer must substantiate its financial ability to respond to warranty claims. The guarantee shall be determined in reference to the manufacturer's business assets and financial experience over the preceding five-year period.
- B. In addition, upon request, the manufacturer shall provide documentation proving ability to financially support the ten (10) year provisions of the warranty/maintenance period. Documentation shall include appropriate financial reports for the previous five business years.
- C. The protection plan shall warrant that component parts of a matched component system that are not subject to coverage limitations and prove to be defective in workmanship and/or material during the first five (5) years from the date of shipment from manufacturer shall be repaired at no charge, and that extended coverage with a fixed repair deductible shall be available for an additional five (5) years.
- D. In total, the warranty/maintenance coverage must assure that system components shall be available to allow system operation during the ten (10) year warranty/maintenance coverage.
- E. A copy of the manufacturer's written warranty outlining the conditions stated above shall be supplied with the bid. Coverage and coverage limitations are to be administered as detailed in the manufacturer's Warranty/Maintenance document.

CERTIFICATE OF INSURANCE

The manufacturer of the required infrared priority control system shall provide a certificate of product liability insurance protection for \$5,000,000 assuring the priority control user that the manufacturer is insured against civil damages if proven to be at fault for an accident due to equipment failure within the system of matched priority control components. This certificate, however, need not, and is not meant to, provide liability

insurance protection to the priority control system dealer, installer or user.

USER SUPPORT SERVICES

The manufacturer of the required infrared priority control system shall offer support programs to assist the purchase and implementation of a priority control system program, including:

- A. A preferred lease program to finance purchase of a system.
- B. Public relations assistance to promote the system within the user community.
- C. Intersection survey service to document appropriate equipment interfaces.
- D. Customized proposals to assist the procurement process.
- E. Driver Training Program

CERTIFICATION

The manufacturer of the required infrared priority control system shall certify that all component products are designed, manufactured and tested as a system of matched components and shall meet or exceed the requirements of this specification.

SYSTEM OPERATION

The Contractor shall demonstrate that all of the components of each system are compatible and will perform satisfactorily as a system.

Operating sequence shall be initiated when the detector receives optical energy of the required identification code and sequential flash rate from an emitter.

Detector shall transform the optical energy signals into electrical signals and transmit the electrical signals to the phase selector module for processing.

The phase selector module shall place a logical true call (high priority) or a pulsing logical true call (6.25 Hz square wave for second priority) into the signal controller to advance to and hold the green display, which grants right-of-way to the authorized vehicle(s) displaying the optical energy pulses.

When a preemption call is registered while the controller is serving a vehicular phase or phase combination other than the preemption phase(s) called for, a clearance interval for the phase(s) in conflict shall be displayed immediately after the minimum green period. If a preemption call is registered while the controller is servicing the preemption phase or phase combination called for, the controller shall remain in that phase or phase combination at least four (4) seconds after the call drops out. If a preemption call is registered while the controller is servicing a pedestrian call, the controller shall immediately terminate the WALK indication and time a separately programmable flashing DONT WALK indication before serving the preemption phase(s) called for.

Phase selector module shall obtain and hold the desired green display(s) for a minimum of four (4) seconds, even if the optical energy signals cease before entering the preempt green display(s).

Phase selector module shall allow the signal controller to resume normal operation 6 to 10 seconds after optical energy signals are lost, if the optical energy signals are lost after

entering the pre-empt green display(s).

Preemption equipment shall be installed in such a manner that the internal wiring of the controller, as normally furnished by the manufacturer, is not altered.

Phase selector module shall provide for assigning right-of-way to one of two (1 of 2) priority levels on either of two (2) channels. Priority is given on a first-detected, first- served basis, except that a high priority optical transmission shall have precedence over a low priority optical transmission when both are detected concurrently.

Full compensation for furnishing all labor, materials, tools, equipment and incidentals for doing the work described in this section (77-1.30) shall be included in the lump sum price paid for "Traffic Signals and Electrical" and no additional compensation shall be allowed therefor.

77-2 BLANK

77-3 BLANK

77-4 TRAFFIC SIGNAL TURN ON AND STREET LIGHT REMOVAL

77-4.01 Traffic Signal Turn On and Change Over

The Contractor shall be responsible to coordinate the turn on or change-over of any traffic signal operation. He shall notify the Resident Engineer and the City Traffic Engineer of the impending turn on or activation of any traffic signal included in this contract at least seven (7) working days in advance of the turn on or change-over. Traffic signal turn on or change over shall occur only on Tuesday and Wednesday, except on holidays. Upon turn on or change-over of any traffic signal, the Contractor shall demonstrate satisfactory compliance with all requirements necessary for the operation of the traffic signal, including, but not limited to, Fiber Optic cabling and communication equipment, PTZ camera and communication equipment, appropriate detection, Vehicle Pre-emption system, controller response, pedestrian countdown and accessible pedestrian system sound features operating, and the traffic signal response to the various calls.

In no case shall the traffic signal be left in operation if any of the design features of the operation are found to be inoperable. All signal and pedestrian heads shall be covered by signal head jackets again and stop signs shall be re-installed.

The intersection shall be protected with portable "Stop" signs and certified Flaggers during any traffic signal turn on or change over. Flaggers and stop signs shall remain on site until all attendees to the turn on or change-over are satisfied that the traffic signal is functioning appropriately.

Mounted "Stop" signs on barricades shall be maintained *on site for immediate* application to any intersection with traffic signal under construction. The Contractor shall respond to *any interruption of normal functioning of a traffic signal within two (2) hours.*

The Contractor shall be responsible for the coordination of all of the necessary sub-contractors for a successful turn on or change-over of a traffic signal, and to determine that all of the appropriate remedies are in place to return a traffic signal to its prior operation mode should a failure of any of the components necessary for successful operation occur.

77-4.02 Street Light Removal

The street lighting system shall fully conform to the National Electrical Code and City of Stockton Standard Specifications and details.

The Contractor shall take care in removing the existing street light and transport to the City corporation yard. When the existing street light is damaged and new material is necessary, such material shall be a replacement of the original and shall be paid for at the Contractor's expense.

Existing foundations shall be removed and disposed of off-site.

DIVISION IX TRAFFIC CONTROL DEVICES

SECTION 84 – MARKINGS

84-1.01 Traffic Stripes, Pavement Markings, and Pavement Markers

Traffic stripes and pavement legends, including crosswalks, shall be placed as shown on the plans, must comply with the California MUTCD, as modified herein, and as directed by the Engineer. All pavement **traffic stripes**, legends, arrows and crosswalks shall be installed with hot applied thermoplastic pavement material. The width and patterns of striping lines shall conform to the striping details shown in Figures 3A-101 (CA) through 3A-113 (CA) in the California MUTCD.

The thermoplastic material shall be free of lead and chromium and conform to State Specification PTH-02ALKYD (for markings) and PTH-02SPRAY (for stripes). Thermoplastic material shall be applied to the pavement at a minimum thickness of 0.060 inches for long lines (4 inches stripes and 8 inches stripes in width) and 0.100 inches for all legends and arrows. The crosswalk lines and limit lines shall be installed at a minimum thickness of 0.125 inches.

A double extruded thermoplastic traffic stripe consisting of two 4-inch wide yellow stripes is measured as 2 traffic stripes.

A double sprayable thermoplastic traffic stripe consisting of two 4-inch wide yellow stripes is measured as 1 traffic stripe.

If the contractor chooses to install stripes by using a cart (extruded) rather than a striping vehicle, all striping shall be applied to the pavement at a minimum thickness of 0.090 inches. Glass beads shall conform to State Specification in Sections 84-2.02D, 84-2.02E,

and 84-2-03C(2)e. Thermoplastic pavement markings and stripes shall be free of runs, bubbles, craters, drag marks, stretch marks, and debris.

Use appropriate installation procedures according to manufacturer. If pavement markings are applied to existing surface over existing painted legends (arrows and crosswalks), existing pavement legends (arrows and sidewalks) shall be removed before thermoplastic material is applied. For either material, pavement shall be preheated to remove all residual moisture prior to installation.

At intersections where existing pavement is removed and replaced, Contractor shall install new crosswalk control points for the City to review and approve.

Configuration of traffic stripes, pavement markings, and crosswalks shall conform to the detail and methods as set forth in the latest issue of the California MUTCD and Caltrans Specifications, unless specifically modified on the plans.

All existing traffic stripes and pavement markings shall be removed where shown on the plans, where the existing striping conflicts with proposed striping, and as designated by the Engineer.

Existing pavement markers, including underlying adhesive, when no longer required for traffic lane delineation, as directed by the Engineer, shall be removed and disposed of.

Removal of traffic stripes and pavement markings, or the removal of objectionable material, shall be performed using methods approved in advance by the Engineer. All resulting residue and dust shall be removed immediately from the surface being treated. Such removal shall be by a vacuum attachment operating concurrently with the blast cleaning operation. **The removal of yellow paint and thermoplastic material shall include testing for lead prior to disposal of the material. Disposal of materials containing lead shall conform to state approved practices.** The removal of yellow paint and thermoplastic material shall also conform to the provisions in Section 14-1.01 "Construction Site Waste Materials Management" of these special provisions.

The Contractor shall place control points for the Engineer to review and approve. No additional "cat tracks" shall be placed until control points are approved by the Engineer. The Contractor shall obtain approval from the Engineer on all striping cat tracks prior to final application and striping and markers.

The Contractor shall place and remove any temporary striping required for routing traffic through the project area.

All thermoplastic shall be provided by the Contractor. Manufacturer and specifications shall be submitted for approval and shall conform to the specifications contained herein. All thermoplastic supplied shall conform to the local air pollution regulations. Traffic line markings shall be reflectorized conforming to the Caltrans Specifications, Section 84-2, "Traffic Stripes and Pavement Markings".

Existing surface which is to receive the thermoplastic material shall be mechanically wire

brushed to remove all dirt and contaminants. Thermoplastic material shall be applied only to the dry pavement surfaces and only when the pavement surface temperature is above fifty (50°F) degrees Fahrenheit. Thermoplastic shall be applied only on a thoroughly dry surface and during periods of favorable weather.

The Contractor shall make all necessary conform striping as required. The completed stripes and markings shall be sharp and clear with clean, well-defined edges.

Any damage by the elements to the newly stripe or marking due to the failure of any Contractor to protect his work shall be repaired by him at no additional cost. Any overspray or tracking of fresh thermoplastic material onto unpainted surfacing shall be removed by any methods to the satisfaction of the Engineer.

On one-way streets and median-divided streets, the side of the retroreflective raised pavement markers that is visible to traffic proceeding in the wrong direction shall be red. The other retroreflective side shall be white or yellow as per the detail. This section is applicable to Details 9, 10, 12, 13, 25, 25A, 26 and 27 in the California MUTCD.

Blue Raised Pavement Markers shall be installed after any surface treatment (overlay, micro-surfacing, chip-seal, cape-seal, etc.) solely for aiding in locating fire hydrants. Typical marker locations are shown on Figure 3B-102 (CA) of the California MUTCD.

(1) *Two-Way Streets*—Markers should be placed 6 inches from the edge of painted centerline on the side nearest the fire hydrant. If the street has no centerline, the marker should be placed 6 inches from the approximate center of the roadway on the side nearest the hydrant.

(2) *Streets with Left Turn Lane at Intersection*—Markers should be placed 6 inches from the edge of painted white channelizing line on the side nearest the hydrant.

(3) *Streets with Continuous Two-Way Turn Lane*—Markers should be placed 6 inches from the edge of the painted yellow barrier line on the side nearest the fire hydrant.

(4) *One-way streets and median-divided streets*—Markers should be placed 6 inches from the edge of lane line on the side nearest the fire hydrant (at least 12' from curb or edge of traveled way).

The noise level created by the combined grinding activities must not exceed 86 dBA when measured at a distance of 50 feet at right angles to the direction of travel.

DIVISION XI MATERIALS

SECTION 90 – CONCRETE

Attention is directed to the Section 90, “Concrete” of the Standard Specifications and these Special Provisions.

90-1.01 Minor Concrete

Section 90-2, "Minor Concrete", of the Caltrans Specifications is amended by adding the following:

Mineral admixture will be required in the manufacture of concrete containing aggregate that is determined to be "deleterious" or "potentially deleterious" when tested in accordance with ASTM Designation: C 289. The use of mineral admixture in such concrete shall conform to the requirements in Section 90-1.02 of the Caltrans Specifications, "Materials", except the use of Class C mineral admixture will not be permitted.
